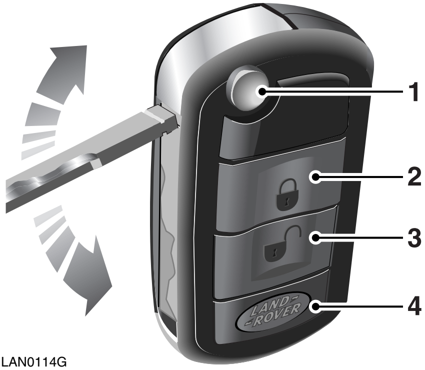
Filling Station Information

FUEL FILLER FLAP 33
TYRE PRESSURES 34

THE REMOTE CONTROL



LAN0114G

1. Key release button.
   Press to release the folded key.
2. Lock button.
   Superlocks all doors and activates perimetric alarm. If interior space protection and tilt sensor options are fitted, they can be over-ridden by pressing the button twice within 3 seconds.
   See **Superlocking, 44**, **Perimetric alarm, 44**, **Interior space protection, 46**, and **Tilt sensor, 46**.
3. Unlock button.
   Press once to disarm all alarm features and unlock driver's door only. Press twice to open all doors.

   Note: *The above applies unless configured for multi-point entry. See **Single-point entry, 42**.*
4. Land Rover button.
   The remote control can be programmed to initiate one of 5 features; Panic alarm, Headlamp courtesy delay, Tailgate release, Tailglass release or Air suspension control.
   See **LAND ROVER BUTTON, 40**.

Single point entry

This is a security feature that unlocks only the driver's door. It can be disabled on individual remote controls by simultaneously pressing and holding buttons **2** and **3** for three seconds. The vehicle will lock and then unlock in the currently selected mode to confirm the change.
You can now unlock all doors with a single press. Repeating the procedure will re-enable Single point entry.

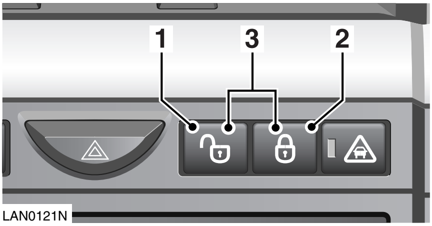
Automatic relock

If the vehicle is unlocked with the remote control, it will automatically relock and arm the alarm if a door or the tailgate is not opened within one minute.

Partial arming

If an aperture (door, bonnet or tailgate) is not fully closed when the remote control lock button is pressed, the horn will sound briefly to signal that an aperture is still open. The alarm will remain disarmed and all of the closed apertures will lock.
As soon as the open aperture is closed, the system will automatically arm, signalled by three flashes of the hazard warning lamps, with interior space protection activating 30 seconds later.

CENTRAL LOCKING



Master lock and unlock switches

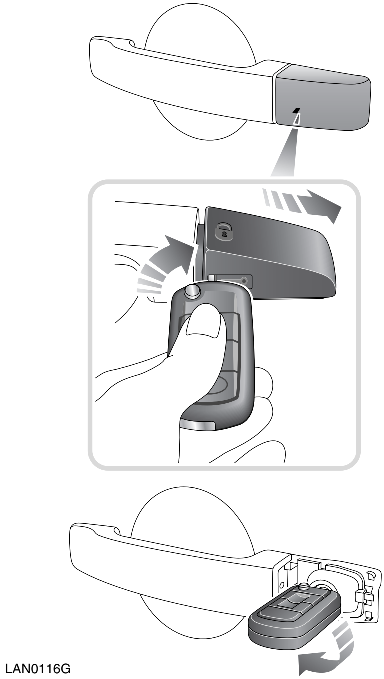
1. Press to unlock all doors and tailgate.
2. Press to lock all doors and tailgate.
3. Press both buttons simultaneously for three seconds to release the tailgate.

Speed related locking

If enabled, the doors and tailgate will automatically lock when the vehicle's speed exceeds 8 km/h (5 mph).

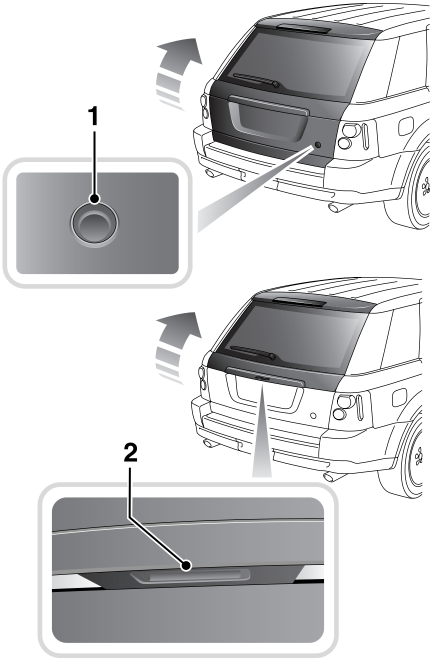
This feature can be disabled or enabled in the **SETTINGS** menu of the trip computer.
See **SELECTING SETTINGS OPTION, 88**.

EMERGENCY UNLOCKING



If the remote control should fail, there is an emergency access feature on the left-hand front door lock. With the key inserted into the slot beneath the handle cap, the cap can be pulled outwards slightly and then moved backwards to unhook it. The key can now be used to unlock the vehicle.
See **Emergency locking/unlocking, 49**.

TAILGATE



LAN0394G

Opening the tailgate

With all the doors unlocked, press the release button **1** on the tailgate to release.

The tailgate incorporates a 'Power closure' feature, which removes the need to 'slam' the tailgate when closing.

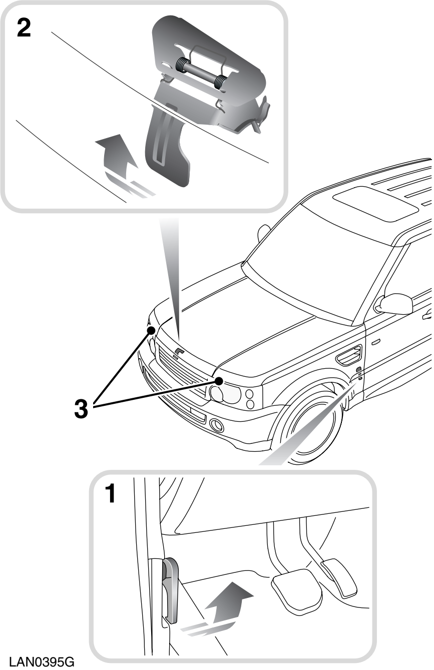
Opening the tailglass

With all the doors unlocked, press the touch pad **2** on the exterior handle and pull to open.

Operating note

If the vehicle is locked/unlocked 10 times within a short period, the door and tailgate latches will be disabled for approximately one minute, to protect the battery and lock mechanism.

BONNET



LAN0395G

Opening

Pull the bonnet release lever **1** located on the left-hand side of the vehicle.

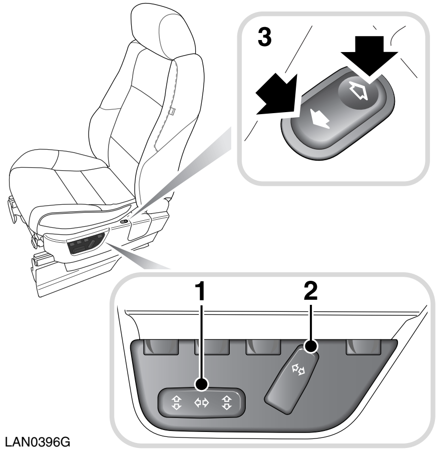
Lift the bonnet safety catch lever **2**, located on the front edge of the bonnet beneath the centre point of the words LAND ROVER and raise the bonnet.

Closing

Lower the bonnet until it is 300 mm (12 inches) from its closed position. Using the palms of both hands positioned on the front edge of the bonnet on either side of the radiator grille, push down until the catches 'click'.

Check that both catches **3** are engaged by trying to lift the front edge of the bonnet.

SEAT ADJUSTMENT - POWER SEATS



To adjust the seats, the starter switch must be in position **I** or **II**.

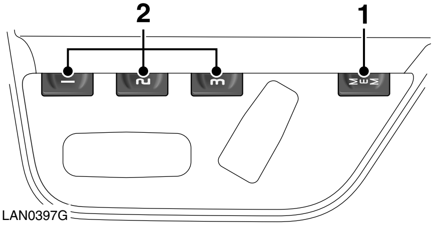
1. Seat recline.
2. Seat fore/aft, cushion height and front tilt control.
3. Lower backrest lumbar support.

Power operated memory driver's seat also has a 10 minute active period (Non-memory power operated seats up to 15 minutes) initiated when:

- The driver's door is opened/closed.
- The starter key is turned to the off position.

See **FRONT SEAT ADJUSTMENT, 54**.

DRIVING POSITION MEMORY



Once you have adjusted the driver's seat and exterior mirrors, the vehicle can memorise these settings for future use.

1. Press the memory store button **1** to activate the memory function for five seconds.
2. Press one of the preset buttons **2** within five seconds to memorise the current settings. **MEMORY STORED** will be displayed in the message centre accompanied by an audible chime to confirm the settings have been memorised.

To recall a stored driving position, press the appropriate preset button **2**.

Operating note

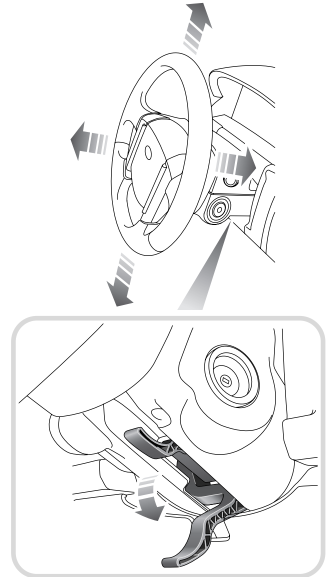
A seat position will only be memorised during the five second active period.
Any existing settings will be over-written when programming a memory position.

Lazy entry

When this feature is enabled, the vehicle stores the seating and mirror positions for each remote control. Next time the vehicle is unlocked using a remote control, the position of the seat and mirrors will adjust to the last used position.

This feature can be disabled or enabled in the **Settings** option accessed via the trip computer.

STEERING COLUMN ADJUSTMENT



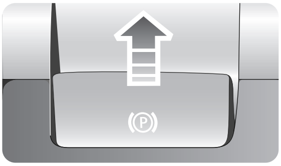
LAN0398G

1. Move the lever located under the steering wheel fully downward.
2. Adjust the height and reach of the steering wheel to the desired position.
3. Move the lever fully up to lock the position of the wheel.

See **STEERING COLUMN ADJUSTMENT, 81**.

PARKBRAKE (EPB)

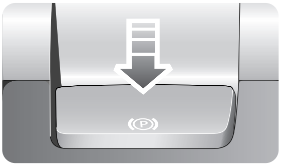
Applying



LAN0406G

With the vehicle stationary, pull up the parkbrake leverand then release it. The lever will return to a neutral position and the red warning indicator in the instrument pack will illuminate.

Releasing



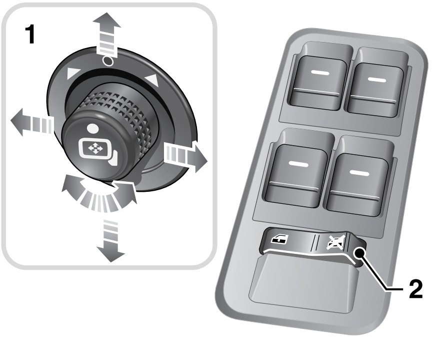
LAN0407G

The starter switch must be in position **I** or **II**. Apply the footbrake and press down on the parkbrake lever.

If the vehicle is stationary with the parkbrake applied and either **D** (Drive) or **R** (Reverse) selected, pressing the accelerator will automatically release the parkbrake.

For more detailed information on the parkbrake, see **PARKBRAKE (EPB), 177**.

WINDOWS/DOOR MIRRORS



LAN0399G

Windows

- To open a window, press and hold the respective switch.
- To close the window, pull and hold the switch.

Window movement can be stopped at any time by releasing the switch.

The driver's window has a one touch facility that allows it to be opened or closed with a single operation of the switch. Firmly press the switch and release. Movement can be stopped by pressing the switch again.

Press the right-hand side of switch **2** to inhibit the operation of the rear window switches. See **ELECTRIC WINDOWS, 119**.

Resonance with lowered windows
If a resonance/booming sound occurs when a rear window is open, lowering an adjacent front window about 25 mm (1 inch) will eliminate the condition.

Door mirror adjustment

To adjust the mirrors, rotate the mirror adjustment knob **1** left or right to select the appropriate mirror. Move the knob in any direction to adjust the position of the mirror glass. See **EXTERIOR MIRRORS, 82**.

Power fold mirrors

Allows the mirrors to be electrically folded towards the door for better clearance/protection.

With the mirror adjustment knob in the central position, push the knob downwards to fold/unfold the mirrors.
See **Folding the mirror body, 83**.

Reverse automatic mirror dip

With the feature enabled, when reverse gear is selected the door mirrors will dip.

The dip position of the door mirrors can be personalised. See **Reverse mirror dipping, 84**.

This feature can be disabled or enabled in the **Settings** option accessed via the trip computer. See **SELECTING SETTINGS OPTION, 88**.

SEAT BELTS/CHILD RESTRAINTS

A warning indicator in the instrument pack will illuminate to alert you that the driver's and/or front passenger's seat belt is unbuckled. An intermittent chime may also be heard.

Automatic Locking Reels (ALR)

All passenger seat belts have ALR fitted for use with child seats or securing large items.

- To engage: extend seat belt to maximum length to enable locking mechanism.
- Allow seat belt to retract onto the child seat/large item (a clicking sound will be heard as the belt retracts). Ensure there is no slack by pressing the seat/item firmly into the vehicle seat.
- To disengage: unbuckle belt and allow belt to fully retract.

With ALR enabled, as the seat belt retracts, it will automatically lock, preventing re-extension.
Ensure passengers do not fully extend the restraints and inadvertently engage this feature during normal use.

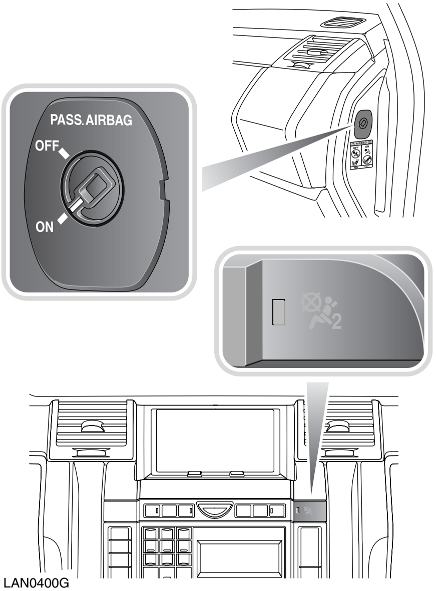
Child Seats

It is important to remember that the child's weight, rather than age, determines the type of seat that is required.

See **Child safety seating and positions, 68**.

Recommended child seat
Land Rover's recommended Group 1 seat is the Land Rover ISOFIX child restraint with a top tether.
The ISOFIX child seat can only be fitted in the outer, rear seating positions.

PASSENGER AIRBAG DISABLING



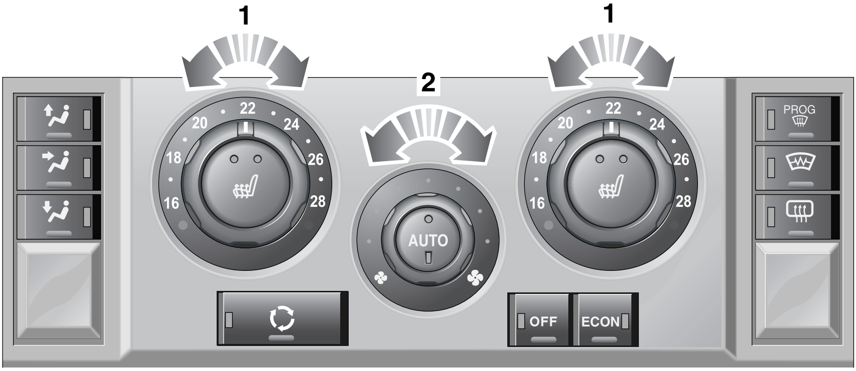
If it becomes necessary to fit a child restraint on the front passenger seat, the passenger airbag must be disabled.

To disable the airbag, open the front passenger door and use the starter key to turn the **PASS. AIRBAG** switch (located on the end of the facia) to the **OFF** position.See **PASSENGER AIRBAG DISABLING SWITCH, 78**

With the airbag disabled, the status indicator will illuminate whenever the starter key is turned to position **II**.

Operating note
When an adult is seated in the front passenger seat, ensure the **PASS. AIRBAG** switch is turned to the **ON** position.

HEATING AND VENTILATION



LAN0402G

AUTO (Automatic) MODE

Press **AUTO** to select automatic operation of the system, both LEDs in the switch will illuminate.

The system adjusts heat output, blower speed, air intake and airflow distribution to maintain your the selected temperature(s) and reduce misting without further adjustments.

Use the air distribution and blower controls to adjust the automatic settings. The appropriate LED in the **AUTO** control will extinguish.

Recommended mode
Select **AUTO** as the normal operating mode. This will help prevent window misting and odours from the climate control system.

Air conditioning

Air conditioning provides cooled and dehumidified air for occupant comfort. Dry airflow is effective in preventing misting of windows and is also beneficial at low external temperatures.

Air conditioning is automatically switched on and controlled whenever the system is not operating in ‘Economy’ mode.

External water deposits
The air conditioning system removes moisture from the air and deposits excess water beneath the vehicle. Puddles may form, but this is normal and no cause for concern.

Temperature selection

Rotate the controls **1** to adjust the temperature for the respective side of the passenger compartment.

Operating note
It is not possible to achieve a temperature differential of more than 4°C (7°F) between left and right.

MANUAL MODE

Blower speed

Rotate the control **2** to adjust the airflow. LEDs will illuminate to indicate which of the eight possible speeds is currently selected.

Air distribution control

Press to select a distribution setting. An LED will illuminate in the switch.

Windscreen and side window vents

Face level vents

Foot level vents

More than one setting can be selected.

Air recirculation

Press to activate air recirculation. An LED will illuminate in the switch. Press again to return to fresh air intake.

OFF

OFF

Press to switch the system off. An LED will illuminate in the switch.

Press again to return the system to its previous operating mode. The system will also be reactivated by using the **AUTO**, blower speed, air distribution or defrost controls.

Economy mode

ECON

Press to select ‘Economy’ mode. An LED will illuminate in the switch.

Air conditioning is switched off to reduce load on the engine and improve fuel consumption.

Seat heaters

Press the relevant button to operate the required seat heater at high level. Both LEDs in the switch will illuminate.

Press a second time to heat the seat at a lower level. One LED will extinguish.

Press a third time to switch off.

Defrost mode

PROG

Press to remove frost or heavy misting from the windscreen. The system will automatically adjust the blower output for maximum clearing, in addition the rear window and windscreen heaters will be activated.

Press again to switch off defrost mode. The rear window and windscreen heaters will remain on for a preset interval.

Heated windscreen/rear window

Press to operate. An LED will illuminate in the switch.

The heaters will automatically switch off after a preset interval.

For more information, see **TEMPERATURE CONTROLS, 123**.

AUXILIARY FUEL-BURNING HEATER

When the heater automatically switches on, exhaust fumes may be seen coming from under the bonnet. This is normal and no cause for concern.

See **AUXILIARY FUEL-BURNING HEATER, 126**.

WARNING INDICATORS

Battery charging - RED.

Low oil pressure - RED.

Parkbrake - RED.

Brakes - RED/AMBER.

Anti-lock braking system - AMBER.

Airbag - RED.

Engine - AMBER.

Diesel glow plugs active - AMBER.

Suspension/Dynamic response - RED/AMBER.

Low tyre pressure - AMBER.

Dynamic Stability Control (DSC) - AMBER.

Adaptive front lighting system - AMBER.

Adaptive Cruise Control (ACC) - AMBER.

Seat belts - RED.

Low gear range selected - GREEN.

Hill Descent Control (HDC) on - GREEN.

Cruise control active - AMBER.

Direction indicator - GREEN.

Trailer direction indicator - GREEN.

Side lamps/Headlamps on - GREEN.

Headlamp high beam on - BLUE.

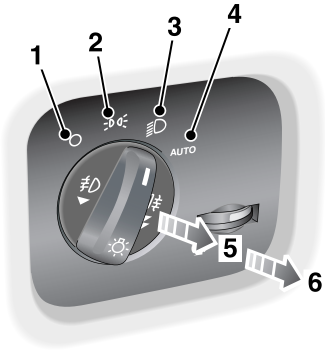
Rear fog lamps on - AMBER.

Front fog lamps on - GREEN.

If a red warning indicator illuminates while driving, a serious fault is indicated. Stop the vehicle and refer to the main section of this handbook.

For a full description of warning indicators and their functions, see **Warning Indicators, 104**.

LAMPS MASTER SWITCH



LAN0403G

1. Side lamps and headlamps off.
2. Side lamps on.
3. Low beam headlamps on.
4. Automatic control lamps on.

   In **AUTO** mode and the starter switch in position **II**, a sensor monitors the exterior light levels and will automatically switch the side lamps and low beam headlamps on or off as required.
5. Front fog lamps on.
6. Front and rear fog lamps on.

If front fog lamps are not fitted, the rear fog lamps will come on at position **5**.

Fog lamps cannot be operated if the lamps master switch is at position **4** Auto.

For a full description of these functions, see **EXTERIOR LAMPS, 110**.

Headlamp courtesy delay

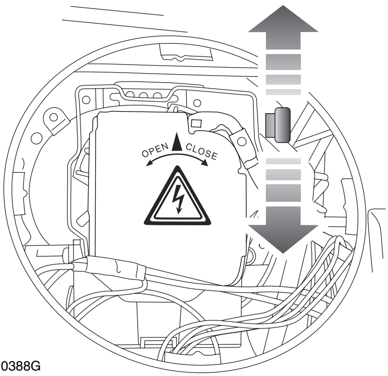
With the master switch in positions **2**, **3** or **4**, turn the starter switch off and remove the key. Turn the master switch to the off position. The headlamps will remain on for up to 240 seconds. For a full description of this feature and how to set the time delay, see **Headlamp courtesy delay, 112**.

HEADLAMP TOURING ADJUSTMENT

Position of the lever illustrated will vary depending on type of headlamps and side of vehicle. It may be on either side of the headlamp bulb aperture.

When touring in a country where traffic drives on the opposite side of the road to where you normally drive, use the tourist lever mechanism within each headlamp unit to alter the beam pattern. This enables the vehicle to be driven without having to stick blanking decals onto the headlamp lens.

Xenon headlamps



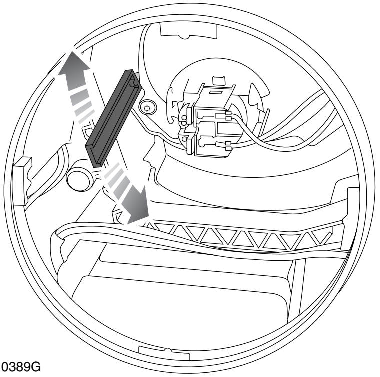
LAN0388G

Follow the process shown in **HEADLAMP UNIT, 272**, to gain access to the inside of the headlamp unit. Move the lever to adjust the beam.

Lever default position - Xenon headlamps

Right hand headlamp	Up
Left hand headlamp	Up

Halogen headlamps



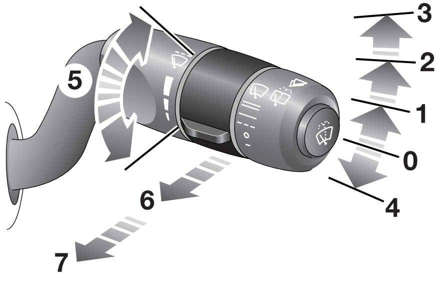
LAN0389G

Follow the process shown in **HEADLAMP UNIT, 272**, to gain access to the inside of the headlamp unit. Move the lever to adjust the beam.

Lever default position - Halogen headlamps

Right hand headlamp	Down
Left hand headlamp	Up

STEERING COLUMN LEVERS



LAN0519G

1. Rain sensor variable delay or Intermittent wipe.
2. Normal speed wipe.
3. Fast speed wipe.
4. Single wipe.
5. Rotate collar to adjust rain sensor/Intermittent variable delay.

Rear wiper and washer

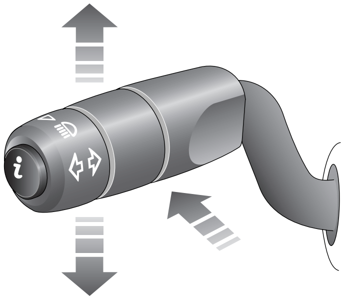
Pull the lever to position **6** for intermittent operation of the rear wiper. Pull and hold the lever in position **7** to operate the rear washer and wiper.

Windscreen washer

Push the button on the end of the lever to operate the wndscreen washer.

For more detailed information on the wash/wipe system, see **WINDSCREEN WIPERS, 114**.

Direction indicators/Headlamp high beam



LAN0405G

Move the lever up or down to activate the direction indicators.

Push the lever away from you to select headlamp high beam. A blue warning indicator will illuminate on the instument pack.

Trip computer

Press the button on the end of the lever to cycle through the trip computer functions displayed on the message centre.
See **TRIP COMPUTER - FUNCTION SELECTION, 87**

CONFIGURABLE FEATURES

Settings options (trip computer)

These are displayed on the main message centre. See **SELECTING SETTINGS OPTION, 88**.

SETTINGS	**CHOICE**
TRIP DISTANCE UNITS (odometer)	MILES/KM
FUEL USAGE UNITS	MPG l/100km Km/l
EXTERNAL TEMPERATURE	°C or °F
OVERSPEED WARNING (Set a personal speed limit - Warnings are displayed in the message centre)	Off 20 - 250 km/h or 15 to 140 mph in 5-unit steps (units set as trip distance)
HEADLAMP OFF DELAY	30/60/120/240 seconds
AUTO DOOR LOCK (speed related locking)	ON/OFF
REVERSE MIRROR DIP	ON/OFF
LAZY ENTRY	ON/OFF
RESTORE DEFAULT SETTINGS	YES/NO

Remote control

The remote control can be configured to operate the following features:

- Panic alarm, for personal protection. See **Panic alarm, 41**.
- Headlamp courtesy delay, providing lighting for personal safety. See **Headlamp courtesy delay, 41**.
- Air suspension control, allows remote operation of the air suspension. See **Air suspension control, 42**.
- Tailgate release function, releases the tailgate as a whole. See **Tailgate release, 43**.
- Tailglass release function, releases only the tailglass. See **Tailglass release, 43**.
- Single point entry, allowing only the drivers door to be opened remotely. See **Single-point entry, 42**.

Passenger airbag disabling

The safest place for a child seat is fitted to the rear seating. However, if it is necessary to fit a child seat to the front passenger seat the front passenger airbag must be disabled. See **PASSENGER AIRBAG DISABLING SWITCH, 78**.

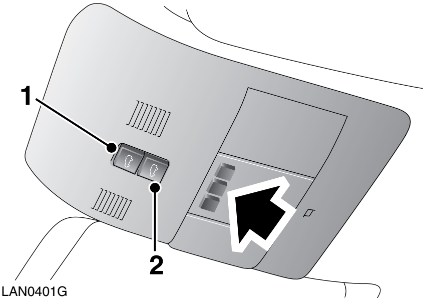
Daytime running lamps

Unless prevented by legislation, it is possible to automatically switch on the exterior lamps whenever the engine is running. See **Daytime running lamps, 112**.

Speed dependent wiper mode

The wiper speed in all modes can be automatically varied according to vehicle speed. See **Speed-dependent mode, 115**.

OVERHEAD CONSOLE



Courtesy lamps

If automatic mode is enabled, the front and rear courtesy lamps will operate in conjunction with the vehicle being unlocked/locked or when a door is opened.

Automatic mode
Automatic mode for the courtesy lamps can be enabled/disabled by pressing and holding the centre lamp switch for more than three seconds.
A message will be displayed in the message centre advising you of the mode currently set.

The courtesy lamps can be manually switched on/off by pressing and releasing the centre lamp switch (arrowed in illustration).
See **Front Interior lamps, 131**.

Interior lamps

The interior lamps can be switched on/off by pressing the switch adjacent to the lamp.

Sunroof

Open/close sunroof:

- Press and release the switch **1** to open the sunroof fully.
- Press the switch **2** to close.

Tilt sunroof:

- Press and release the switch **2** to open the sunroof to the tilt position.
- Press and hold the switch **1** to close.

If the sunroof is moving, it can be stopped by pressing the swich again.

See **SUNROOF OPERATION, 121**.

Operating note
The sunroof can be operated with the starter key in position **I** or **II** and for 40 seconds after position **0** has been selected, providing that neither front door has been opened.
With the starter key in position **I** or **0**, the switch will need to be pressed and held until the roof reaches the desired position.

REAR VIEW MIRROR

Automatic dimming

Some rear view mirrors are fitted with a feature that will automatically darken to counteract glare from the headlamps of a following vehicle.

This feature is temporarily switched off while reverse gear is selected.

See **REAR VIEW MIRRORS, 137**.

AUTOMATIC TRANSMISSION

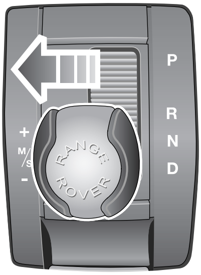
Gearshift interlock

The starter switch must be in position **II**, the foot brake applied and the selector release button pressed before the gear selector can be moved from **P** (Park) to **R** (Reverse).

The gear selector must be in **P** before the starter key can be removed.

See **AUTOMATIC TRANSMISSION USE, 157**.

Sport mode



LAN0408G

In Sport mode, automatic gear changing is maintained but the gearshift changes are modified to improve performance.

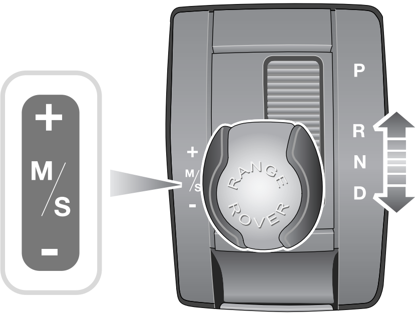
To select Sport mode, move the gear selector from **D** towards the left-hand side of the vehicle.

The word **SPORT** will appear in the instrument pack display and the LED in the gear selector surround will illuminate.

With the gear selector in Sport, the transmission will stay in lower gears for longer with downshifts occurring more readily.
Fuel consumption will be adversely affected.
If Terrain Response is fitted, Sport mode is only available if the **General** program is selected.

CommandShift

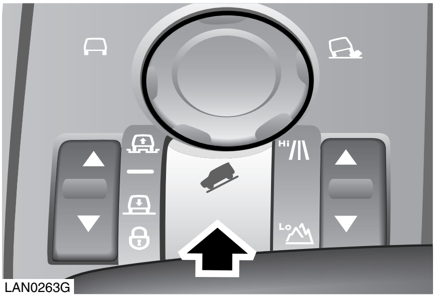
CommandShift gear selection can be used as an alternative to automatic gear selection and is particularly effective when rapid acceleration or engine braking is required.



LAN0422G

1. Select Sport mode. The transmission will automatically select the gear most appropriate to the vehicle's road speed and accelerator position.
2. Moving the selector lever forward (**+**) or backward (**-**) and then releasing will manually select a higher or lower gear (when available). The message **TRANSMISSION COMMANDSHIFT SELECTED** will appear in the message centre.
3. Subsequent gear selections will shown in the instrument pack display.
4. To deselect CommandShift mode, move the selector lever back to **D**.

HILL DESCENT CONTROL (HDC)



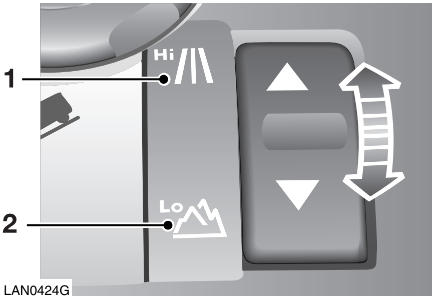
HDC operates in conjunction with the anti-lock braking system to provide greater control in off-road situations, particularly when descending severe gradients.

Press the switch (arrowed in illustration) to select HDC. HDC can be selected at speeds below 80 km/h (50 mph), but will not be fully active until the vehicle speed reduces below 50 km/h (30 mph), confirmed by a continuously illuminated HDC indicator in the instrument pack.

Press the switch again to deselect HDC.

See **HILL DESCENT CONTROL, 181**.

TRANSFER GEARBOX



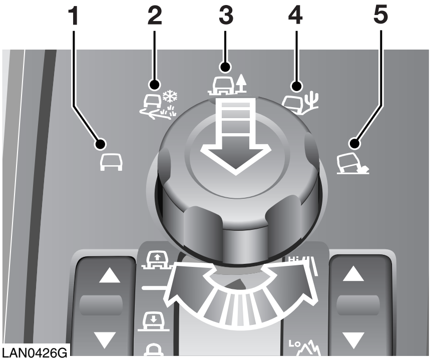
1. **HIGH** range should be used for all normal road driving and also for off-road driving across dry level terrain.
2. **LOW** range should be used in situations where low speed manoeuvring is necessary, or in extreme off-road conditions.

Range changing

The recommended method for range changing is with the vehicle stationary. With the engine running and the main gearbox in **N** (Neutral), press and release the front/rear of the transfer gearbox switch to select the range required. The indicators on the switch and instrument pack display will flash during range changing. When range changing is complete, a chime will sound and a message displayed in the message centre.

See **TRANSFER GEARBOX, 162**.

TERRAIN RESPONSE SYSTEM



1. **General:** Suitable for surfaces that match typical road surfaces.
2. **Grass-Gravel-Snow:** Suitable for surfaces which are firm, but have a slippery surface, e.g. grass, snow, loose gravel, pebbles or icy conditions.
3. **Mud-Ruts:** Suitable for soft, muddy, uneven or deeply rutted ground. It is recommended that LOW range is selected on the Transfer gearbox.
4. **Sand:** Suitable for soft, predominantly dry, yielding sandy ground, e.g. sand dunes and deserts. If the sand is damp or wet, the Mud-Ruts program may be more beneficial.
5. **Rock Crawl:** Only selectable when the Transfer gearbox is in LOW range. Suitable for crossing wet or dry, solid unyielding ground requiring high levels of wheel displacement, e.g. clusters of boulders or rocky river beds.

See **TERRAIN RESPONSETM, 191**.

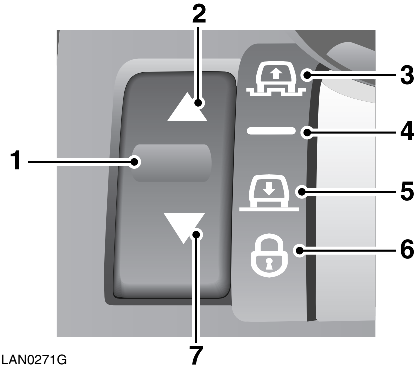
The Terrain Response system is always active and cannot be switched off. When the vehicle is started, the system will normally start in its **General** program.

To raise the rotary knob, press down lightly and release. Manual selection of a special program, by rotating the knob, will provide benefits in how the vehicle can be driven over different surfaces or terrains by automatically adjusting the vehicle's drive and suspension systems.

It is recommended that a special program be engaged whenever driving conditions could become difficult and cancelled once the conditions for use are no longer present. To lower the rotary knob press down until a 'click' is heard.

Wading
When driving through water less than 490 mm (19 inches) deep, select the program suitable for the surface beneath the water.

AIR SUSPENSION



Vehicle height can be manually adjusted via the raise/lower switch **1**. Height changes may only be made when the the engine is running and the driver and passenger doors are closed.

Indicators **2** or **7** will illuminate to show the direction of movement. They extinguish when the height change is complete.

Off-road height **3**, provides improved ground clearance and approach, departure and break-over angles.

On-road height **4**, is the normal height for the vehicle.

Access height **5**, lowers the vehicle to provide easier entry, exit and loading of the vehicle. This position may be selected up to 40 seconds after the starter switch is turned off.

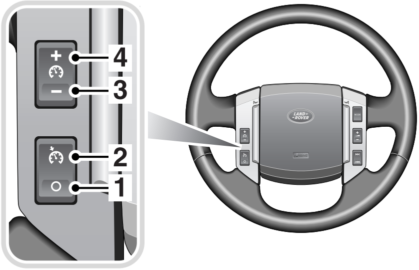
Crawl (locked at Access height) **6**, allows the vehicle to be driven at low speeds at access height, to give increased roof clearance.

Vehicle height will be automatically adjusted according to road speed in order to maintain driveability and handling.
If Terrain Response is fitted, some of its programs will automatically adjust the suspension height.

See **AIR SUSPENSION, 184**.

CRUISE CONTROL

Cruise control enables the driver to maintain a constant road speed without using the accelerator pedal.



1. **CANCEL:** cancel cruise control, but retains the set speed in memory.
2. **RESUME:** resumes a SET speed retained in memory.
3. **SET - :** to set a road speed or decrease the speed in 2 km/h (1 mph) steps when cruise control is operating.
4. **SET + :** to set a road speed or increase the speed in 2 km/h (1 mph) steps when cruise control is operating.

Cruise control will automatically disengage when the brake pedal is used or when the vehicle speed falls below 30 km/h (18 mph).

See **CRUISE CONTROL, 165**.

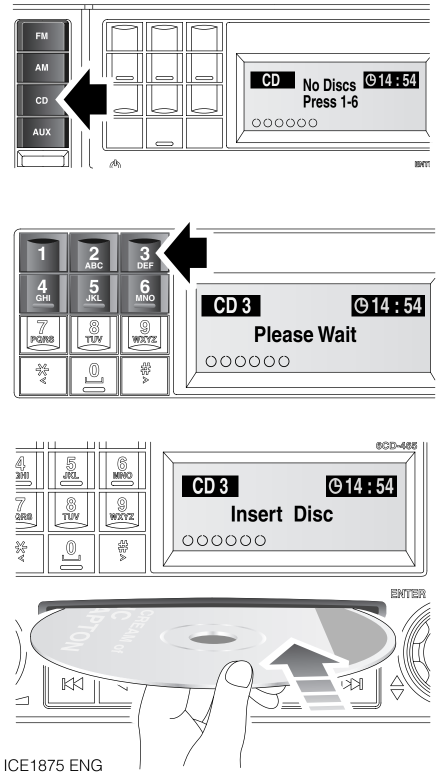
To autostore FM or AM stations, press and hold the **FM** or **AM** buttons. **Autostore** will be shown in the information display and the stations will be stored under the pre-set numbers, in the order that they are found.

To access the stations once stored, press the required pre-set number briefly.

CD OPERATION

Inserting a CD



Premium audio unit illustrated

Before inserting a CD into the audio unit, select CD mode by pressing the **CD** button.

Note: *On Premium audio units it is necessary to then select an empty CD slot, by pressing the appropriate disc selection button (e.g.* ***3****). The six circles at the bottom left-hand side of the screen represent the six available CD slots. As soon as one has a CD in it, its number will appear in the circle. Empty slots are, therefore, those without numbers.*

When inserting a disc into either player, ensure that the label side of the disc is facing upwards and present the disc to the slot. Do not push it into the slot, the player mechanism will draw the disc in automatically.

There will be a short pause whilst the player reads the information from the disc, which will then be displayed on the screen. Play will commence at the first track on the newly inserted disc.

Dual and DVDPlus discs

Please be aware that a new generation of DVD discs is being adopted by the music industry. They are known as **Dual Discs** or **DVDPlus** discs. They have digital music on one side and video content on the other. Current in-car audio systems with a front loading CD player may load and play this type of disc, however, it is likely that the disc will not eject and will block up the player. Such damage to a CD player will not be covered under warranty.

Premium audio unit illustrated

Premium audio: To start CD playback, briefly press the **CD** mode button, followed by the disc number required. If no disc number is selected, playback will begin at one of two places:

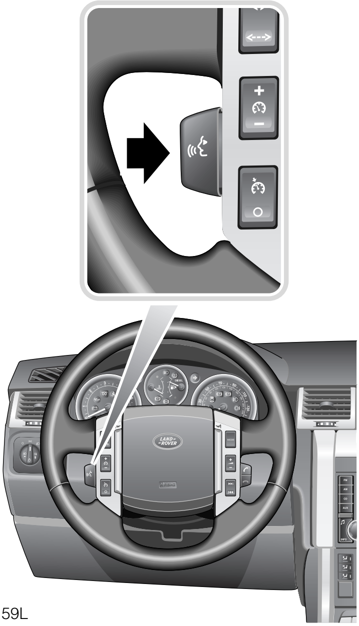
- If the discs contained in the player have not been removed since their last use, playback will begin from the point at which it was stopped previously.
- If the discs contained in the player have not been used since they were inserted, playback will begin at the start of disc one.

Standard audio: CD playback will commence automatically when a CD is inserted.

If a CD is already inserted but the audio system is currently in radio mode, press the **CD** mode button to commence playback.

VOICE RECOGNITION

Activating the system



To activate voice control:

- Briefly pull the control paddle (your Audio system will mute at this point). A brief acoustic signal will be heard, and **LISTENING** will be displayed on the main message centre to indicate that the system is now waiting for a voice command.

Note: *It is only necessary to use the steering wheel voice control paddle at the beginning of each voice session.*

Defined voice commands

The voice control system understands predefined commands which need to be quoted word for word.

An audio feedback of voice commands is available. To activate the feedback, pull the voice control paddle briefly and give one of the following commands:

General commands

- **Voice help** - To list all commands.
- **Notepad Help** -To list Notepad commands.

  See **Voice Recognition, 142**.

Audio commands

- **Radio help -** To list Radio commands.
- **CD help -** To list CD commands.

  See **Audio Voice Recognition, 337**.

Navigation and Telephone commands

- **Phone help** - To list telephone commands.
- **Navigation help -** To list Navigation commands.

  Please refer to the **Navigation, TV and Telephone Systems** Handbook.

FUEL FILLER FLAP

Note: *The fuel filler flap has a spring loaded release, do not force it open.*

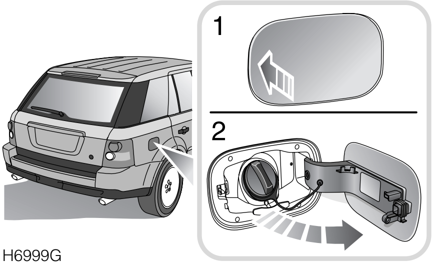
The fuel filler is located in the rear right-hand wing. With the vehicle fully unlocked, press and release the centre of the left edge of the fuel filler flap to open. See arrow position (1).

The fuel filler flap springs out, revealing the filler cap (2).

Unscrew the filler cap and place it on the projection on top of the hinge of the fuel filler flap.

Insert the pump nozzle into the filler neck, pushing aside the spring-loaded cover.

When delivery is complete, withdraw the nozzle and replace the cap. Tighten the cap clockwise until you hear it click three times. Return the fuel filler flap to its closed position.



Note: *For more detailed information, see* ***FUEL FILLER, 151****.*

Fuel type	
Petrol vehicles	Premium unleaded 95 RON
Diesel vehicles	To EN590 specification. Maximum allowable Bio-diesel mix is 5%.

Engine oil top-up	
V8 petrol vehicles	Use a 5W/30 oil to specification ACEA A3 Land Rover WSS-M2C913-B preferred.
Diesel vehicles	Use a 5W/30 oil to specification ACEA B1 or B3
Cooling system top-up	
All vehicles to -40°C (-40°F)	50% mix of water and an approved antifreeze

Note: *For more detailed information, see* ***LUBRICANTS AND FLUIDS, 286****.*

TYRE PRESSURES

Air pressure naturally increases in warm tyres (after the vehicle has been driven for a while). If you have to check warm tyres, you should expect the pressures to have increased by between 30 and 40 kPa (0.3 to 0.4 bar) (4 to 6 lbf/in^2). In this circumstance, NEVER let air out of the tyres in order to match the recommended pressures.

Loading condition		**kPa**	**bar**	**lbf/in^2**
Temporary spare wheel (All operating conditions)		420	4.2	60

Note: *For more detailed information, see* ***Tyre pressure and loading label, 239****.*

SYMBOLS GLOSSARY

The following warnings, cautions and symbols used within the handbook call your attention to specific types of information.

Warnings

WARNING

Safety warnings are included in this handbook. These indicate either a procedure which must be followed precisely, or information that should be considered with great care in order to avoid the possibility of personal injury.

Cautions

Caution: Cautions are included in this handbook. These indicate either a procedure which must be followed precisely, or information that should be considered with great care in order to avoid the possibility of damage to your vehicle.

Symbols

This recycling symbol identifies those items that must be disposed of safely in order to prevent unnecessary damage to the environment.

This symbol identifies those features that can be adjusted or disabled/enabled by a Land Rover Dealer/Authorised Repairer.

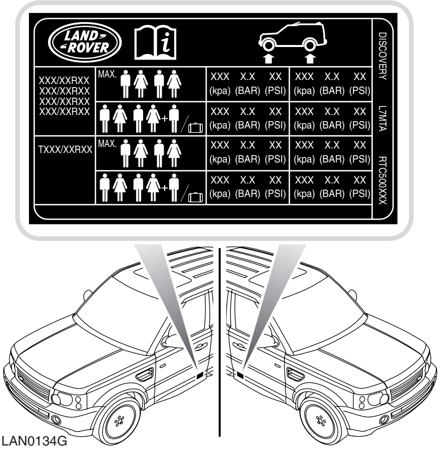
WARNING LABELS ATTACHED TO THE VEHICLE

Warning labels attached to your vehicle bearing this symbol mean: DO NOT touch or adjust components until you have read the relevant instructions in the handbook.

Labels showing this symbol indicate that the ignition system utilises very high voltages. DO NOT touch any ignition components while the starter switch is turned on.

Warning labels

Labels are attached to your vehicle at several positions. These are applied to draw your attention to important subjects, e.g. tyre pressures, tow bar use, airbags, roll-over risk, engine compartment hazards, etc.



Examples of left/right-hand drive.

It is important that you are familiar with these subjects to ensure that your vehicle and its features are used safely. Using the index at the back of this handbook, refer to the relevant topic for more information.

WARNING

Your vehicle has a higher ground clearance and hence, a higher centre of gravity than ordinary passenger cars, to enable the vehicle to perform in a wide variety of off-road applications. An advantage of the higher ground clearance is a better view of the road allowing you to anticipate problems.

The vehicle is not designed for cornering at the same speed as conventional passenger cars any more than a low-slung sports car is designed to perform satisfactorily under off-road conditions. If at all possible, avoid sharp turns or abrupt manoeuvres. As with other vehicles of this type, failure to operate the vehicle correctly may result in loss of control or vehicle roll-over.

DATA RECORDING

Service data recording

Service data recorders in your vehicle are capable of collecting and storing diagnostic information about your vehicle. This potentially includes information about the performance or status of various systems and modules in the vehicle, such as engine, accelerator, steering or brakes.

In order to properly diagnose and service your vehicle, Land Rover and service and repair facilities may access vehicle diagnostic information through a direct connection to your vehicle.

Event data recording

Event data recorders are capable of collecting and storing data during a crash or near-crash event. The recorded information may assist in the investigation of such an event. The modules may record information about both the vehicle and the occupants, potentially including information such as:

- How various systems in your vehicle were operating.
- Whether or not the driver and passenger seat belts were buckled.
- How far, if at all, the driver was depressing the accelerator and/or the brake pedal.
- How fast the vehicle was travelling.
- Where the driver was positioning the steering wheel.

To access this information special equipment must be connected directly to the recording modules. Land Rover do not access event data recorder information without obtaining consent, unless pursuant to court order or where required by law enforcement, other government authorities or third parties acting with lawful authority. Other parties may seek to access the information independently of Land Rover.

PARTS AND ACCESSORIES

WARNING

The fitting of non-approved parts and accessories, or the carrying out of non-approved alterations or conversions, may be dangerous and could affect the safety of the vehicle and occupants and also invalidate the terms and conditions of the vehicle warranty.

Land Rover will not accept any liability for death, personal injury or damage to property which may occur as a direct result of fitment on non-approved accessories or the carrying out of non-approved conversions to Land Rover vehicles.

Land Rover strongly advise against making any modifications to the suspension or steering system. This could seriously affect the handling and stability of the vehicle leading to loss of control or roll-over.

The vehicle has been designed, built and tested to cope with a variety of off-road driving conditions, some of which can place the severest possible demands on control systems and components. As such, fitting replacement parts and accessories that have been developed and tested to the same stringent standards as the original components will safeguard the continued reliability, safety and performance of your vehicle.

To augment the vehicle's already impressive performance, a comprehensive range of Land Rover-approved spare parts and accessories is available, enabling the vehicle to fulfil a wide variety of roles, and enhancing and protecting the vehicle in the many tasks to which it can be applied.

Land Rover parts are the only parts built to original equipment specifications AND approved by Land Rover designers; this means that every single part and accessory has been rigorously tested by the same engineering team that designed and built the vehicle and can therefore be guaranteed for twelve months with unlimited mileage.

A full list and description of all accessories is available from your Land Rover Dealer/ Authorised Repairer.

Electrical equipment

WARNING

It is extremely hazardous to fit or replace parts or accessories, the installation of which requires the dismantling of, or addition to, either the electrical or fuel systems.

ALWAYS consult a Land Rover Dealer/ Authorised Repairer before fitting any accessory.

Fitting inferior quality parts or accessories, may be dangerous and could invalidate the vehicle warranty.

It is recommended that you always consult a Land Rover Dealer/Authorised Repairer for advice regarding the approval, suitability, installation and use of any parts or accessories before fitting.

Parts and Accessories

Airbag

WARNING

The components that make up the airbag are sensitive to electrical or physical interference, either of which could easily damage the system and cause inadvertent operation or a malfunction of the airbag module.

To prevent any airbag malfunction, ALWAYS consult a Land Rover Dealer/ Authorised Repairer before fitting any of the following:

- **Electronic equipment such as a mobile phone, two-way radio or in-car entertainment system.**
- **Accessories attached to the front of the vehicle.**
- **Any modification to the front of the vehicle.**
- **Any modification involving the removal or repair of any wiring or component in the vicinity of any of the airbag components, including the steering wheel, steering column, instrument or facia panels.**
- **Any modification to the facia panels or steering wheel.**

After-sales service

The After Sales Parts service is of paramount importance, both in the UK and across the world. In the UK there are over 100 authorised Land Rover Dealer/Authorised Repairer, all computer linked for rapid ordering of parts and accessories.

In addition, with franchised representation in over 100 countries worldwide, Land Rover are able to support your vehicle wherever you go.

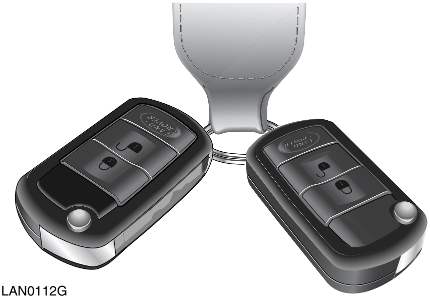
Travelling abroad

In certain countries, it is illegal to fit parts which have not been made to the vehicle manufacturers' specification.

Owners should ensure that any parts or accessories fitted to the vehicle while travelling abroad will also conform to the legal requirements of their own country when they return home.

KEYS AND REMOTE CONTROLS

Caution: Keep the spare remote control in a safe place - NOT IN THE VEHICLE.



LAN0112G

You have been supplied with two remote controls, with integral keys which operate all of the vehicle's locks.

The operation of all remote control buttons, on all remote controls, will be inhibited while a key is in the starter switch.

Note: *The remote control may not operate correctly in areas that are subject to interference from other radio equipment operating on a similar frequency. Areas where, for example, equipment such as amateur radio, medical devices, telecommunications equipment or other remotely operated alarms are in use may cause difficulty. If such difficulties are experienced, try to operate the remote control as close as possible to the vehicle, or use the key in the door lock. See* ***Emergency locking/unlocking, 49****.*

The remote controls supplied with your vehicle are programmed to your security system - the engine cannot be started without a remote control programmed to your vehicle.

Note: *Should a remote control be lost or damaged, a replacement can only be obtained from your Land Rover Dealer, where it will be programmed to your vehicle. The dealer will require proof of ownership, and keep a log of all enquiries for replacement remote controls.*

It is advisable to notify your dealer as soon as possible if a remote control is lost or stolen, and have the remaining remote control reprogrammed. This will prevent access to the vehicle using the lost/stolen remote control.

Remote control battery

Caution: The remote control contains delicate electronic circuits and must be protected from impact and water damage, high temperatures and humidity, direct sunlight and the effects of solvents, waxes and abrasive cleaners.

The battery is rechargeable. The fact that the battery needs recharging will be apparent from the following:

- **KEY BATTERY LOW** will be displayed in the main message centre.
- A gradual deterioration in range and performance will be noticed.

Battery recharge

Insert the key into the starter switch and start the engine. This will start to recharge the remote control battery.

SECURITY SYSTEM

The security system fitted to your vehicle is Thatcham category one approved, and meets European regulation 97 and directive 95/56/EC.

Security Information

For your own safety, and that of the vehicle, when the vehicle is left unattended:

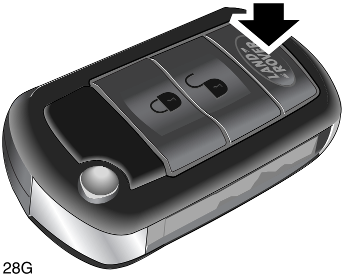
- Apply the parkbrake.
- Remove all keys and remote controls from the vehicle prior to locking the doors.
- Close all doors, windows, luggage compartment (including blind), sunroof, and glovebox.
- Park the vehicle where it is visible (a well lit area after dark).
- Keep your vehicles keys safely out of sight.
- NEVER leave children or pets unattended in the vehicle.
- NEVER leave luggage or valuables on display.

LAND ROVER BUTTON

Customer programmable button

WARNING

Be aware that the previously programmed feature will be activated when the button is initially pressed to start the programming sequence.



LAN0128G

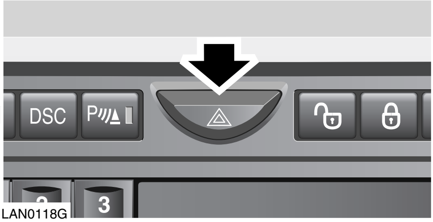
The fourth button on the remote control - marked with the Land Rover logo - can be programmed to give remote operation of one of the following functions:

- panic alarm.
- headlamp courtesy delay.
- air suspension control.
- tailgate release.
- tailglass release.

Note: *Programming and subsequent use of the Land Rover button will not occur if the key is in the starter switch.*

REMOTE CONTROL PROGRAMMING

Panic alarm



LAN0118G

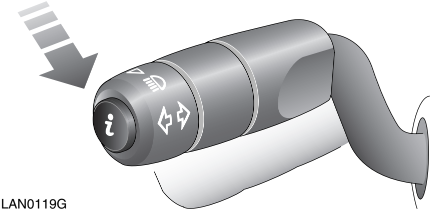
Programme by keeping the Land Rover button pressed and also pressing the hazard warning lamps button on the instrument panel. A chime from the instrument panel will confirm successful programming.

A short press of the button will now cause the vehicle's alarm to be sounded and the hazard warning lamps to flash.

The alarm is turned off by inserting the key in the starter, or pressing the lock or unlock buttons on the remote control.

Note: *In some countries it is an offence to activate the panic alarm for any purpose other than an emergency.*

Headlamp courtesy delay



LAN0119G

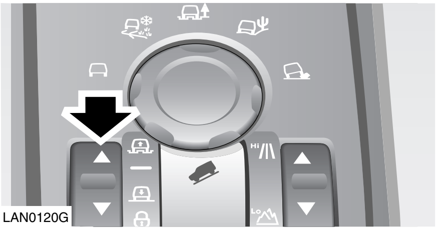
Programme by keeping the Land Rover button pressed and also flashing the headlamps. A chime from the instrument panel will confirm successful programming.

A short press of the Land Rover button will now cause the vehicle's headlamps to illuminate for the length of time specified in Settings. See **SELECTING SETTINGS OPTION, 88**.

A second press of the button after three seconds will deactivate the lamps.

Air suspension control

Programme by keeping the Land Rover button pressed and also pressing the suspension control switch. A chime from the instrument panel will confirm successful programming.



Programming of this function must be done within one minute of switching off the engine.

After programming, to change the suspension height via the remote control, remove the starter key, turn on the hazard warning lamps and close all the doors. Remote operation is not possible unless this is done.

To raise the vehicle, press and hold the Land Rover button and Lock button.

To lower the vehicle, press and hold the Land Rover button and Unlock button.

If any button is released during the raising or lowering of the suspension, all movement of the suspension will stop. It will restart once the buttons are pressed again.

The height will initially change slowly but, after three seconds, the speed will increase. While the height is changing, a symbol on the raise/lower switch will be lit according to the direction of movement. See **Adjusting suspension heights, 185**.

If the starting height is above or below On-road height, movement will stop when On-road height is reached. Further movement can be achieved by releasing the buttons and pressing them again.

See **AIR SUSPENSION, 184**.

Single-point entry

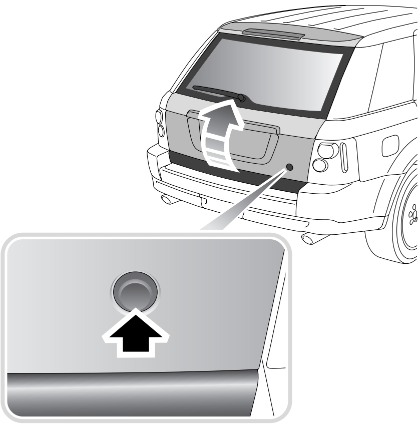
This is a personal security feature, which enables only the driver's door to be unlocked, leaving the other doors in a locked state.

Single-point entry can be disabled on individual remote control keys by pressing and holding the lock and unlock buttons together for three seconds.

Repeating the procedure will re-enable the feature.

Each time single-point entry is turned on or off, the vehicle will lock then unlock into the selected mode (all doors unlocked or just the driver's door unlocked).

Tailgate release

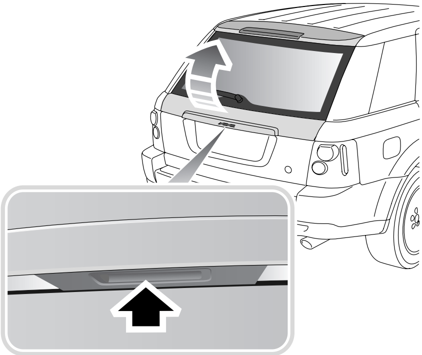


LAN0125G

Programme by keeping the Land Rover button pressed and also pressing the main tailgate release button on the rear tailgate. A chime from the instrument panel will confirm successful programming.

A short press of the button will now cause the vehicle's tailgate to release.

Tailglass release

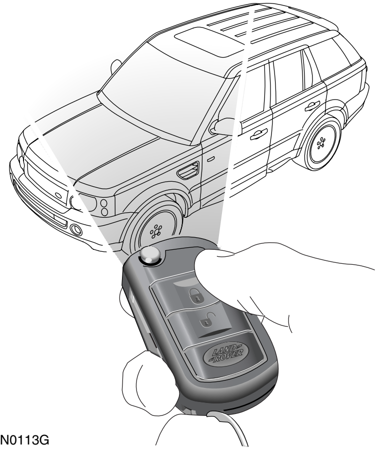


LAN0124G

Programme by keeping the Land Rover button pressed and also pressing the main tailglass release button situated under the rear number plate plinth. A chime from the instrument panel will confirm successful programming.

A short press of the button will now cause the vehicle's tailglass to release.

ALARM SYSTEM



LAN0113G

Your vehicle is fitted with a sophisticated electronic anti-theft alarm and engine immobilisation system. There are also a number of additional security features, some of which are selectable options and some are standard features of the vehicle.

In order to ensure maximum security and operating convenience, you are strongly advised to gain a full understanding of the features and alternatives available, by thoroughly reading this section of the handbook.

Note: *FOR MAXIMUM SECURITY ALWAYS SUPERLOCK THE VEHICLE. If passengers or animals are to be left in the vehicle, windows and/or sunroof are left open, or the vehicle is on a moving platform, e.g. a ferry, lock the vehicle by pressing the lock button twice within three seconds. This disables the superlocking, tilt sensing and interior space protection.*

Superlocking

WARNING

For safety, NEVER use Superlocking if passengers are to remain inside the vehicle - in an emergency they would not be able to escape, or be released by emergency services. Also, any movement from within the vehicle would activate the interior space protection alarm.

Superlocking is activated by one press of the lock button on the remote control.

When the vehicle is superlocked, the doors can only be opened (from inside or outside of the vehicle) with the correct key or remote control.

Superlocking immobilises the interior door handles, thereby preventing an intruder from gaining entry by smashing a window and reaching inside the vehicle to operate the door handles.

Perimetric alarm

This feature is activated automatically, whenever the vehicle is locked using the remote control and protects the doors, bonnet and tailgate.

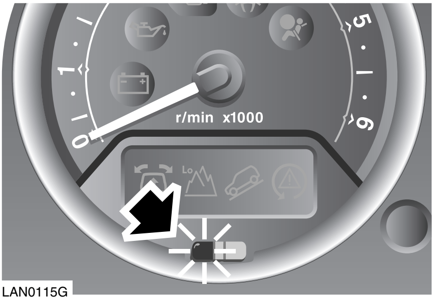
If any of these apertures are opened, or if a key that has not been programmed to the vehicle is inserted into the starter switch while the feature is activated, the alarm will be triggered.

When the perimetric alarm is activated, the direction indicators will flash three times and the security system status indicator will flash.

Mislock

If an aperture is open when an attempt is made to lock the vehicle an audible warning will sound once to indicate that the vehicle is not secure.

Anti-theft alarm indicator



The indicator provides information about the status of the alarm and immobiliser systems, as follows:

When the alarm is armed with interior space protection:

The indicator will triple flash for 10 seconds then continue to single flash until the vehicle is disarmed and immobilised.

When the alarm is armed without interior space protection:

The indicator will double flash for 10 seconds, then continue to single flash until the vehicle is disarmed and immobilised.

When the alarm is disarmed but the vehicle is immobilised (key out of starter switch):

The indicator will single flash until the alarm is armed or the vehicle is mobilised.

When the alarm is disarmed and the vehicle is mobilised (key in starter switch):

The indicator gives a one-second flash on remobilisation.

If the alarm sounds

If the alarm is triggered, the alarm will sound and the hazard warning lamps will flash for 30 seconds, before resetting to the same protection status that existed prior to the alarm being triggered.

To silence the alarm, press the lock or unlock button on the remote control or insert the key into the starter switch. Pressing the lock button will keep the alarm armed.

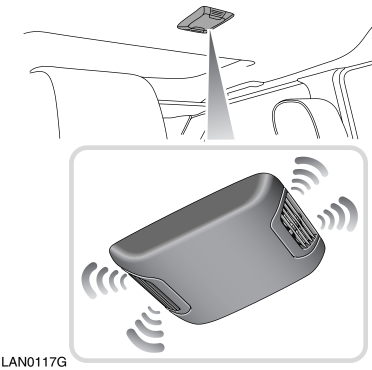
When the vehicle is disarmed, the hazard warning lamps will quickly flash eight times if the alarm has sounded since the vehicle was last armed.

Interior space protection

Interior space protection is activated whenever the vehicle is superlocked.

Note: *Never activate interior space protection if windows or sunroof are to be left open, or if passengers or animals are to be left inside the vehicle - any movement will activate the alarm.*

Interior space protection is designed to protect the interior of the vehicle from intrusion (entry by a thief through a smashed window, for example).



Four roof-mounted sensors monitor the interior space and activate the alarm if air movement is detected in the passenger compartment.

Note: *Interior space protection cannot be activated if a door is open.*

Disabling interior space protection:

If there is a requirement to disable interior space protection (if a window or sunroof is to be left open, for example), press the lock button on the remote control twice within three seconds.

Tilt sensor

Your vehicle is fitted with a tilt sensor which activates the alarm if the vehicle is tilted fore and aft, or side to side, after it has been superlocked.

The alarm will sound if theft is attempted by hoisting onto another vehicle or if a side is lifted to attempt wheel removal.

Disabling tilt sensor protection:

If you wish to have the doors locked but the tilt sensor disabled (e.g. when aboard a ferry or having the vehicle transported on a recovery truck) press the lock button twice within three seconds.

Battery-backed sounder

This device will sound the full alarm if the alarm is activated, or if the vehicle’s battery or the sounder is disconnected whilst the security system is armed.

ENGINE IMMOBILISATION

Engine immobilisation is an important aspect of the security system. It is designed to safeguard the vehicle from theft, should the driver forget to lock the doors. The system prevents the engine from being started unless the GENUINE remote control key is inserted into the starter switch.

Engine immobilisation is automatic five seconds after the key is removed from the starter switch.

***Note:** The engine will be re-mobilised automatically whenever the genuine remote control key is inserted into the starter switch. When this happens, the anti-theft alarm indicator will illuminate for one second and then extinguish.*

LOCKING/UNLOCKING

While it is not necessary to point the remote control at the vehicle, the remote control must be within range of the vehicle when a button is pressed.

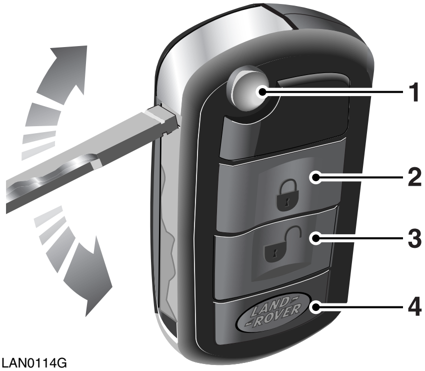
***Note:** If the remote control fails to work even when close to the vehicle, it could be that it is not synchronised with the system, see **Emergency locking/unlocking, 49**. Putting the key in the starter switch and running the engine for six minutes will restore full operation.*

The operating range may vary, depending upon remote control battery condition and may sometimes be limited by physical and geographical factors beyond your control.

***Note:** If a key is in the starter switch, the vehicle will not respond to remote control commands.*

Locking with the remote control

Remove the key from the starter switch and shut all doors, the bonnet and the tailgate.



The four buttons on the remote control are used as follows:

1. Key release button.
2. Lock button: Press to superlock all doors and to activate the perimetric alarm and interior space protection and activate the tilt sensor. See **Superlocking, 44**, **Tilt sensor, 46**.

   Press twice within three seconds to lock all doors and activate the perimetric alarm, but NOT activate interior space protection or the tilt sensor.

   The direction indicators will flash three times.
3. Unlock button: Press once to disarm the alarm and unlock the driver's door and to activate the Lazy entry feature. See **Lazy entry, 57**. Press again to unlock the remaining doors. See **Single-point entry, 42**.

   In either case, the interior lamps illuminate and the direction indicators flash once.

   The hazard warning lamps will quickly flash eight times when the vehicle is disarmed if the alarm has sounded since the vehicle was last armed.
4. Customer configuration - Land Rover button: This button can be configured to operate panic alarm, headlamp courtesy delay, tailgate release, tailglass release or suspension control. See **LAND ROVER BUTTON, 40**.

Partial arming

If an aperture (door, bonnet or tailgate) is not fully closed when the remote control lock button is pressed, the horn will sound briefly to signal that an aperture is still open. The alarm will remain disarmed and all of the closed apertures will lock.

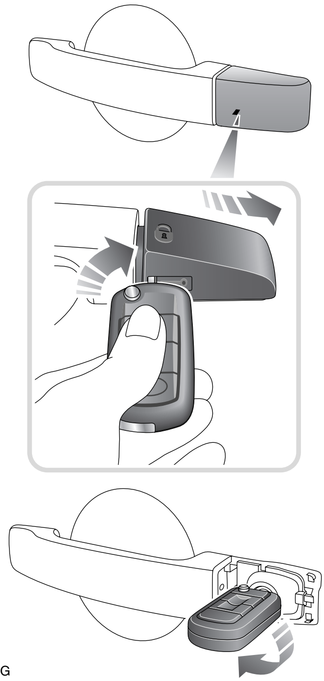
As soon as the open aperture is closed, the system will automatically arm, signalled by three flashes of the hazard warning lamps, with interior space protection activating 30 seconds later.

Note: *The vehicle will not superlock if an aperture (other than the bonnet) is open.*

Emergency locking/unlocking

Under a removable cap on the left front door outer handle, there is an emergency-use door lock.

Removing the cap



1. Insert the key fully into the slot under the handle cap.
2. The cap can now be removed at the forward edge and unhooked from the rear edge.
3. Remove the key from the slot and use it in the emergency lock. Turn the key anti-clockwise to unlock.

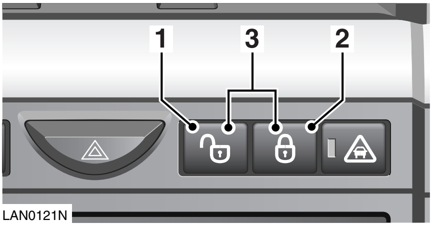
   Note: *If the alarm was previously armed, the alarm will sound when the door is unlocked. To disable it, insert the key into the starter switch.*

4. To lock the door, turn the key clockwise. The alarm system will not be armed.

Refitting the cap

1. Insert the key fully into the slot in the handle cap.
2. Hook the cap onto the lock barrel at the rear edge.
3. Push the front edge of the cap onto the panel.
4. Remove the key from the slot.

Master lock and unlock switches



1. Pressing the master unlock switch will unlock all of the doors.
2. Pressing the master lock switch will lock all of the doors.
3. Simultaneously pressing both the master lock and unlock switches for three seconds will cause the whole tailgate to release.

Note: *If the locks have already been superlocked using the key, the switch will not release the locks.*

Speed related locking

This security feature locks all the doors automatically when the vehicle speed exceeds 8 km/h (5 mph).

Note: *The speed at which speed-related locking occurs is not selectable by the driver. Any presses of the master lock or unlock switches will over-ride the speed locking function, and will remain in that state for the whole journey.*

Speed-related locking can be selected or deselected by a Land Rover Dealer/Authorised Repairer or by the driver.

See **SELECTING SETTINGS OPTION, 88**.

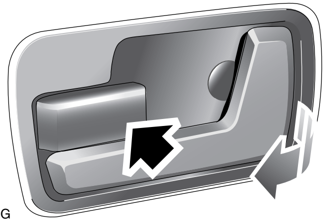
Automatic relock

If the vehicle is unlocked using the remote control and one minute elapses before a door or the tailgate is opened, the vehicle will relock and the alarm will re-arm.

Automatic unlocking

If the vehicle is involved in a collision forceful enough to cause a restraints device to deploy, all door locks will automatically be unlocked and the hazard warning lamps will start to flash. The interior lamps will also illuminate.

Interior door handles and locking levers



LAN0122G

From inside the vehicle, each door can be individually locked by pushing the appropriate lever (arrowed).

To unlock and open a front door, simply pull the door handle.

To open a rear door, first return the locking lever to its unlocked position, then pull the door handle.

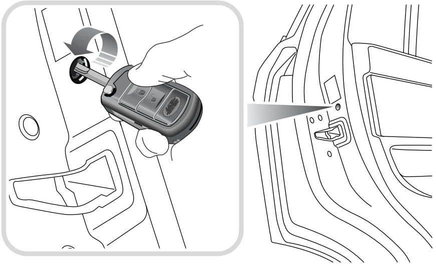
When the master lock or unlock switch is used, or speed related locking is activated, all door locking levers will activate automatically.

These locking levers will only operate if the doors have not been secured using the remote control or door key.

CHILD SAFETY LOCKS

WARNING

NEVER leave children unsupervised in the vehicle.



LAN0123G

Child safety locks are fitted to the rear doors.

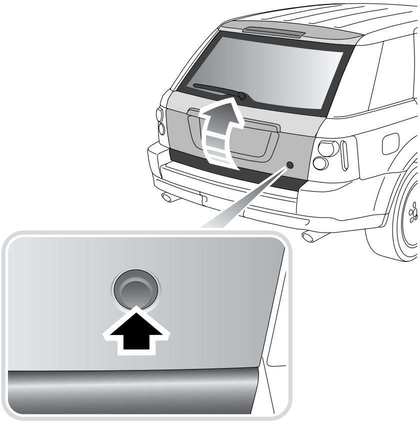
Open a rear door and insert the starter key into the child safety keyhole. Turn the key one quarter of a turn so that the top of the key moves away from the vehicle. Repeat for the other door.

With the child safety locks engaged, the rear doors cannot be opened from inside the vehicle. This prevents a door from being opened accidentally.

Inserting the key and turning it in the opposite direction disengages the lock.

TAILGATE

Opening the tailgate



LAN0125G

With all doors unlocked, press the tailgate release button on the right-hand side of the tailgate.

If the tailgate fails to open, an emergency procedure is available.

Note: *If the tailgate is open, the system prohibits the tailglass release, and vice versa. It will only accept another release when the open panel has been closed.*

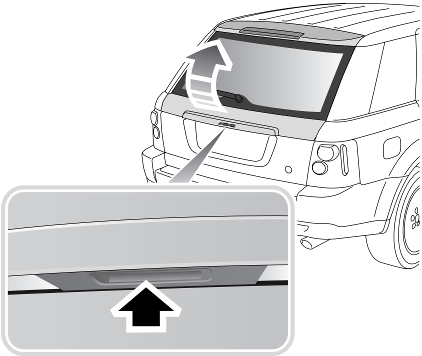
Tailgate emergency unlock

Simultaneously pressing both the master lock and unlock switches for three seconds will cause the whole tailgate to release. This is an emergency release function in case the tailgate exterior release switch becomes inoperative.

Power closure

The tailgate incorporates a ‘Power closure’ feature, which removes the need to ‘slam’ the tailgate when closing.

Opening the tailglass



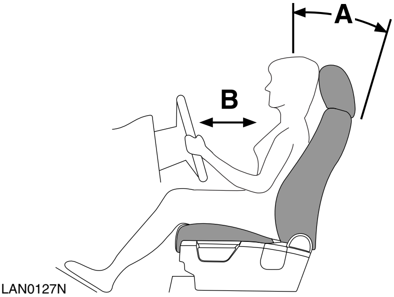
LAN0124G

With all doors unlocked, press the touch pad on the underside of the exterior handle and pull to open.

FRONT SEATS

WARNING

To reduce the risk of loss of control and personal injury, DO NOT adjust the driver's seat while the vehicle is in motion.



Sitting correctly

The seats, head restraints, seat belts and airbags all contribute to the protection of the occupants. Optimal use of these components will give you more protection. Therefore, observe the following points:

- Sit in the most upright position with the base of your spine as far back as possible and the backrest reclined not more than 30 degrees (**A**).
- Do not move the driver’s seat too close to the steering wheel. Ideally, a minimum distance (**B**) of at least 254 mm (10 in) between the centre of the breastbone and the cover of the steering wheel airbag is recommended. The driver should hold the steering wheel with slightly bent arms. The legs should also be slightly bent so that the pedals can be pressed to the floor.
- The seat belt should rest in the centre of the shoulder. The lap part should fit tightly across the hips and not on the stomach.

Make sure your driving position is comfortable and enables you to maintain full control of the vehicle. A properly adjusted seat helps reduce the risk of injury from sitting too close to an inflating airbag.

Note: *For information on adjusting the steering column, see* ***STEERING COLUMN ADJUSTMENT, 81****.*

FRONT SEAT ADJUSTMENT

WARNING

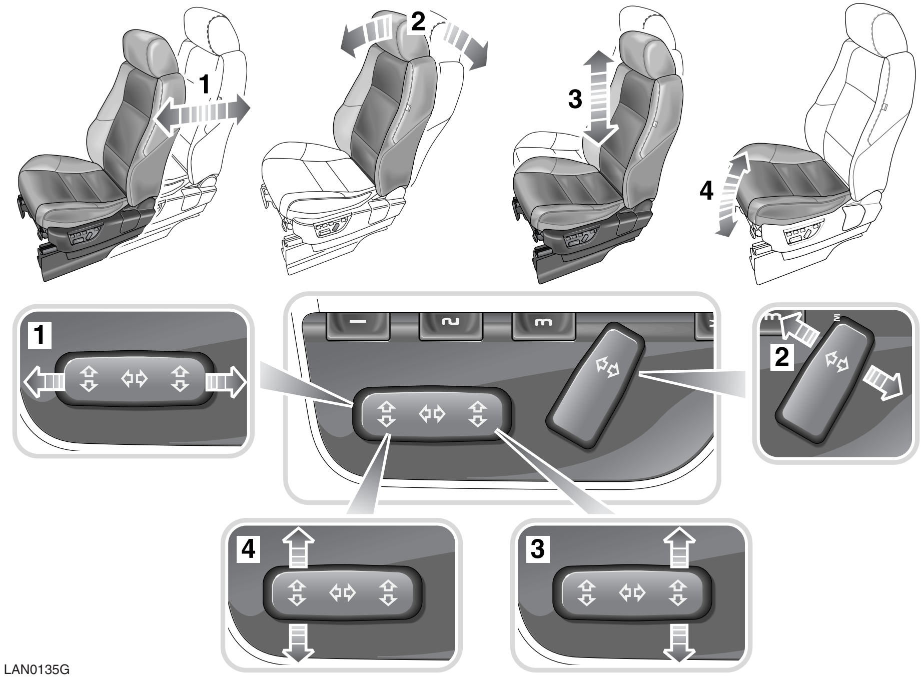
DO NOT adjust any part of a seat while the vehicle is in motion.

Vehicle movement may cause the seat to suddenly shift, potentially causing injury.

The seat adjustment controls are situated on the outboard side of the seat cushion.

Note: *The position of any part of the power operated seats can be changed with the starter key in positions **I** or **II**. Power operated memory driver's seat also has a 10 minute active period (Non-memory power operated seats up to 15 minutes) initiated when:*

- *The driver's door is opened/closed.*
- *The starter key is turned to the off position.*



1. Forward/backward adjustment

Push and hold the switch to move the seat to the desired position. Release the switch to stop adjustment.

2. Seat back adjustment

WARNING

DO NOT travel with the seat backs reclined steeply rearwards. Optimum benefit is obtained from the seat belt with the seat back angle set to no more than 30 degrees from the upright (vertical).

Failure to maintain the correct seat back angle will reduce the effectiveness of the seat belts and increase the risk of serious injury or death in a crash.

Twist the switch until the desired seat back angle is achieved. Release the switch to stop adjustment.

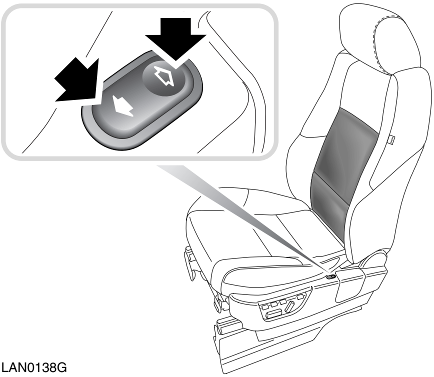
3. Seat cushion height adjustment

Push the switch up or down to raise or lower the cushion. Release the switch to stop adjustment.

4. Seat cushion edge adjustment (Driver's seat only)

Push the switch up or down to raise or lower the front edge of the cushion. Release the switch to stop adjustment.

Lumbar support adjustment

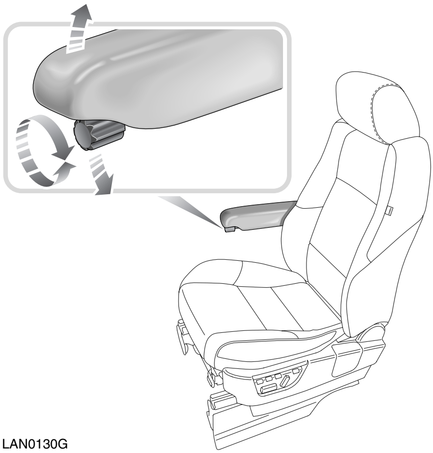


LAN0138G

A separate switch located in the side of the seat provides for adjustment of lumbar support.

Press the front end of the switch to stiffen the support or the rear end of the switch to relax the support. Release the switch to stop adjustment.

Folding armrest



LAN0130G

Some vehicles are fitted with adjustable front seat armrests. These are used in the horizontal position or can be stowed vertically alongside the seat backrest.

The horizontal position can be adjusted for height by turning the knob set into the end of the armrest. Turning the knob clockwise raises the armrest; anti-clockwise lowers it.

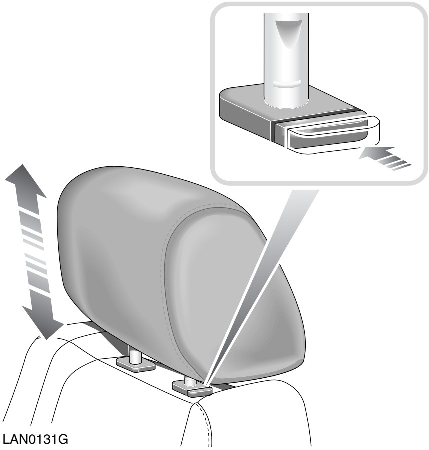
Head restraint adjustment and removal

WARNING

Head restraints are designed to support the back of the head (NOT THE NECK), and to restrain rearward movement of the head in the event of a collision. The restraint must be positioned as described to be effective.

DO NOT drive or carry passengers with the head restraints removed from occupied seats, or adjust the head restraints while the vehicle is in motion.

Failure to have the head restraint installed and properly positioned will increase the potential for serious injuries.



Adjust the head restraint correctly, up or down by pressing the collar button as indicated. The top of the head restraint should be level with the top of the head.
See **Sitting correctly, 53**.

Remove the head restraint by pressing the collar button as indicated, whilst lifting the restraint clear of the seat.

To replace the head restraint, engage the guide posts into the collars and press the restraint downwards until a click is heard.

Rear seat entertainment

WARNING

The video display screens contain toxic substances including Mercury. These substances can cause severe illness and possibly death.

In the event that a video display screen is damaged, avoid all contact with it, and contact your dealer as soon as possible.

Caution: When rear seat passengers are entering or leaving the vehicle it is important that they do not hold the head restraint to ease entry/exit. This may damage the video display screens.

The video display screens fitted to the rear of the front seat head restraints are NOT touch-screens. Avoid contact with the screen wherever possible.

Only clean the screens using the Land Rover approved cleaning materials available from your Land Rover Dealer/Authorised Repairer.

If rear seat entertainment is fitted, the front head restraints can be adjusted for height, but cannot be removed from the seat.

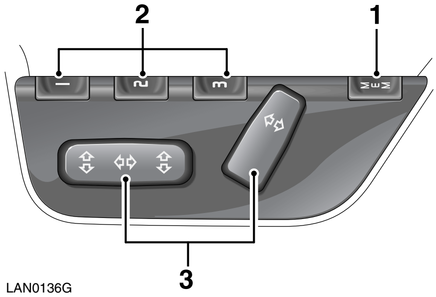
HEATED SEATS

For information on operating the front and rear seat heaters, refer to **SEAT HEATERS, 126**.

DRIVER'S SEAT MEMORY FACILITY

WARNING

Before activating the seat memory, ensure that the area immediately surrounding the seat is clear of obstructions and that all occupants are clear of moving parts.



1. Memory store button.
2. Memory pre-set buttons.
3. Seat adjustment controls. See **FRONT SEAT ADJUSTMENT, 54**.

Your vehicle can memorise up to three different driver seating positions for each of three possible starter keys. This enables three separate drivers to achieve optimum comfort at the touch of a button.

Setting the memory pre-sets

1. Insert the starter key and turn it to position **I** or **II**.
2. Adjust the seat and exterior mirrors to the desired position.

   Note: *For information on adjusting the mirrors, see* ***EXTERIOR MIRRORS, 82****.*
3. Press the memory store button **1** to activate the memory function.
4. Within five seconds, press the desired pre-set button **2**.
5. **Memory Stored** will be displayed on the message centre to confirm the storing action. A single chime will sound from the instrument panel to confirm storing.

Recalling a stored seat position

Providing the power operated memory seat is active, press the pre-set button associated with the desired driving position. The seat and mirrors will move to the position stored on that pre-set.

A confirmation message will display in the message centre and a double chime will sound when adjustments are complete.

Note: *To stop seat movement at any time when recalling a memory setting, press any seat adjustment control.*

Lazy entry

When the lazy entry option is selected and the vehicle is unlocked using the remote control, the vehicle adjusts the driver's seat and the exterior mirrors to the position associated with that particular remote control.

Lazy entry and associated options can be selected or deselected by a Land Rover Dealer/Authorised Repairer or by selecting Settings. See **SELECTING SETTINGS OPTION, 88**.

REAR SEATS

WARNING

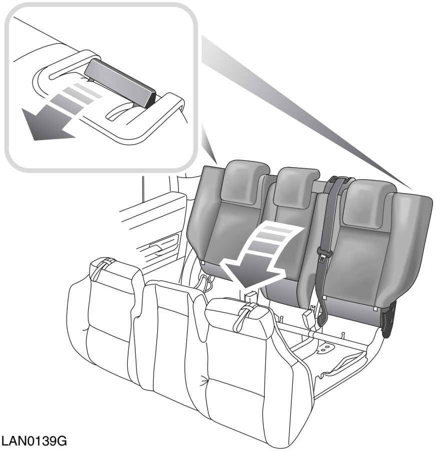
DO NOT adjust any part of a seat while the vehicle is in motion.

Vehicle movement may cause the seat to suddenly shift, potentially causing injury.

WARNING

It is extremely dangerous to ride in the loadspace. In a collision, anyone riding in this area is more likely to be injured or killed. Do not allow anyone to ride in any area of your vehicle that is not equipped with seats and seat belts. Be sure that everyone in your vehicle is in a seat and using a seat belt properly.

Folding down the seats



One or both parts of the split rear seat can be fully folded to further increase the rear loadspace.

Before attempting to fold down the seats, remove the outboard seat belts from the seat belt guides and remove any items from the rear seats and footwell.

If the front seats are in their rearmost position, move them forward. They can be returned to their original position after the rear seat backs have been folded down.

Ensure that the head restraints are fully lowered. Press in the collar at the base of the head restraint support, and push the head restraint down.

Using the strap at the rear of each cushion, pull the required cushions forwards as far as they will travel.

To fold a backrest forwards, pull the seat backrest release lever(s). While pulling the lever(s) located on the top edges of the backrests, tip the seat backrest(s) forwards as far as possible.

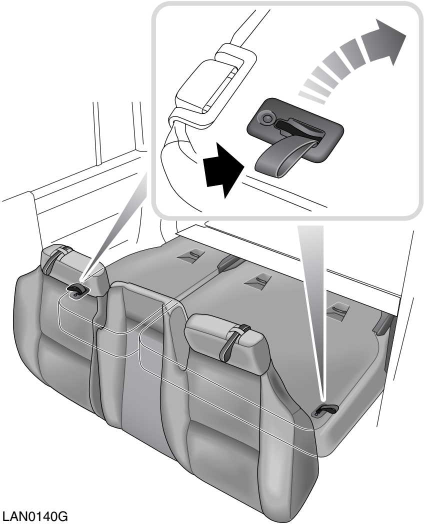
Note: *Only Land Rover approved seat covers and accessories should be used on these seats.*

Returning the seats to the upright position

WARNING

After the seat is returned to the upright position, the latching mechanism should be checked and physically tested to ensure that both the seat base and backrest are secure before driving.

Also, ensure that the head restraint is adjusted correctly for each passenger (the top of the head restraint should be level with the top of the head).



LAN0140G

If the front seats are in their rearmost position, move them forward. They can be returned to their original position after the rear seats have been returned to the upright position.

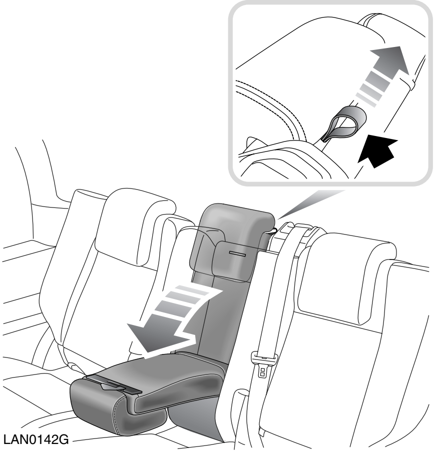
Pull the strap vertically on the back of the seat to unlock the seat. Continue to pull to raise the backrest(s) until they click into position. Push the seat cushion(s) firmly back into position.

Visually check that the lever is fully in place. If it has not returned to its locked position, red flags will be visible around the lever sides.

To raise the head restraint, pull it upwards to the required height.

Replace the outboard seat belts back into the seat belt guides.

Rear seat armrest



LAN0142G

To release the armrest, first pull the loop at the top of the centre seat/armrest (see inset.), then push the armrest downwards to the required position.

To replace, raise the armrest and push until a click is heard when latched.

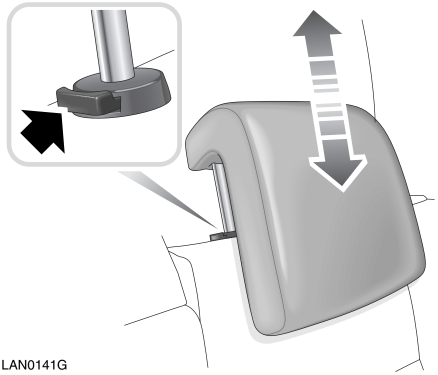
Head restraint adjustment and removal

WARNING

Head restraints are designed to support the back of the head (NOT THE NECK), and to restrain rearward movement of the head in the event of a collision. The restraint must be positioned as described to be effective.

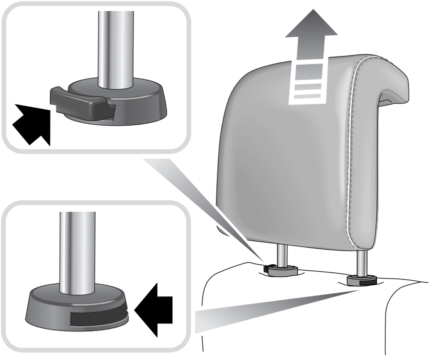
DO NOT drive or carry passengers with the head restraints removed from occupied seats, or adjust the head restraints while the vehicle is in motion.

Failure to have the head restraint installed and properly positioned will increase the potential for serious injuries.



LAN0141G

Adjust the head restraint correctly (up or down) for each passenger by pressing the collar button as indicated. The top of the head restraint should be level with the top of the head.



LAN0143G

Remove the head restraint by pressing the collar button and indented button as indicated, whilst lifting the restraint clear of the seat.

To replace the head restraint, engage the guide posts into the collars and press the restraint downwards until a click is heard.

SEAT BELTS

The use of front and rear seat belts is mandatory in most countries. Using seat belts saves lives. They should be worn by all occupants whenever the vehicle is in use, for maximum protection.

Lap/shoulder inertia reel seat belts are provided for both front seat occupants and all rear seat positions.

The inertia reel operating mechanism of the seat belts allows the wearers to move their upper bodies to reach various controls. The seat belt locks automatically with accelerated body movement or in the event of emergency braking.

The front seat belt assemblies are fitted with pre-tensioners. The pre-tensioners operate with the airbags as part of the Airbag Supplementary Restraint System (SRS). See **HOW THE AIRBAGS WORK, 75**.

Seat belt warning indicator

Driver Beltminder commences when the starter switch is turned to position **II** and the driver belt is unbuckled.

In certain markets the seat belt reminder feature also applies to the passenger seat and will be activated if the seat is occupied and the occupant is unbuckled.

The visual and audible warnings applicable to either driver or passenger Beltminder are market dependent to meet individual market requirements. The warning signals given may also change depending on whether the vehicle is stationary or when the vehicle speed exceeds a pre-determined threshold. See **AUDIBLE WARNINGS, 109**.

Note: *Objects placed on the passenger seat may activate the seat belt warning system.*

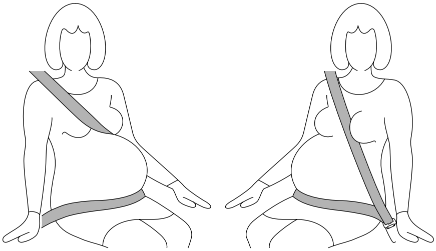
Although not advisable, it is possible to disable the Beltminder function. Please see a Land Rover Dealer/Authorised Repairer to disable or reinstate the function.

SEAT BELT USE DURING PREGNANCY

WARNING

Pregnant women must wear a correctly positioned seat belt; it is safer for mother and unborn child.

Never place anything between you and the seat belt in an attempt to cushion the impact in the event of an accident. It can be dangerous and reduce the effectiveness of the seat belt in preventing injury.



LAN0144G

During pregnancy, women should wear the lap belt across the hips below the baby, with the diagonal belt passing across the shoulder, between the breasts and to one side of the baby - if in doubt, consult a doctor.

SEAT BELT PRE-TENSIONERS

WARNING

The seat belt pre-tensioners will only be activated once and then MUST BE REPLACED by a Land Rover Dealer/Authorised Repairer. Failure to replace the pre-tensioners will reduce the efficiency of the vehicle's front restraint systems.

After any impact, always have the seat belts and pre-tensioners checked and, if necessary, replaced by a Land Rover Dealer/ Authorised Repairer.

In the interests of safety, it is recommended that removal or replacement of the front seats and seat belts should only be carried out by a Land Rover Dealer/Authorised Repairer.

The seat belt pre-tensioners activate in conjunction with the airbag and provide additional protection in the event of a severe frontal impact on the vehicle. See **HOW THE AIRBAGS WORK, 75**. The pre-tensioners automatically retract the seat belts fitted to the front seats. This reduces any slack in both the lap and diagonal portions of the belts, thereby reducing forward movement of the belt wearer in the event of a severe frontal collision.

The airbag warning indicator on the instrument pack will alert you to any malfunction of the seat belt pre-tensioners.

If the pre-tensioners have been activated, the seat belts will still function as restraints, and must be worn in the event that the vehicle remains in a driveable condition.

Note: *The seat belt pre-tensioners will be activated in major side and frontal impacts and in roll-overs.*

AUTOMATIC LOCKING MECHANISM

WARNING

Where possible, use the seat belt automatic locking mechanism to secure large items that are to be carried on the seats. In the event of an accident, loose items become projectiles capable of causing serious injury. Care must be taken to prevent any sharp edges damaging the belt.

Use the seat belt automatic locking mechanism to restrain pets in harnesses or pet carriers when not utilising the loadspace.

The passenger seat belts have a special locking mechanism which retains large items securely.

To use:

1. Place the item on the seat.
2. Put the seat belt around the item, using both the lap and shoulder parts of the belt.
3. Fasten the seat belt.
4. Pull on the shoulder part of the belt, to unreel all of the remaining belt. This will engage the automatic locking feature, which only allows the belt to retract.
5. Allow the seat belt to retract onto the item (a clicking sound will confirm that the ratchet has engaged).
6. Ensure that there is no slack in the seat belt by pulling upwards on the shoulder belt immediately above the item. The item will now be held firmly in position by the belt.

When the seat belt is released and is allowed to retract, the seat belt locking mechanism reverts to normal operation.

SEAT BELT SAFETY

WARNING

Seat belts are life saving equipment. In a collision, occupants not wearing a seat belt can be thrown around inside, or possibly thrown out of the vehicle. This is likely to result in more serious injuries than would have been the case had a seat belt been properly worn. It may even result in loss of life.

Make sure ALL occupants are securely strapped in at all times - even for the shortest journeys.

The airbag supplemental restraint system (SRS) is designed to add to the overall effectiveness of the seat belts. It does not replace them. SEAT BELTS MUST ALWAYS BE WORN.

Seat belts are designed to bear upon the bony structure of the body and should be worn low across the pelvis, chest and shoulders, as applicable; wearing the lap section of the belt across the abdominal area must be avoided.

DO NOT wear seat belts over hard, sharp or fragile items in clothing, such as pens, keys, spectacles, etc.

Seat belts should be adjusted as firmly as possible, consistent with comfort, to provide the protection for which they are designed. A slack belt will greatly reduce the protection afforded to the wearer.

DO NOT allow front seat occupants to travel with the seat backs reclined steeply rearwards. Optimum benefit is obtained from the seat belt with the seatback angle set to no more than 30 degrees from the upright.

WARNING

Ensure that all seat belts are worn correctly - an improperly worn seat belt increases the risk of death or serious injury in the event of a collision.

Belts should not be worn with the straps twisted.

Each belt assembly must only be used by one occupant; it is dangerous to put a belt around a child being carried on the occupant's lap.

It is essential to replace the entire assembly after it has been worn in a severe impact even if damage to the assembly is not obvious.

No modifications or additions should be made by the user which will either prevent the seat belt adjusting devices from operating to remove slack, or prevent the seat belt assembly from being adjusted to remove slack.

Should the seat belt not retract and remain at its static length, consult your Land Rover Dealer/Authorised Repairer immediately.

Care should be taken to avoid contamination of the webbing with polishes, oils and chemicals, and particularly battery acid. Cleaning may safely be carried out using mild soap and water. The belt should be replaced if webbing becomes frayed, contaminated or damaged.

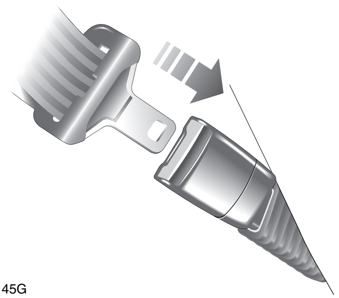
Where possible, use the seat belt automatic locking mechanism to secure large items that are to be carried on the seats. In the event of an accident, loose items become projectiles capable of causing serious injury. Care must be taken to prevent any sharp edges damaging the belt.

FRONT SEAT BELTS

Fastening the seat belts

WARNING

Never wear just the lap strap of a lap/shoulder diagonal seat belt and never sit on the lap strap using just the shoulder strap. Both of these actions are extremely dangerous and may increase your risk of serious injury.



LAN0145G

Pull the belt over the shoulder and across the chest and, ensuring that the webbing is not twisted, insert the metal tongue plate into the buckle nearest the wearer - a CLICK indicates that the belt is securely locked.

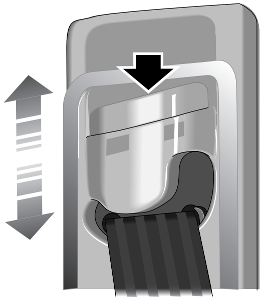
Releasing the belt

Press the RED button on the seat belt buckle.

Upper anchorage adjustment

WARNING

Maladjustment of the seat belt could reduce its effectiveness in a crash. Always ensure that the anchorage is correctly located and properly locked in one of the height positions before driving and DO NOT adjust the height once the vehicle is in motion.



LAN0146G

The height of the seat belt upper anchorage can be adjusted for comfort AND safety on both front seats. Press down (solid arrow) to release the catch, then lift or push down to adjust the height of the anchorage. For safety, the seat belt should always be worn with the webbing crossing the shoulder MIDWAY BETWEEN THE NECK AND THE EDGE OF THE SHOULDER.

Ensure the anchorage has clicked into one of the locked positions before driving.

Where possible, rear seat passengers should adjust their position on the seat to enable the seat belt webbing to cross the shoulder without pressing on the neck.

CARING FOR SEAT BELTS

WARNING

Always replace a seat belt that shows signs of webbing damage or has withstood the strain of a severe vehicle impact.

Regularly inspect the belt webbing for signs of fraying, cuts and wear; also pay particular attention to the condition of the fixing points and adjusters.

DO NOT bleach or dye the webbing and avoid contaminating the webbing with polish, oil or chemicals. See **Seat belts, 248**.

Testing inertia reel belts

- With the seat belt fastened, give the webbing near the buckle a quick upward pull. The buckle must remain securely locked.
- With the seat belt unfastened, unreel the webbing to the limit of its travel. Check that unreeling is free from snatches and snags and then allow the belt to FULLY retract.
- Partially unreel the webbing, then hold the tongue plate and give it a quick forward pull. The mechanism must lock automatically and prevent any further unreeling.

If a seat belt should fail any of these tests, contact your Land Rover Dealer/Authorised Repairer immediately.

Note: *If the vehicle is parked on ground that is not level, the seat belt mechanism may lock. This is not a fault; gently ease the belt from its upper anchorage to release.*

Service information

WARNING

DO NOT attempt to service, repair, replace, modify or tamper with any part of the pre-tensioner and airbag, or wiring in the vicinity of a pre-tensioner or airbag component; this could cause the system to activate, resulting in personal injury.

In addition, ALWAYS contact your Land Rover Dealer/Authorised Repairer if:

- An airbag inflates.
- A pre-tensioner activates.
- The front or side of the vehicle is damaged, even if the pre-tensioner has not activated.

CHILD SEATS

WARNING

Original text according to ECE R94.01.

Extreme Hazard! Do not use a rearward facing child restraint on a seat protected by an airbag in front of it.

There is a risk of death or serious injury when the airbag deploys.

The safest place for children is properly restrained in the rear seats.

WARNING

DO NOT allow a baby or infant to be carried on the lap. The force of a crash can increase effective body weight by as much as 30 times, making it impossible to hold onto the child.

Children typically require the use of a booster seat appropriate to their age and size, thereby enabling the seat belts to be properly fitted. This reduces the risk of injury in a crash. Children could be endangered in a crash if their restraints are not properly secured in the vehicle.

DO NOT use a child seat that hooks over the seat back. This type of seat cannot be satisfactorily secured and is unlikely to be safe for a child.

The seat belts fitted to your vehicle are designed for adults and larger children. For their safety, it is very important that all infants and children under 12 are restrained in a suitable child safety seat appropriate to their age and size (see table). Child safety seats approved for use in your vehicle are available from your Land Rover Dealer/Authorised Repairer.

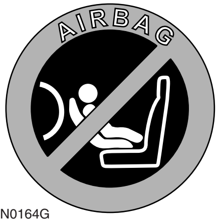
Only fit a child seat that has been approved for use in your vehicle, and ensure that the manufacturer's fitting instructions are followed exactly.

Note: *Crash statistics show that children are safer when properly restrained in the rear seating positions, than they are in the front.*

For optimum safety, children should travel in the rear of the vehicle at all times, front passenger seat travel is NOT recommended. However, if it is essential that a child should travel in the front passenger seat, Land Rover recommends that when installing child restraints, the vehicle front passenger seat be positioned fully rearward, the lumbar adjusted to its minimum support position and the cushion adjusted to its highest position. Additionally, if your vehicle is also fitted with front cushion rake adjustment, this should be adjusted to its lowest position. The seat belt upper adjustable anchorage should be set to its lowest position. Disable the airbag using the switch on the end of the instrument panel. See **PASSENGER AIRBAG DISABLING SWITCH, 78**.

Always use an approved child seat, suitable for a child’s age and size.

Holding a baby or child in a person’s arms is not a substitute for a child restraint system. In an accident, a baby or child held in a person’s arms can be crushed between the vehicle’s interior and a restrained person.



LAN0164G

This symbol affixed to the passenger side **B** post of your vehicle, warns against the use of a REAR-FACING child seat in the front passenger seat, when a passenger airbag is fitted and operational.

Child Restraints

Child safety seating and positions

The following table shows the suitability of each passenger seat position for the carriage of children up to 12 years of age or 1.5 m (5 feet) tall and the installation of suitable child restraint systems.

Mass group (with approximate age) *As indicated on child restraint*	**0** = Up to 10 kg (22 lb) (0-10 months)	**0+** = Up to 13 kg (29 lb) (0-18 months)	**I** = 9 to 18 kg (20 to 40 lb) (9 months - 5 years)	**II and III** = 15 to 36 kg (33 to 80 lb) (4-12 years)
Seating positions				
Front passenger†	U†	U†	U†	U†
Rear seats, rear outboard	U	U	U	U
Rear seats, rear centre	U	U	U	U

U = Suitable for universal category restraints approved for this mass group.
† Never place a child seat in the front passenger seating position unless the airbag has been disabled. See **PASSENGER AIRBAG DISABLING SWITCH, 78.**

WARNING

DO NOT use a forward-facing seat until a child is above the minimum weight of 9 kg (20 lb.) and able to sit up unaided. Up to the age of two, a child's spine and neck are not sufficiently developed to avoid injury in a frontal impact.

Caution: Information given in the table is correct at the time of going to press. However, availability of child restraints may change. Please refer to your Land Rover Dealer/Authorised Repairer for the latest recommendation.

In many countries, legislation governs how and where children should be carried when travelling in a vehicle.

It is the responsibility of the driver to comply with all regulations in force in the country where the vehicle is being used.

Seat belt locking mechanism

The passenger seat belts have a special locking mechanism which aids the retention of child seats. See **AUTOMATIC LOCKING MECHANISM, 70**.

Child restraints for larger children

In a situation where a child is too large to fit into a child safety seat, but is still too small to safely fit the 3 point seat belt properly, a booster seat is recommended for maximum safety. Follow the manufacturer's fitting instructions exactly, then adjust the seat belt to suit.

ISOFIX table of installation

Note:

ISOFIX anchorages are provided for both outer rear seating positions. ISOFIX child restraints should be securely attached following the manufacturers instructions at these locations only.

Mass group as shown on child restraint	Size Classes	Fixtures	Vehicle ISOFIX positions
Carrycot	F/ G	ISO L1/ L2	X
0 = Up to 10 kg (22lb)	E	ISO R1	IL
0+ = Up to 13 kg (29lb)	C/ D/ E	ISO R1/ R2/ R3	IL
I = 9 to 18 kg (20 to 40 lb)	C/ D A/ B1/ B	ISO R2/ R3 ISO F2/ F2X/ F3	IL IUF
II = 15 to 25 kg (33 to 55 lb)	-	N/A	N/A
III = 22 to 36 kg (48 to 79 lb)	-	N/A	N/A

- IUF = suitable for ISOFIX forward child restraint systems of universal category approved for use in the mass group.
- IL = suitable for particular ISOFIX child restraint systems (CRS) given in the attached list. These ISOFIX CRS are those of the “specific vehicle”, “restricted” or “semi-universal” categories.
- X = ISOFIX position not suitable for ISOFIX child restraint systems in this mass group and/or this size class.

AUTOMATIC LOCKING MECHANISM

WARNING

Where possible, use the seat belt automatic locking mechanism to secure large items that are to be carried on the seats. In the event of an accident, loose items become projectiles capable of causing serious injury. Care must be taken to prevent any sharp edges damaging the belt.

Use the seat belt automatic locking mechanism to restrain pets in harnesses or pet carriers when not utilising the loadspace.

The passenger seat belts have a special locking mechanism which aids the retention of child seats and large items. The procedure to install a child seat is as follows;

1. Place a child seat in the vehicle, attach the seat belt and secure the buckle in accordance with the manufacturers fitting instructions.
2. Pull on the shoulder section of the belt to reel out all of the remaining webbing to the limit of its travel. This will engage the automatic locking feature, which then acts as a ratchet, allowing the webbing ONLY to retract.
3. Allow the seat belt to retract onto the child seat (a clicking sound will confirm that the ratchet has engaged), while firmly pushing the child seat into the vehicle seat.
4. Ensure that there is no slack in the seat belt by pulling upwards on the shoulder belt immediately above the child restraint. The seat belt should now be locked and the child seat held firmly in position.

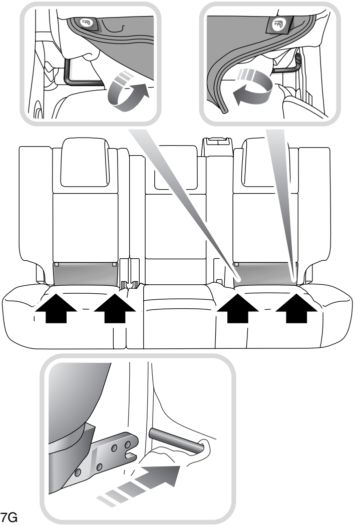
When the child seat belt is renovating all of the seat belt is allowed to retract, the seat belt locking mechanism reverts to normal operation.

ISOFIX CHILD RESTRAINTS

WARNING

DO NOT attempt to fit ISOFIX restraints to the centre seating position - the anchor bars are not designed to hold an ISOFIX restraint in this position.

In some markets, child restraint systems complying with International Standard Organisation regulations and approved for fitting in your vehicle may be available. These restraints are different from conventional child seats, requiring anchor bars built into the vehicle seat in order to accept the ISOFIX locking mechanism.



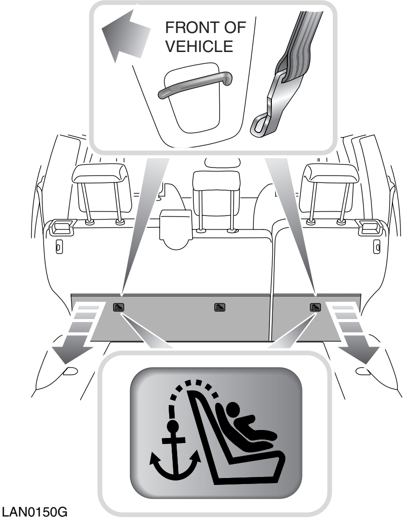
LAN0147G

Both outer rear seating positions in your vehicle are equipped to accept ISOFIX restraints.

To install your child seat with an ISOFIX restraint system:

- Raise or remove the head restraint.
- Lift the velcro strap, exposing the ISOFIX locking mechanism.
- Slide the child seat into the locking mechanism.

The tether anchorages are provided at each seating position equipped to accept Isofix child restraints (shown in the illustrations).



Note: *Always ensure that, if an upper tether is provided, it is secured and tightened properly as this provides the maximum protection for a child.*

Fitting ISOFIX child restraints

WARNING

If the restraint is not correctly anchored, there is a significant risk of injury to the child in the event of a collision or emergency braking.

Child restraint anchorages are designed to withstand only loads imposed by correctly fitted child restraints. Under no circumstances are they to be used for adult seat belts, harnesses or for attaching other items or equipment to the vehicle.

ISOFIX child restraints should only be fitted in the two **outer** rear seating positions. Anchor bars built into the rear seat frame, enable the ISOFIX restraints to be securely attached to the vehicle seat only in these positions.

In addition, two tether anchor bars are fitted to back of the rear seats, to secure child restraint anchor straps.

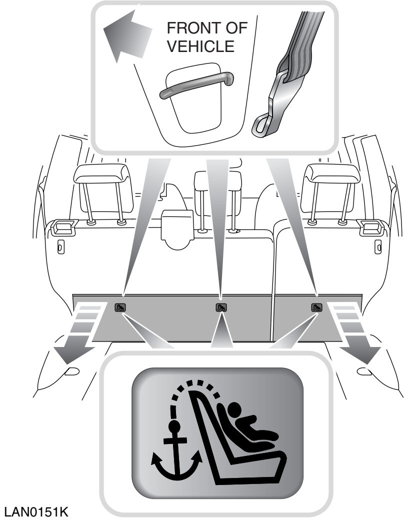
When fitting ISOFIX child restraints, always follow the instructions supplied by the manufacturer of the restraint.

Once the ISOFIX restraint is installed, you are recommended to test the security of the installation before seating the child. Attempt to twist the restraint from side to side and to pull the restraint away from the vehicle seat; then check that the anchors are still securely in place.

TETHER STRAP ANCHORAGES (Australia only)

WARNING

Child restraint anchorages are designed to withstand only loads imposed by correctly fitted child restraints. Under no circumstances are they to be used for adult seat belts, harnesses or for attaching other items or equipment to the vehicle.



Provision is made in the rear seats for the fitting of up to three child seats, of the type that requires tether strap anchorage points.

There are three tether strap anchorage points. These should be used to attach tether straps from child seats or restraint systems. Three anchorage points are located in the floor panel of the luggage area behind the rear seats.

CHILD RESTRAINT CHECK LISTS

Non-ISOFIX child restraints

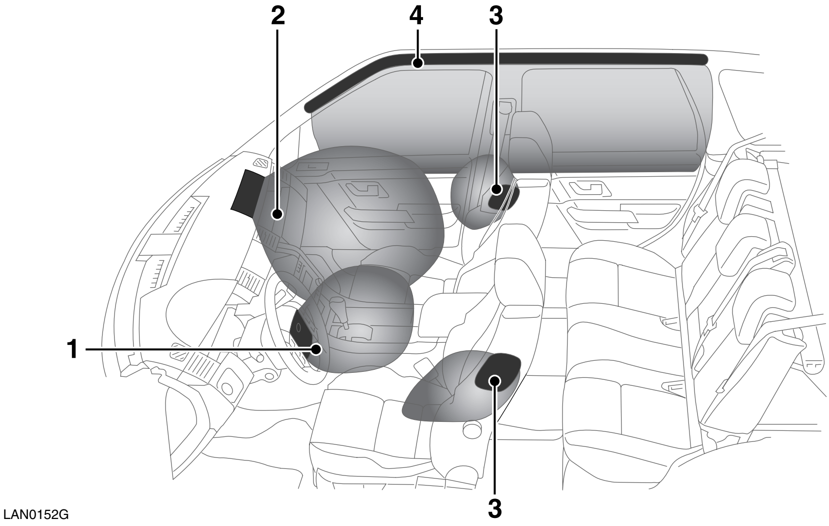
Follow the check list every time a child travels in the vehicle:

- Carefully follow the instructions provided by the manufacturer of the restraint system.
- Always use the appropriate child restraints and adjust harnesses for every child, every trip.
- Avoid dressing a child in bulky clothing and do not place any objects between the child and the restraint system.
- Regularly check the fit of a child seat and replace seats or harnesses that show signs of wear.
- Ensure that you have removed all slack from the adult seat belt.
- No child seat is completely child-proof. Encourage a child not to play with the buckle or harness.
- Never leave a child unsupervised in the vehicle.
- Activate the rear door child safety locks. See **CHILD SAFETY LOCKS, 51**.
- Ensure that a child does not exit the vehicle from the side where there is traffic.
- Set children a good example - always wear your seat belt.

ISOFIX child restraints

Follow the check list every time a child travels in the vehicle:

- **Always attach the top tether when installing the ISOFIX seat.**
- Carefully follow the instructions supplied with the child seat.
- Always give the ISOFIX seat a final pull to ensure that the lower anchors are secure.
- Always use the appropriate child restraints and adjust the harnesses for every child, every trip.
- Make sure that a child falls into the correct weight range for the seat.
- Avoid dressing a child in bulky clothing and do not place any objects between the child and the restraint system.
- Regularly check the fit of a child seat and replace seats and harnesses that show signs of wear.
- No child seat is completely child-proof. Encourage children not to play with the buckle or harness.
- Never leave a child unsupervised in the vehicle.
- Activate the rear door child safety locks. See **CHILD SAFETY LOCKS, 51**.
- Ensure that a child does not exit the vehicle from the side where there is traffic.
- Set children a good example - always wear your seat belt.



WARNING

The airbag is a supplementary restraint system that provides ADDITIONAL protection in a severe impact only - it does NOT replace the need to wear a seat belt. To reduce the risk of severe injury or death in the event of a crash, all occupants in all seating positions, including the driver, should always wear their seat belt, whether or not an airbag is present at that seating position.

An inflating airbag can cause facial abrasions and other injuries. Minimise the risk of injury by ensuring that front seat occupants are wearing their seat belts and are seated correctly, with the seat as far back as is practical.

Ensure that a gap is maintained between the side of the vehicle and the head and torso, to enable unobstructed inflation of the curtain and seat mounted side airbags. DO NOT lean out of the window.

INTRODUCTION

The airbag supplementary restraint system (SRS) incorporates front airbags **1** and **2**, seat mounted side airbags **3** and curtain airbags **4** for the driver and front passenger and curtain airbags **4** for the rear seat outboard passengers (see illustration for airbag locations). These are indicated by the word **AIRBAG** on the trim.

Provided occupants are correctly seated, with seat belts properly worn, the airbags will provide additional protection to the chest and facial areas of the front seat occupants in the event of the vehicle receiving a severe frontal impact, and also to the side of the body facing the impact, if a severe side collision occurs.

In the event of a side collision or a roll-over, curtain airbags will afford additional protection to the side of the head facing the impact for the front seat and outer rear seat occupants.

Disability modifications

Occupants with disabilities that may require the vehicle to be modified must contact a Land Rover Dealer/Authorised Repairer before any modifications are made.

Airbag warning indicator

A warning indicator mounted in the instrument pack will alert you to any malfunction of the airbag, see **Warning Indicators, 104**. The airbag should always be checked by a Land Rover Dealer/Authorised Repairer if any of the following symptoms occurs:

- The warning indicator fails to illuminate when the starter switch is turned to position **II**.
- The warning indicator fails to extinguish within approximately four seconds after the starter switch is turned to position **II**.
- The warning indicator illuminates after the engine is started, or while the vehicle is being driven.

HOW THE AIRBAGS WORK

In the event of a collision, the airbag control unit monitors the rate of deceleration induced by the collision, to determine whether the airbags should be deployed.

Operation of the airbag is dependent on the rate at which the vehicle's passenger compartment changes speed as a result of a collision. The circumstances affecting different collisions (vehicle speed, angle of impact, type and size of object hit, for example), vary considerably and will affect the rate of deceleration accordingly.

Note: *Airbags will only deploy when they are required to supplement the restraining force of the front seat belts.*

Note: *The airbag is not designed to operate as a result of:*

- *Rear collisions.*
- *Minor front impacts.*
- *Minor side impacts.*
- *Heavy braking.*
- *Driving over bumps and potholes.*

It follows, therefore, that significant superficial damage can occur without the airbags deploying or, conversely, that a relatively small amount of structural damage may cause the airbags to be deployed.

Dual stage deployment

The front airbags deploy in two stages, depending on the severity of the frontal collision. The unit monitors the rate of deceleration during the impact.

In a moderately severe frontal impact, the airbags inflate sufficiently to protect the front seat passengers and reduce the risk of injury.

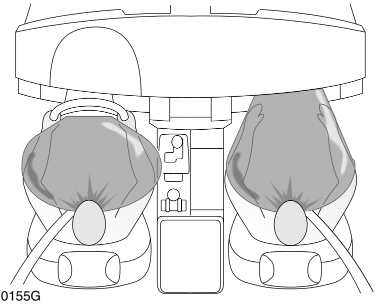
In a severe frontal impact, the airbags will fully inflate thereby providing maximum protection.

Airbag inflation is virtually instantaneous and occurs with considerable force, accompanied by a loud noise. The inflated bag, together with the seat belt restraint system, limit the movement of an occupant, thereby reducing the risk of injury to the head and upper torso.

In the case of a severe frontal collision, both front airbags will be deployed. In the case of a severe side collision, only the seat mounted side airbags and curtain airbags on the impacted side of the vehicle will inflate.

However, there may also be impact conditions whereby one set of side and both front airbags deploy at the same time, or where front and side airbags respond separately as a result of a secondary impact occurring after the initial collision has taken place.

1 and 2. Front mounted airbags

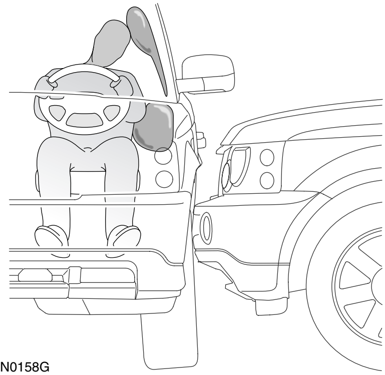


LAN0155G

3 and 4. Side and Curtain airbags

WARNING

For the curtain airbags to deploy correctly, the roof lining and A post trim must be undamaged and fitted correctly. Any damage or suspect fitting should be referred to a Land Rover Dealer/Authorised Repairer for examination.



LAN0158G

Curtain airbags are designed to protect the head in the event of a severe side impact or roll-over event. They will NOT inflate as a result of frontal or rear impacts alone.

The curtain airbag modules are located behind the roof lining and pillar finisher, above the doors. In the event of a severe side collision, the airbag pushes out from behind the roof lining and pillar finisher as it inflates. The curtain airbag remains inflated for longer than the other airbags, to provide additional head protection in the event of a secondary impact/vehicle roll-over.

Deployment effects

WARNING

When an airbag inflates, a fine powder is released. This is not an indication of a malfunction. However, the powder may cause irritation to the skin and should be thoroughly flushed from the eyes and any cuts or abrasions of the skin.

Activation of an airbag creates dust, causing possible breathing difficulties for asthma sufferers or other people with respiratory problems. If an airbag is activated, any occupant who suffers from breathing difficulties should either leave the vehicle as quickly as possible, or obtain fresh air by fully opening the windows and doors.

Following inflation, some airbag components are hot - DO NOT touch until they have cooled.

After inflation, the front and seat mounted side airbags deflate immediately (curtain airbags deflate slowly). This provides a gradual cushioning effect for the occupant and also ensures that the driver's forward vision is not obscured.

WARNING

Even with airbag equipment fitted, seat belts must ALWAYS be worn because:

- **An airbag will only provide additional protection in certain types of frontal collisions. NO protection is afforded against the effects of rear impacts, or minor frontal impacts.**
- **Inflation and deflation take place instantaneously and will not provide protection against the effects of secondary impacts that can occur during multiple vehicle collisions.**

Obstruction of airbags

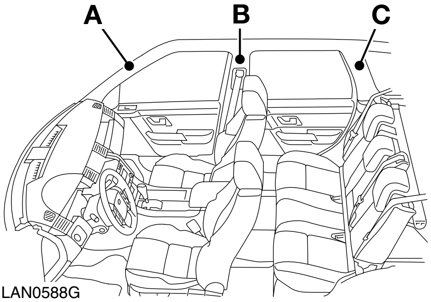
WARNING

Do not allow passengers to obstruct the operation of the airbags by placing feet, knees or any other part of the person, or any other objects in contact with, or in close proximity to, an airbag module.

DO NOT attach or position items on, or close to the roof lining, A, B and C post finishers, front seat backs or to an airbag cover, which could interfere with the inflation of the airbag or, if the airbag inflates, be propelled inside the vehicle causing injury to the occupants.

Caution: If a non-approved phone system is to be fitted, ensure that the installer is aware of the airbag system.

To ensure correct deployment of the airbags, it is essential that obstructions are not allowed to intervene between an airbag and the occupant. The following are examples of the type of obstructions that could either, impede correct operation of the airbags, or jeopardise personal safety in the event of an airbag deployment:



- Accessories attached to or obscuring an airbag cover, including; the roof lining, A, B and C post finishers and the seat backs of the front seats.
- Items of hand luggage, or other objects placed on an airbag cover.
- Feet, knees or any other part of the anatomy in contact with, or in close proximity to, an airbag cover.
- Head, arms or any part of the anatomy in contact with, or in close proximity to, a seat mounted side airbag.
- Items of clothing hanging from the grab handle attached to the roof.
- Items of clothing or cushions draped over the part of the front seat containing the airbag.
- Non-approved seat covers/accessory seat covers over a front seat; in particular, seat covers that have not been designed for use with side airbag. If in doubt, consult your Land Rover Dealer/Authorised Repairer.

Note: *Unauthorised modification of the vehicle or parts may invalidate the vehicle's warranty.*

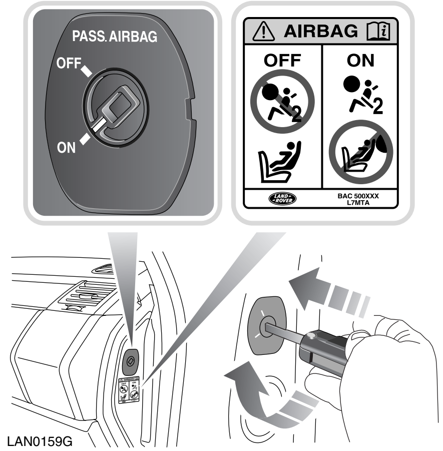
PASSENGER AIRBAG DISABLING SWITCH

WARNING

Do not use a child restraint on a seat protected by an operational airbag in front of it.

There is a risk of death or serious injury when the airbag deploys.

The safest place for children is properly restrained in the rear seats.



If it becomes necessary to fit a child restraint on the front passenger seat, the airbag must be de-activated using the switch located on the end of the instrument panel on the passenger's side. Access to the switch can only be obtained with the passenger's door open.

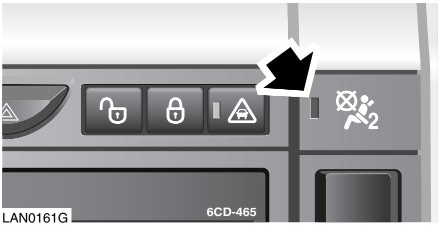
This switch is operated using the starter key.

To use a child restraint in the front, make sure that the key switch is turned to the OFF position.

Operational status indicator

WARNING

When checking the status of the airbag using the operational status lamp, always ensure that the starter key is in position II.



The passenger airbag operational status indicator is an oblong lamp which illuminates amber when the passenger airbag disabling switch has been turned to the OFF position to de-activate the passenger's airbag.

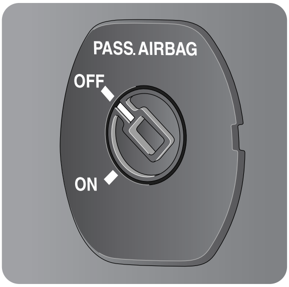
After the airbag has been de-activated, the indicator does not illuminate until the starter key has been turned to position **II**.

Airbag switched off

WARNING

To avoid the risk of injury, NEVER use a child restraint in the front of the vehicle unless the passenger airbag has been switched OFF.

To ensure that the adult restraint system performs as intended, make sure that the passenger airbag is switched ON



LAN0162G

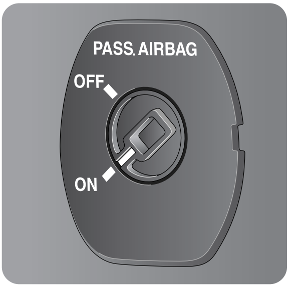
In order to fit a child restraint to the front passenger seat, use the starter key to turn the airbag disabling switch to the OFF position.

Check that when the vehicle has been switched on (position **II**), the operational status lamp on the instrument panel is illuminated indicating that the passenger airbag is NOT operational.

If the airbag warning indicator in the instrument cluster illuminates continuously, it means that there is a malfunction of the system, see **Warning Indicators, 104**.

Remove the child restraint from the front seat and consult your Land Rover Dealer/Authorised Repairer.

Airbag switched on



LAN0163G

When an adult is seated in the front passenger seat of your vehicle, ensure that the airbag disabling switch is turned to the ON position.

This will ensure that the airbag will perform as intended in the event of a crash.

Check that, when the vehicle is switched on (position **II**), the operational status lamp on the instrument panel is NOT illuminated, indicating that the passenger airbag is operational.

The safest place in your vehicle for a child, is in the rear seat.

SERVICE INFORMATION

WARNING

DO NOT attempt to service, repair, replace, modify or tamper with any part of the airbag, or wiring in the vicinity of an airbag component; this could cause the system to activate, resulting in personal injury.

WARNING

For your safety it is recommended that you seek the assistance of a Land Rover Dealer/Authorised Repairer to carry out any of the following:

- **Removal or repair of any wiring or component in the vicinity of any of the airbag components, including the steering wheel, steering column, door trim, roof lining, instrument pack and instrument panel.**
- **Installation of electronic equipment such as a mobile phone, two-way radio or in-car entertainment system.**
- **Modification to the front or side of the vehicle, including the bumper and chassis.**
- **Attachment of accessories to the front or side of the vehicle.**

Caution: The components that make up the airbag are sensitive to electrical or physical interference, either of which could easily damage the system and cause inadvertent operation or a malfunction of the airbag.

In addition, ALWAYS contact your Land Rover Dealer/Authorised Repairer if:

- an airbag inflates.
- the front or side of the vehicle is damaged, even if the airbag has not inflated.
- any part of an airbag module cover shows signs of cracking or damage.
- any trim containing airbags - front seat back, headlining or pillar trims - becomes damaged.

STEERING COLUMN ADJUSTMENT

WARNING

DO NOT adjust the steering wheel position while the vehicle is in motion. This is extremely dangerous!

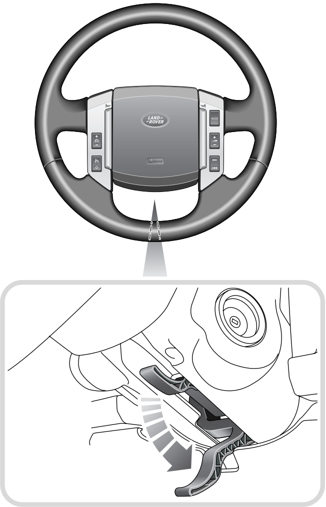
Ensure that the lever is fully up. Inadvertent movement of the wheel might occur if the lever is not fully tightened.

The steering wheel position can be adjusted in two directions.

Move the lever located under the steering wheel fully downwards (see inset).

Adjust the steering wheel up or down, in or out.

Move the lever fully up to lock.

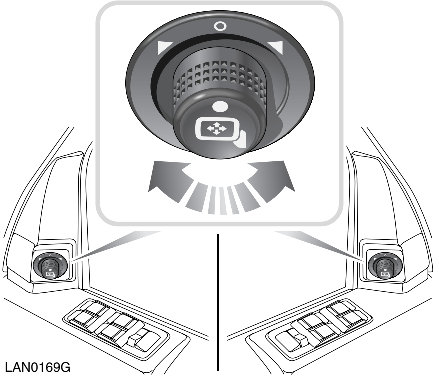


LAN0168G

EXTERIOR MIRRORS

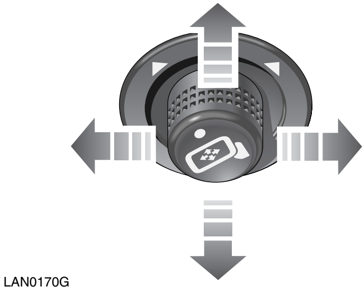
Caution: Objects viewed in exterior mirrors may appear further away than they actually are.

Mirror adjustment



Left and right hand drive.

With the starter switch turned to position **I** or **II**, rotate the knob to select either the left or right-hand mirror. Push the knob in the appropriate direction to tilt the mirror glass up/down/left or right.

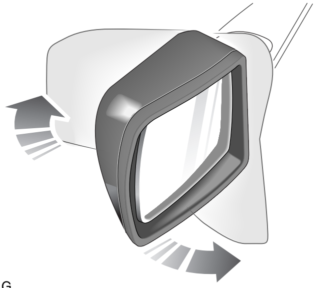


The door mirrors have integral heating elements which disperse ice or mist from the glass. These will operate automatically with the starter switch in position **II** and are controlled according to the external temperature and wiper status.

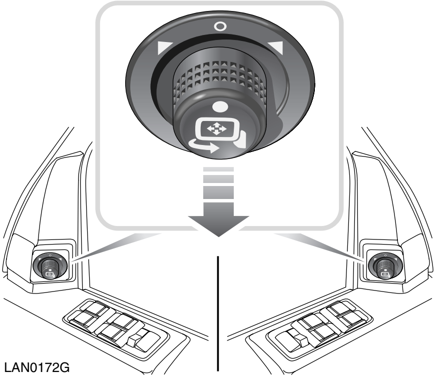
Note: *On vehicles fitted with the driver's seat memory facility, up to three exterior mirror positions for each of three possible starter keys can be stored. See* ***DRIVER'S SEAT MEMORY FACILITY, 57****.*

Folding the mirror body

The door mirrors are designed to fold forwards or rearwards on impact. They can also be folded in towards the side windows into a park position.



Manual operation: On some vehicles this operation can be carried out manually, by physically pushing the mirror bodies towards the side windows.



Left and right hand drive.

Electric operation: With the rotary knob in the central position, push the knob downwards to fold the mirrors. Push the knob downwards again to unfold the mirrors.

If the mirrors are accidentally knocked out of position (i.e. with one mirror folded and the other in the normal position), an additional operation of the switch will re-synchronise them.

Door Mirrors

Reverse mirror dipping

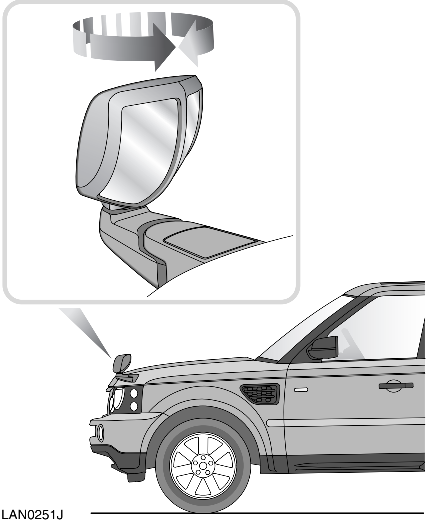
Vehicles with driver's seat memory have a pre-stored function, which causes the door mirrors to dip whenever reverse gear is selected, giving the driver a view of the kerbside.

When this feature is first turned on, the mirrors will dip to a pre-set amount. See **SELECTING SETTINGS OPTION, 88**. The degree of dipping can be programmed using the following sequence:

1. Insert the starter key and turn it to position **I** or **II**. Do not start the engine.
2. Adjust the seat and the exterior mirrors to the correct position and perform a memory-store routine. See **Setting the memory pre-sets, 57**.
3. Select reverse gear - the mirrors will dip to a pre-set level.
4. Adjust the mirrors to the required dipped position.
5. Perform a memory-store sequence.
6. Within 5 seconds, press the pre-set button you previously stored the seat and mirror positions on.
7. **DOOR MIRROR DIP STORED** will be displayed on the message centre.
8. A single chime will sound from the instrument pack.

This feature can be enabled or disabled by a Land Rover Dealer/Authorised Repairer or by the driver. See ***SELECTING SETTINGS OPTION, 88****.*

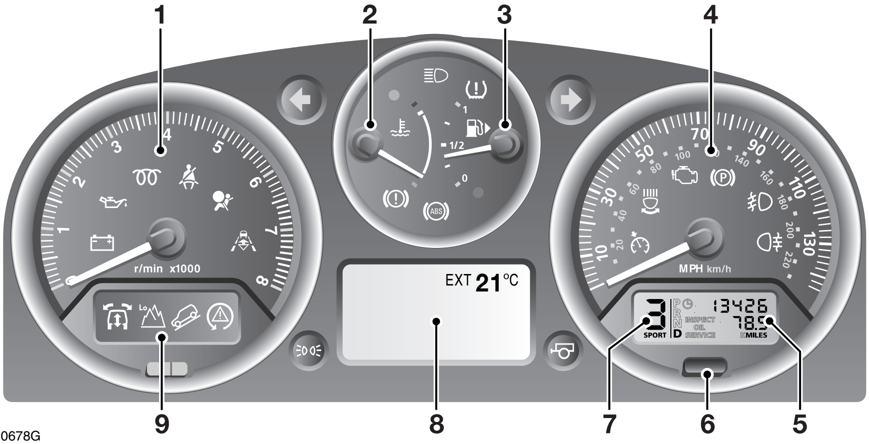
Proximity mirror (Japan only)



The proximity mirror has a split lens, providing views along the left side and immediately ahead of the vehicle. Correct adjustment of the mirror will reduce blind spots.

Adjust the mirror by rotating the head to the left or right. The mirror should be adjusted a few degrees at a time and the view checked from the driver's seat before making further adjustments.

INSTRUMENT PACK



LAN0678G

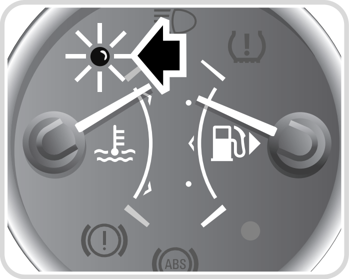
1. Tachometer

Indicates engine speed in revolutions per minute (x 1000). In normal driving conditions the engine is most fuel efficient between 2000 and 3000 rev/min.

2. Temperature gauge

At normal operating temperature, the pointer will be positioned midway between the RED and BLUE segments of the gauge (the precise position will vary according to climatic conditions).

If the pointer moves above the mid point, the engine coolant is becoming too hot. Should the pointer move INTO the RED segment and the RED warning indicator within the gauge illuminates, severe engine damage could occur.



LAN0175G

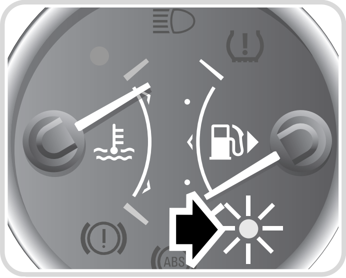
Idle the engine and allow to cool down until the temperature gauge recovers. If the problem persists, seek qualified assistance before continuing.

Note: *If the engine is in danger of overheating, the air conditioning may switch off and engine performance may reduce, in order to minimise engine load.*

3. Fuel gauge

Caution: NEVER allow vehicles to run out of fuel as the resultant misfire may destroy the catalytic converter.

When the starter switch is turned to position **II**, the pointer quickly rises to show the level of fuel in the tank.



LAN0176G

When the remaining fuel reaches a minimum of 12 litres (3 gallons) on petrol vehicles, the AMBER low fuel warning indicator in the fuel gauge illuminates (arrowed).

The remaining fuel should give a range of 80 km (50 miles).

The small arrow visible alongside the fuel pump symbol on the gauge indicates the side of the vehicle on which the fuel filler is located - a useful reminder to help you position the vehicle on the correct side of the forecourt pumps before refuelling.

4. Speedometer

Indicates road speed.

5. Total distance (odometer) and trip recorder

Indicates the total distance travelled, and also shows the most recent individual journey distance. See **ODOMETER DISPLAY, 103**.

6. Trip recorder reset switch

With the starter switch in position **II**, pressing this button resets the trip recorder to zero.

7. Gear selector position display

Displays the current gear selector position. See **GEAR SELECTOR DISPLAY, 102**.

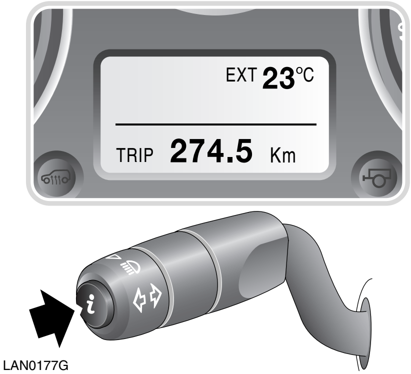
8. Main message centre

Displays all warning and information messages. See **MAIN MESSAGE CENTRE, 90**.

9. Tachometer indicators panel

Displays four system status indicators.

TRIP COMPUTER - FUNCTION SELECTION



LAN0177G

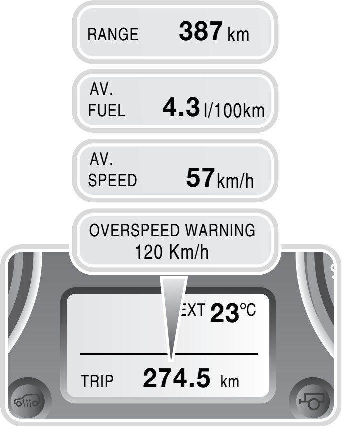
The trip computer functions can be set by the user to give a wide range of information, with the units used by the displays being chosen by the driver. See **SELECTING SETTINGS OPTION, 88**.

The system is also used to display any warning messages generated by the vehicle's self-checking facility.

At engine start-up, the screen shows **SYSTEM CHECK IN PROGRESS**. When this check is completed, the screen will show the outside temperature. If the vehicle is in motion, the screen will also show the current trip distance.

Trip computer statistics can be viewed by pressing the **i** button on the end of the direction indicator stalk.

A long press of the button (over two seconds) will zero the trip distance recorder which will then start to record distance from that point.



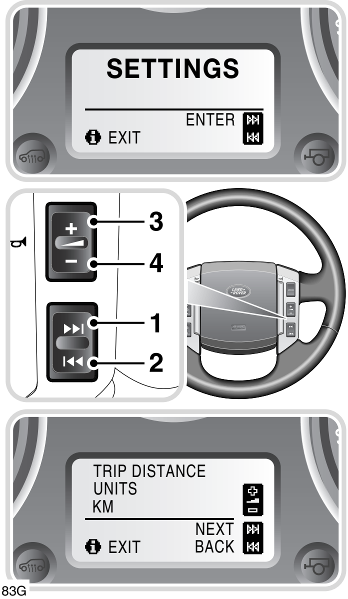
LAN0180G

A series of short presses of the button (less than two seconds) will scroll through the following:

- Available range (with current fuel tank contents)
- Average fuel consumption
- Average speed
- The option to activate/de-activate the overspeed warning function (A long press of the button turns the function on or off)
- A review of active warning messages
- A blank trip computer window (screen shows outside temperature)
- Settings option menu
- A display of trip distance
- Time display

SELECTING SETTINGS OPTION

Various vehicle functions can be selected to suit personal requirements. These can be set by the driver.



LAN0183G

With the starter key in any position, but with the vehicle stationary and a blank screen displayed, a short press (less than two seconds) on the **i** (information) button on the end of the direction indicator stalk brings up the **SETTINGS** display.

Once this screen is displayed, pressing button **1** gives access to the menu of options that can be personalised.

Move through the Settings menu by pressing buttons **1** or **2**, and make choices by pressing buttons **3** or **4**.

When you have finished making adjustments, a short press (less than two seconds) on the **i** button will return you to the trip computer display.

Settings Option

SETTINGS	CHOICE
TRIP DISTANCE UNITS (odometer)	MILES/KM
FUEL USAGE UNITS	MPG l/100km Km/l
EXTERNAL TEMPERATURE	^{0}C or ^{0}F
OVERSPEED WARNING	Off 20 - 250 km/h or 15 to 140 mph in 5-unit steps (units set as trip distance)
HEADLAMP OFF DELAY	30/60/120/240 seconds
AUTO DOOR LOCK (speed related locking)	ON/OFF
REVERSE MIRROR DIP	ON/OFF
LAZY ENTRY	ON/OFF
RESTORE DEFAULT SETTINGS	YES/NO

Confirming choices

After making any changes to the Settings options, press the information button again to save settings and exit.

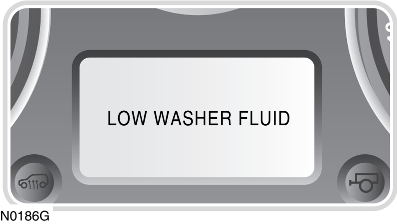
Note: *If the vehicle is moved while any changes are being made to the Settings options, the system will prevent any further input until the vehicle is stationary again.*

Key memory

All of the choices made during Settings are stored within the vehicles memory. The choices are referenced to the remote control that was used during the process.

These choices are recalled when the vehicle is next unlocked using that remote control.

MAIN MESSAGE CENTRE



LAN0186G

Driver warning and information messages are displayed in the main message centre.

They are displayed when a fault is detected and also when the starter switch is turned off. It is possible, by pressing the **i** button on the direction indicator stalk, to view messages for up to 3 minutes after the key has been removed from the starter switch.

Messages have different priority levels and are grouped into the following categories.

Critical warning messages

Critical warning messages are accompanied by an audible warning and may have the handbook symbol next to it.

DO NOT ignore these messages - TAKE CORRECTIVE ACTION IMMEDIATELY!

Warning messages

Warning messages are non-critical, but must be treated with some urgency. They will also be accompanied by an audible warning each time the message is displayed.

DO NOT ignore these messages - TAKE CORRECTIVE ACTION AS SOON AS POSSIBLE.

All Warning messages are displayed for approximately 4 seconds, after which the i▸ symbol is displayed in the main message centre for as long as the message exists. there are current warning messages waiting to be reviewed. Review the messages by pressing the **i** button on the direction indicator stalk until the list of messages appears. The message centre will then automatically cycle through the messages, until the **i** button is pressed again.

Information messages will be displayed as and when applicable, and also when the starter switch is turned on or off. Where the message requires action by the driver - TAKE CORRECTIVE ACTION AS SOON AS POSSIBLE.

Messages are displayed in order of importance with critical warnings taking priority.

Information messages

Information messages will be displayed as and when applicable, and also when the starter switch is turned on or off. Where the message requires action by the driver - TAKE CORRECTIVE ACTION AS SOON AS POSSIBLE.

Messages are displayed in order of importance with critical warnings taking priority.

Languages

The language displayed in the main message centre is a dealer configurable feature.

The languages supported are:

- English
- English US
- French
- German
- Italian
- Spanish

If your vehicle has the navigation option, the language you select for navigation display will also be displayed in the main message centre, if it is one of the supported languages in the above list. If the main message centre does not support the selected navigation language, English will be displayed.

MESSAGE CENTRE MESSAGES

The following table is a comprehensive list of all messages that could appear in the message centre. Market criteria mean that some messages will not apply to your vehicle and will therefore not appear.

Message	Meaning	What to do?
The i▸ icon appears in the display	There are current warning messages waiting to be reviewed.	Press the **i** button on the end of the direction indicator stalk to view the list of messages.
AIRBAG FAULT	Fault in supplementary restraint system.	Seek qualified assistance immediately.
CANNOT EDIT ON THE MOVE	Driver has attempted to access the Customer Settings menu when the vehicle is moving.	Stop the vehicle before entering Customer Settings menu.
CAUTION PARKBRAKE APPLIED	Parkbrake has been applied while the vehicle is moving.	Only use this function in an emergency.
CAUTION! RISK OF GROUNDING WITH SUSPENSION AT NORMAL HEIGHT	Displayed when the Terrain Response system would normally have provided off-road height but the driver has manually lowered the vehicle (or the system cannot raise the vehicle).	Raise suspension manually to off-road height if possible and appropriate.
CHECK ALL TYRE PRESSURES	Advisory message, pressure in a running tyre decreased to first warning threshold.	Check tyre pressures.
CHECK BRAKE FLUID	Brake fluid in reservoir below recommended level.	Seek qualified assistance immediately.
CHECK BRAKE PADS	Brake pads worn beyond the service limit.	Seek qualified assistance immediately.
CHECK SPARE TYRE PRESSURE	Pressure in spare tyre decreased to warning threshold.	Check pressure of spare tyre.
COOLING SYSTEM FAULT MONITOR GAUGE	Low coolant level	Stop the vehicle and check level. Top up with engine coolant. If the problem persists, consult your Dealer.
CRUISE CANCELLED	Driver has switched off cruise control.	Nothing.

Message Centre

Message	Meaning	What to do?
DRIVER OVERRIDE	Driver is pressing the accelerator pedal during cruise control.	Nothing, message will clear when the driver releases the accelerator, then cruise control will resume.
CRUISE NOT AVAILABLE	System not available due to system fault.	Consult your Land Rover Dealer/Authorised Repairer.
CRUISE CONTROL NOT PERMITTED	System fault or vehicle operating parameters outside threshold for operation of cruise control.	Consult cruise control section of this handbook for guidance.
SET SPEED XXX MPH KM/H	Speed set for Adaptive Cruise Control.	Nothing.
CRUISE GAP 🚙 <--> 🚙	Adaptive Cruise Control set distance (time gap).	Adjust to required distance. (4 settings).
ACC SENSOR BLOCKED	Adaptive Cruise Control field of view may be obstructed.	Check to make sure nothing is covering the ACC sensor.
FWD ALERT ON (or OFF)	Forward alert feature has been turned on or off.	Nothing.
FWD ALERT <---->	Forward alert sensitivity adjustment.	Adjust to required sensitivity. (4 settings).
DOOR MIRROR DIP STORED	Memory system - confirmation that memory has stored driver information.	Nothing.
DRIVER INTERVENE	Alert that action by the driver to apply the brakes is required.	If required, the driver should apply the brakes.
DRIVER'S DOOR OPEN	Driver's door open or not fully closed.	Close driver's door.
DSC SWITCHED OFF	System not available - switched off by driver.	To reselect, press DSC switch.
ENGINE SYSTEM FAULT	Engine management system registers a serious fault - reduced performance may be experienced.	Avoid high speeds and consult your Land Rover Dealer/ Authorised Repairer.
ENGINE SYSTEM SERVICE REQUIRED	The relevant service interval has elapsed and your vehicle requires servicing.	Arrange as soon as possible.
FASTEN SEAT BELTS	Seat occupied and safety belt not fastened.	Fasten safety belt.

Message	Meaning	What to do?
GRASS GRAVEL SNOW	If you leave the rotary knob in this position then you will activate the highlighted Terrain Response special program.	Nothing.
GRASS GRAVEL SNOW PROGRAM SELECTED	The rotary knob has been left in one position for longer than two seconds and Grass Gravel Snow special program has been activated.	Nothing.
HDC FAULT SYSTEM NOT AVAILABLE	System fault.	Drive with care and do not attempt to descend steep slopes. Seek assistance immediately.
HDC NOT AVAILABLE IN THIS GEAR	HDC not operative because of incorrect gear selection. HDC is fully functional in **1**, **R** and **D** in HIGH range. It operates in all gears in LOW range.	Select correct gear if HDC is required. In LOW range, HDC operates in all gears.
HDC NOT AVAILABLE SPEED TOO HIGH	HDC unavailable, speed threshold exceeded. Max HDC operating speed is 50 km/h, max speed for HDC selection is 80 km/h.	Reduce vehicle speed.
HDC SWITCHED OFF	HDC switched off by driver, Terrain Response system or speed threshold exceeded.	Nothing.
HDC TEMPORARILY NOT AVAILABLE SYSTEM COOLING	HDC switched off while brake system is cooling.	Wait until message disappears before attempting to descend steep slopes.
HIGH ENGINE SPEED FOR COOLING	Engine idle speed increasing to improve cooling and/or air conditioning performance.	Nothing.
HIGH/LOW RANGE SELECTED	Advises driver that transfer box has engaged HIGH/LOW range.	Nothing.
INTERIOR LIGHTS OFF	Courtesy lamps can only be operated manually, and will not illuminate when a door is opened.	Nothing
INTERIOR LIGHTS AUTOMATIC	All courtesy lamps have been enabled.	Nothing

Message	Meaning	What to do?
KEY BATTERY LOW PLACE KEY IN IGNITION TO CHARGE	Remote control battery charge low.	Insert key in starter switch and start the engine to recharge the remote control battery.
LOW COOLANT LEVEL	Coolant level in header tank below recommended level.	Stop the vehicle and check level in the header tank. Top up with correct mixture of antifreeze and water at the earliest opportunity. If the problem persists, consult your Land Rover Dealer/Authorised Repairer.
LOW WASHER FLUID	Washer fluid quantity below 1 litre.	Top up washer fluid.
MEMORY 1/2/3 STORED/SELECTED	Memory system - confirmation that memory has been stored/selected.	Nothing.
MUD RUTS	If you leave the rotary knob in this position then you will activate the highlighted Terrain Response special program.	Nothing.
MUD RUTS SELECTED	The rotary knob has been left in one position for longer than two seconds and Mud Ruts special program has been activated.	Nothing.
PARKBRAKE BEDDING CYCLE ACTIVE	A garage technician has requested a bedding cycle.	If not required, an ignition reset will cancel the function.
PARKBRAKE FAULT	Supports the amber warning indicator - electric parkbrake functions may not be available.	Seek qualified assistance.
PARKBRAKE FAULT AUTO RELEASE NOT FUNCTIONAL	Drive-away release function is not available.	Use manual release.
PARKBRAKE FAULT SYSTEM NOT FUNCTIONAL	Supports the red warning indicator - electric parkbrake functions are not available.	Seek qualified assistance immediately.
PARKBRAKE FAULT TO HOLD VEHICLE REMOVE KEY THEN APPLY PARKBRAKE	Electric parkbrake has lost vehicle speed information.	Follow the instructions to park the vehicle.

Message Centre

Message	Meaning	What to do?
PARKBRAKE OFF LIFT SWITCH TO APPLY	An emergency release operation is detected.	Once original faults have been corrected, apply the switch to reinstate electric parkbrake.
PARK LOCK FAILURE APPLY HANDBRAKE	Automatic transmission park lock function ineffective due to transfer box being out of HIGH or LOW range.	Seek qualified assistance immediately.
PRESS FOOT BRAKE AND PARKBRAKE SWITCH TO RELEASE	A switch release has been detected without brake pedal contact.	Follow the instructions to achieve a manual release.
PRESS FOOT BRAKE OR CLUTCH AND PARKBRAKE SWITCH TO RELEASE	A switch release has been detected without brake pedal contact.	Follow the instructions to achieve a manual release.
PROGRAM CHANGE IN PROGRESS	Conditions prevail which make it temporarily impossible to select a new Terrain Response program. This can be due to ABS or DSC activity or the overheating of the electronic differentials.	Be patient. If conditions change within 60 seconds, the chosen program will be activated. If the message is prompted by electronic differential overheat, then it will take longer but there will be separate advice about this. Once the differentials have cooled and this advice is no longer present, try to reselect the required special program.
RECOMMEND LOW RANGE IS SELECTED FOR MUD-RUTS PROGRAM	LOW range is usually better for Mud-Ruts special program.	Select LOW range if required.
RECOMMEND RAISING SUSPENSION TO OFF ROAD HEIGHT IN DEEP MUD-RUTS	In deep ruts it is beneficial to raise the vehicle to off-road height. This is done automatically in LOW range but has to be done manually if mud/ruts program is used in HIGH range.	Raise suspension manually to off-road height.

Message	Meaning	What to do?
RECOMMEND STARTING IN 2ND/3RD GEAR FOR SLIPPERY CONDITIONS	For slippery conditions it can be beneficial to start off in a higher gear than usual.	Select second/third gear.
REDUCED ENGINE PERFORMANCE	Engine management system registers a serious fault - reduced engine performance may be experienced.	Avoid high speeds and consult your Land Rover Dealer/Authorised Repairer.
RESET SUSPENSION HEIGHT IF CLEAR OF OBSTACLE	Suspension still in extended mode.	Check if vehicle is clear of obstacle. If clear, select required suspension.
ROCK CRAWL	If you leave the rotary knob in this position then you will activate the highlighted Terrain Response special program.	Nothing.
ROCK CRAWL SELECTED	The rotary knob has been left in one position for longer than two seconds and Rock Crawl special program has been activated.	Nothing.
SAND	If you leave the rotary knob in this position then you will activate the highlighted Terrain Response special program.	Nothing.
SAND SELECTED	The rotary knob has been left in one position for longer than two seconds and Sand special program has been activated.	Nothing.
SELECT LOW RANGE TO ACTIVATE ROCK CRAWL	Vehicle is not in LOW range, so Rock Crawl cannot be activated.	Select LOW range if Rock Crawl is required.
SELECT NEUTRAL FOR RANGE CHANGE	Alerts driver that range change will not occur until neutral is selected on the transmission.	Select neutral.
SLOW DOWN OR VEHICLE WILL LOWER/RAISE	Vehicle will automatically lower/raise if vehicle speed increases.	Choose to slow down or accept height change.
SPECIAL PROGRAMS OFF	You have deselected a Terrain Response special program and the general program has now been activated.	Nothing.

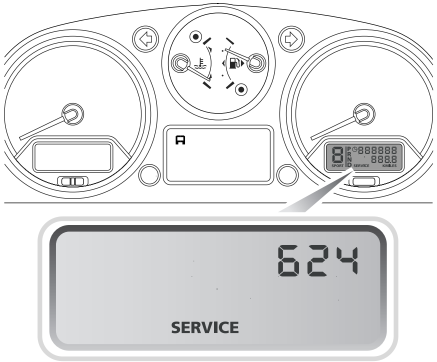
Message	Meaning	What to do?
SPEED TOO HIGH FOR RANGE CHANGE	Driver has requested range change when vehicle speed is too high.	Reduce speed to 40 km/h.
SUSPENSION ACCESS HEIGHT SELECTED	Access height selected.	Nothing.
SUSPENSION CLOSE DOOR TO CHANGE HEIGHT	Air suspension height change is prevented because a door is open.	Close all doors.
SUSPENSION FAULT	A fault has been detected in the air suspension system. System may still operate normally.	Seek qualified assistance immediately.
SUSPENSION FAULT MAX SPEED 50 KM/H (MAX SPEED 30 MPH)	A major fault has been detected in the air suspension system. Height cannot be controlled.	Drive slowly until fault can be rectified.
SUSPENSION FAULT NORMAL HEIGHT ONLY	A fault has been detected in the air suspension system. Only normal height is available.	
SUSPENSION FAULT STOP SAFELY STOP ENGINE	Major component failure.	Stop vehicle immediately and seek qualified assistance.
SUSPENSION FAULT VEHICLE LEAN WHEN CORNERING	A fault has been detected in the Dynamic Response system.	Drive slowly and take additional care until fault can be fixed.
SUSPENSION IN EXTENDED MODE	Vehicle body has become trapped on an obstacle and will raise automatically.	Nothing.
SUSPENSION LOCKED AT ACCESS HEIGHT	Crawl mode selected and suspension locked.	Nothing.
SUSPENSION NORMAL HEIGHT SELECTED	Normal height selected.	Nothing.
SUSPENSION SPEED TOO HIGH TO CHANGE HEIGHT	A height change has been requested but is prevented because speed is too high.	Reduce vehicle speed.
SUSPENSION START ENGINE TO RAISE VEHICLE	Vehicle height can only be raised with the engine running.	Start the engine.

Message	Meaning	What to do?
SUSPENSION VEHICLE RAISING SLOWLY	Vehicle is raising slowly because reservoir is empty (only displayed if lift time exceeds 24 seconds. This is NOT a system fault).	Nothing.
SUSPENSION WILL RAISE WHEN SYSTEM COOLED	Air suspension compressor is cooling. Lifting will resume when compressor has cooled.	Wait for suspension to carry out lifting sequence.
SYSTEM CHECK IN PROGRESS	Instrument cluster internal diagnostic routine.	Nothing.
SYSTEM FAULT SOME PROGRAMS NOT AVAILABLE	Some Terrain Response special programs are not available because of a system fault.	Be careful going off-road as Terrain Response may not function in the program required. Get the vehicle checked and rectified.
SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE	There is a fault on the vehicle which makes the Terrain Response special programs unavailable.	Be careful going off-road as Terrain Response cannot function in any of its special programs. Get the vehicle checked and rectified.
TERRAIN RESPONSE SPECIAL PROGRAMS OFF	If you leave the Terrain Response rotary knob in this position, you will activate the general program and any active Terrain Response special program will be deselected.	Nothing.
TRAILER CONNECTED OFF ROAD HEIGHT NOT SELECTED AUTOMATICALLY	Advisory message that vehicle has not selected off-road height as trailer socket is being used.	If a trailer is connected, do nothing, as it may not be safe to raise the vehicle to off-road height. If no trailer is connected electrically but something else is, such as a bike rack, then the vehicle can be raised to off-road height manually. If nothing is connected, then the socket needs checking for faults.
TRANSMISSION FAULT	Advises driver that automatic transmission has a fault.	Seek qualified assistance immediately.

Message	Meaning	What to do?
TRANSMISSION FAULT AND OVERHEAT	Advises driver that an automatic transmission fault has occurred and the temperature is too high.	Seek qualified assistance immediately.
TRANSMISSION FAULT LIMITED GEARS AVAILABLE	Advises driver that automatic transmission has a fault and performance may be affected.	Seek qualified assistance immediately.
TRANSMISSION FAULT STOP SAFELY	Advises driver that a fault has occurred with the electronic rear differential.	Stop the vehicle as soon as it is safe to do so.
TRANSMISSION FAULT TRACTION REDUCED	Advises driver that a fault has occurred with the transfer box control system.	Reduce speed and seek qualified assistance immediately. ***Note:*** *Off-road performance will be reduced.*
TRANSMISSION OVERHEAT SLOW DOWN	Rear differential temperature has reached or is approaching the overheat threshold.	Reduce speed and seek qualified assistance immediately.
TRANSMISSION RANGE CHANGE NOT AVAILABLE	Advises driver that a fault has occurred which prevents the transfer box from changing range.	Reduce speed and seek qualified assistance immediately.
TRANSMISSION TRACTION REDUCED	Transfer box control module fault.	Reduce speed and seek qualified assistance immediately.
TYRE PRESSURE NOT MONITORED	Possible loss of RF transmission or defective sensor battery.	Seek assistance immediately.
TYRE PRESSURE TOO HIGH	Pressure in a running tyre too high, threshold reached.	Adjust to correct pressure as soon as possible.
TYRE PRESSURE VERY LOW	Pressure in a running tyre decreased to warning threshold.	Adjust to correct pressure as soon as possible.
TYRE PRESSURE MONITORING SYSTEM FAULT	TPM system fault has occurred.	Seek qualified assistance immediately.
TYRE PRESSURES TOO HIGH		Adjust to correct pressure as soon as possible.
TYRE PRESSURES VERY LOW		Adjust to correct pressure as soon as possible.

Message	Meaning	What to do?
TYRE PRESSURE MONITORING SET FOR HEAVY LOAD	Indicates the system is set to monitor the tyre pressures for heavily laden conditions.	Ensure setting is correct for the current tyre pressures and loading conditions.
TYRE PRESSURE MONITORING SET FOR LIGHT LOAD	Indicates the system is set to monitor the tyre pressures for normally laden conditions.	Ensure setting is correct for the current tyre pressures and loading conditions.

SERVICE INTERVAL INDICATOR



LAN0187G

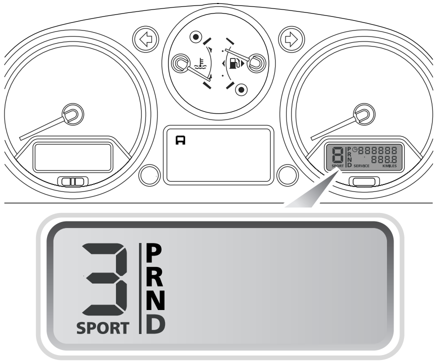
The service interval indicator is a market configurable feature and may not be enabled. If the feature is enabled, the display will become active when a pre-determined distance or time before service is reached. These pre-determined values are market dependent.

When the starter switch is turned to position **I** and the pre-determined value is reached, a distance countdown to the next service appears in the display. A minus sign preceding the distance indicates that the service interval point has been exceeded by that distance.

After approximately five seconds, the display reverts to show the total distance travelled.

Note: *After the completion of each service, the Land Rover Dealer/Authorised Repairer will reset the distance display for the countdown to the next service.*

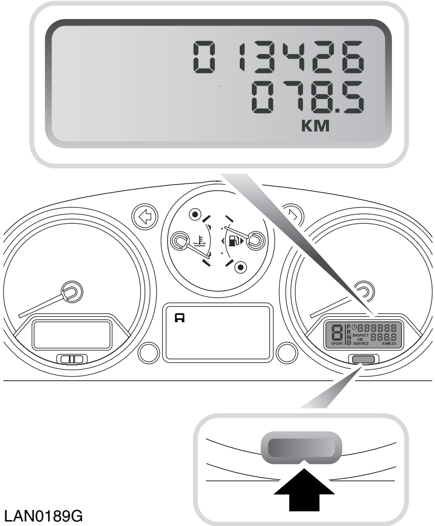
GEAR SELECTOR DISPLAY



LAN0188G

This shows the current gear lever position and indicates when SPORT has been selected.

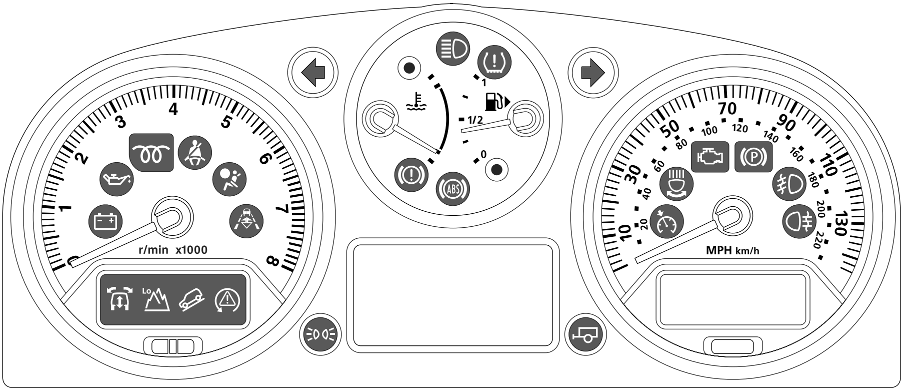
ODOMETER DISPLAY



With the starter switch turned to position **II**, the display indicates the total distance travelled by the vehicle, and also shows the most recent individual journey distance. See **SELECTING SETTINGS OPTION, 88**. Pressing the trip recorder reset button (see inset), resets the trip recorder to zero.

Warning Indicators

INDICATOR GROUPING



LAN0677G

Caution: RED warning indicators are of particular importance; their illumination indicates that a fault exists. If a RED warning indicator illuminates, stop the vehicle safely and review the specific instructions given in this section.

The location and specification of the warning indicators may vary according to model and market requirements.

For ease of identification, the warning indicator descriptions have been grouped into the five locations on the instrument pack.

These are:

- background
- tachometer
- fuel/temperature gauge
- message centre
- speedometer

BACKGROUND

Direction indicators - GREEN

An indicator flashes in time with the corresponding left or right direction indicator, whenever they are operated. If the warning indicator fails to flash, or flashes very rapidly, this may indicate a bulb failure in one of the direction indicator lamps.

If the hazard switch is pressed, both warning indicators will flash in conjunction with the direction indicators.

Side lamps/Headlamps - GREEN

The indicator illuminates when the side lamps or headlamps are turned on.

Trailer - GREEN

The indicator illuminates as a bulb check when the starter switch is turned to position **II** and extinguishes when the engine is started.

If a trailer is attached to the vehicle and the direction indicators are used, this indicator will flash in synchronisation with the direction indicators. If it does not flash, this indicates that a trailer bulb is defective.

TACHOMETER

Battery charging - RED

Illuminates as a bulb check when the starter switch is turned to position **II** and extinguishes once the engine is running. If it remains on, or illuminates whilst driving, a fault with the battery charging system is indicated. Seek qualified assistance urgently.

Low oil pressure - RED

Illuminates as a bulb check when the starter switch is turned to position **II** and extinguishes when the engine is started. If the indicator remains on, flashes on and off, or illuminates whilst driving, stop the vehicle as soon as safety permits and SWITCH OFF THE ENGINE IMMEDIATELY. Seek qualified assistance before driving. Always check the oil level when this indicator illuminates.

Glow plug - AMBER (diesel only)

Illuminates when the starter switch is turned to position **II**. When the engine is cold, wait for the lamp to extinguish before starting. If the engine is warm, the lamp will not illuminate.

Seat belt - RED

Illuminates when the starter switch is turned to position **II** and extinguishes after approximately 6 seconds, even if the driver's seat belt remains unfastened. In some markets illumination of the indicator will be accompanied by a warning chime. See **AUDIBLE WARNINGS, 109**.

Note: *In certain markets, the indicator will illuminate until the driver's seat belt is fastened correctly.*

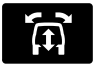
Airbag - RED

The indicator illuminates when the starter switch is turned to position **II** and extinguishes after about 4 seconds. If the indicator illuminates at any other time, there is a fault with the system - seek qualified assistance urgently.

Adaptive Cruise Control (ACC) active

Illuminates when Adaptive Cruise Control detects a vehicle in front and will react to it.

Suspension- AMBER/RED



This lamp is shared between the Air suspension system and Dynamic Response.

The lamp illuminates both RED and AMBER briefly as a bulb check when the starter switch is turned to position **II**.

If illumination occurs whilst driving, a fault with one of the systems is indicated, as follows:

- If the lamp shows RED (a flashing red lamp which changes to constant illumination after two minutes, and is accompanied by a warning chime): This indicates a system fault that may result in serious damage to vehicle components and reduced Dynamic Response performance. Stop the vehicle as soon as safety permits and switch off the engine. DO NOT CONTINUE DRIVING! Seek qualified assistance immediately.

The following message will be displayed in the message centre window to accompany a red warning lamp for a dynamic response system failure:

SUSPENSION FAULT, STOP SAFELY, STOP ENGINE.

If the following message is displayed in the message centre:

SUSPENSION FAULT, MAX SPEED 50KPH (MAX SPEED 30MPH).

This indicates an air suspension fault, with the system not being able to control ride height. In which case the maximum speed indicated should not be exceeded until the fault has been rectified.

- If the lamp shows AMBER (constant illumination): This indicates a system fault that will result in reduced Dynamic Response performance but will not leave the vehicle in a dangerous condition. You may continue driving, but reduce speed, take additional care, and consult a Land Rover Dealer/Authorised Repairer at the earliest opportunity. The ride quality of the vehicle may be reduced in this condition.

The following message will be displayed in the message centre window to accompany an amber warning lamp:

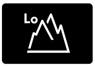
SUSPENSION FAULT, VEHICLE LEAN, WHEN CORNERING.

If the following message is displayed in the message centre:

SUSPENSION FAULT, NORMAL HEIGHT ONLY.

This indicates an air suspension fault, but the vehicle can still be driven normally.

LOW gear- GREEN



Illuminates when LOW range has been selected; flashes during range change.

Hill Descent Control (HDC) information - GREEN

Illuminates briefly as a bulb and system check when the starter switch is turned to position **II** and also illuminates when HDC is selected.

If HDC is selected and all operating conditions are met, the indicator will illuminate continuously.

If HDC is selected and all operating conditions are not met (vehicle in neutral gear, vehicle speed above HDC operating range) the indicator will flash.

If a fault with the HDC system occurs, HDC will fade-out and then deselect, or deselect immediately (depending on the type of fault and whether or not HDC is in operation). The green indicator will extinguish and the message **SYSTEM NOT AVAILABLE** will be displayed in the message centre.

Dynamic Stability Control (DSC) and Electronic Traction Control (ETC) - AMBER

Illuminates briefly as a bulb check when the starter switch is turned to position **II**. The indicator also illuminates when DSC is switched off. De-activating DSC has no effect on traction control.

The indicator will flash while DSC and/or ETC is activated and will remain flashing until the system is no longer active.

If the indicator illuminates constantly, and does not extinguish when the DSC switch is pressed, a fault has been detected in the system and DSC and/or ETC will be inactive - drive with care and seek qualified assistance as soon as possible.

FUEL/TEMPERATURE GAUGE

Headlamp high beam - BLUE

Illuminates when the headlamps are switched to high beam or headlamps are flashed.

TPM system operation

The tyre pressure warning comprises a yellow warning indicator (telltale) within the instrument pack and an associated message within the message centre.

Brake systems - AMBER/RED

This indicator shares its position and symbol with four brake system warnings and illuminates briefly as a bulb check when the starter switch is turned to position **II** (the indicator will illuminate red and amber during bulb check).

Emergency Brake Assist (EBA) - AMBER

If the indicator remains amber after starting, or illuminates whilst driving, a fault with the EBA system is indicated. Drive with care and seek qualified assistance urgently.

Brake pad wear - AMBER

It illuminates when brake pad wear has reached a predetermined limit.

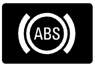
Electronic Brake force Distribution (EBD) - RED

A fault with the EBD system is indicated by illumination of the red brake warning indicator. If this illuminates while the vehicle is being driven, stop the vehicle gently, as soon as safety permits, check and top up brake fluid if necessary. If the lamp remains illuminated, seek qualified assistance before continuing.

Brake fluid level - RED

Low brake fluid level is indicated by illumination of the red brake warning indicator. If this illuminates while the vehicle is being driven, stop the vehicle gently, as soon as safety permits. Check and top up brake fluid if necessary. If the lamp remains illuminated, seek qualified assistance before continuing. Have the problem checked by your Land Rover Dealer/Authorised Repairer.

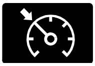
Anti-lock Braking System (ABS) - AMBER



Illuminates as a bulb check when the starter switch is turned to position **II**. If the indicator remains on or illuminates whilst driving, a fault with the ABS system is indicated. Drive with care, avoiding heavy brake application, and seek qualified assistance urgently.

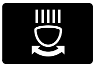
SPEEDOMETER

Cruise control active - AMBER



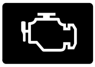
Illuminates when Cruise Control is operating.

Adaptive Front lighting System (AFS) - AMBER



Flashes when a fault occurs with the Adaptive Front Lighting System.

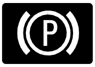
Check engine - AMBER



Illuminates as a bulb and system check when the starter switch is turned on and extinguishes as soon as the engine is started. Illumination at any other time indicates an engine fault. If the indicator illuminates continuously while driving, the emission performance of the engine management system is impaired - seek qualified assistance.

If the indicator flashes while driving, immediately reduce engine power to avoid catalytic converter damage.

Parkbrake system - RED

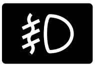


Illuminates for about 3 seconds as a bulb check when the starter switch is turned to position **II**.

If the indicator flashes red, a fault with the parkbrake system is indicated, seek qualified assistance before continuing.

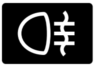
When parking the vehicle in this condition, ensure that the vehicle is secured stationary without reliance on the parkbrake.

Front fog lamps - GREEN



Illuminates when the front fog lamps are switched on.

Rear fog lamps - AMBER



Illuminates when the rear fog lamps are switched on.

AUDIBLE WARNINGS

The market specification will determine which of the following audible warnings are appropriate to your vehicle.

Electronic air suspension warnings

A warning chime will sound:

- Whenever the air suspension raise/lower switch is operated to raise the vehicle to off-road height, or to return it to standard ride height.
- If changes to or from off-road height are requested but not permitted.
- Whenever the speed threshold for the current ride height is reached.
- Whenever the air suspension is lowered to crawl mode.

Dynamic Response warning

A warning chime will sound:

- If a fault with the Dynamic Response system is detected. The chime will coincide with the suspension warning lamp flashing RED then turning solid after 2 minutes, with the following message in the message centre **SUSPENSION FAULT, STOP SAFELY, STOP ENGINE.** This indicates a system fault that may result in serious damage to vehicle components and reduced Dynamic Response performance. Stop the vehicle as soon as safety permits and switch off the engine. DO NOT CONTINUE DRIVING! seek qualified assistance immediately.

Dynamic Stability Control (DSC) warning

A warning chime will sound once:

- If a fault with the DSC system is detected, and the appropriate warning indicator(s) illuminates (DSC, ABS, Amber Brake Warning or HDC fault text message). The vehicle may still be driven with care, but seek qualified assistance at the earliest opportunity.

Adaptive Cruise Control (ACC) warning

A warning chime will sound:

- When the driver must intervene and take control.

Electric parkbrake

A warning chime will sound:

- If the driver selects electric parkbrake whilst the vehicle is moving.

Starter key reminder

A warning will chime continuously:

- If the key is left in the starter switch while the driver's door is open. The chime stops as soon as the door is closed or the key is removed from the starter switch.

Seat belt reminder

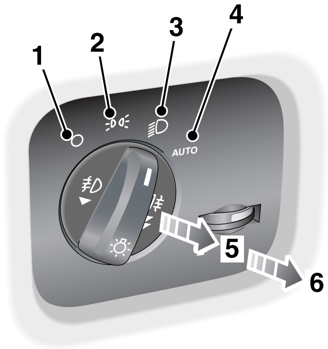
In some markets, a warning chime will sound (one second frequency):

- If the driver's seat belt has not been fastened when the starter switch is turned on. The chime operates in conjunction with the seat belt warning indicator and sounds for 6 seconds, or until the seat belt is fastened (whichever occurs first).

If the seat belt remains unfastened, the chime will sound at intervals of 15 seconds.

EXTERIOR LAMPS

Lamps master switch



LAN0403G

1. Side lamps and headlamps off.
2. Side lamps on.
3. Low beam headlamps on.
4. Automatic control lamps on.
5. Front fog lamps on.
6. Front and rear fog lamps on.

If front fog lamps are not fitted, the rear fog lamps will come on at position **5**.

Note: *Fog lamps cannot be operated if the lamps master switch is at position **4** Auto.*

Side lamps

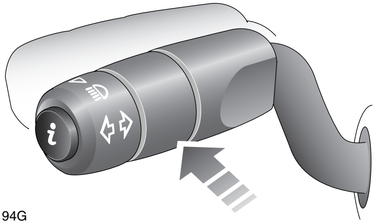
The front and rear side lamps, along with licence plate lamps, illuminate when the lamps master switch is turned to positions **2** or **3**, regardless of the position of the starter switch.

Automatic control lamps

With the lamps master switch in position **4** and starter switch in position **II**, the side lamps, low beam headlamps and licence plate lamps will illuminate automatically when the ambient light falls below a pre-defined level.

All of the lamps will go out when the ambient light rises above that level.

High beam



LAN0194G

With the lamps master switch in position **3** and starter switch in position **II**, push the left-hand steering column lever away from the steering wheel as far as it will go to select high beam, and release it.

To cancel high beam, pull the lever towards the steering wheel again and release it.

While high beam is selected, a blue indicator will be illuminated in the instrument pack.

Headlamp high beam flash

To flash the headlamps on high beam, pull the lever towards the steering wheel and release it.

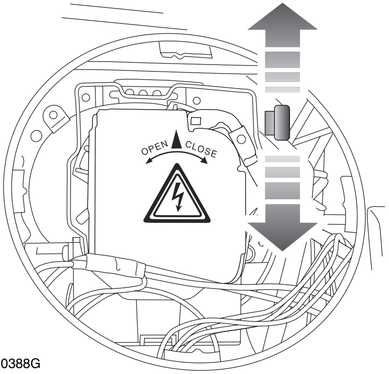
The blue indicator in the instrument pack illuminates when the headlamps are flashed.

Headlamp touring adjustment

Position of the lever illustrated will vary depending on type of headlamps and side of vehicle. It may be on either side of the headlamp bulb aperture.

When touring in a country where traffic drives on the opposite side of the road to where you normally drive, use the tourist lever mechanism within each headlamp unit to alter the beam pattern. This enables the vehicle to be driven without having to stick blanking decals onto the headlamp lens.

Xenon headlamps

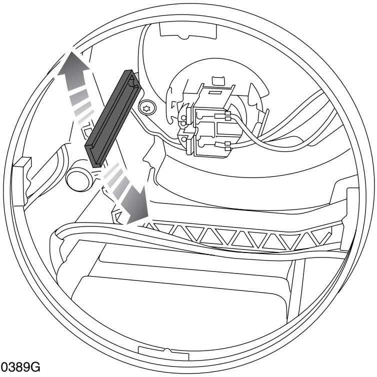


LAN0388G

Follow the process shown in **HEADLAMP UNIT, 272** to gain access to the inside of the headlamp unit. Move the lever to adjust the beam.

Lever default position - Xenon headlamps	
Right hand headlamp	Up
Left hand headlamp	Up

Halogen headlamps

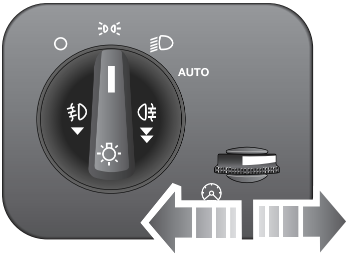


LAN0389G

Follow the process shown in **HEADLAMP UNIT, 272** to gain access to the inside of the headlamp unit. Move the lever to adjust the beam.

Lever default position - Halogen headlamps	
Right hand headlamp	Down
Left hand headlamp	Up

Dimmer control



LAN0195G

Rotate the dimmer control to vary the level of instrument pack illumination.

Headlamp courtesy delay

As a driver convenience feature the headlamps can be kept on for a short time after the vehicle is parked. Turn the starter switch off with the headlamps still switched on. The lamps master switch can be in positions **2**, or **3**. With the switch in position **4** the Headlamp delay works in automatic mode.

Remove the key from the starter switch and turn lamps master switch fully anticlockwise to the Off position. The headlamps will remain illuminated for up to 240 seconds. This automatic time delay is configurable. See **SELECTING SETTINGS OPTION, 88**.

The courtesy delay may be cancelled at any time by turning the starter switch to position **I** or **II** or the lamps master switch from position **1** to **2**.

Note: *If Automatic Control Lamps are switched on, the headlamp courtesy delay will operate automatically.*

Headlamp courtesy delay can be enabled or disabled by a Land Rover Dealer/Authorised Repairer or by the driver. See **SELECTING SETTINGS OPTION, 88***.*

Cornering lamps

The cornering lamps produce an angled beam on the relevant side of the vehicle at speeds below 40 km/h (25 mph) when the headlamps are on and the turn indicator stalk is moved to indicate a turn.

Daytime running lamps

In certain markets, with the engine running and the main lighting switch turned off, the front and rear side lamps, the licence plate lamps and the headlamp low beams will illuminate. The instrument pack illumination remains off.

Unless they are required or prohibited by law, daytime running lamps can be disabled/enabled by a Land Rover Dealer/Authorised Repairer.

Note: *The following lamps operate only with the starter switch in position* ***II****.*

Stop lamps

The stop lamps will illuminate when the brake pedal is pressed and will remain on while the brake pedal is pressed.

The stop lamps also illuminate when Hill Descent Control is braking the vehicle or during Electronic Parkbrake dynamic deceleration.

Reversing lamps

Selection of reverse gear will operate the reversing lamps.

Front fog lamps

WARNING

Fog lamps should ONLY be used when visibility is severely restricted - as soon as conditions clear, switch off fog lamps to prevent dazzling of other road users.

With the lamps master switch in positions **2** or **3**, pull out the switch to position **5** to operate the front fog lamps.

An indicator will illuminate in the instrument pack.

Rear fog lamps (with front fog lamps fitted)

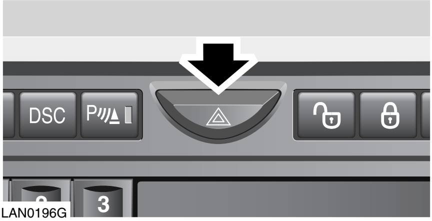
With the lamps master switch in positions **2** or **3**, pull out the switch to position **6**. An indicator will illuminate in the instrument pack.

Rear fog lamps (no front fog lamps fitted)

With the lamps master switch in position **3**, pull out the switch to position **6**. An indicator will illuminate in the instrument pack.

ALWAYS remember to switch the fog lamps off as soon as visibility permits.

HAZARD WARNING LAMPS

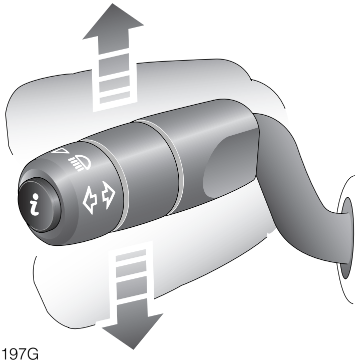


LAN0196G

Press the switch to operate the hazard warning lamps. All of the direction indicator lamps (including the instrument pack warning indicators and those fitted to a trailer) will flash together.

Use ONLY in an emergency to warn other road users when your stationary vehicle is causing an obstruction, or is in a hazardous situation. Remember to switch off before moving away.

DIRECTION INDICATORS



LAN0197G

With the starter switch in position **II**, the left-hand steering column lever will operate the direction indicators (a GREEN warning indicator on the instrument pack will flash in time with the direction indicators).

Note: *Bulb failure of any front or rear direction indicator lamp (not side repeaters) will cause the instrument pack warning indicator to flash rapidly and the audible indicator signal to double in speed.*

Lane change flash

Move the lever partially up or down against spring pressure then release, to indicate a lane change. The relevant direction indicator flashes three times.

If the lever is held against spring pressure, the direction indicators will continue to operate until the lever is released.

Lane change flash can be disabled/enabled by a Land Rover Dealer/Authorised Repairer.

OPERATING

The wipers and washers will only operate when the starter switch is turned to position **I** or **II**.

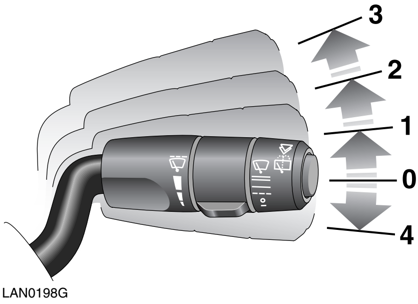
Note:

- *DO NOT operate the wipers on a dry screen.*
- *In freezing or very hot conditions, ensure that the blades are not stuck to the glass.*
- *In winter, remove any snow or ice from around the arms and blades, including the wiped area of the windscreen and the heater air intakes.*

Note: *If the wiper blades have stuck to the glass, an electronic cut-out may temporarily prevent the wiper motor from operating. If this is the case, switch the wipers off and turn the starter switch off. Clear the obstruction and try again.*

Semi-automatic operation of the wiper blades is possible by setting the wiper lever to the rain sensor variable delay mode. In this mode, the wipers operate only when the rain sensor detects moisture on the windscreen and remain inactive whilst the screen is dry.

WINDSCREEN WIPERS



Rain sensor/Intermittent variable delay

Push the lever up to position **1**.

Normal speed wipe

Push the lever up to position **2**.

Fast speed wipe

Push the lever up to position **3**.

Single wipe

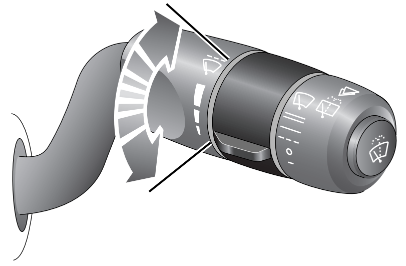
Pull the lever down to position **4** and release immediately.

Note: *With the lever held down, the wipers will operate at fast speed until the lever is released.*

Auto park

If the starter switch is turned to the Off position while the wipers are operating, they will continue to the Park position and stop.

Intermittent variable delay



With the lever in position **1**, rotate the delay switch clockwise to increase (a wipe will occur immediately), and anticlockwise to decrease, the frequency of the intermittent wipe.

Speed-dependent mode

When speed dependent mode is configured, the operation of all wiper modes will be affected by vehicle speed.

If the vehicle's speed drops below 8 km/h (5 mph) with the wipers operating, the wiper frequency automatically reduces. The wipers will switch to the next lowest operating speed. When the vehicle's speed increases to over 8 km/h (5 mph), the original wiper speed setting is restored automatically.

This setting can be configured by a Land Rover Dealer/Authorised Repairer.

Speed-dependent-intermittent mode

The frequency of intermittent variable delay is also adjusted automatically according to road speed on those vehicles not equipped with a rain sensor.

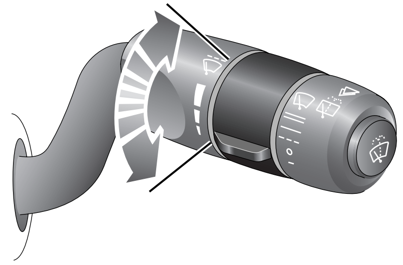
The intermittent period can be adjusted for each of the speed-dependent modes by rotating the delay switch either clockwise or anticlockwise.

This setting can be configured by a Land Rover Dealer/Authorised Repairer.

Rain sensor variable delay

WARNING

BEFORE entering an automatic car wash, ensure that the wipers are switched off-otherwise, they could operate during the car wash programme and be damaged.



The rain sensor is fitted to the inside of the windscreen, immediately ahead of the rear view mirror. The sensor is able to detect varying amounts of dirt or water on the outside of the screen.

With the wiper switch in position **1**, the variable delay automatically adjusts the frequency of the wiper operation according to the information supplied by the rain sensor.

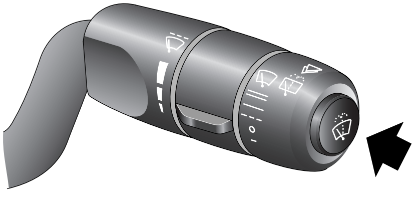
You can increase (a wipe will occur immediately) or decrease the sensitivity of the rain sensor, and therefore the frequency of wiper operation, by rotating the delay switch-either clockwise or anticlockwise.

If the sensor detects constant rain, the wipers will operate continuously.

FRONT WINDSCREEN WASHER

WARNING

If you operate your vehicle in temperatures below 5°C (40°F), use washer fluid with anti-freeze protection. In cold weather, failure to use washer fluid with anti-freeze protection, could result in impaired windscreen vision and increase the risk of a vehicle crash.



LAN0200G

Push the wiper stalk button to operate the front screen washer. If the button is pressed for more than 0.5 seconds, the washer will continue to operate while the button is pressed. When the button is released, the wipers will complete the current stroke and then complete two further strokes before parking automatically.

If the button is pressed for less than 0.5 seconds, only the washer will operate.

Note: *National or local regulations may restrict the use of volatile organic compounds (VOCs), which are commonly used as anti-freeze agents in washer fluid. A washer fluid with limited VOC content should be used only if it provides adequate freeze resistance for all regions and climates in which the vehicle will be operated.*

HEADLAMP POWER WASH

If the headlamps are on, and there is sufficient liquid in the washer reservoir, operating the screen washer will also power-wash the headlamps.

The headlamp power wash will operate on every fifth operation of the screen washer, provided that the headlamps are still switched on and 10 minutes have elapsed since the last headlamp wash.

Switching the headlamps off and back on again will reset the cycle.

The headlamp wash will operate every third operation of the screen washer in all Special Programs. See **Terrain Response, 191**.

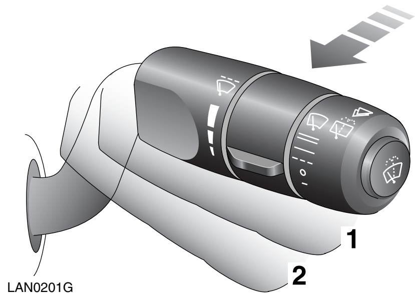
Note: *In the screen washer reservoir, if the fluid level sensor detects a low level, the headlamp power wash is inhibited.*

Heated washer jets

If the ambient temperature falls to a point where icing of the washer jets could occur, power is applied to heat the jets provided that the starter switch is in position **II**.

An approved screenwash is necessary to prevent freezing in very cold weather. See **LUBRICANTS AND FLUIDS, 286**.

REAR WINDOW WIPER AND WASHER



Wiper - intermittent operation

Pull the lever position **1**. The intermittent delay period will vary according to the delay switch setting and with the vehicle's speed, if speed-dependent-intermittent mode has been enabled. See **Speed-dependent-intermittent mode, 115**.

Wiper - continuous operation

If preferred the rear wiper operation can be configured by a Land Rover Dealer/Authorised Repairer to operate continuously.

Washer

Pull the lever to position **2** and hold it there. The wiper and washer will both operate. When the lever is released, the washer will stop and the wiper will complete a further two wipe cycles and then return to intermittent operation, provided that the continuous function has not been set.

Reverse gear input

If reverse gear is selected while the front wipers are operating, the rear wiper will operate accordingly.

If reverse gear is selected while the rain sensor is operational and the front windscreen wipers are in use, the rear wiper will operate accordingly.

Tailgate open disable

If the rear wiper is switched on or already running and the tailgate is opened, the wiper will:

- Stop immediately.
- Not start to move if it is already stationary.

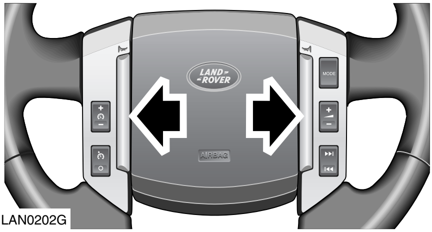
If the tailgate is subsequently closed, the wiper will resume its normal operation after a delay of three seconds.

If the tailgate is open and the vehicle's speed is above 3 km/h (2 mph), the wiper will operate as if the tailgate were closed.

Auto park

If the starter switch is turned to the **Off** position while the wiper is operating, it will continue to the Park position and stop.

HORN



LAND ROVER
AIRBAG
MODE
LAN0202G

To operate, press either of the horn switches.

ELECTRIC WINDOWS

WARNING

Closing of an electrically operated window on fingers, hands or any vulnerable part of the body, can result in serious injury. Always observe the following precautions:

ISOLATE the rear window switches when carrying children.

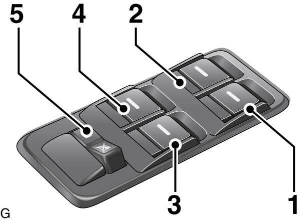
ENSURE that children are kept clear whilst raising or lowering windows.

ENSURE that all adult passengers are familiar with the controls and the potential dangers of electrically operated windows.

DO NOT allow passengers to extend any part of their bodies through a window aperture while the vehicle is moving - injury from flying debris, branches of trees or other obstructions could occur.

It is recommended that the starter key be removed when leaving the vehicle.

Switch operation



1. Right-hand front window.
2. Left-hand front window.
3. Right-hand rear window.
4. Left-hand rear window.
5. Isolating switch for rear door window switches.

Operating the windows

The electric windows can be operated when the starter switch is at position **I** or **II** and for up to 40 seconds after the starter switch is turned to position **0** (provided a front door is not opened).

If a front door is opened, the windows become inoperable.

To lower a window, press and hold the front of the switch until the desired position is reached.

To raise a window, lift and hold the front of the switch until the desired position is reached.

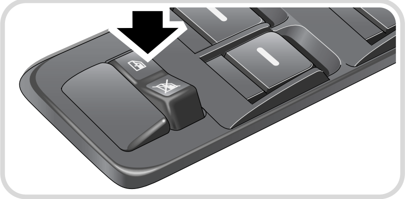
One touch operation (front door's only)

Press/lift the switch briefly to open or close the window in one movement. Window movement can be stopped at any time by pressing the switch again.

Resetting one touch operation

Disconnecting the power when the window is moving will cause memory loss. To reset the memory, drive the window to the top and keep the switch pressed for one second.

Rear window isolation switch



LAN0205G

Press the right-hand side of the switch to isolate the window switches in the rear doors; press the left-hand side to restore independent control.

Anti-trap mechanism (front door's only)

If the anti-trap sensor detects an obstruction during window closing, the closing operation is interrupted and the window backs off.

This is a safety feature designed to prevent inadvertent closing of a window on vulnerable parts of the body or other obstructions. Remove any obstruction and then close the window.

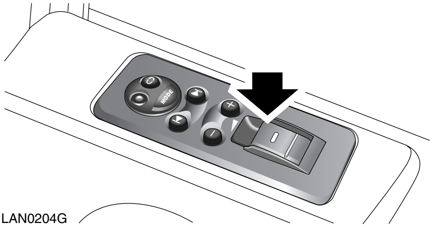
If, for any reason, it is required to override the anti-trap mechanism the following procedure should be used:

After the initial attempt to close the window, attempt it twice more with less than 10 seconds between switch presses.

On the next (fourth attempt) the window will move up a short distance with increased force to override the blockage.

If this fails to move the blockage the anti-trap feature will be lost and must be reset. See **Resetting one touch operation, 120**.

Rear window operation



LAN0204G

The rear windows can also be operated from the switches on the rear passenger doors. The rear door window switches will not operate if the isolating switch in the driver's door has been activated. See **Rear window isolation switch, 120**.

SUNROOF OPERATION

WARNING

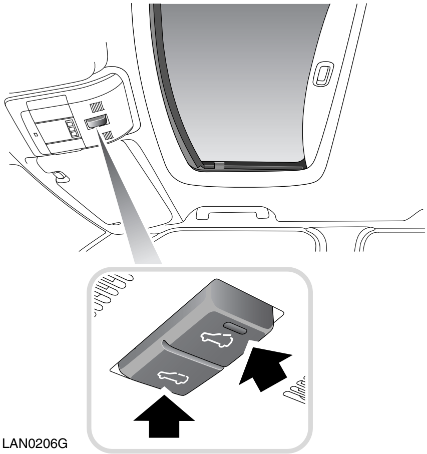
Accidental closure of a sunroof on fingers, hands or any vulnerable part of the body, can result in serious personal injury. Always observe the following precautions:

ENSURE that children are kept clear and that the sunroof is not obstructed when opening or closing.

ENSURE that all adult passengers are familiar with the controls and the potential dangers of operating an electrically operated sunroof.

DO NOT allow passengers to extend any part of their bodies through the sunroof aperture while the vehicle is moving - injury from flying debris, branches of trees or other obstructions could occur.

Caution: ALWAYS close the sunroof when the vehicle is unattended.



The electric sunroof can be operated when the starter switch is at positions **I** or **II** and for 40 seconds after position **0** has been selected, provided that neither front door has been opened.

- **To tilt the sunroof:** With the sunroof closed, press the front of the switch. The roof will move towards its fully tilted position.To close the sunroof from the tilt position, press and hold the rear of the switch.
- **To open the sunroof:** With the sunroof in the closed position, press the rear of the switch momentarily. If the starter key is not in position **II**, the switch will have to be held pressed.
- **To close the sunroof:** With the sunroof open, press the front of the switch. If the starter key is not in position **II**, the switch will have to be held pressed.

Note: *At any time while the sunroof is moving, a further press of the switch will stop the movement.*

Anti-trap mechanism

WARNING

It is possible to override the anti-trap mechanism by pressing and holding the front of the switch whilst the sunroof is closing.

Extreme care must be taken to ensure that none of the vehicles occupants have any part of their body in a position where it can be trapped by the roof.

The override allows the sunroof to be closed when movement is restricted by ice or dirt.

If the sunroof encounters resistance while travelling anywhere between the fully open and the closed position, the closing operation is interrupted and the sunroof opens slightly. This is a safety feature designed to prevent inadvertent closing of the sunroof on vulnerable parts of the body or other obstructions. Remove any obstruction and then close the sunroof.

This anti-trap feature does not apply while the sunroof is closing from the tilted position.

Operation after power supply interruption

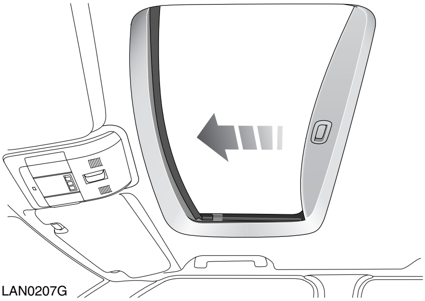
Under certain unusual circumstances, the sunroof may lose its calibration which will render it inoperable. If this happens, it needs to be recalibrated as follows:

- WIth the power supply reconnected, turn the starter switch to position **II**.
- Depress the front of the switch for 20 seconds. The sunroof will start to move. Continue to hold the switch until the sunroof completes one full open and closing cycle. When the sunroof stops moving, release the switch.

The sunroof can then be operated as normal.

Note: *Calibration will not function if the vehicle battery voltage is low.*

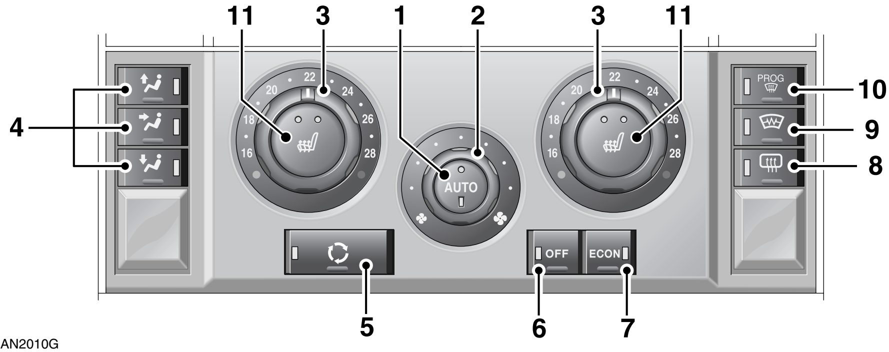
Sunroof blind



Pull the sunroof blind, across the sunroof aperture to open and close.

Note: *The sunroof blind can be opened and closed manually, but will retract automatically when the sunroof is opened, and will open slightly if the roof is tilted.*

TEMPERATURE CONTROLS



LAN2010G

The air conditioning system features automatic temperature and air distribution control and is programmed to maintain optimum levels of comfort within the vehicle in all but the most severe climatic conditions.

The configuration of controls may vary depending on the specification of your system. The variants are shown as insets to the main illustration.

The system may be fitted with the options of seat heating and front screen heating.

Note: *The indicators in the switches illuminate when that feature is operational.*

OPERATION OF CONTROLS

1. Auto mode

Allowing the system to function automatically is by far the simplest method of operation for the owner and is preferable in most operating conditions.

- Press AUTO (1) for fully automatic operation.
- Rotate the temperature controls (3) to select the required temperature.
- Let the automatic temperature control system do the rest.

In Auto mode, air conditioning, air distribution, blower speeds and air recirculation are adjusted automatically to achieve, and then maintain, a thermal environment consistent with prevailing conditions.

The air distribution and blower controls can be operated independently to override the automatic setting.

In this case, the appropriate indicator in the AUTO switch extinguishes. The circular indicator represents the blower, the rectangular indicator represents air distribution.

Press AUTO again to re-establish automatic operation.

Note: *If the air distribution and blower controls are operated independently, the system may not be able to achieve or maintain the required temperature settings.*

2. Blower control

Rotate the blower control (2) to adjust airflow through the vents.

3. Temperature controls

Rotate the controls (3) to set the required temperature for the corresponding side of the passenger compartment.

Temperatures within the range 16°C (60°F) to 28°C (83°F) can be set. The blue dot gives maximum cooling and the red dot maximum heating (depending on prevailing conditions).

Note: *Because of the mixing of air within the vehicle, the system will not achieve a temperature differential from left to right of more than 4°C (7°F).*

To obtain maximum air conditioning, rotate the temperature controls fully anticlockwise.

This mode automatically activates the air conditioning and air recirculation, and sets the blower speed at maximum and the air distribution to the face-level vents.

Note: *Rotating the temperature controls fully clockwise provides maximum heating to the foot/screen vents.*

When in stationary traffic, select **P** or **N** to maximise air conditioning efficiency.

4. Air distribution control

Press to select the desired distribution setting:

↑ Windscreen and side window vents

→ Face level vents

↓ Foot level vents

More than one setting can be selected to achieve the desired distribution.

5. Air recirculation

Air recirculation prohibits the entry of air from outside the vehicle, recirculating the air inside the vehicle instead. This is useful to prevent the entry of traffic fumes.

Air recirculation also significantly influences the dehumidifying and cooling performance of the air-conditioning system.

Note: *Prolonged recirculation at low ambient temperatures may cause the windows to mist.*

⟳ Press the button (5) once to activate air recirculation (switch indicator illuminates). Press the button a second time to deselect recirculation and return to fresh air intake (switch indicator extinguishes).

With recirculation deselected, the ventilation system may automatically re-activate recirculation, if necessary, to enable optimum air conditioning performance. When this occurs, the switch indicator will not illuminate.

6. Off

OFF Press to switch the system off; the indicator in the switch will illuminate to show this condition. Pressing the button again returns the system to its previous mode.

7. Economy mode

ECON With the engine running, press the button (7) to put the air conditioning system into Economy mode. This turns off the air conditioning compressor which reduces the power consumed by the system and system performance. Prolonged use may cause the windows to mist.

8. Heated rear screen

WARNING

DO NOT stick labels over the heating elements on the rear screen, and DO NOT scrape or use abrasive materials to clean the inside of the rear screen.

Press to operate.

Note: *Heated front and rear screen functions are only available while engine is running.*

9. Heated front screen

Press to operate. If the vehicle is not fitted with a heated front screen, this button will be blank.

10. Defrost mode

If the windscreen is misting or covered in ice, press button (10) to activate the automatic defrost programme; the system will immediately direct its output to achieve maximum screen clearing by:

- setting the blower speed to an appropriate level.
- distributing air flow to the screen only.
- deactivating air recirculation (in certain circumstances).

In addition, the rear and front screen heaters will be switched on (or their timed operating cycle will recommence if they are already switched on).

Press the button a second time (or select AUTO or any air distribution control) to leave the Defrost mode. Heated screens will remain on until their time-out period has expired.

11. Front seat heaters

Press the left or right button once to operate the relevant seat heater at a high level, press twice to heat the seat at a lower level. For further information concerning the operation of both front and rear seat heaters, please refer to **SEAT HEATERS, 126**.

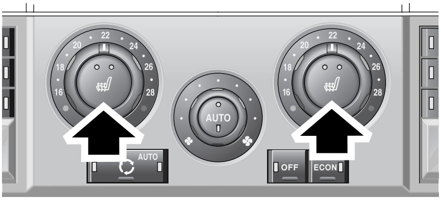
Note: *If the vehicle is not fitted with front seat heaters, these buttons will be blank.*

General notes

- For optimum operating efficiency, ensure all the air vents (including those in the rear of the vehicle) are open.
- For the automatic temperature control system to function efficiently, all windows (and the sunroof) should be closed, and the air intake vents free from ice, snow, leaves or other debris.
- In very humid conditions, slight screen misting may be experienced when the air conditioning system is turned on. This is a natural occurrence on most automotive air conditioning systems. It is not a fault and misting will clear after a few seconds once the air conditioning system is operating.
- The air conditioning compressor will not function unless the engine is running.
- Surplus water produced by the dehumidifying process is expelled from the system via drain tubes beneath the vehicle. This may result in a small pool of water forming on the road when the vehicle is stationary and is not a cause for concern.

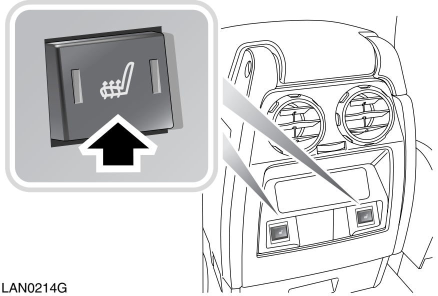
SEAT HEATERS

Caution: The seat heaters consume considerable power from the battery. For this reason, they should ONLY be operated while the engine is running.



LAN0212G

Front seat heaters



LAN0214G

Rear seat heaters

With the starter switch turned on, the seat cushion and seat back can be heated at two different levels.

- Press once to operate at a high level (both indicators illuminate).

  After a period based on cabin temperature, the high level will end and one lamp will extinguish.
- Press twice to heat the seats at a lower level (right-hand indicator extinguishes).
- Press the switch a third time to turn off the heater manually (both indicators will extinguish).

The seat heaters are thermostatically controlled and will operate to maintain a factory-set temperature. The indicators in the switches will remain illuminated until the heaters are manually turned off, the high level has timed out, or the engine is turned off.

AUXILIARY FUEL-BURNING HEATER

WARNING

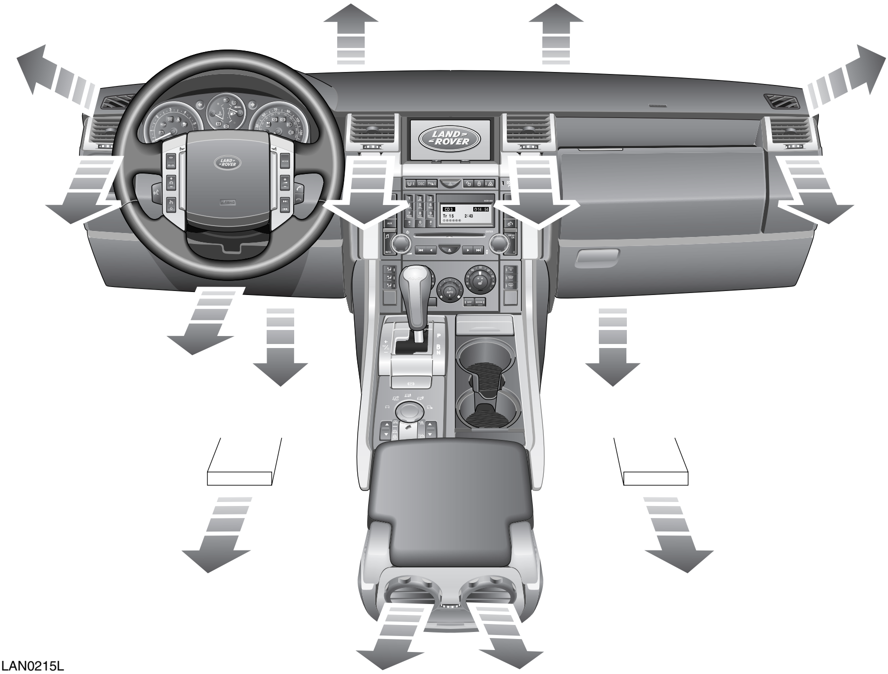
Turn the starter switch off, to ensure that the fuel-burning heater is switched off when refuelling the vehicle.

If the fuel-burning heater has been used recently, take care not to touch the unit's exhaust when performing any checks/servicing under the bonnet.

When the engine is started in very cold weather, the auxiliary fuel-burning heater is automatically switched on to provide extra heat to help warm up the engine.

During this period, exhaust fumes from the heater may be seen coming from under the bonnet. This is normal and no cause for concern.

VENTILATION



LAN0215L

The ventilation system provides fresh, conditioned and/or heated air to the interior of the vehicle from the air intake grille in front of the windscreen.

Note: *Always keep the air intake grille clear of obstructions such as leaves, snow or ice.*

Air outlets are provided to the windscreen, face, lap (driver only) and feet - the location of these vents is shown in the illustration above. The temperature of the air supplied to the vents is controlled by the heater.

Particulate air filter

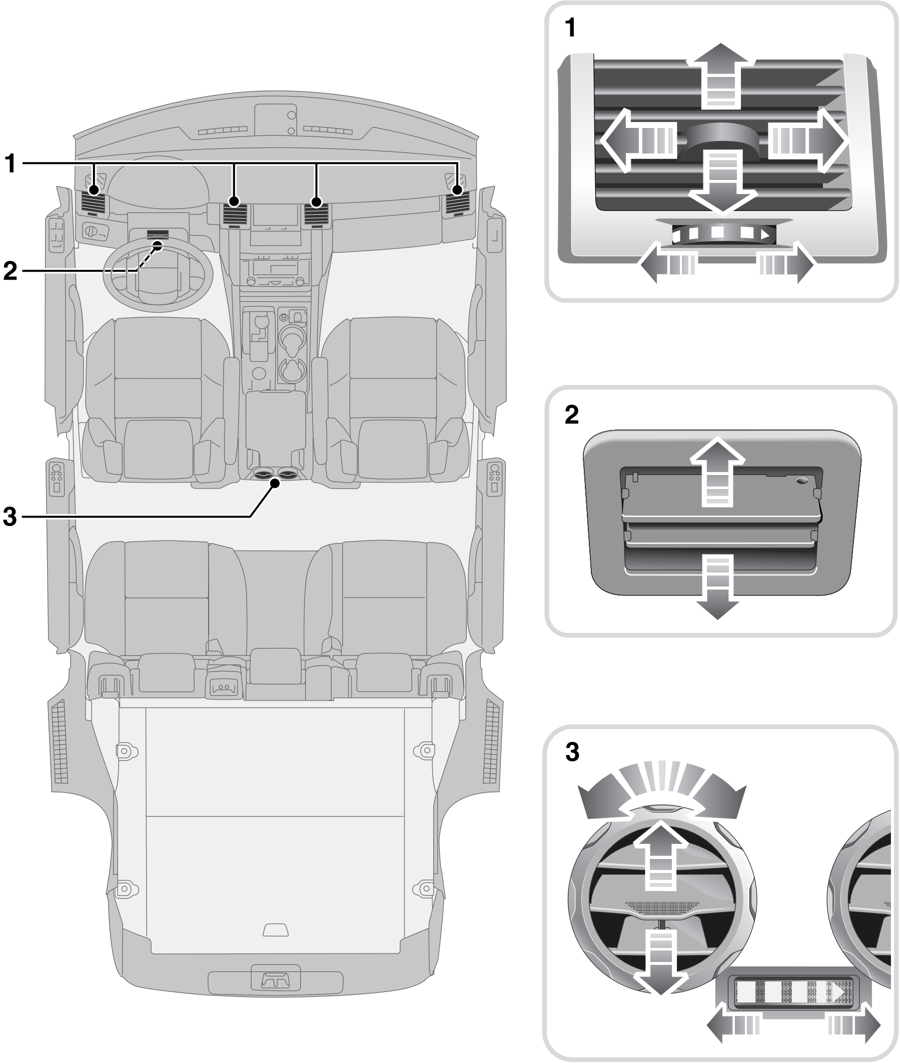
The ventilation system is fitted with a particulate air filter to remove most potentially harmful particles such as pollen, industrial fall-out and road dust from the air entering the vehicle's interior.

Combined filter

Vehicles fitted with automatic temperature control have a combined carbon and particulate air filter.

The carbon layer reduces the level of odours coming through the heater system from outside.

AIR VENTS



LAN0217

Air temperature from all vents is controlled by the temperature settings of the heater.

1. Face level vents

Direct the air flow by moving the control in the centre of the louvres. Rotate the thumbwheel towards the right to fully open, or the left to fully close the vents.

To ensure best ventilation and minimum noise, the vents should be fully open when the air distribution control is set to face level.

2. Driver's lap vent

Airflow can be directed to the driver's lap via an outlet located below the steering wheel. Control the airflow by adjusting the louvres.

3. Centre console rear vent controls

Move the louvres to adjust the direction and volume of airflow. Rotate the bezel to direct the air flow.

Note: *The temperature cannot be set by the rear occupants.*

LAMP TYPES

The vehicle's interior lighting falls into two categories:

- Courtesy lighting consists of approach lamps, footwell lamps, puddle lamps, starter switch glow ring and loadspace lamp. They enable safe entry into, or exit from the vehicle in low light conditions without the need to switch on individual lamps.
- Demand lighting consists of interior lamps, map lamps, glovebox and vanity mirror lamps. They offer lighting at the touch of a switch, usually part of the lamp fitting.

Courtesy lighting

Front footwell lamps

These illuminate the front footwell areas of the vehicle.

Starter switch glow ring

This surrounds and illuminates the starter key slot.

Loadspace lamp

This illuminates the rear loadspace area during entry to and exit from the vehicle, also when the tailgate is opened.

Automatic activation

All of the courtesy lighting comes on when:

- The position of the starter switch is changed to **0**, from **I** or **II**.
- Any door, including the tailgate is ajar.
- The vehicle receives an Unlock signal.

The courtesy lamp feature automatically turns off these lamps if:

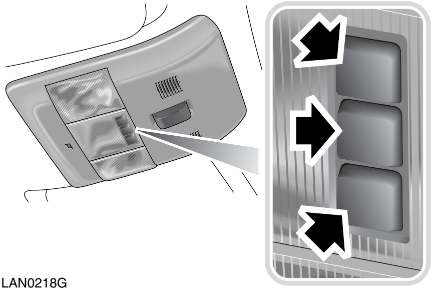
- 60 seconds (customer adjustable) have elapsed since the courtesy lamps were activated.
- 60 seconds (customer adjustable) have elapsed since the last door was closed.
- the starter switch is switched to **II** with all doors closed.
- the last door is closed after the car is externally locked.

A battery-saving feature turns off all interior lamps 15 minutes after the starter switch has been turned from **II** or **I** to **0**. This timing feature will be restarted if any of the automatic switch-on criteria occur.

Collision illumination

In the event of a collision occurring at a speed of less than 5 km/h (3 mph), all of the courtesy lamps (except approach lamps) will be turned on.

Front Interior lamps



LAN0218G

The front interior lamps are grouped together centrally above the front windscreen.

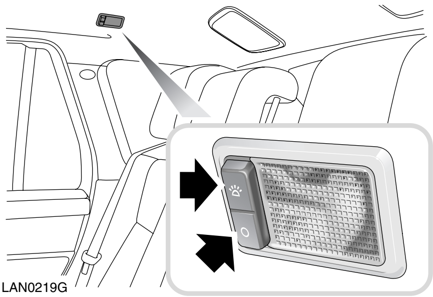
Any of the interior lamps can be switched on or off by pressing the switch adjacent to the lamp required.

It is possible to de-activate the courtesy lamps automatic mode by pressing the centre switch. The message **INTERIOR LIGHTS OFF** will flash in the message centre.

To switch the lamps off without disabling automatic mode briefly press the centre switch.

To enable automatic mode press the front centre switch for more than three seconds. The message **INTERIOR LIGHTS AUTOMATIC** will flash in the message centre.

Rear interior lamps



LAN0219G

Map lamp operation

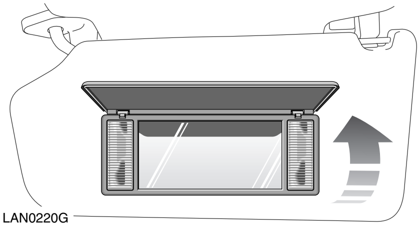
Press the required map lamp switch to turn on and off.

Glovebox lamp

Illuminates automatically (with headlamps on) whenever the glovebox is opened and extinguishes when the glovebox is closed.

Vanity mirror lamps

The vanity mirror lamps are turned on when the corresponding vanity mirror cover is opened and turned off when it is closed.



LAN0220G

Pivot the sun visor downward and raise the cover on the vanity mirror, to illuminate the mirror. Close the cover to extinguish the lamps.

Note: *Map lamps, glovebox lamps and vanity mirror lamps will extinguish automatically after 15 minutes to prevent battery drain provided that the starter switch is in position* ***0****.*

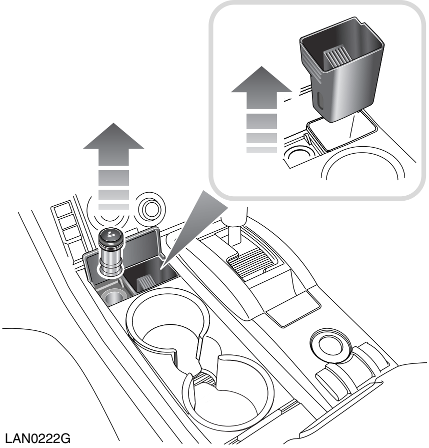
Low-level night-time illumination

With the main lighting switch turned to side lamps or headlamps, LEDs in the front interior lamps provide very low level illumination. The level of illumination can be adjusted using the instrument pack illumination dimmer switch. See **Dimmer control, 111**.

Low level lighting provides very limited illumination for the interior of the vehicle, whilst the vehicle is being driven, without affecting the driver's night vision.

SMOKERS' EQUIPMENT

Lighter



With the starter switch turned on, press the lighter in to heat up. When it has reached the correct temperature it will partially eject and can then be withdrawn for use.

- ONLY hold the lighter by the handle.

After use, push the lighter back in to the first position.

Ashtrays

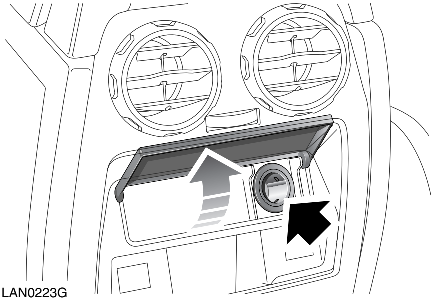
WARNING

DO NOT use the ashtrays for disposing of waste paper or other combustible items.

To remove the ashtray, open fully, then pull the ashtray upwards.

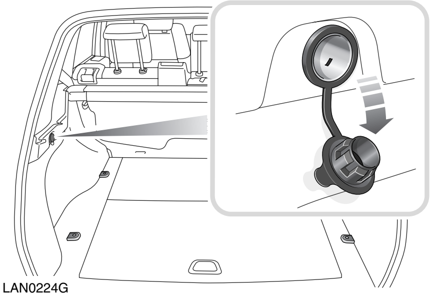
AUXILIARY POWER SOCKETS

Rear auxiliary power socket



A power socket is located on the rear face of the centre console.

Loadspace auxiliary power socket



Another power socket is fitted in the left-hand side trim in the loadspace area.

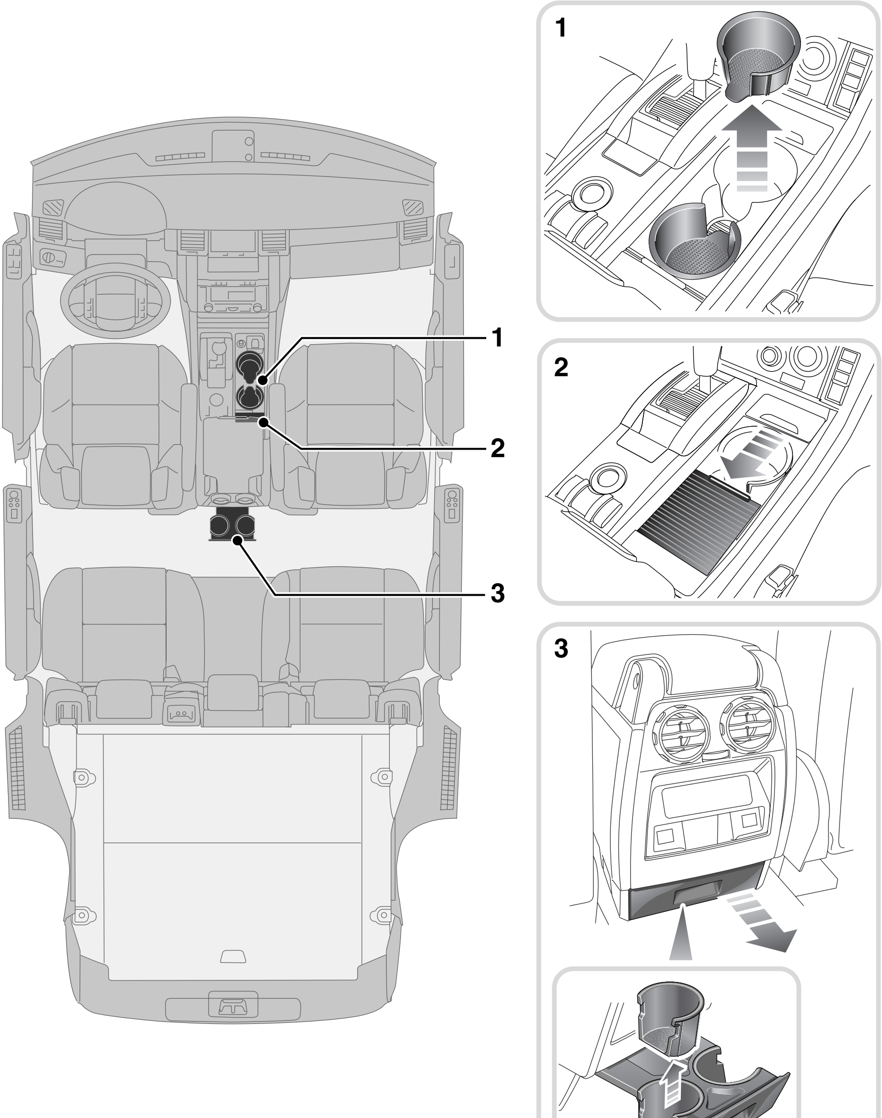
Using a power socket

Caution: NEVER plug non-approved accessories into a power socket - damage to the vehicle's electrical systems could occur.

Always run the engine during prolonged use of electrical accessories, otherwise the battery may become discharged.

The power sockets can be used to power Land Rover approved accessories that use a maximum of 180 Watts.

CUP HOLDERS



LAN0225G

WARNING

The driver should not drink and should not use the cup holder while driving.

If the cup holder is retractable, it should be kept closed when not in use.

Do not carry open-top drink containers in the cup holders while the vehicle is in motion; a spilled hot drink could cause personal injury. Spilled drinks can also damage upholstery, carpeting and electrical components.

Use only for soft containers. DO NOT use to hold cups made of glass, china or hard plastic, as these may cause injury in the event of an accident or emergency manoeuvre. Unopened, sealed containers (drinks cans, for example) are hard objects and may also cause injury.

---

1 and 2. Front seat cup holders

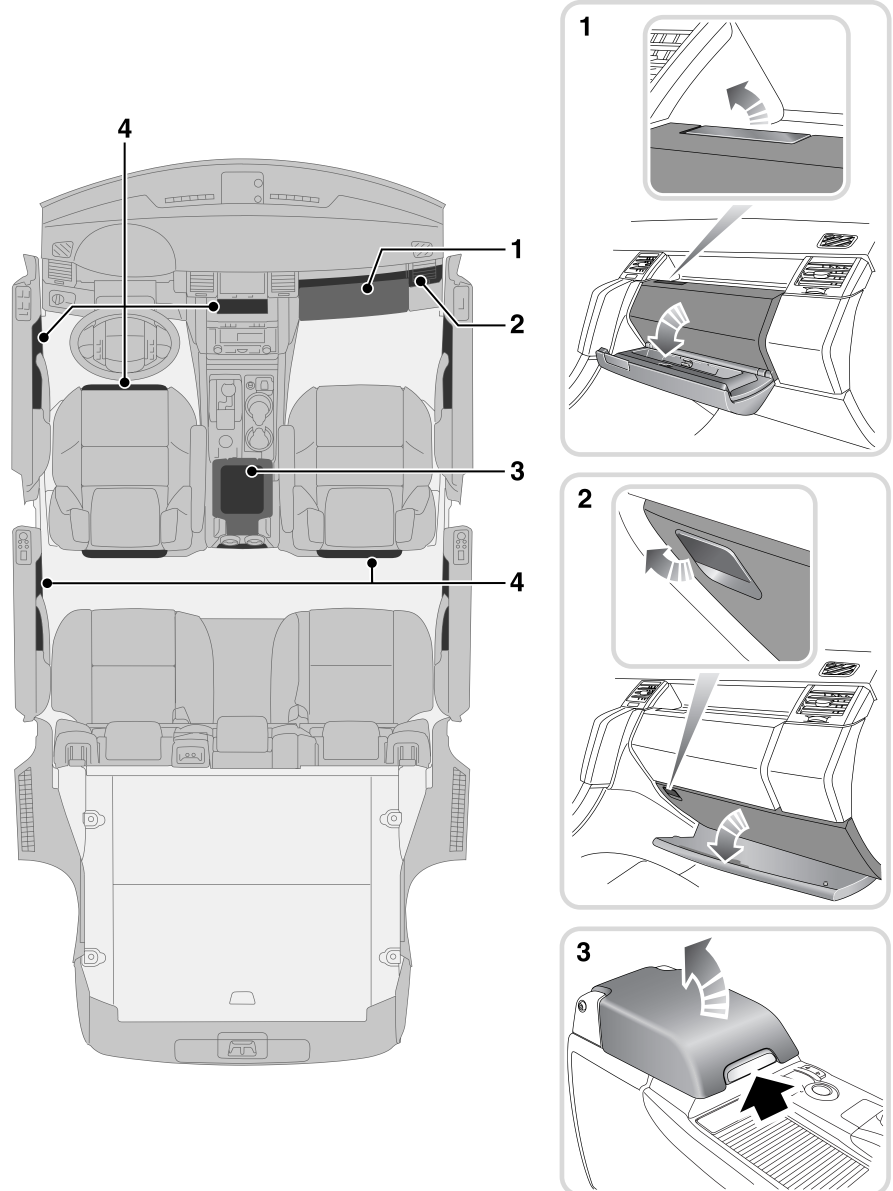
The inner core of the front passenger's cup holder can be lifted out for cleaning or to make a holder for a larger drinks container.

3. Rear seats cup holders

The cup holders for the occupants of the rear seats are in the centre console. Pull out the tray to gain access to the cup holders. Press in again to close.

The inner cores of the cup holders can be lifted out for cleaning or to make a holder for a larger drinks container.

STORAGE COMPARTMENTS



4
1
2
3
4
1
2
3
LAN0226G

1 and 2. GLOVEBOX

Lift the release catch to open the upper glovebox. The lid will naturally be returned by a spring to its closed position. It should be pushed fully closed.

Pull the release catch to open the lower glovebox. Close the lid by pushing it until it clicks.

CD storage rack

If the optional cool box has been specified a CD storage rack is available for the glovebox.

The rack can be removed by pressing down the lock tab, and pulling the rack out of the glovebox.

3. CUBBY BOX

Lift the catch at the front of the cubby box lid to access the main cubby box.

Card holder

On the front inside face of the cubby box is a feature to hold a credit/toll card.

CD storage

A rubber mat in the bottom of the cubby box is designed to hold CD cases and is removable for cleaning.

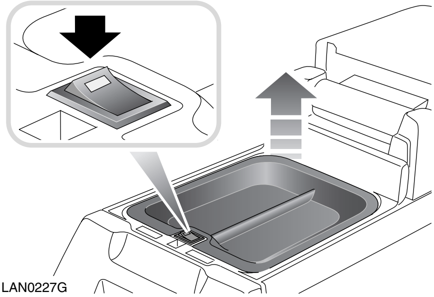
3. COOL BOX

Switch on/off using the switch on the inside front lip of the cool box. This switch has a built-in indicator which will illuminate to show that the cool box is operating. There is a short delay (1-2 seconds) between pressing the switch, and illumination of the indicator.

If the indicator does not illuminate when the cool box is switched on, or it goes out while the cool box is operating, battery voltage is low and the cool box has switched off. This will only happen when the engine is not running.

If the engine is started, the indicator will illuminate and the cool box will operate.

To protect the vehicle's battery, the cool box should be switched off when not needed.



The tray on top of the cool box should always be in place to ensure maximum cooling performance. This tray can be inverted to allow the storage of taller bottles while still maintaining the sealing.

The tray can be clipped onto the inside of the main lid when not required.

The cool box is most effective when filled with cold or pre-chilled items.

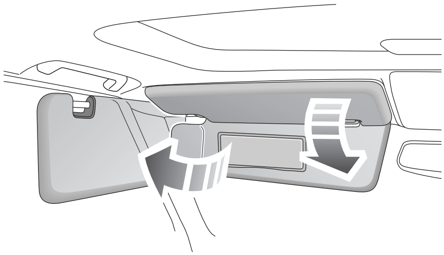
The cool box must be cleaned regularly to remove any condensation or contamination that could lead to odours.

Note: *The cool box will continue to operate for a short period after the starter switch is turned to position **0**.*

4. ADDITIONAL STORAGE

Further storage areas as indicated.

SUN VISOR



H6136L

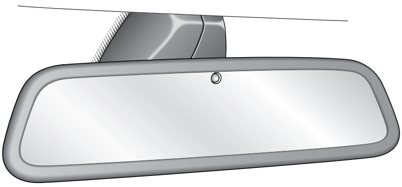
Pivot the sun visor downward to reduce sun glare through the front windscreen. If required, the visor can then be pivoted towards the side window to reduce sun glare from that side of the vehicle.

Vanity mirror

Lifting the cover of the vanity mirror switches on the lamp; closing the cover switches off the lamp.

REAR VIEW MIRRORS

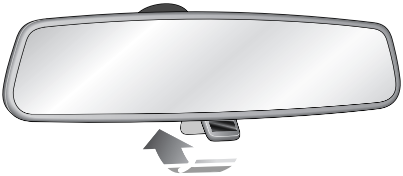
Automatic dipping mirror



LAN0231G

A light sensor detects excessive light and automatically dips the mirror, to reduce glare from the headlamps of following vehicles in dark or low light conditions.

Manual rear view mirror



LAN0230G

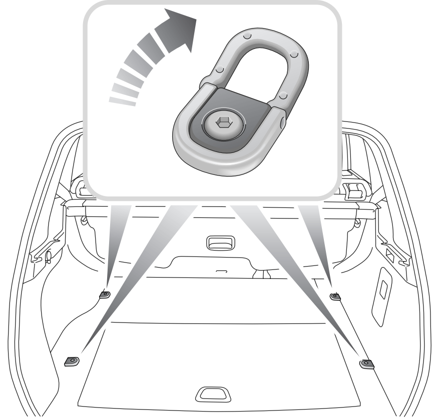
Adjust the mirror manually to suit.

Moving the lever at the bottom of the mirror forwards or backwards changes the mirror’s position to and from dimmed.

LUGGAGE ANCHOR POINTS

WARNING

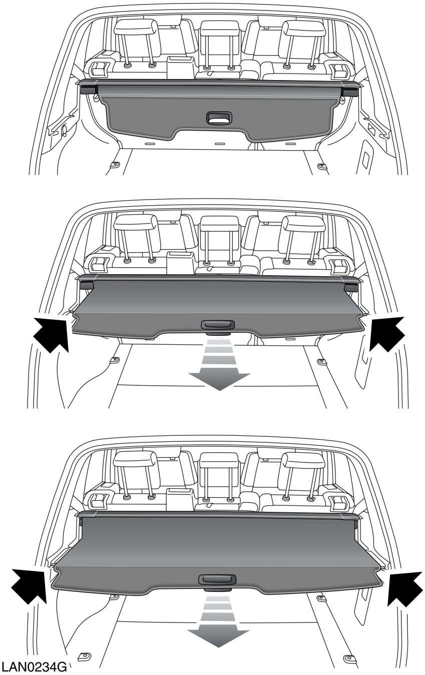
DO NOT carry unsecured equipment, tools or luggage, which could move and cause personal injury in the event of an accident or emergency manoeuvre either on or off-road.



LAN0232G

Four fixing points are provided in the rear loadspace floor, to assist in safely securing large items of luggage. Land Rover provide a range of approved luggage retention accessories.

LOADSPACE COVER



The loadspace cover is a roller-blind type of cover which can be extended to cover the rear loadspace.

To operate the loadspace cover

Caution: When retracting the cover ensure that nothing is left on top. If any items a left on top, including paper or fabrics, they may be drawn into the mechanism and cause it to jam.

Caution: If the cover is damaged in any way it should not be used as the damaged area may prevent the cover from operating correctly.

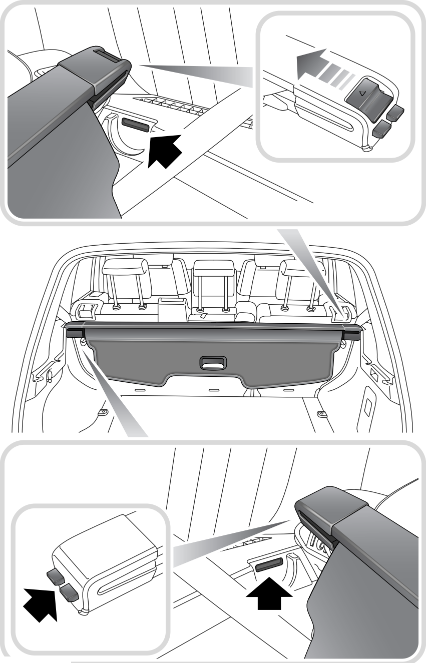
1. Pull the rigid portion of the blind to unroll the cover.
2. Engage the end pieces into the recessed features moulded into the loadspace sides.

Loadspace Cover

To remove the deployed loadspace cover

WARNING

When fitting the loadspace cover position ensure that the location pegs on the left hand side are fully engaged and the release button on the right hand side has returned fully home to ensure engagement. Failure to do so may allow the cartridge to move when the vehicle is in motion.



1. Disengage the ends from the recess and fully retract the cover into the cassette unit.
2. Push the release button on the right hand side of the cassette housing and lift to release the right hand side of the cassette from the loadspace trim.
3. Manoeuvre the complete loadspace cover to the right hand side to release the left hand side location pegs and extract from the vehicle.
4. Installation of the loadspace cover is the reverse of the removal procedure above.

IN-CAR TELEPHONES

WARNING

Using any hand-held appliance while driving can be dangerous. Always stop the vehicle before making a call and ensure that the telephone is switched off while you are driving.

For your safety, always note the following precautions before fitting an in-car telephone, or any mobile communication equipment.

- Only use an installation kit incorporating an aerial external to the vehicle.
- Ensure that the installation is carried out by a competent installer and that the installer is aware of the Airbag System.

VOICE RECOGNITION

Voice control provides a safe and convenient way of operating certain vehicle systems without the need to operate the controls manually. This enables you to concentrate fully on driving the vehicle, and removes the need to divert your attention from the road ahead in order to change settings, or receive feedback from the systems.

A number of voice commands are available, and with a little experience you will find them easy and convenient to use. Whenever you issue one of the defined commands with the system active, voice control converts your command into a control signal for the appropriate system. Your inputs take the form of dialogues or commands. You are guided through these dialogues by announcements or questions.

Defined voice commands

The voice control system understands predefined commands which need to be quoted word for word.

An audio feedback of voice commands is available. To activate the feedback, pull the voice control paddle briefly and give one of the following commands:

General commands

- **Voice help** - To list all commands.
- **Notepad help** - To list Notepad commands.

Audio commands

- **Radio help** - To list Radio commands.
- **CD help** - To list CD commands.

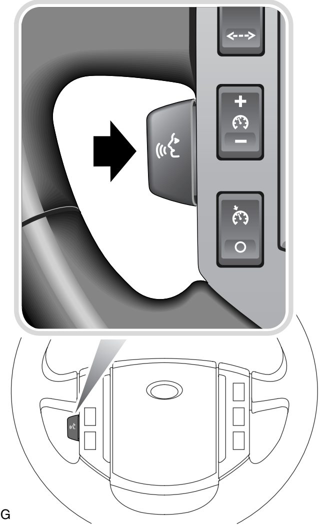
  See **Audio Voice Recognition, 337**.

Navigation and Telephone commands

- **Phone help** - To list telephone commands.
- **Navigation help** - To list Navigation commands.

  Please refer to the **Navigation, TV and Telephone Systems** Handbook.

Activating the system



LAN0237G

To activate voice control:

- Briefly pull the control paddle (your Audio will mute at this point). A brief acoustic signal will be heard, and **LISTENING** will be displayed on the main message centre to indicate that the system is now waiting for a voice command.

Note: *It is only necessary to use the steering wheel voice control paddle at the beginning of each voice session.*

Using Notepad

Notepad is a feature for recording short messages as memory aids or reminders.

You can record up to 10 notes for up to 30 seconds each in length.

Pull the voice paddle towards the steering wheel, wait for **LISTENING** to appear in the message centre, then give the Notepad command.

The voice recording will automatically be stopped if the note is longer than 30 seconds. To stop voice recording at any time, pull the voice button towards the steering wheel.

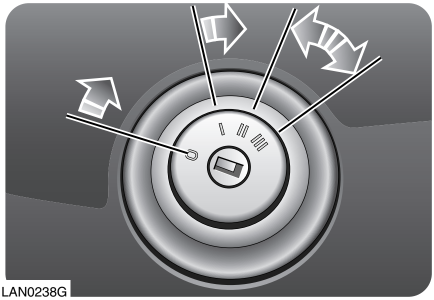
Command	System response	Action
Record note or **Notepad record**.	The system gives a beep to indicate the start of recording.	You may start your recording after the beep. To stop recording, pull and hold in the steering wheel voice paddle.
Play notepad or **Read notepad**.	Notepad audio will read out each note in turn. You can say Replay, Delete or Cancel after each beep, or remain silent to hear the next note.	Saying **Replay** will replay the previous message. Saying **Delete** will delete the previous message. Saying **Cancel** will end the Notepad session.
Clear Notepad or **Notepad delete**.	Do you want to clear the notepad?	Say **Yes** to delete all stored notes. Say **No** to cancel the command.
Notepad help.	The system will read out Notepad information and all the commonly used commands.	

STEERING COLUMN LOCK

WARNING

Once the steering lock is engaged, it is impossible to steer the vehicle. DO NOT remove the key while the vehicle is in motion.

Caution: The gear selector MUST be in the P (park) position, before the starter key can be removed. If the starter key is left in place, a continuous battery drain occurs which could completely discharge the battery.



The starter switch and steering column lock are located in the side of the steering column cover.

To unlock the steering column

Insert the key into the starter switch and rotate key to position **I**. If the key will not rotate, turn the steering wheel left or right while rotating the key.

To lock the steering column

Remove the key from the starter switch.

The lock is now set to operate. Rotate the steering wheel until the lock operates.

STARTER SWITCH

The starter switch uses the following sequence of key positions to operate the steering lock, electrical circuits and starter motor:

Position 0

- Steering locked.
- Some lighting circuits are operational, including: side lamps and hazard warning lamps.
- With the driver’s door open, seat memory facility operational.

Position I

- Steering unlocked.
- Clock, audio system and lighter can now be operated.
- Wipers/washers are operational.

Position II

- All instruments, warning indicators and electrical circuits are operational.

Position III

- The starting sequence is initiated. Note that operation of position **I** electrical functions will be interrupted during engine cranking.

Note: *The gear selector position* ***P*** *or* ***N*** *must be selected before the engine can be started.*

STARTING - Petrol models

WARNING

Never start or leave the engine running in an unventilated building - exhaust gases are poisonous and contain carbon monoxide, which can cause unconsciousness and may even be fatal.

If the engine fails to start, continued use of the starter may result in unburnt fuel damaging the catalytic converter.

1. Check that the parkbrake is applied and that the gear selector is in the **P** (Park) or **N** (Neutral) position.
2. Switch off all unnecessary electrical equipment.
3. Turn the starter switch to position **II** and then on to position **III** and immediately release it. The starter will automatically switch off when the engine starts. DO NOT press the accelerator pedal while starting.

Note: *The battery charging and oil pressure warning indicators should extinguish as soon as the engine is running.*

Cold climates

In very cold climates the oil pressure warning indicator may take several seconds to extinguish. Similarly, engine cranking times will also increase. At -25°C (-13°F) the starter motor may require continuous operation for as long as 30 seconds before the engine will start. For this reason, ensure that all non-essential electrical equipment is switched off to maximise the available battery effort for starting.

After starting

Ensure that the parkbrake AND FOOT BRAKE are firmly applied and the accelerator pedal is not depressed while moving the gear selector lever from **N** or **P**. An interlock will prevent this movement if the foot brake is not applied.

STARTING - Diesel models

WARNING

Never start or leave the engine running in an unventilated building - exhaust gases are poisonous.

WARNING

The diesel engine must not be run above idle speed until the oil pressure warning lamp extinguishes. This will ensure that the engine and turbo-charger bearings are properly lubricated before being run at speed.

Similarly, ALWAYS allow the engine to idle for 10 seconds before switching off.

Caution: Continued use of the starter will not only discharge the battery, but may cause damage to the starter motor.

1. Check that the parkbrake is applied and that the gear selector is in the **P** (Park) or **N** (Neutral) position.
2. Switch off all non-essential electrical equipment.
3. Insert the starter key and turn the switch to position **II**. Wait until the glow plug warning lamp extinguishes.
4. Turn the key to position **III** and immediately release it. The starter will automatically switch off when the engine starts. DO NOT press the accelerator pedal while starting.

Note: *The waiting time will vary according to the engine coolant temperature (when the engine is hot, the glow plug warning lamp will extinguish almost immediately, or may not illuminate at all).*

In temperate climates DO NOT operate the starter for longer than 10 seconds. If the engine fails to start, switch off and wait 10 seconds before re-using the starter.

Note: *The battery charging and oil pressure warning indicators should extinguish as soon as the engine is running.*

Cold climates

In very cold climates the oil pressure warning lamp may take several seconds to extinguish. Similarly, engine cranking times will also increase. At -25°C (-13°F) the starter motor may require continuous operation for as long as 30 seconds before the engine will start. For this reason, ensure that all non-essential electrical equipment is switched off to maximise the available battery effort for starting.

After starting

Ensure that the parkbrake AND FOOT BRAKE are firmly applied and the accelerator pedal is not depressed while moving the gear selector lever from **N** or **P**. An interlock will prevent this movement if the foot brake is not applied.

GENERAL DRIVING ADVICE

Instruments and warning indicators

Caution: Red warning indicators are of particular importance, their illumination indicating that a fault exists. If a red indicator illuminates, always stop the vehicle and seek qualified assistance before continuing.

In the case of the parkbrake, the above only applies if the vehicle is moving when the indicator illuminates.

Before driving, it is important to fully understand the function of the instruments and warning indicators. See **INSTRUMENT PACK, 85**.

Power assisted steering

Note: *Power assistance is dependent on the engine running. If the engine is not running, a much greater effort will be required to steer the vehicle.*

Warming-up

In the interests of fuel economy and of reducing engine wear, it is advisable to drive the vehicle straight away, remembering that harsh acceleration or labouring the engine before the normal operating temperature has been reached, can damage the engine.

When the engine is cold, engine idle speeds will be faster than normal. Under these circumstances, use the foot brake to control the vehicle while idling, until the engine is warm and running at normal speed and be aware of the need to take additional care when manoeuvring the vehicle.

Vehicle height

Caution: The overall height of your vehicle exceeds that of ordinary passenger cars, see DIMENSIONS, 292. Always be aware of the height of your vehicle and check the available headroom before driving through low entrances. This is particularly important if the vehicle is fitted with a roof rack or if the sunroof is tilted open.

Vehicle stability

WARNING

Utility vehicles have a significantly higher roll-over rate than other types of vehicles. Since theses vehicles are designed to be operated off-road, they have a higher ground clearance and, hence, a higher centre of gravity. Such a feature has been associated with increased risk of vehicle roll-over. An advantage associated with higher ground clearance vehicles, is a better view of the road, allowing the driver to anticipate problems. Another factor shown to significantly increase roll-over risk, is unauthorised vehicle modifications, such as fitting incorrect specification tyres, oversize tyres, body lifting, incorrect springs/dampers and incorrect vehicle loading/trailer towing. However, on-road crash data also indicates that driver behaviour is a greater factor than a high centre of gravity, in determining a vehicle's overall roll-over rate. The single most effective driver behaviour, that can reduce the risk of injury or death in all crashes including roll-over, is to ALWAYS WEAR YOUR SEAT BELT and to properly restrain all child passengers in the rear seat, in an appropriate child safety seat. In a roll-over crash, an unbelted person is significantly more likely to die than a person wearing a seat belt.

Other measures that can reduce the risk of injury and death from vehicle crashes and roll-over are:

- Limit speed. Posted speed limits should never be exceeded, and you should always drive below these limits whenever traffic, weather, road or other conditions dictate. Always use your common sense and good judgement.
- Take curves at reasonable speeds, avoiding unnecessary braking.
- Drive defensively. Be aware of traffic, road and weather conditions. Avoid risk-taking behaviour such as following too close, rapid lane changing or abrupt manoeuvres.
- Assume that pedestrians or other drivers are going to make mistakes. Anticipate what they might do. Be ready for their mistakes.
- Avoid distractions such as cellular phone calling, reading, eating, drinking or reaching for items on the floor.
- Before changing lanes, check your mirrors and use your direction indicators.
- Always leave room for unexpected events such as sudden braking.
- Never operate your vehicle when you have consumed alcohol, are sleepy or fatigued or have taken any medication that affects judgement, reflexes or alertness.

WARNING

Many vehicle roll-overs occur when a driver attempts to bring a vehicle back onto the road after some or all of the wheels drift onto the shoulder of the road, especially when the shoulder is unpaved. If you find yourself in such a situation, do not initiate any sharp or abrupt steering and/or braking manoeuvres to re-enter the roadway. Instead, let the vehicle slow down as much as safely possible before attempting to re-enter the roadway and keep your wheels as straight as possible while re-entering the roadway.

Breakdown safety

If a breakdown occurs while travelling:

- Wherever possible, consistent with road safety and traffic conditions, the vehicle should be moved off the main thoroughfare, preferably onto the shoulder as far as possible. If a breakdown occurs on a motorway, pull well over to the inside of the hard shoulder.
- Switch on hazard warning lamps.
- If possible, position a warning triangle or a flashing amber lamp at an appropriate distance from the vehicle to warn other traffic of the breakdown (note the legal requirements of some countries).
- Consider evacuating passengers through the doors facing away from traffic, to a safe area away from the vehicle, as a precaution in case your vehicle is accidentally struck by another one.

Fuel economy

Fuel consumption is influenced by two major factors:

- How your vehicle is maintained.
- How you drive your vehicle.

To obtain optimum fuel economy, it is essential that your vehicle is maintained in accordance with the manufacturer's service schedule.

Items such as the condition of the air cleaner element, tyre pressures and wheel alignment will have a significant effect on fuel consumption. But, above all, the way in which you drive is most important. The following hints may help you to obtain better value from your motoring:

- Avoid unnecessary, short, start-stop journeys.
- Avoid fast starts by accelerating gently and smoothly from rest.
- Do not drive in the lower gears for longer than necessary.
- Decelerate gently and avoid sudden and heavy braking.
- Anticipate obstructions and adjust your speed accordingly well in advance.
- When stationary in traffic, select neutral to improve fuel economy and air conditioning performance.

Running-in

Proper running-in will have a direct bearing on the reliability and smooth running of your vehicle throughout its life.

In particular, the engine, gearbox, brakes and tyres need time to bed-in and adjust to the demands of everyday motoring. During the first 800 km (500 miles), it is essential to drive with consideration for the running-in process and heed the following advice:

- LIMIT maximum road speed to 110 km/h (68 mph) or 3,000 rev/min. Initially, drive the vehicle on a light accelerator and only increase engine speeds gradually once the running-in distance has been completed.
- DO NOT operate at full accelerator or allow the engine to labour in any gear. It is advisable NOT to use Sport mode when running in.
- AVOID fast acceleration and heavy braking except in emergencies.
- Remember! Regular servicing is vital to ensure that the brake pads are examined for wear and changed periodically to ensure long term safety and optimum performance.

Servicing requirements

Vehicles operated in arduous conditions, particularly on dusty, muddy or wet terrain, and vehicles undergoing frequent or deep wading conditions will require more frequent servicing. Contact a Land Rover Dealer/Authorised Repairer for advice.

After wading in salt water or driving on sandy beaches, use a hose to wash the underbody components and any exposed body panels with fresh water. This will help to protect the vehicle's cosmetic appearance and prevent impairment of parkbrake efficiency.

Wading

Caution: The maximum advisable wading depth is normally 490 mm (19 in.). but can be increased to 540 mm (21 in.), when the air suspension system is operated at Off-road height. Wading at a depth greater than the maximum advisable wading depth is not recommended.

Severe electrical damage may occur, if the vehicle remains stationary for any length of time with the water level above the door sills.

Do not switch off the engine during wading. If the engine stalls during wading, restart it immediately and, as soon as possible, get the vehicle checked by a Land Rover Dealer/ Authorised Repairer.

If, during wading, it is thought that water may have entered the engine air intake, switch off the engine immediately. Have the vehicle towed out and delivered to a Land Rover Dealer/Authorised Repairer for checking.

BEFORE DRIVING OFF ROAD

Before venturing off-road, it is absolutely essential that inexperienced drivers become fully familiar with the vehicle's controls, in particular the transfer gear switch, CommandShift, Hill Descent Control (HDC) and the Terrain Response system.

Basic information and Off-Road driving techniques can be found in the Off-Road driving handbook, available on-line at:
http//:www.ownerinfo.landrover.com

It is strongly recommended that off-road driver training is undertaken by anyone intending to drive off-road. Training is available at your nearest Land Rover Experience centre. More details can be found at:
http://www.landroverexperience.com

AUXILIARY EQUIPMENT

Caution: DO NOT use auxiliary equipment, such as roller generators, that are driven by only one or two wheels of the vehicle, as they will cause failure of the transfer gearbox.

EMISSION CONTROL SYSTEM

WARNING

Exhaust fumes contain poisonous substances and inhalation can cause unconsciousness and may even be fatal.

- **DO NOT drive with the tailgate open.**
- **DO NOT modify the exhaust system from the original design.**
- **ALWAYS have exhaust system leaks repaired immediately.**
- **If you think exhaust fumes are entering the vehicle, have the cause determined and corrected immediately.**

Land Rover vehicles are fitted with emission and evaporative control equipment necessary to meet a number of territorial requirements.

In many countries it is against the law for vehicle owners to modify or tamper with emission control equipment, or to sanction the unauthorised replacement or modification of this equipment. In such cases the vehicle owner and the repairer may both be liable for legal penalties.

It is important to remember that all Land Rover Dealer/Authorised Repairer are properly equipped to perform repairs and to maintain the emission control system on your vehicle.

SAFETY ON THE FORECOURT

WARNING

Petroleum gases are highly inflammable and, in confined spaces, are also extremely explosive.

Always take sensible precautions when refuelling:

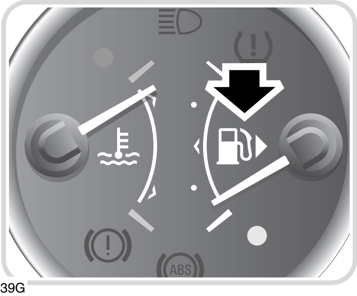
- Switch off the engine.
- Switch off mobile phones.
- Do not smoke or use a naked flame or light.
- Take care not to spill fuel.
- Do not overfill the tank.
- Do not fill petrol containers in the vehicle.

FUEL FILLER

WARNING

To avoid any sudden discharge of fuel, caused by excessive fuel vapour pressure, DO NOT fully remove the filler cap until any captive tank pressure has been released.

Take careful note of warning labels located around the filler cap.



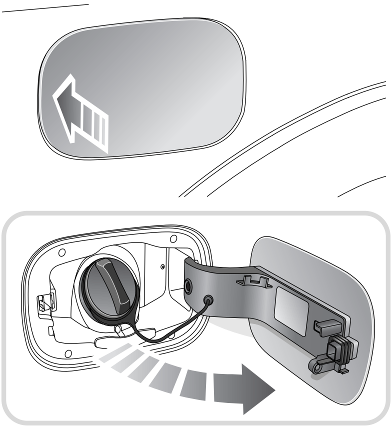
LAN0239G

The fuel filler is located behind the rear right-hand wheel arch. An arrow on the fuel gauge points to that side of the vehicle.

Caution: The fuel filler flap has a spring loaded release, do not force it open. If the flap has been forced open, it may fail to close properly. In this eventuality, take your vehicle to your Land Rover Dealer for attention, as this condition may be due to damaged or misaligned components.

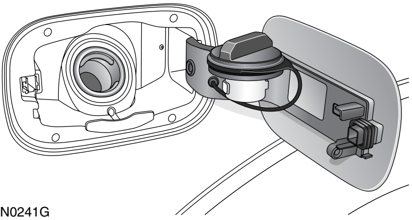
Caution: When replacing the fuel filler cap ensure that it is tightened until it clicks. Failure to do so may result in the engine warning lamp illuminating due to evaporative emission levels increasing.

With the vehicle fully unlocked (all doors and tailgate), press the left side of the fuel filler flap to open (shown in inset).



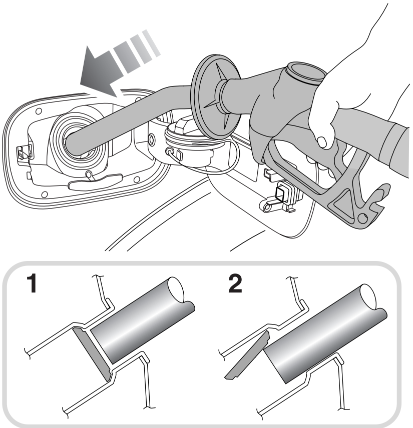
LAN0240G

The fuel filler flap springs out revealing the filler cap.



LAN0241G

Unscrew the filler cap and place it on the projection on top of the hinge of the fuel filler flap.



LAN0242G

Insert the pump nozzle (1) into the filler neck, pushing aside the spring-loaded cover (2).

When delivery is complete, withdraw the nozzle and replace the cap. Tighten the cap clockwise until you hear it click three times.

TYPE OF FUEL

Fuel specification - petrol engines

Caution: On petrol engine vehicles fitted with a catalytic converter, serious damage to the catalyst will occur if LEADED fuel is used!

See **ENGINES, 288**.

The RON value (octane rating) and type of petroleum available at garage forecourts will vary in different parts of the world.

During manufacture, engines are tuned to suit the fuel supplies commonly available in the country for which the vehicle is destined. However, if a vehicle is later exported to a different country, or is used to travel between different territories, the owner should be aware that the available fuel supplies may not be compatible with the engine specification.

Your engine will run on a lower grade of fuel but performance and fuel economy will be reduced.

Using petrol with a lower octane rating than 91 RON, however, can cause persistent, heavy engine knock (a metallic rapping noise). If severe, this can lead to engine damage.

If in doubt, seek advice from the territory concerned.

If heavy engine knock is detected when using the recommended octane rated fuel, or if steady engine knocking is present while maintaining a steady speed on level roads, contact your Land Rover Dealer/Authorised Repairer for advice.

Note: *An occasional, light, engine knock while accelerating or climbing hills is acceptable.*

Fuel specification - diesel engines

Caution: Maximum allowable Bio-diesel mix is 5%. To EN590 specification.

See **ENGINES, 288**.

Caution: If the fuel tank is accidentally filled with petrol, it is ESSENTIAL that you contact your Land Rover Dealer/Authorised Repairer BEFORE attempting to start the engine!

The quality of diesel fuel (Derv) can vary in different countries and only clean, good quality fuel should be used. It is important that the sulphur content of diesel fuel does not exceed 0.3%. In Europe all supplies should be within this limit, but in other parts of the world, you should check with your supplier.

In markets where the sulphur content exceeds 0.3%, more frequent engine oil and filter changes will be required.

FUEL FILLING

WARNING

DO NOT attempt to fill the tank beyond its maximum capacity. If the vehicle is to be parked on a slope, in direct sunlight, or high ambient temperature, expansion of the fuel could cause spillage.

Filling station pumps are equipped with automatic cut-off sensing to avoid fuel spillage. Fill the tank until the filler nozzle automatically cuts-off the supply. DO NOT attempt to fill the tank beyond this point.

Diesel engine vehicles

The use of commercial vehicle diesel pumps with a higher fill rate, may result in premature pump cut-off and fuel spillage.

EMPTY FUEL TANK

Caution: DO NOT RUN THE FUEL TANK DRY.

Running the fuel tank dry could create an engine misfire capable of damaging the engine, the catalytic converter or the fuel pump.

Note: *Should the vehicle run out of fuel, it will be necessary to add a minimum of 4 litres (0.8 gallons) of fuel in order to restart the vehicle. In some circumstances it will be necessary to drive a short distance, typically 1.6 - 5 km (1 - 3 miles) in order for the vehicles monitoring systems to register the additional fuel.*

FUEL CUT-OFF SYSTEM

In the event of an accident, the Supplementary Restraint System (airbag system) may stop the operation of the fuel pump, depending on the severity and type of the impact.

If this happens, the system must be reset before attempting to restart the engine.

Resetting the fuel cut-off system

WARNING

To avoid the possibility of fire or personal injury, do not reset the fuel cut-off system if you see or smell fuel.

If no fuel leak is apparent, reset the system as follows:

1. Turn the starter switch to position **0** and wait for 1 minute.
2. Turn the starter switch to position **II** and wait for 30 seconds.
3. Make a further check for fuel leaks.
4. If no leak is found, start the engine as normal.

CATALYTIC CONVERTER

WARNING

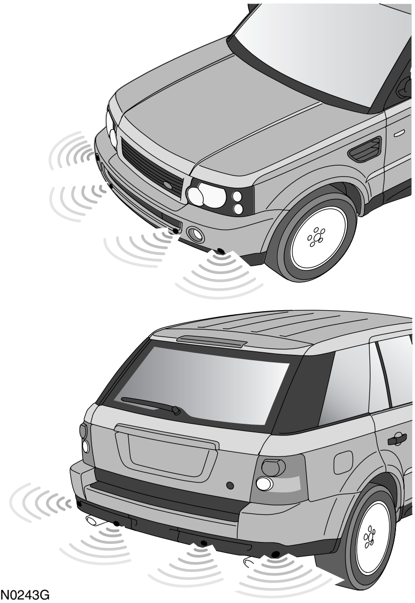
Exhaust system temperatures can be extremely high - DO NOT park on ground where combustible materials such as dry grass or leaves could come into contact with the exhaust system.

Caution: Catalytic converters can be easily damaged through improper use, particularly if the wrong fuel is used, or if an engine misfire occurs.

USING PARK DISTANCE CONTROL (PDC)

Caution: The Park Distance Control is a parking aid for guidance only. It remains the driver's responsibility to detect obstacles and estimate the vehicle's distance from them. The sensors may not be able to detect certain types of obstruction (narrow posts or small narrow objects, small objects close to the ground and some objects with dark, non-reflective surfaces, for example). Always be vigilant when reversing.

Caution: Keep the sensors free from dirt, ice and snow. If deposits build up on the surface of the sensors, their performance may be impaired. When washing the vehicle, avoid aiming high pressure jets directly at the sensors at close range.



Park Distance Control (PDC) is a system that assists the driver when manoeuvring the vehicle into a parking space, or anywhere that there are obstacles that need to be avoided, warning the driver accordingly.

The vehicle is fitted with four ultrasonic sensors on each of the bumpers. (some vehicles are fitted with sensors only in the rear bumpers.)

The range of the front sensors, and the two sensors on the corners of the rear bumper is approximately 0.6 metres (2 feet). The two centre rear sensors have a range of approximately 1.5 metres (5 feet).

PDC in operation

Caution: PDC is automatically switched off at the rear when a trailer is attached to the vehicle.

The distance from an obstruction is identified by an intermittent tone sounding (higher pitch for the front sensors and a lower pitch for the rear). As the vehicle moves closer to an obstruction, the repetition frequency of the tones increases proportionally.

When the distance between the sensor and the obstruction is less than approximately 0.30 metres (1 foot), the tone becomes continuous.

Activating PDC

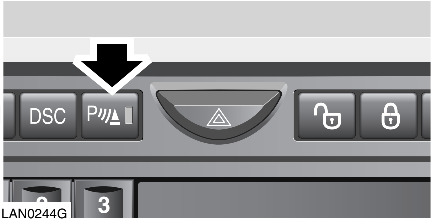
PDC is automatically activated whenever **R** (Reverse) is engaged, while the starter switch is turned on.

If **R** is selected, both front and rear sets of sensors become activated and a short confirmation tone sounds after one second.

In **R**, the sensors remain on regardless of speed.

If the driver selects **N** from **R**, both sets of sensors remain active.

Selection of Park **P**, or applying the EPB while the vehicle is stationary, will override other inputs and turn off the PDC system.



PDC is automatically cancelled when **D** (Drive) is selected and the vehicle exceeds 16 km/h (10 mph). When driving into a limited space, front PDC can be enabled manually.

Front PDC can be manually selected or deselected by pressing the switch (illustrated) on the centre front instrument panel. The switch indicator illuminates and a short tone sounds as confirmation.

Note: *The confirmation tone only sounds when the rear PDC is activated by selecting reverse, or when the system is re-activated by pressing the switch.*

If a long, high-pitched tone sounds and the switch indicator flashes when PDC is activated, then a fault in the system has been detected - first check that the sensors on the bumpers are not obscured by dirt, ice or snow. If the fault persists after cleaning the sensors, contact your Land Rover Dealer/Authorised Repairer for assistance.

AUTOMATIC TRANSMISSION USE

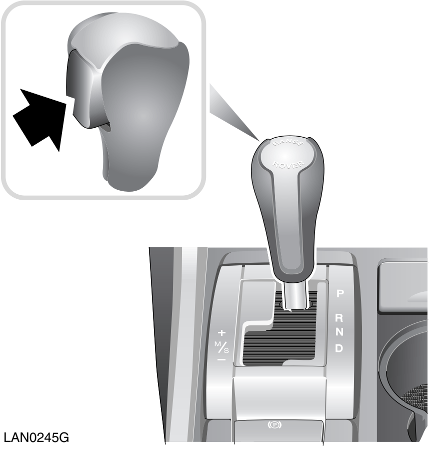
Starting

The engine can only be started with the selector lever in the **P** (Park) or **N** (Neutral) positions.

- ALWAYS apply the parkbrake and foot brake before starting the engine.
- KEEP THE BRAKES APPLIED while moving the selector lever into a drive position (the selector lever cannot be moved from the **P** or **N** position unless the foot brake is applied).

Note: *If pressure is applied to the selector lever before the foot brake is applied, any gear selected may not be available irrespective of the lever position. In this situation, remove pressure from the selector lever, ensure that the foot brake is applied and select the required gear.*

- The selector release button (see inset) must be pressed while selecting **P** and **R**, and also to enable the lever to be moved between the **P** and **R** positions.
- DO NOT rev the engine or allow it to run above normal idle speed while selecting **D** or **R**, or while the vehicle is stationary with any gear selected.
- ALWAYS keep the brakes applied until you are ready to move off - remember, once a drive gear has been selected, an automatic vehicle will tend to creep forward (or backward if reverse is selected).
- DO NOT allow the vehicle to remain stationary for any length of time with a drive gear selected and the engine running (always select **N** if the engine is to idle for a prolonged period).



Note: *The gear selector lever MUST be in the* ***P*** *position before the starter key can be removed.*

Note: *For maximum air conditioning performance while stationary, select* ***P*** *or* ***N****.*

AUTOMATIC TRANSMISSION

Selector lever positions

WARNING

Do not leave children unattended in the vehicle, especially with keys in the starter switch.

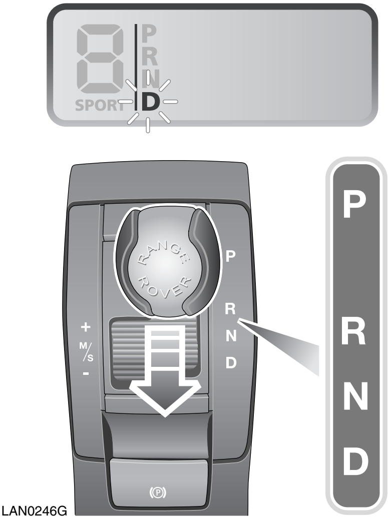
Select P and shut off the engine prior to exiting the vehicle.

Caution: DO NOT select P or R if the vehicle is moving.

DO NOT select a forward drive gear when the vehicle is moving backwards.

Do not select reverse gear when the vehicle is moving forwards.

An illuminated indicator on the selector panel and a number or letter on the gear selector display in the instrument pack, identify the selected gear position.



P - Park:

This position locks the transmission and should be selected before switching the engine off. To avoid transmission damage, ensure that the vehicle is completely stationary, with the parkbrake applied, before selecting **P**.

The selector release button MUST be pressed before moving the selector lever into **P.**

Press the selector release button and foot brake to move the selector lever out of **P**.

Note: *The selector lever will not be released from* ***P*** *unless the engine starter switch is in position* ***II****.*

R - Reverse:

Before selecting **R**, ensure that the vehicle is stationary, with the brakes applied. The selector release button MUST be pressed before moving the selector lever into **R** position.

N - Neutral:

Select **N** when the vehicle is stationary and the engine is required to idle for a brief period (at traffic lights, for example). In **N**, the transmission is not locked, so the parkbrake must be applied whenever **N** is selected.

If the vehicle remains stationary, the selector lever becomes locked in **N** and it is then necessary to depress the brake pedal in order to release the selector lever.

Press the selector release button and foot brake to move from **N** to **R** or **D**.

D - Drive:

Select for all normal driving; full automatic gear changing occurs on all six forward gears, according to road speed and accelerator position.

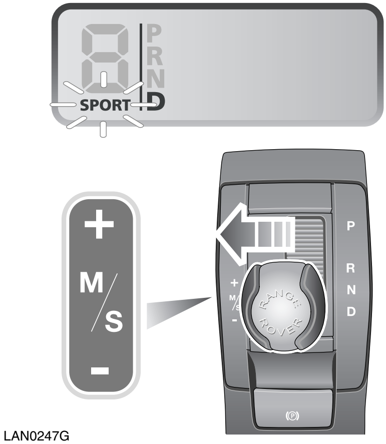
Kick-down in automatic mode

To provide rapid acceleration for overtaking, push the accelerator pedal to the full extent of its travel (this is known as kick-down), a click will be felt through the accelerator pedal. Up to a certain speed, this will cause an immediate downshift to the lowest appropriate gear, followed by rapid acceleration. Once the pedal is relaxed, normal gear change speeds will resume (dependent upon road speed and accelerator pedal position).

Note: *Moderate accelerator pressure may also result in a downshift in the transmission, depending on vehicle speed.*

Sport mode

In Sport mode, full automatic progression through the gear ratios is retained and the transmission will stay in the lower gears for longer. This improves mid-range performance with downshifts occurring more readily.



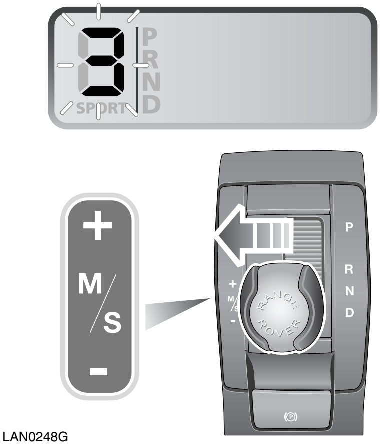
To select Sport mode, move the gear lever from the **D** position towards the left hand side of the vehicle (see illustration). The word **SPORT** will appear in the gear selector display in the instrument pack (for approximately 6 seconds) and the LED in the selector display to the side of the selector lever illuminates.

Sport mode can be deselected at any time, by returning the lever to the **D** position.

To return to Sport mode after CommandShift has been selected move the selector into the **D** position. Then move it back into Sport mode.

CommandShift ™

CommandShift gear selection can be used as an alternative to fully automatic transmission and is particularly effective when rapid acceleration or engine braking are required.



LAN0248G

1. With **D** selected, move the gear selector from the **D** position towards the left-hand side of the vehicle (this is the same as selecting Sport mode).
2. The transmission then automatically selects the ratio most appropriate to the vehicle's road speed and accelerator depression. Move the selector forward or backward to manually select a higher or lower gear (when available). The message **TRANSMISSION COMMANDSHIFT SELECTED** appears in the main message centre.
3. A single forward (**+**) movement of the selector lever will change the transmission to a higher gear. Rearward (**-**) movement of the lever will change down to a lower gear. The selected gear will be indicated in the digital display in the instrument pack (see inset).
4. To deselect CommandShift, simply move the selector lever sideways, back to the **D** position. Automatic gear changing will then resume.

Note: *In CommandShift, kick-down is still available for increased acceleration. See* ***Kick-down in automatic mode, 159****.*

Note: *When the Terrain Response is selected, the automatic transmission will go straight into CommandShift if the lever is moved into sport/CommandShift in any Special Program.*

Using CommandShift in HIGH range

If CommandShift is selected in HIGH range, 1st gear must be selected to move off from stationary. Normal sequential gear changing can be utilised once the vehicle is moving.

Using CommandShift in LOW range

If CommandShift is selected in LOW range, the vehicle can move off from stationary in 1st, 2nd or 3rd gear - this is particularly useful to improve traction when driving off-road.

Kick-down in CommandShift

When in CommandShift, kick-down overrides the manual gear selection, to provide increased acceleration.

In HIGH range, with CommandShift selected, kick-down will cause a downshift to the lowest gear possible for current vehicle speed.

ELECTRONICALLY SELECTED AUTOMATIC MODES

In automatic or Sport modes (not available in CommandShift), the transmission control system will electronically adjust gear change points to suit a variety of driving conditions.

Hill ascent, trailer and high altitude mode

A suitable gear change pattern is selected to retain lower gears for longer. This is to counter momentum loss caused by more frequent gear changing during hill ascent or when towing. This gear change pattern is also selected at high altitudes to combat reduced engine torque.

Hill descent mode

When in manual CommandShift mode, with the optimum gear for engine braking selected, the selector lever can then be moved across to the **D** position. The transmission will retain the previously selected manual gear until the descent is completed, then the transmission will automatically change to **D**.

High coolant temperature mode

In high ambient temperatures during extreme load conditions, it is possible for the engine and the gearbox to overheat. At a certain temperature the transmission will select a gear change pattern designed to aid the cooling process, whilst enabling the gearbox to continue performing normally in high temperatures.

Note: *When the Terrain Response system is used, automatic transmission change points/patterns will change depending on which mode has been selected.*

Limp-home mode

Should the transmission develop a fault, **F** is displayed in the gear position display and only limited gears are available. Seek immediate assistance from your Land Rover Dealer/ Authorised Repairer.

TRANSFER GEARBOX

Your vehicle is equipped with an electronically controlled transfer gearbox allowing the driver to select HIGH or LOW range driving gears.

HIGH range

HIGH range should be used for all normal road driving and also for off-road driving across dry, level terrain.

LOW range

LOW range should ONLY be used in situations where low speed manoeuvring is necessary, such as reversing a trailer or negotiating a boulder-strewn river bed, or when moving off while heavily loaded or towing.

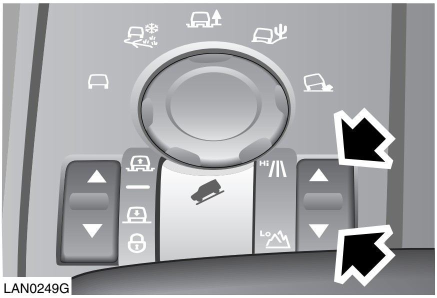
Also use LOW range for more extreme off-road conditions, such as steep ascents and descents. DO NOT attempt to use the LOW range for normal road driving.

Range changing

The recommended method of changing range is with the vehicle stationary. For vehicles equipped with a message centre, the messages displayed will assist the experienced driver in carrying out a range change on-the-move.

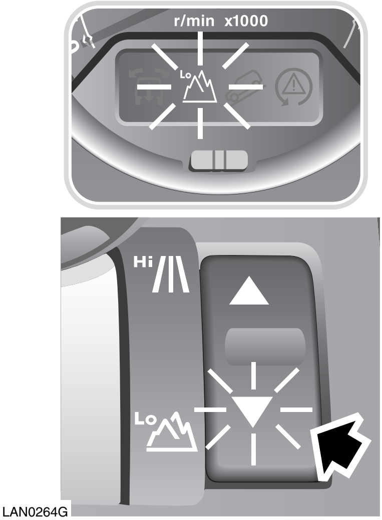
Stationary method

With the vehicle stationary and the engine running, apply the foot brake and move the automatic gearbox selector to **N** (neutral). Press the transfer gear switch to select HIGH or LOW and release it.



While the vehicle is in HIGH range, the range indicator in the instrument pack display is extinguished and the HIGH range indicator at the switch is illuminated.

The range indicator in the instrument pack display illuminates continuously to act as a reminder that LOW range is engaged. It flashes to indicate a range change in progress and extinguishes once the vehicle is in HIGH range.

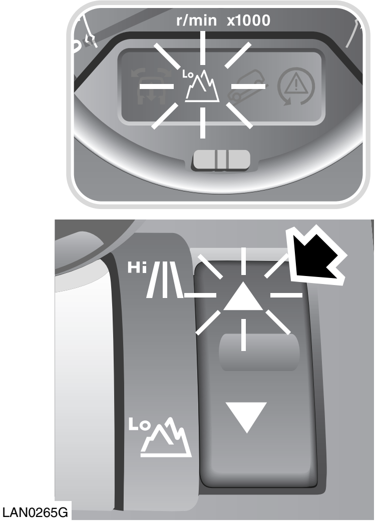


LAN0264G

While a HIGH to LOW range change is in progress, the HIGH range indicator in the switch will remain illuminated. The LOW range indicators in both the switch and the instrument pack display will flash.

When the range change is complete, the HIGH range indicator in the switch extinguishes. The LOW range indicators in both the switch and the instrument pack display will illuminate constantly.

A warning chime will sound, and **LOW RANGE ENGAGED** is displayed in the message centre for a few seconds.



LAN0265G

While a LOW to HIGH range change is in progress, the LOW range indicator in the switch will remain illuminated. The HIGH range indicators in both the switch and the instrument pack display will flash.

When the range change is complete, the LOW range indicator in both the switch and the instrument pack display extinguishes. The HIGH range indicator in the switch will illuminate constantly.

A warning chime will sound, and **HIGH RANGE ENGAGED** is displayed in the message centre for a few seconds.

RANGE CHANGING ON THE MOVE

Note: *If the vehicle speed is too high when a range change is requested, a warning chime sounds and* ***SPEED TOO HIGH FOR RANGE CHANGE*** *appears in the message centre.*

If **N** is not selected before using the transfer gear switch, the message **SELECT NEUTRAL FOR RANGE CHANGE** is displayed and a warning chime sounds.

Note: *Do not attempt to make moving range changes at speeds of 3 km/h (2 mph) or less.*

Changing from HIGH to LOW on the move

With the vehicle slowing down and travelling NO FASTER THAN 40 km/h (24 mph), first select **N** in the main gearbox. Press the rear of the transfer gear switch to the LOW position and release it.

Indication of the range change status is the same as for the Stationary method.

Now select **D** or manual CommandShift mode. The transmission interlock prevents the engagement of a drive gear until the range change is complete.

Changing from LOW to HIGH on the move

Caution: If the range change indicator still flashes when the starter key is turned from position II to position I, apply the parkbrake.

With the vehicle travelling NO FASTER THAN 60 km/h (38 mph), select **N** in the main gearbox. Press the front of the transfer gear switch to the HIGH position and release it.

Indication of the range change status is the same as for the stationary method.

Now select **D** (drive). The transmission interlock prevents the engagement of a drive gear until the range change is complete.

Transmission fault message

If a fault occurs within the transmission, a message will be displayed in the main message centre. See **MESSAGE CENTRE MESSAGES, 92**.

AUXILIARY EQUIPMENT

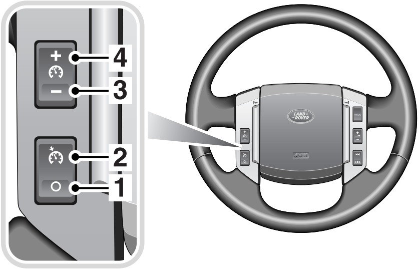
Caution: DO NOT use auxiliary equipment, such as roller generators, that are driven by only one or two wheels of the vehicle, as they will cause failure of the transfer gearbox.

CRUISE CONTROL

Caution: Always observe the following precautions:

- **DO NOT use cruise control in traffic conditions where a constant speed cannot easily be maintained.**
- **DO NOT use cruise control on winding or slippery road surfaces, or in off-road conditions such as rough tracks or on sand.**
- **Use of Sport mode is not recommended when cruise control is selected.**

Cruise control enables the driver to maintain a constant road speed without using the accelerator pedal. This is particularly useful for motorway cruising or for any journey where a constant speed can be maintained for a lengthy period.



The steering wheel switches operate as follows:

1. **CANCEL:** Cancels without erasing memorised speed.
2. **RESUME:** Resume set speed.
3. **SET - :** Set the speed (**-**) or decrease.
4. **SET + :** Set the speed (**+**) or increase.

Note: *Cruise control is NOT available when the vehicle is being driven in LOW range.*

It is also not available when using the Terrain Response system, when Mud Ruts, Sand or Rock Crawl is selected and also when Hill Descent Control (HDC) is selected.

To operate

Accelerate until the desired cruising speed is reached. This must be above the system's operational minimum speed of 30 km/h (18 mph).

Press the **+** switch (4) to set the vehicle speed in the system's memory. Cruise control will now maintain that road speed.

The warning indicator in the instrument pack illuminates. With cruise control operating, speed can be increased by normal use of the accelerator e.g. for overtaking. When the accelerator is released, road speed will return to the previously set cruising speed.

Note: *When cruise control speed is set and the accelerator pedal is pressed for more than 60 seconds, cruise control will be cancelled.*

A speed can be set and stored whilst the vehicle speed is below 30 km/h (18 mph), or the vehicle is stationary but the gear selector is in **D** or **N**. Once the vehicle speed exceeds 30 km/h (18 mph) the set speed can be achieved by pressing the resume switch (2).

Suspending cruise control

Cruise control can be suspended by a single press of the **CANCEL** switch (1). The warning indicator in the instrument pack extinguishes.

Cruise control will also suspend when the brake pedal is pressed, when the gear selector is moved into neutral or if HDC or DSC becomes active.

To resume cruise control at the previously set speed, press the **RESUME** switch (2).

Note: *The set speed will NOT be erased by pressing the* ***CANCEL*** *switch (1). The set speed will only be erased when the starter switch is turned to position* ***0****, or the gear selector lever is moved to* ***R*** *or* ***P****.*

Reducing the cruise speed

Press and hold the **-** switch (3); the vehicle will decelerate. Release the switch as soon as the desired speed is reached. The vehicle speed at the point of switch release becomes the new set speed.

Alternatively, the set speed can be decreased incrementally by tapping the **-** switch (3). Each press of the switch will decrease the speed by 2 km/h (1 mph).

Increasing the set cruising speed

WARNING

When setting cruise control to the speed limit it is important to remember that it is possible for the vehicle speed to increase when travelling downhill. This may result in the vehicle speed exceeding the speed limit.

The driver must ALWAYS ensure that a safe speed is maintained below the speed limit, taking account of traffic and road conditions.

Press and hold the **+** switch (4); the vehicle will accelerate. Release the switch as soon as the desired speed is reached.

The vehicle speed at the point of switch release becomes the new set speed.

Alternatively, the set speed can be increased incrementally by tapping the **+** switch (4). Each press of the switch will increase the speed by 2 km/h (1 mph).

A further alternative is to increase speed by normal use of the accelerator. When the desired speed is reached, press the **+** switch (4) to set the cruise control.

Note: *If the accelerator pedal is pressed to increase speed, but the* ***+*** *switch (4) is not pressed, cruise control will be cancelled after 60 seconds.*

ADAPTIVE CRUISE CONTROL (ACC)

WARNING

Adaptive Cruise Control is not a collision warning or avoidance system. Additionally, Adaptive Cruise Control will not detect:

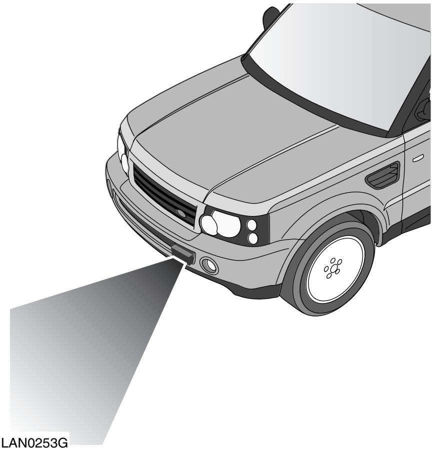
- **Stationary or slow moving vehicles below 10 km/h (6 mph).**
- **Pedestrians or objects in the roadway.**
- **Oncoming vehicles in the same lane.**

A radar sensor mounted in the front bumper, projects a beam directly forward to detect objects ahead.

ACC utilises this radar sensor to maintain a gap between your vehicle and a vehicle ahead. The gap can be adjusted to one of four distance settings to suit your driving style. If there is no vehicle ahead within radar range, a set road speed can be maintained. Any speed between 30 km/h (18 mph) and 180 km/h (110 mph) can be stored in the ACC memory.

When ACC is active, a set gap can be maintained behind a leading vehicle even if your stored speed is higher. If the road situation allows you to move into an adjacent lane, your vehicle will automatically accelerate up to your stored speed as long as there is no vehicle ahead within radar range.

In a situation where your set gap is reduced by a slowing lead vehicle, ACC will automatically apply the brakes to re-establish the gap.

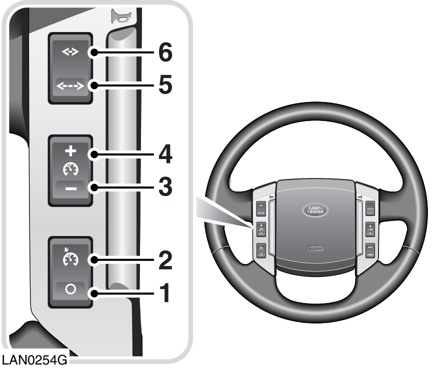


- Only use ACC when conditions are favourable, that is, straight, dry, open roads with light traffic.
- Do not use in poor visibility, specifically fog, heavy rain, spray or snow.
- Do not use on icy or slippery roads.
- It is the driver's responsibility to stay alert, drive safely and be in control of the vehicle at all times.
- Keep the front of the vehicle free from dirt, metal badges or objects, including vehicle front protectors, which may prevent the sensor from operating.
- Do not use ACC when entering or leaving a motorway.

Adaptive Cruise Control (ACC)

Steering wheel switches

The system is operated by switches mounted on the steering wheel. The driver can also intervene at any time by use of the foot brake or accelerator pedals.



The steering wheel switches operate as follows:

1. **CANCEL:** Cancels without erasing memorised speed.
2. **RESUME:** Resume set speed.
3. **SET - :** Set the speed **-** or decrease.
4. **SET + :** Set the speed **+** or increase.
5. **GAP <---> :** Gap increase.
6. **GAP <-> :** Gap decrease.

Setting a speed

Accelerate as normal until the required speed is reached.

Press the **SET +** button (4) briefly and the vehicle speed will then be stored in the memory and the system activated. The set speed will be displayed on the message centre (e.g. **SET SPEED 80KM/H 50MPH**).

Entering the follow mode

WARNING

When in follow mode the vehicle will not decelerate automatically to a stop, nor will the vehicle always decelerate quickly enough to avoid a collision without driver intervention.

Once a set speed has been selected, the driver can release the accelerator and the set road speed will be maintained.

When a vehicle ahead enters the same lane or a slower vehicle is ahead in the same lane and travelling in the same direction, the vehicle speed will be adjusted automatically until the gap to the vehicle ahead corresponds to the preset gap. The vehicle is now in follow mode.

The warning lamp in the instrument cluster will be illuminated.

CRUISE GAP

The message centre will display the gap set.

The vehicle will then maintain the constant time gap to the vehicle ahead until:

- The vehicle ahead accelerates to a speed above the set speed.
- The vehicle ahead moves out of lane or out of view.
- The vehicle ahead slows so that low speed automatic switch off occurs.
- A new gap distance is set.

If necessary, the vehicle brakes will be automatically applied to slow the vehicle to maintain the gap to the vehicle in front.

The maximum braking which is applied by the ACC system is limited and can be overridden by the driver applying the brakes, if required.

Note: *Driver braking will cancel ACC.*

If the ACC system predicts that its maximum braking level will not be sufficient, then an audible warning will sound while the ACC continues to brake. **DRIVER INTERVENE** will be displayed on the message centre. The driver should take IMMEDIATE action.

When in follow mode the vehicle will automatically return to the set speed when the road ahead is clear, for instance when:

- The vehicle in front accelerates or changes lane.
- The driver changes lane to either side or enters an exit lane.

The driver should intervene if appropriate.

Low speed automatic switch off

If the speed of the vehicle decreases below 30 km/h (18 mph), the ACC system will be automatically switched OFF and the instrument warning lamp will go out.

If the brakes were being applied by the ACC system, they will be slowly released.

This will be accompanied by an audible warning, and **DRIVER INTERVENE** will be displayed on the message centre. The driver must take control.

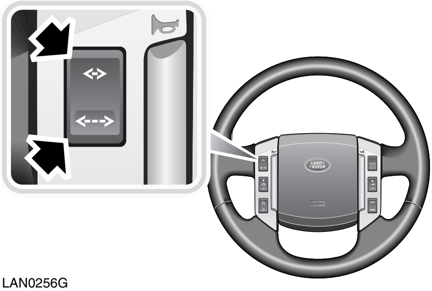
Overriding the set speed/follow mode

WARNING

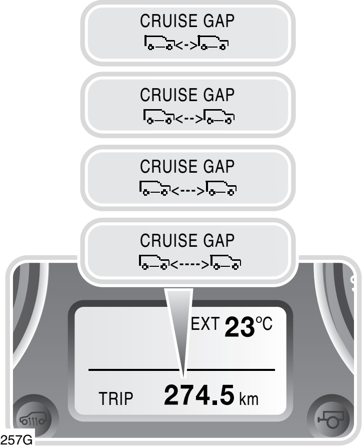
Whenever the driver is overriding the ACC by depressing the accelerator pedal, the ACC will not automatically apply the brakes to maintain separation from any vehicle ahead.

The set speed and gap can be overridden by pressing the accelerator pedal when cruising at constant speed or in follow mode. If the vehicle is in follow mode, the instrument warning lamp will go out when the ACC is overridden by the driver using the accelerator and **CRUISE OVERRIDE** will be displayed on the message centre. When the accelerator is released the ACC function will operate again and vehicle speed will decrease to the set speed, or a lower speed if follow mode is active.

Adjusting the gap



LAN0256G



LAN0257G

The gap from the vehicle ahead can be decreased or increased by pressing the rocker switch (5) or (6), on the steering wheel.

Four gaps are available and the selected gap setting will be displayed on the message centre when either button is pressed. After the starter is switched ON the default gap will be automatically selected ready for ACC operation.

Note: *It is the driver's responsibility to select a gap appropriate to the driving conditions.*

Adjusting the set speed

There are three ways to change the set speed:

- Accelerate or brake to the required speed and press the **SET +** button (4).
- Increase or decrease the speed by pressing and holding either the **SET +** or **-** button (4) or (3) until the required set speed is shown on the message centre. The vehicle speed will gradually change to the selected speed.
- Increase or decrease the speed in steps of 2 km/h (1 mph) by briefly pressing the **SET +** (4) or **SET -** button (3).

ACC operates between approximately 30 km/h and 180 km/h (18 mph and 110 mph) dependent on the country specification.

Set speeds outside this range will not be captured.

The ACC may apply the brakes to slow down the vehicle to the new set speed. The new set speed will be displayed on the message centre for four seconds after it has been changed.

ACC automatic switch off

ACC will disengage, but not clear the memory when:

- The CANCEL button (1), is pressed.
- The brake pedal is pressed.
- The vehicle speed falls below 30 km/h (18 mph).
- **N** is selected.
- Dynamic Stability Control (DSC) activates.
- Electronic Traction Control (ETC) activates.
- Hill Descent Control (HDC) is selected.

ACC will disengage, and clear the memory when:

- The starter switch is set to position **0**.
- Maximum vehicle speed is reached.
- A fault occurs in the ACC system.

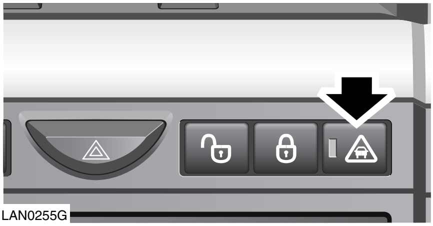
Resuming the set speed/follow mode

Caution: RESUME should only be used if the driver is aware of the set speed and intends to return to it.

By pressing the resume button (2), after ACC has been cancelled, for example, after braking, the ACC will become active again provided that the set speed memory has not been erased. The set speed will be displayed for four seconds and the original set speed will be resumed, unless a vehicle ahead causes the follow mode to become active.

Forward alert

Limited warning of vehicles ahead is provided during ACC operation by the ACC **DRIVER INTERVENE** warning. The forward alert feature additionally provides warnings whilst ACC is not engaged; if a vehicle is detected close ahead, then the warning tone and message will be issued. The brakes will not be applied.



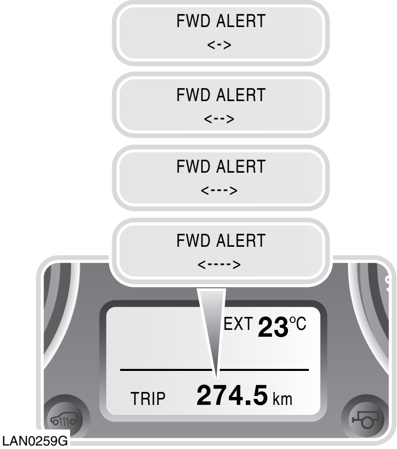
This additional feature may be switched on or off using the forward alert switch as indicated

When the indicator lamp in the switch is on, forward alert is active.

The sensitivity of the warning may be changed:

- Press the gap decrease button when ACC is disengaged to display and then decrease the sensitivity of the alert.
- Press the gap increase button to display and then increase the sensitivity of the alert.

Both of these alerts are accompanied by the **FWD ALERT <---->** message in the message centre.



Driving with ACC active

The system acts by regulating the speed of the vehicle using engine control and the brakes. Gear changes may occur in response to deceleration or acceleration whilst in ACC.

ACC is not a collision avoidance system, however, during some situations the system may provide the driver with an indication that intervention is required.

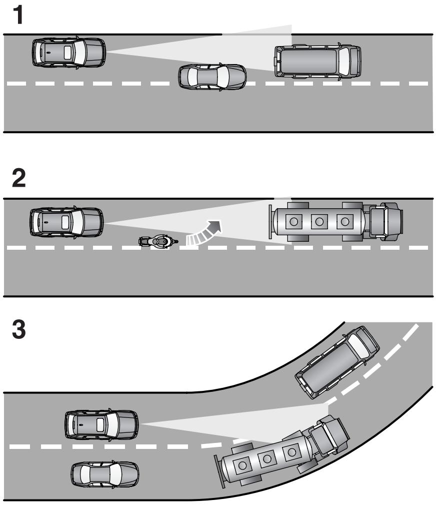
An audible alarm will sound, accompanied by the message **DRIVER INTERVENE** if the ACC detects:

- A failure has occurred whilst the system is active.
- That using maximum ACC braking only is not sufficient.
- That the vehicle speed has decreased below the minimum for ACC operation.

Note:

- *ACC operates when the gear selector lever is in position **D**.*
- *When engaged, the accelerator pedal rests in the raised position. Fully release the pedal to allow normal ACC operation.*
- *When braking is applied by the ACC the brake pedal may move down and up as braking is applied or removed. The vehicle brake lamps will be switched on while braking is applied.*

Detection limitations



LAN0250G

Detection limitations can occur:

1. When driving on a different line to the vehicle in front.
2. With vehicles which edge into your lane which can only be detected once they have moved fully into your lane.
3. There may be issues with the detection of vehicles in front when going into and coming out of a bend.

In these cases ACC may brake late or unexpectedly. The driver should stay alert and intervene if necessary.

ACC failure

If a fault occurs during operation of the system in cruise or follow modes, the ACC system will switch OFF and cannot be used until the fault is cleared. The message **DRIVER INTERVENE** appears briefly, and is then replaced by the message **CRUISE NOT AVAILABLE**.

If failure of the ACC or any related system occurs at any other time the message **CRUISE NOT AVAILABLE** will be displayed. It will not be possible to activate the ACC system in any mode.

Accumulations of dirt, snow or ice on the sensor or cover may inhibit ACC operation. Fitting of a vehicle front protector or metallised badges may also affect ACC operation.

If this occurs in ACC cruise/follow mode, the audible alarm sounds and the message **DRIVER INTERVENE** appears briefly. The message **ACC SENSOR BLOCKED** is then displayed. The system is no longer active.

Clearing the obstruction allows the system to return to normal operation. If the obstruction is present when ACC is inactive, e.g. on initial starting or with the ACC system switched off, the message **ACC SENSOR BLOCKED** will be displayed.

Tyres other than those recommended may have different sizes. This can affect the correct operation of the ACC.

FOOT BRAKE

WARNING

DO NOT rest your foot on the brake pedal while travelling as this may overheat the brakes, reduce their efficiency and cause excessive wear.

NEVER allow the vehicle to freewheel with the engine turned off, as braking assistance will not be available. The pedal brakes will still function, but more pressure will be required to operate them.

If the RED brake warning indicator should illuminate while the vehicle is in motion, bring the vehicle to a halt as quickly as traffic conditions and safety allow and seek qualified assistance before continuing. See Warning Indicators, 104.

Never place non-approved floor matting or any other obstructions, under the brake pedal. This restricts pedal travel and braking efficiency.

For your safety, the hydraulic braking system operates through dual circuits. If one circuit should fail, the other will continue to function.

However, in the event of brake failure where only one circuit is operational, the vehicle should only be driven at slow speed to the nearest qualified Land Rover Dealer/Authorised Repairer.

In these circumstances, exercise extreme caution and be aware that increased brake pedal travel, greater pedal pressure, and longer stopping distances will be experienced.

Servo assistance

The braking system is servo assisted, but ONLY when the engine is running. Without this assistance greater braking effort is necessary to safely control the vehicle, resulting in longer stopping distances. Always observe the following precautions:

- ALWAYS take particular care when being towed with the engine turned off.
- If the engine should stop for any reason while the vehicle is in motion, bring the vehicle to a halt as quickly as traffic conditions safely allow, and DO NOT pump the brake pedal as the braking system may lose any remaining assistance available.

Brake pads

Brake pads require a period of bedding in. For the first 800 km (500 miles), you should avoid situations where heavy braking is required.

Remember! Regular servicing is vital to ensure that the brake pads are examined for wear and changed periodically to ensure long term safety and optimum performance.

Wet conditions

Driving through water or even very heavy rain may adversely affect braking efficiency. Always dry the braking surfaces by intermittent light application of the brakes, first ensuring that you are at a safe distance from other road users.

ANTI-LOCK BRAKES

WARNING

ABS cannot overcome the physical limitations of braking distance, or the danger of aquaplaning, i.e. where a layer of water prevents adequate contact between the tyres and the road surface.

The fact that a vehicle is fitted with ABS must never tempt the driver into taking risks that could affect safety. In all cases, it remains the driver's responsibility to drive within normal safety margins, having due consideration for prevailing weather and traffic conditions.

The driver should always take account of the surface to be travelled over and the fact that brake pedal reactions will be different to those experienced on a non-ABS vehicle.

The purpose of the anti-lock braking system (ABS) is to allow efficient braking without wheel locking - thereby allowing the driver to retain steering control of the vehicle.

Under normal braking conditions, where sufficient road surface friction exists to slow the vehicle without the wheels locking, ABS will not be activated. However, if the wheels begin to lock under braking, then ABS will automatically come into operation. This will be recognisable by a rapid pulsation felt through the brake pedal.

In an emergency situation, ABS functions most effectively when full braking effort is applied even when the road surface is slippery. The ABS system constantly monitors the speed of each wheel and varies the brake pressure to each, according to the available grip.

No matter how hard you brake, you should be able to continue steering the vehicle as normal.

- DO NOT pump the brake pedal at any time; this will interrupt operation of the system and may increase the stopping distance.
- NEVER place additional floor matting or any other obstruction under the brake pedal. This restricts pedal travel and may impair brake efficiency.

Warning indicator

A fault with the ABS system is indicated by illumination of the amber ABS warning indicator. If the indicator illuminates, drive with care, avoiding heavy brake applications and seek qualified assistance urgently. See **Anti-lock Braking System (ABS) - AMBER, 108**.

Off-road driving

While anti-lock braking will operate in off-road driving conditions, on certain surfaces total reliance on the system may be unwise. It cannot reliably compensate for driver error or inexperience on difficult off-road surfaces.

Note the following:

- On soft or deep surfaces such as powdery snow, sand or gravel, and on extremely rough ground, the braking distance required by the anti-lock braking system may be greater than for normal braking, even though improved steering would be experienced. This is because the natural action of locked wheels on soft surfaces is to build up a wedge of surface material in front which assists the wheels to stop.
- If the vehicle is stopped on a very steep slope where little traction is available, it may slide with the wheels locked as there is no wheel rotation to provide a signal to the ABS. To counteract this, briefly release the brakes to permit some wheel movement, then re-apply the brakes to allow ABS to gain control.

Cornering Brake Control (CBC)

Cornering Brake Control (CBC) is an advanced form of ABS, which maintains vehicle stability and steerability during braking whilst cornering or changing lanes at speed.

Emergency Brake Assist (EBA)

If rapid full brake application is made, EBA automatically boosts the braking force to the maximum and helps to stop the vehicle. Also, if the driver brakes more slowly, but with sufficient brake pressure to activate ABS on both front wheels, the system automatically increases the braking force so that all four wheels are in ABS control, optimising the performance of the ABS system.

Pressure should be maintained on the brake pedal during the entire brake application. If the brake pedal is released, EBA will cease operation.

A fault with the EBA system is indicated by illumination of the amber brake warning indicator. See **INDICATOR GROUPING, 104**.

In the event of a fault, the system should be checked by a Land Rover Dealer/Authorised Repairer at the earliest opportunity.

Electronic Brake Force Distribution (EBD)

Your vehicle is equipped with Electronic Brake Force Distribution (EBD), which balances the distribution of braking forces between front and rear axles to maintain maximum braking efficiency under all vehicle loading conditions.

For example; under light loads EBD applies less effort to the rear brakes to maintain vehicle stability; conversely allowing full braking effort to the rear wheels when the vehicle is towing or is heavily laden.

A fault with the EBD system is indicated by illumination of the red brake warning indicator. If this illuminates while the vehicle is being driven, gently stop the vehicle as soon as safety permits and seek qualified assistance.

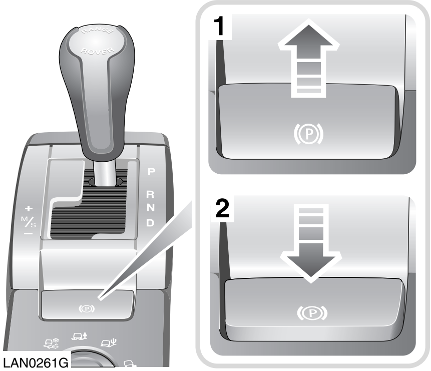
PARKBRAKE (EPB)

WARNING

DO NOT rely on the parkbrake system to hold the vehicle stationary if the amber parkbrake warning indicator is illuminated and/or the red warning indicator is flashing. Seek qualified assistance urgently.

Caution: Driving the vehicle with the parkbrake applied or repeated use of the parkbrake to decelerate the vehicle may cause serious damage to the brake system.

Your vehicle is equipped with an electrically operated parkbrake (EPB).



Applying the parkbrake manually

With the vehicle stationary, pull up the lever (1) and release it. The lever will return to the neutral position and the red parkbrake warning indicator in the instrument pack will illuminate.

If the lever is operated while the vehicle is travelling at less than 3 km/h (2 mph), the vehicle will be brought to a stop abruptly. The stop lamps will not illuminate.

If the system detects a fault with the parkbrake, the amber parkbrake warning indicator will illuminate and the message **PARKBRAKE FAULT** will appear on the instrument pack. If a fault is detected while EPB is operated, the red warning indicator will flash and the amber indicator will illuminate. Also the message **PARKBRAKE FAULT. SYSTEM NOT FUNCTIONAL** will appear in the main message centre. The red indicator will continue to be illuminated for at least ten seconds after the starter switch has been turned off.

Dynamic operation

In an emergency, the parkbrake can be applied dynamically, i.e. with the vehicle travelling at more than 3 km/h (2 mph). Pulling up on the lever and holding it up gives a gradual reduction in speed. The brake warning indicator will illuminate accompanied by a harsh sound and **CAUTION! PARKBRAKE APPLIED** appears on the main message centre. The stop lamps will illuminate.

Releasing or depressing the lever will cancel the parkbrake application.

Releasing the parkbrake manually

WARNING

The parkbrake operates on the rear wheels of the vehicle and hence secure parking of the vehicle is dependent on being on a hard and stable surface.

DO NOT rely on the parkbrake to operate effectively if the vehicle has been subjected to immersion in mud and water.

To disengage the parkbrake, the starter key must be in position **I** or **II**. Apply pressure to the foot brake while pressing down on the parkbrake lever.

It is not possible to manually release the parkbrake without pressing the foot brake.

If the parkbrake cannot be released manually, seek qualified assistance immediately.

Releasing the parkbrake automatically

If the vehicle is stationary with the parkbrake applied and in **D** or **R**, pressing the accelerator will release the parkbrake and allow the vehicle to move off.

To delay the automatic release feature, hold the lever in the apply position, then at the desired point, release it.

To assist in a smooth drive-away, the system anticipates the requirement and reduces the system load depending on the gradient (it may be possible to hear this pre-arm operation).

If the reduction in load causes the vehicle to move after a valid gear is engaged, the full system load will be re-applied to the parkbrake. This may cause a small reduction in the refinement of the subsequent drive-away. It is also possible to override this load reduction by lifting the parkbrake lever after gear engagement.

In the event of a fault, **PARKBRAKE FAULT. AUTO RELEASE NOT FUNCTIONAL** will appear in the main message centre. In this event, release the parkbrake manually.

Under most conditions the EPB system will release seamlessly as the accelerator is applied, allowing the vehicle to move forward. However, release times may be extended for an initial time period at the start of a journey when changing into gear from **P** or **N**. This is normal and is to allow for the extended gear engagement times that may occur under certain circumstances.

If the vehicle is used in severe off-road conditions, such as wading, deep mud, etc., additional maintenance and adjustment of the parkbrake will be required. Consult your Land Rover Dealer/Authorised Repairer.

Fault management

If a fault is diagnosed by the system when the starter is on but the parkbrake is not in use, the amber parkbrake warning indicator will flash and the message **PARKBRAKE FAULT** will be displayed in the main message centre.

Note: *Under some transmission fault conditions the parkbrake may not function, or may not operate automatically.*

DYNAMIC STABILITY CONTROL (DSC)

WARNING

Dynamic Stability Control (DSC) is unable to compensate for driver misjudgement. It remains the driver's responsibility to adopt a suitable driving style in every driving situation. Risks should never be taken on account of the additional security afforded by the DSC system.

DSC helps to optimise dynamic stability, even in critical driving situations. The system controls dynamic stability when accelerating. Additionally, it identifies unstable driving behaviour, such as understeering and oversteering and helps to keep the vehicle under control by manipulating the engine output and applying the brakes at individual wheels. Some noise may be generated when the brakes are applied. The system is ready to operate each time the engine is started.

Warning indicator

The indicator illuminates briefly as a bulb and system check when the starter switch is turned to position **II**.

If the warning indicator flashes, the system is active, regulating engine output and brake forces.

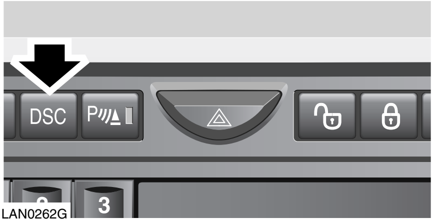
If the indicator illuminates constantly, and does not extinguish when the DSC switch is pressed, a fault has been detected in the system. Any fault will deactivate DSC. Drive with care and seek qualified assistance as soon as possible.

Deactivating DSC operation

Land Rover recommend that DSC is operational in all normal driving conditions.

In some driving conditions, to maximise traction, it may be beneficial to deactivate DSC. Such conditions include:

- To rock the vehicle out of a hollow or out of a soft surface.
- Starting in deep snow or on a loose surface.
- Driving in deep sand.
- Driving on tracks with deep longitudinal ruts.
- Driving through deep mud.



To deactivate DSC, press and briefly hold the DSC switch on the instrument panel (the DSC warning indicator will illuminate continuously). Deactivating DSC has no effect on traction control operation.

Note: *Driving with DSC deactivated, may add additional loads on the brakes - always drive with DSC switched on if possible.*

Reactivating DSC

To reactivate DSC, press and briefly hold the DSC switch on the instrument panel. DSC will automatically reactivate when the engine is started.

ELECTRONIC TRACTION CONTROL (ETC)

ETC is continuously available to boost vehicle traction when one or more wheels has a tendency to spin, while others do not. It operates in conjunction with the DSC system.

If a wheel is spinning, ETC automatically brakes that wheel until it regains grip. This braking activity allows the engine power to be transmitted to the remaining wheels. Some noise may be generated when the brakes are applied.

Warning indicator

A fault with the ETC system is indicated by illumination of the amber DSC warning indicator. This could also indicate that the DSC has been manually deactivated. See **INDICATOR GROUPING, 104**.

If the indicator illuminates constantly, and does not extinguish when the DSC switch is pressed, a fault has been detected in the system. Any fault will deactivate ETC. Drive with care and seek qualified assistance as soon as possible.

HILL DESCENT CONTROL

Hill Descent Control (HDC) operates in conjunction with the anti-lock braking system to provide greater control in off-road situations particularly when descending severe gradients.

HDC is fully functional and should only be used in first and reverse gears in HIGH range and all gears in LOW range.

HDC is fully functional and should only be used in **D**, **R** and CommandShift **1** in HIGH range and in **D**, **R** and all CommandShift gears in LOW range. When in **D**, the vehicle will automatically select the most appropriate gear. The vehicle should not be driven with the HDC active in **N** neutral.

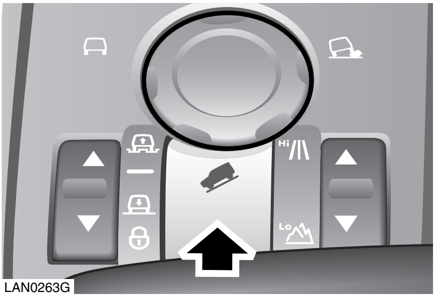
Note: *Some of the Terrain response program/range combinations will activate or deactivate HDC automatically.*

Warning indicator

HDC can be selected at speeds below 80 km/h (50 mph). The green warning indicator will illuminate continuously when vehicle speed reduces below 50 km/h (30 mph) and full HDC function is activated.

If the vehicle speed exceeds 80 km/h (50 mph), HDC will deselect and the green HDC indicator will extinguish.

If HDC is already selected and vehicle speed rises above 50 km/h (30 mph) in HIGH range, HDC function is suspended and the green HDC indicator will flash. A message will also appear in the main message centre.



To select HDC

Press and release the switch (arrowed) to select HDC. To deselect, press and release again.

The green information indicator will extinguish. If HDC is deselected when HDC is operating, the system fades out, allowing the vehicle to gradually increase in speed.

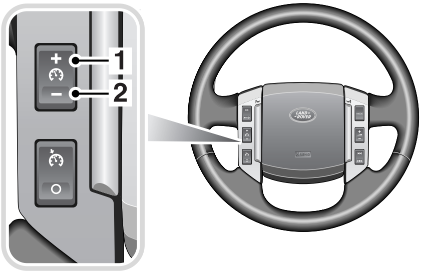
When used in LOW range, HDC controls the vehicle speed more aggressively. Use LOW range gears when steep descents are to be attempted.

Note: *HDC is automatically deselected if the vehicle starter is switched off for more than 6 hours.*

HDC in action

HDC should be used in conjunction with an appropriate gear selection.

During a hill descent, if engine braking is insufficient to control the vehicle speed, HDC automatically operates the brakes to slow the vehicle and maintain a speed relative to the selected gear range and the accelerator pedal position.



LAN0266G

While HDC is controlling the vehicle speed, descent speeds can be varied using the steering-wheel-mounted cruise control (1) **+** and (2) **-** switches. To reduce the descent speed, press and hold the **-** switch. The vehicle speed at the point of switch release will become the new descent speed.

To increase the descent speed, press and hold the **+** switch. The vehicle speed at the point of switch release will become the new descent speed. Alternatively, the descent speed can be adjusted by tapping the **+** or **-** switches. Each press of the switch will adjust the descent speed by approximately 0.5 km/h (0.3 mph).

Note: *Each gear has a pre-defined minimum descent speed.*

Note: *The descent speed will only increase if the gradient is sufficiently steep to cause the vehicle to accelerate as the braking effect is reduced. On a shallow slope, pressing the **+** switch may result in no speed increase.*

When driving off-road, HDC can be permanently selected to ensure that control is maintained. ABS and traction control are still fully operational and will assist if the need arises.

Note: *With HDC selected, gear changes can be carried out in the normal way.*

If the brake pedal is depressed when HDC is active, HDC is overridden and the brakes will perform as normal (a pulsation might be felt through the brake pedal). If the brake pedal is then released, HDC will recommence operating at the speed at which the brakes were released.

In extreme circumstances, the HDC system may cause brake temperatures to exceed their pre-set limits. If this occurs, **HDC TEMPORARILY NOT AVAILABLE SYSTEM COOLING** will be displayed in the message centre. HDC will then fade out and become temporarily inactive. HDC will not be available until the brakes reach an acceptable temperature, at which time the warning message will disappear from the message centre and HDC will, if required, resume operating.

If a fault is detected in the HDC system, **HDC FAULT SYSTEM NOT AVAILABLE** will appear in the display. If the fault is detected while the system is active, HDC will fade out. Do not attempt a steep descent when HDC is unavailable or use a very low gear and/or the foot brake. If a fault has been detected, consult your Land Rover Dealer/Authorised Repairer at the earliest opportunity.

HDC fade-out

HDC fade-out gradually decreases the HDC function with the effect that the rate of hill descent will increase. HDC will be disabled completely once the descent is complete.

If required (e.g. the angle of the descent levels out significantly), fade-out may be achieved deliberately by deselecting HDC while the system is operating.

HDC information indicator - GREEN

If HDC is selected and the operating conditions are met, the indicator will illuminate continuously.

If the indicator flashes while HDC is active, HDC operating conditions are not met.

AIR SUSPENSION

The air suspension system maintains the correct vehicle height by controlling the quantity of air in the vehicle's air springs.

Unless stated otherwise, height changes may only be made while the engine is running and the driver and passenger doors are closed.

When the air suspension system lifts the vehicle, it normally uses compressed air stored in its reservoir. The suspension will rise much more slowly if this reservoir is depleted due to repeated raising and lowering of the suspension.

On-road height

The normal height for the vehicle.

Off-road height

This is 55 mm (2.2 in.) higher than On-road height. It provides improved ground clearance and approach, departure and break-over angles. See **DIMENSIONS, 292**.

Off-road height can be selected at any speed up to 40 km/h (24 mph). When the system is at Off-road height, the system will automatically select On-road height if the vehicle speed exceeds 50 km/h (30 mph).

Note: *When using Terrain Response, some of its programs/range combinations will adjust suspension height automatically*

Extended mode

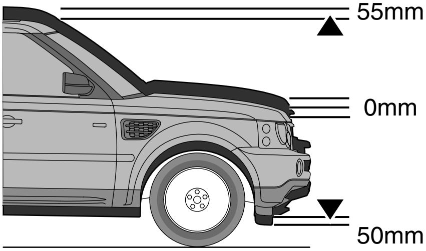
If the vehicle is grounded while at off-road height and traction control is induced, the system provides additional lift to clear the obstruction. Extended mode is activated automatically and cannot be selected manually.

Access height

WARNING

The driver should ensure that the vehicle is clear of obstacles and people before lowering the vehicle. Remember that, for example, the clearance under the floor and bumpers, and in the wheel arches, will be 105 mm (4.1 in.) less at Access height than at Off-road height.

This is 50 mm (2 in.) lower than On-road height. It provides easier entry, exit and loading of the vehicle.



LAN0277G

Access height can be selected at any time, but the system response will depend on the vehicle's speed:

- If the vehicle speed is greater than 20 km/h (12 mph), the suspension will wait for up to one minute for the vehicle to slow down. If the vehicle does not slow down to below 20 km/h (12 mph) within this time, the Access height request will be cancelled.
- If the vehicle speed is less than 20 km/h (12 mph), the suspension will move to a part-lowered height and remain at this height for up to one minute. If the vehicle does not slow down to 8 km/h (5 mph) within this time, the Access height request will be cancelled.

- If the vehicle speed is lower than 8 km/h (5 mph), the suspension will be lowered to Access height immediately.

Access height may be selected up to 40 seconds after the starter is turned off, provided that the driver's door has not been opened within this time.

The suspension will automatically rise from Access height when the vehicle speed exceeds 10 km/h (6 mph).

If Access height was selected directly from Off-road height, the system will return to Off-road height when the vehicle speed exceeds 10 km/h (6 mph). Otherwise the system will lift the suspension to On-road height.

High speed height

This feature lowers the suspension ride height by 20 mm if the vehicle exceeds 160 km/h (100 mph) for longer than five seconds. This action is automatic and cannot be over-ridden. Ride height will return to normal when vehicle speed remains below 130 km/h (80 mph) for 30 seconds.

Note: *NEVER exceed the speed limits.*

Crawl (locked at Access height)

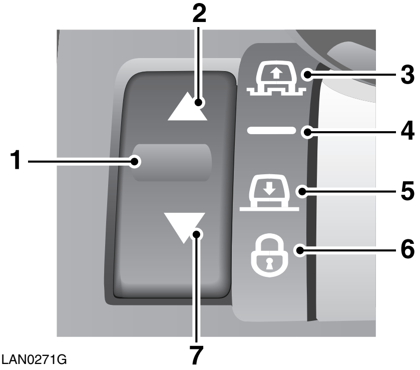
This mode enables the vehicle to be driven at low speeds at Access height to give increased roof clearance in low car parks, etc.

Crawl can be selected when the vehicle speed is below 35 km/h (22 mph), but will not be activated until vehicle speed drops below 10 km/h (6 mph). When the vehicle is in Crawl, On-road height will be selected automatically if the vehicle speed exceeds 40 km/h (24 mph).

Messages

When a message centre is fitted to the vehicle, messages relating to the air suspension system may be displayed. See **MAIN MESSAGE CENTRE, 90**

Adjusting suspension heights



1. Raise/lower switch
2. Raising indicator
3. Off-road indicator
4. On-road indicator
5. Access indicator
6. Lock indicator
7. Lowering indicator

Suspension heights

The raise/lower switch (1) is used to move up or down through the suspension heights. Indicators (3), (4) or (5) will be lit to show the height selected. A message indicating the suspension height will also be displayed in the message centre when Off-road, Access or Crawl is selected.

Indicators (2) or (7) will be lit to show the direction of movement. They extinguish when the height change movement is completed.

If a height change is requested that is not allowed, such as attempting to raise the height of the vehicle with the engine not running, indicators (2) and (7) will flash twice and a chime will sound. A message will be displayed on the message centre.

A flashing indicator (2) or (7) indicates that the system is in a waiting state or shows that it will automatically override the driver's choice if speed criteria are exceeded.

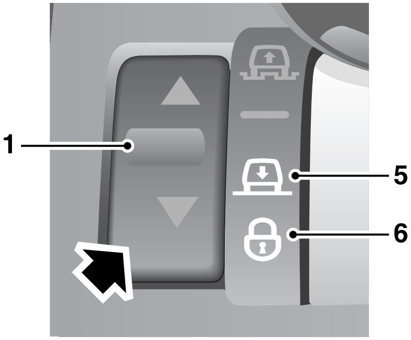
Selecting Access height

If Access height is selected above 20 km/h (12 mph), indicators (5) and (7) will flash while the system waits for the vehicle to slow down.

When the vehicle slows down to 20 km/h (12 mph), indicator (4) will extinguish as the system goes to the part-lowered height. indicator (5) will be lit and indicator (7) will continue to flash.

When the vehicle slows down to 8 km/h (5 mph), indicators (5) and (7) will be lit. When Access height is reached, indicator (7) will extinguish.

Selecting and cancelling Crawl (locked at Access height)



LAN0272G

When the suspension is at On-road or Access height and the vehicle speed is below 10 km/h (6 mph), press the raise/lower switch (1) in the down direction for one second. Indicators (5) and (6) will be lit to confirm the selection.

Crawl can be cancelled manually by pressing the raise/lower switch in the up direction for one second. Indicator (6) will extinguish.

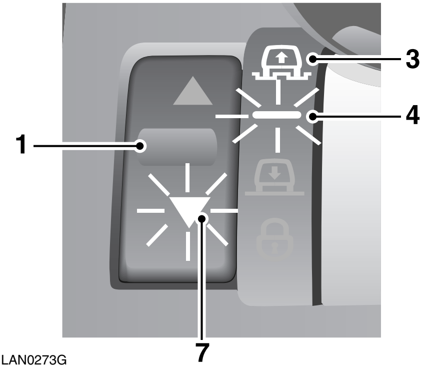
Note: *When Crawl is cancelled, the suspension will rise to On-road height if the vehicle speed is greater than 10 km/h (6 mph).*

Selecting Access height directly from Off-road height

When the suspension is at Off-road height, press switch (1) down, then press it again before indicator (7) goes out.

The system will remember to return the suspension to Off-road height automatically if the vehicle is driven above 10 km/h (6 mph).

Automatic height change warnings



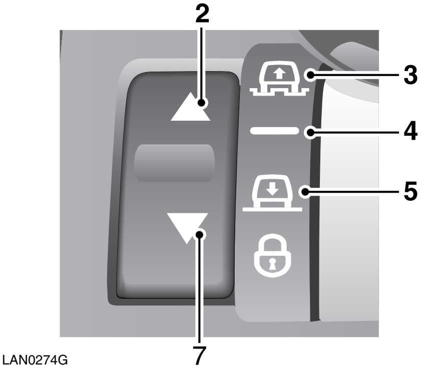
When the suspension is at Off-road height, Access or Crawl, the suspension height will change automatically when vehicle speed exceeds predetermined levels.

When the suspension is at Off-road height or Crawl, it warns the driver that the vehicle is approaching a speed threshold. A chime will sound, a message will be displayed on the message centre and the On-road indicator (4) and either (2) or (7) will flash.

The Off-road height speed warning is shown above. If the vehicle slows down, the warning will disappear.

Door open override

If a door is opened during a height change while the vehicle is at rest, the height change will be restricted.



The indicator for the target height (3, 4 or 5) will remain lit and the raising indicator (2) or the lowering indicator (7) will flash.

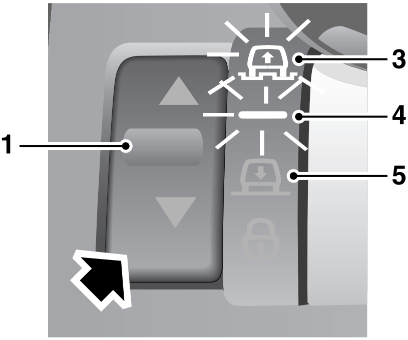
The height change will resume if all of the doors are closed within 90 seconds.

If the doors are not closed within this time, the raising indicator (2) or the lowering indicator (7) will extinguish and the indicators showing the heights above and below the current position will be illuminated.

Selecting a new height using the raise/lower switch (1), or driving off will reset the system.

Extended mode

If the vehicle is grounded and traction control is induced, the system raises the vehicle by 35 mm (1.4 in.) to clear the obstruction. Extended mode is activated automatically and cannot be selected manually.



LAN0275G

When Extended mode is activated, indicator (3) will flash if the suspension is above Off-road height. Indicators (3) and (4) will flash if the suspension is between Off-road and On-road heights. Indicators (4) and (5) will flash if the suspension is between On-road and Access heights. A message will be displayed on the message centre.

To exit Extended mode, either press the raise/lower switch (1) briefly up or down, or drive the vehicle at a speed greater than 5 km/h (3 mph) for 30 seconds.

Additional lift whilst in Extended mode

When Extended Mode has been invoked and the automatic lifting of the vehicle has been completed, the driver can request an additional lift in order to clear the obstacle. This can be particularly useful when Extended Mode has been invoked on soft surfaces.

To request additional lifting wait for the raising indicator (2) to extinguish, then press and hold the switch (1) in the up direction for 3 seconds whilst ALSO pressing the brake pedal. A chime will sound to confirm that the request has been accepted. The raising indicator (2) will be illuminated while the vehicle is being lifted.

Suspension freeze

If the system is attempting to change the suspension height and it detects that the suspension is prevented from moving, the system will freeze all movements.

This can be caused by attempting to lower the vehicle onto an obstacle or attempting to lift the vehicle against an obstruction.

The symbols behave in the same way as described in Extended mode and the same message will be displayed on the message centre. As in Extended mode, to exit this freeze state, either press the switch (1) up or down, or drive the vehicle at a speed greater than 20 km/h (12 mph).

Remote operation

WARNING

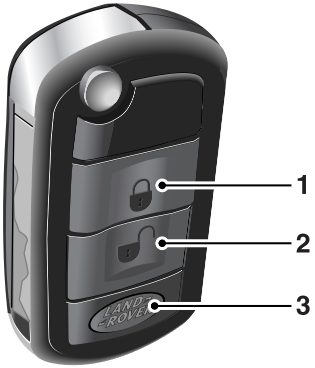
The remote control will operate effectively from inside the vehicle. It is therefore important to keep it out of reach of children at all times.

When operating the remote control from inside the passenger compartment, ensure that the underside of the vehicle has been checked for obstructions before lowering, and that a responsible adult has been posted outside the vehicle to supervise the lowering process.

Care should be taken with all suspension height changes when a trailer is attached to the vehicle.

The remote control is programmable to give a range of functions. See **REMOTE CONTROL PROGRAMMING, 41**. If the vehicle's remote control has been configured to operate the air suspension, height may be controlled remotely to assist in loading the vehicle or attaching a trailer.

After programming, to change the suspension height via the remote control, remove the starter key, turn on the hazard warning lamps and close all doors. Remote operation is not possible unless this is done.



LAN0276G

To raise the vehicle, press and hold the Land Rover button (3) and Lock button (1).

To lower the vehicle, press and hold the Land Rover button (3) and Unlock button (2).

If any button is released during the raising or lowering of the suspension, all movement of the suspension will stop. It will restart once the buttons are pressed again.

The height will initially change slowly but, after three seconds, the speed will increase. While the height is changing, a indicator on the raise/lower switch will be lit according to the direction of movement.

If the starting height is above or below On-road height, movement will stop when On-road height is reached. Further movement can be achieved by releasing the buttons and pressing them again.

Normal height control will resume when the vehicle is driven away.

Note: *Remote operation is disabled when the vehicle is moving.*

DYNAMIC RESPONSE

Caution: If the warning lamp illuminates RED a system fault has occurred that may result in serious damage to vehicle components. Stop the vehicle and switch off the engine as soon as safety permits. Seek qualified assistance immediately.

Dynamic Response is a patented feature unique to Land Rover. The system is designed to eliminate vehicle body roll at low cornering speeds and reduce body roll at higher cornering speeds, while maintaining a soft, car-like, suspension for straight line travelling. On uneven surfaces and rough tracks, the Dynamic Response system will adjust the suspension according to the vehicle speed and roughness of the surface to provide improved passenger comfort.

At very low speeds the roll bars are effectively decoupled, giving significant benefits in off-road axle articulation and improved traction.

The system is entirely automatic in operation and cannot be influenced by the driver in any way. However, the functionality of the warning indicator in the instrument panel is very important and drivers should be aware of the following:

Warning indicator

The warning indicator illuminates RED when the starter switch is turned to position **II**. After two seconds, the RED illumination changes to AMBER and, after a further two seconds, the indicator extinguishes. This process is a system check that takes place every time the vehicle is used. Provided the Dynamic Response system and air suspension system are operating correctly, illumination will not occur at any other time.

If illumination occurs while driving, a fault with the system is indicated, as follows:

- **If the indicator shows RED** (a flashing red indicator, which changes to constant illumination after two minutes, and is accompanied by a warning chime):

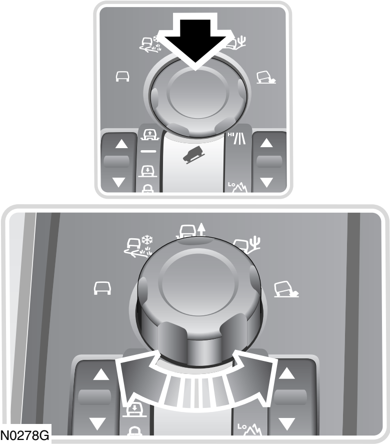
  This indicates a system fault that may result in serious damage to vehicle components and reduced Dynamic Response performance. You must stop the vehicle as soon as safety permits and switch off the engine. DO NOT CONTINUE DRIVING! Seek qualified assistance immediately

- **If the indicator shows AMBER** (constant illumination):

  This indicates a system fault that will result in reduced Dynamic Response performance, but will not leave the vehicle in a dangerous condition. You may continue driving, but reduce speed, take additional care, and consult a Land Rover Dealer/Authorised Repairer at the earliest opportunity.

TERRAIN RESPONSE™

The Terrain Response system is permanently active, continuously providing benefits in traction and driveability. These can be further enhanced for specific on and off-road driving conditions by the selection of special programs, using one simple driver interface.



To raise the rotary knob, press down on it lightly and release. To lower the rotary knob, press down until it clicks.

This interface allows the driver to tell the vehicle what sort of terrain is to be driven over. Based on the selected special program, the system optimises the vehicle set-up for the prevailing conditions, providing the optimum in traction, driveability and vehicle composure.

The Terrain Response special programs, automatically bring in changes in vehicle drive and suspension systems, that have until now been only individually and manually controllable by the driver.

The suspension and drive systems comprising Terrain Response are:

- Engine management.
- Gearbox management.
- Intelligent differential control.
- Dynamic stability, traction control and HDC systems.
- Air suspension.

The system will provide a variable accelerator response, ranging from very cautious for slippery conditions (where a large pedal movement has only a small effect on engine power) to very responsive, e.g. for sand, where engine power is allowed to rise more quickly.

This further extends the breadth of off-road capability of Land Rover vehicles. In addition, Terrain Response offers control of systems that have previously not been manually controllable.

***Note:** Since each Terrain Response special program uses the optimum settings of each drive component - accelerator response, suspension, transmission, etc. - relative to the terrain being driven over, it follows that changing from one special program to another brings in a different set of criteria.*

This means that, for instance, the engine revs produced by the current accelerator position might increase or decrease slightly in the new program, or the suspension could change height. The changes are not dramatic, but are noticeable.

To obtain the maximum benefits from the system, it is suggested that you first try it out in circumstances where any distraction will not affect other road users.

Terrain Response is designed to benefit the driver, regardless of the level of off-road driving experience. The enhanced traction system, with the control of many system parameters through one simple driver input, coupled with specific advice from the message centre, will aid drivers with limited off-road experience. Additionally, the system can back-up the skills of experienced drivers, who will also benefit from the wider performance envelope available through the special programs.

Using Terrain Response

WARNING

When towing, the automatic vehicle height rise associated with using the system in low range, will be automatically prevented by the system. This will be indicated by a message in the message centre. However, this function relies on the fitting of a Land-Rover approved towing electrical socket. Failure to fit a Land-Rover approved towing electrical socket or to follow these guidelines may lead to the vehicle being raised to off-road height even with a trailer attached.

The Terrain Response system is always active and can not be switched off. When the vehicle is started, the system will normally start in its General program. Using the correct special program, will provide benefits in how the vehicle can be driven over different surfaces or terrains. It is recommended that a special program be engaged whenever driving conditions could become difficult.

Depending on the terrain, it may be beneficial for the automatic transmission to change gear under different speed and load conditions. Each special program will provide the most appropriate gear-shift points for the terrain, including the most appropriate gear to set off in (i.e., second, HIGH range, or third, LOW range, in Grass-Gravel-Snow or first, LOW range, when in Rock Crawl).

The amount of slip allowed in the electronically controlled differentials will be optimised continuously, both from the point of view of traction and vehicle stability.

Depending on the Terrain Response program selected, the control of the differentials will vary to provide the optimum settings.

Note: *Special programs should be engaged pro-actively - before starting to drive in particular conditions. They are not intended as a means of extracting a vehicle that has been driven into difficulties.*

The system has been designed to instil confidence regarding choice of special program, despite the fact that conditions associated with each program are distinctly different. However, the vehicle will be very capable under all circumstances, even when no special program is selected, as some sub-systems will re-act to the conditions where possible. In case of any uncertainties about the most appropriate special program selection, it will be best to leave the system in Terrain Response General program until terrain conditions become more distinct and a program choice can be made with more confidence.

The system is of particular use when driving off-road, but, even here, it should be used pro-actively and not be used as a means of retrieving control.

If a Terrain Response special program has been selected, then the transmission can be left in **D**. If descending a slippery slope, CommandShift **1** or **2** should be considered.

Driver over-ride options

WARNING

This height increase will start regardless of whether the vehicle is moving or not.

All systems will be set to optimum parameters for the terrain conditions reflected in the choice of control program. Two of the systems controlled by Terrain Response may also be operated independently by the driver:

- Air suspension.
- Hill Descent Control.

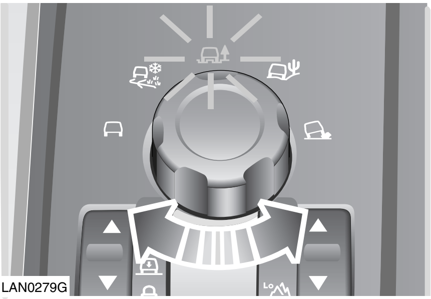
In some special programs, the Terrain Response system will switch on HDC and in LOW range the system will automatically move the suspension to Off-road height.

Both the HDC and ride height automatic selections can be cancelled by the driver at any time. Conversely, if HDC or a specific ride height has not been automatically selected by the system, the driver can always choose to operate it as normal at any time.

Whether the HDC or ride height options are being brought in automatically by the system, or manually by the driver, the changes of state will be confirmed through the message display and by the individual system information indicators. Use of the system in the special programs, particularly in low range, may prompt some driving advice and warnings as well as additional information to be displayed on the message centre.

Note: *Gear selection can be overridden, by using the CommandShift function on the gearbox to lock the vehicle in a particular gear.*

Operation



LAN0279G

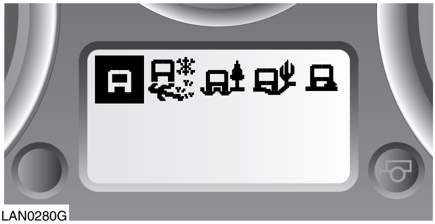
A rotary knob just behind the gear lever is rotated to select the required special program. When the selector reaches either end of the selection range, it can be turned further, but doing so has no effect.

In addition to the Terrain Response General setting, four special programs are available:

- Grass/gravel/snow (also includes ice).
- Mud/ruts.
- Sand.
- Rock Crawl.

When the starter switch is turned on, the graphics around the control knob are illuminated, with the active program highlighted in amber. The brightness of the graphics night illumination is controlled as part of the instrument illumination control; the brightness of the amber lighting is high or low, depending on the use of the headlamps.

If a special program is active, the special program symbol will also be displayed on the message centre.



LAN0280G

If the starter switch is turned off when any special program is selected, then the system will remember for approximately six hours which program was selected, and return to that program once the starter switch is turned back on.

The system indicates, via the message centre that the previously selected special program is still selected. After more than six hours, the system will automatically revert back to the General program (special programs off).

Terrain Response general

When the Terrain Response special programs are off, the system will be in its General program. This will be indicated by the above symbol being displayed briefly on the message centre. Sub-systems will adapt to the prevailing terrain conditions and select control settings based on the conditions sensed.

This program setting is compatible with all on and off-road terrain conditions. Normal conditions in which it is not necessary to select a specific program include driving on surfaces that closely match a hard road surface. Dry cobbles, Tarmac or even wooden planks are all included in the scope which consists of hard supportive surfaces with no loose coating of water, dust or similar material.

It is recommended that a special program be de-selected, once the specific conditions for its use no longer prevail. This is done by turning the selector knob back to the General program position.

When a special program is de-selected, all vehicle systems will be returned to their normal control settings. The one exception is HDC, which will remain active if it was manually selected previously. Also, as a precaution, the vehicle will change from raised to Normal ride height only when moving.

Grass-Gravel-Snow

Use this program for surfaces where the underlying base is fairly firm, but a coating of other material gives a tendency to slip. The coating can be water, slime, grass, snow or loose gravel, shale or pebbles, or even a thin coating of sand. This program should also be selected in icy conditions.

In this special program the Terrain Response systems will select settings to give the best traction, handling and driveability for predominantly slippery conditions. Hill Descent Control will be engaged automatically in low range, but can be manually de-selected. See **HILL DESCENT CONTROL, 181**.

In slippery conditions, it is often beneficial to start off in a higher gear than usual, for example, CommandShift **2** in HIGH range or CommandShift **3** in LOW range.

For use of the vehicle with snow chains fitted, see **SNOW CHAINS, 241**.

Note: *When in deep snow, if the vehicle is struggling for forward traction or is stuck, then switching off Dynamic Stability Control (DSC) may be an advantage. If DSC is switched off, then it must be switched back on as soon as the difficulty is overcome.*

Mud-Ruts

Use this program when traversing ground that is not only muddy or deeply rutted, but possibly soft and uneven to the point of demanding maximum axle displacement. This unevenness can also be that brought about by sizeable wooden debris in the form of roots, brushwood, small logs, etc.

This acts like the previous program, except that it selects settings for the individual systems that optimise traction and driveability for muddy/rutted driving conditions, with driver over-ride options as before. The program is available in HIGH and LOW range, but LOW range is recommended.

It is anticipated that this program will usually be used in low range. If not, the driver will be prompted to consider selecting low range. If the Mud-Ruts program and low range are selected together, the vehicle ride height will be raised automatically.

Sand

Use this program to drive on soft and predominantly dry, yielding sandy ground, such as dry beaches, dunes and sand deserts. Also consider using this program for deep gravel.

The Sand special program uses the control settings and software logic best suited to driving on sand, with the driver-override option as before.

In instances where the sand is damp or wet and soggy, the conditions are better addressed by the use of mud/ruts special program.

Where the sand is extremely soft and dry and of a depth that allows the wheels to sink well into it, there may be additional benefit in switching off the Dynamic Stability Control. See **Deactivating DSC operation, 179**.

Rock Crawl

Caution: Selection of a wholly inappropriate special program for the prevailing terrain conditions, will not endanger the driver or immediately damage the vehicle. However, if continued, such an action will impair vehicle response to those conditions and will reduce the durability of the suspension and drive systems.

Use this program to cross wet or dry, solid, unyielding ground, such as clusters of boulders, which demands high levels of road-wheel displacement and careful vehicle control. This program would also be used for crossing river beds strewn with large rock features submerged below water.

Unlike the other options, Rock Crawl is only selectable in LOW range. If selection is attempted in HIGH range, the special program selection will NOT be accepted and the driver will be prompted to select LOW range. This special program will utilise system control settings to optimise the vehicle suspension and traction system for the conditions, which are likely to require extreme suspension articulation and good low-speed control.

When a special program requires increased air suspension height, the system will automatically select it, unless it suspects that a trailer is attached because an electric load is seen on the trailer socket.

A message will be displayed on the message centre.

Inappropriate special program selection

If an inappropriate special program is attempted to be selected - such as choosing Rock Crawl while in HIGH range - the symbol of that program will flash amber, an audio warning will sound, and the message centre will advise that the chosen special program is unavailable and will suggest corrective action to be taken.

If, after 60 seconds, the requirements have not been met, the warnings will cease and the message centre will show which program remains active.

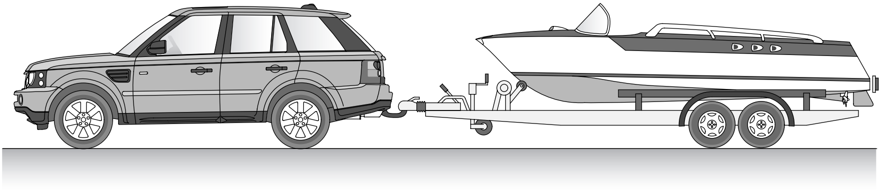
Should the system become partly inoperable for any reason, it may not be possible to select certain special programs and a warning will be given when selection of an affected program is attempted. If the system should become totally inoperable, all of the control program symbols will be switched off and the message centre will display a message.

The air suspension system provides an automatic levelling function. See **AIR SUSPENSION, 184**. In circumstances where the system is used in LOW range, it is most likely that mobility and vehicle composure would benefit from increased ground clearance.

System messages

Messages relating to the Terrain Response system are displayed on the message centre.

For an explanation of those messages, see **MAIN MESSAGE CENTRE, 90**.



LAN0282G

TOWING

WARNING

To preserve vehicle handling and stability, only fit towing accessories that have been designed and approved by Land Rover.

DO NOT use lashing eyes or vehicle recovery towing eyes to tow a trailer. Use of the towing eyes for purposes other than their designed intention could result in damage or injury.

Caution: An equalising or other form of weight distributing hitch should NOT be used with your vehicle.

The torque ranges of Land Rover engines allow maximum-weight loads to be pulled smoothly from standstill and reduce gear changing on hills or rough terrain.

It is the driver's responsibility to ensure that the towing vehicle and trailer/caravan are loaded and balanced, so that the combination is stable when in motion. When preparing your vehicle for towing, pay attention to any instructions provided by the trailer/caravan manufacturer as well as to the information that follows.

Balancing the combination

To ensure optimum stability, it is essential that the trailer adopts a level aspect. In other words, the trailer must be level with the ground, with the towing hitch and trailer drawbar set at the same height (note the illustration above).

This is particularly important when towing twin axle trailers!

- The trailer should be level with the ground when loaded.
- The height of the drawbar hitch point should be set so that the trailer is level when connected to the loaded vehicle.

Points to remember:

- When calculating the laden weight of the trailer, remember to include the weight of the trailer PLUS the load.
- The recommended trailer nose weight, plus the combined weight of the vehicle's load-carrying area and rear seat passengers, must never exceed the specified maximum rear axle load. See **Vehicle Weights, 291**.
- Before balancing the combination, ensure that:

  All doors are closed.

  The engine is running.

  On-road ride height is selected.

  This ensures that the towing hitch is at the correct height.
- Where the load can be divided between trailer and tow vehicle, loading more weight into the vehicle will generally improve the stability of the combination.
- Towing regulations vary from country to country. Always ensure national regulations governing towing weights and speed limits are observed (refer to the relevant national motoring organisation for information). The vehicle's maximum permissible towed weight refers to its design limitations and NOT to any specific territorial restriction. See **Vehicle Weights, 291**.

***Note:** When towing do not exceed 100 km/h (60 mph), or 80 km/h (50 mph) when the temporary spare wheel is in use. See **WHEELS AND TYRES, 290**.*

Gear range selection

To avoid overheating the gearbox, it is not advisable to tow heavy trailer loads at speeds of less than 32 km/h (21 mph) using the transfer gearbox in HIGH range. Select LOW range instead.

Vehicle weights

WARNING

In the interest of safety, the gross vehicle weight, maximum rear axle weight, maximum trailer weight and tow hitch load (nose weight) must not be exceeded.

The nose weight, plus the combined weight of the vehicle's load carrying area and rear seat passengers, must never exceed the specified maximum rear axle load. See Vehicle Weights, 291.

Exceeding allowable vehicle and axle loads will increase the risk of tyre and suspension failure, increase stopping distance and adversely affect vehicle handling and stability. This may result in a crash or roll-over.

When loading a vehicle to its maximum weight (gross vehicle weight), ensure that axle loading does not exceed the permitted maximum values. It is the driver's responsibility to limit the vehicle load in such a way, that neither the maximum axle loads, nor the gross vehicle weight, are exceeded. The most accurate method of determining load distribution is by using a public weighbridge.

Nose weight must be the greater of 50 kg or 7% of the actual trailer laden weight, up to the maximum tow hitch load. Nose weight can be measured using a proprietary brand of nose weight indicator.

Trailer socket

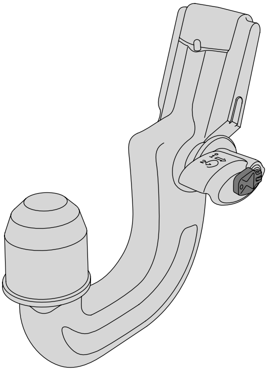
The trailer socket is located alongside the rear towing eye, behind the rear bumper cover. See **Removing the rear cover, 207**.

The vehicle's electrical system is configured to support all towing requirements and the electrical socket fitted complies with legal requirements for the specific territory in which the vehicle was sold.

All towing circuits are independently fused in a satellite fusebox located in the lower loadspace trim panel. See **Tow hitch fuses, 270**.

ESSENTIAL TOWING CHECKS	
Tyre pressures:	Increase rear pressures of towing vehicle to those for Maximum gross vehicle weight conditions. See **WHEELS AND TYRES, 290**. Ensure trailer/caravan tyres are at recommended pressures.
Nose weight:	If the vehicle is loaded to the Gross Vehicle Weight (GVW), the nose weight is limited to 150 kg (330 lb). If a greater nose weight is necessary (up to 250 kg (550 lb) maximum), vehicle load should be reduced to ensure the GVW and rear axle weights are not exceeded. See **Vehicle Weights, 291**.
Breakaway cable or secondary coupling	A breakaway cable or secondary coupling MUST be attached. If the trailer/caravan is fitted with brakes, it is usual for an attached breakaway cable to operate the brakes in the event of the coupling becoming detached. See your trailer manufacturer's literature. If your trailer does not have a breakaway cable, a secondary coupling must be attached. Use a suitable point on the towing bracket to securely attach the coupling. It is not advisable to loop cables or couplings around the neck of the tow ball as they could slide off.

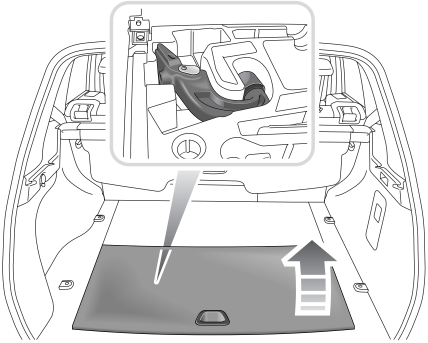
TOW BAR



LAN0284G

Your vehicle is fitted with a towing housing which will accept a detachable tow bar.

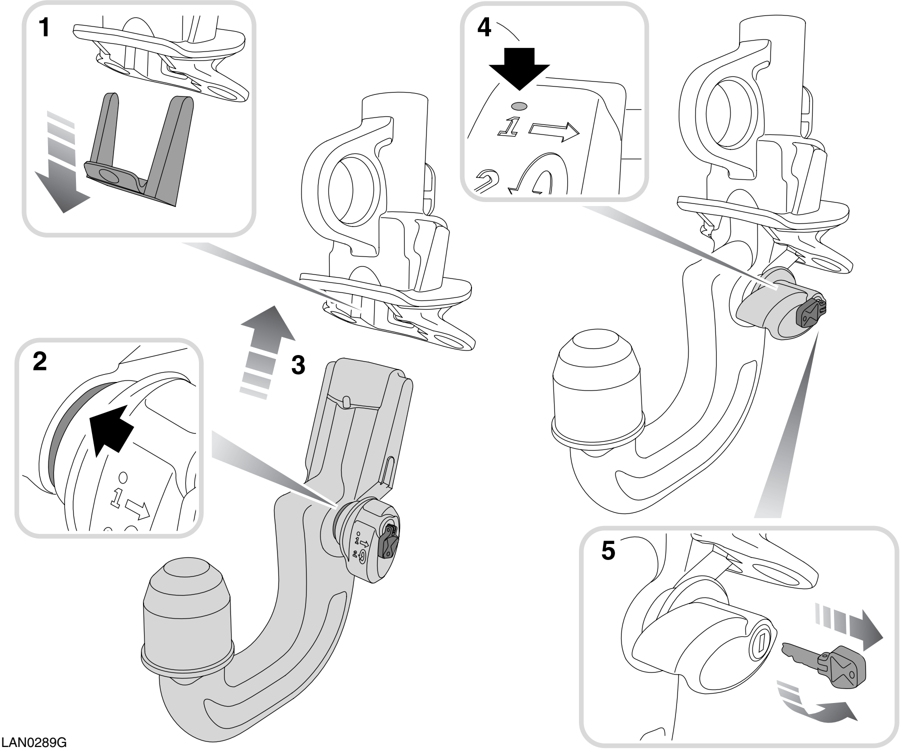
Detachable tow bar stowage



LAN0287G

The tow bar is stowed under an access hatch in the rear loadspace floor.

Fitting the detachable tow bar



WARNING

The tow bar is heavy. Care must be taken when handling it.

WARNING

When handling the tow bar, hold the bottom of the component. Locking into position occurs automatically and causes the locking lever to rotate under spring pressure.

1. Remove the protective cover from the tow bar mounting.

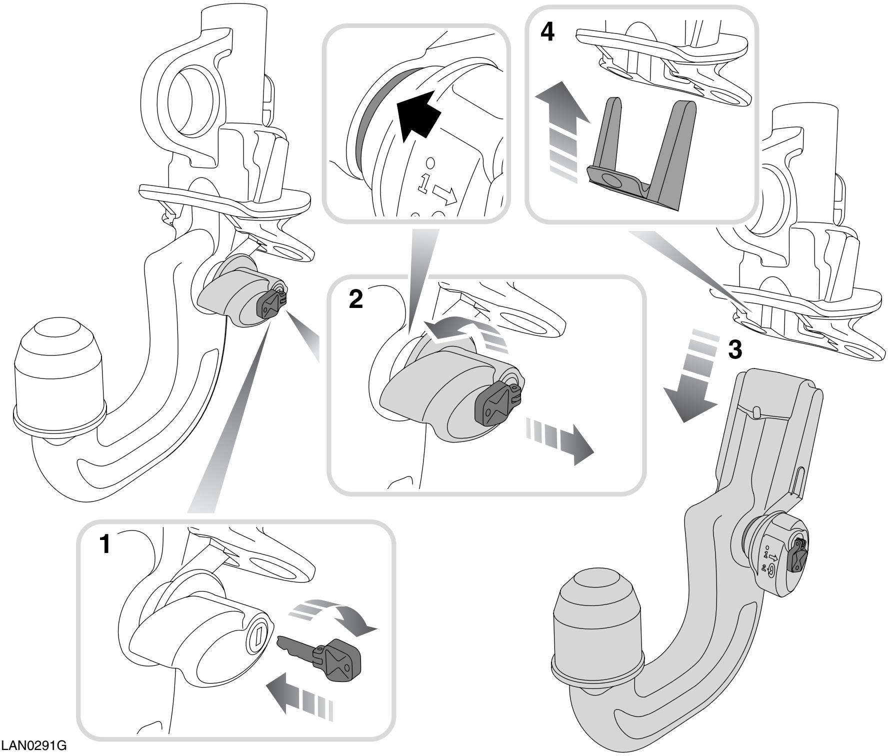
   Note: *The protective cover should be stowed in the tow bar stowage area, while the tow bar is installed.*

2. The tow bar can only be installed when the green locking lever is in the unlocked position.
3. Insert the tow bar into the mounting and push firmly upwards until the tow bar locks into position.
4. The red marker should be completely covered by the green locking lever.
5. A key is provided to prevent theft from the vehicle. Turn the key anticlockwise to lock the tow bar. Remove the key and store in a safe place.

The tow bar must be locked in position before towing. The tow bar can only be locked if it is installed correctly into the tow bar mounting.

It is advised that the tow bar be removed and stored within the vehicle stowage when not in use.

Removing the tow bar



WARNING

The tow bar is heavy. Care must be taken when handling it.

1. Insert the key and turn it clockwise to unlock the tow bar.
2. To remove the tow bar, pull the handle outwards and rotate the handle anticlockwise until a click is heard. The marker on the handle should show red.
3. Carefully lower the tow bar and place it in its stowage area and fully secure it.
4. Replace the protective towing cover in the tow bar mounting. Press the bottom of the cover to fix it in position.

TOWING EYES

WARNING

The towing eyes at the front and rear of the vehicle are designed for on-road vehicle recovery purposes only and must NOT be used to tow a trailer or caravan.

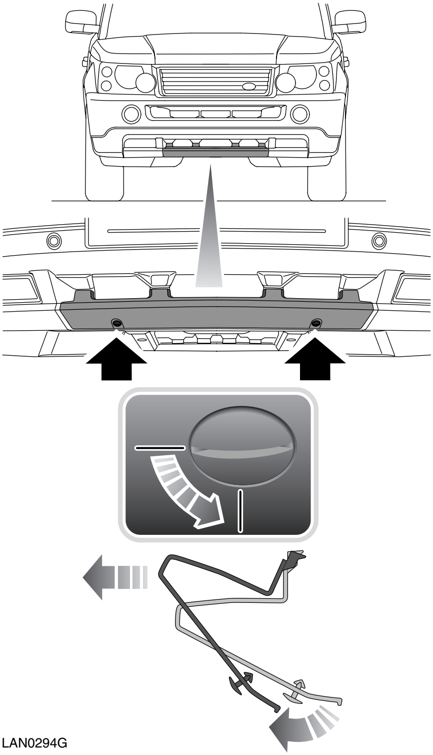
Use of the towing eyes for purposes other than their designed intention could result in damage or injury.

Front towing eye

A front towing eye, set behind a removable panel in the lower front bumper, is provided at the front of the vehicle for on-road recovery.

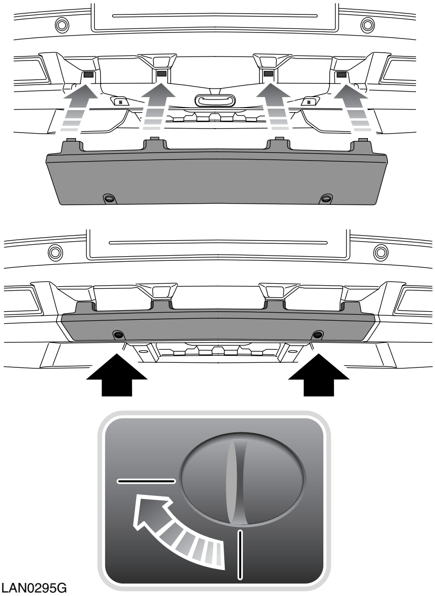
Before driving off-road, remove the panel from the lower front bumper, as a precaution against accidental loss.

Removing the panel



Rotate each of the fasteners through a quarter turn with a coin (or something similar), to loosen the panel. Rotate the lower edge forwards then pull the panel to release the four top edge hooks from their locating holes.

Refitting the panel

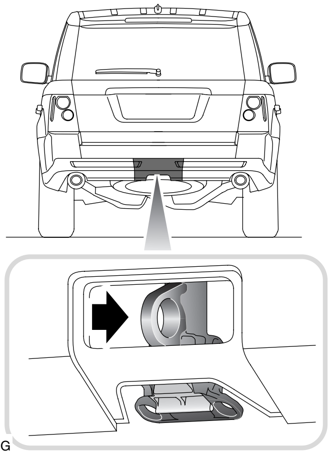


LAN0295G

Offer up the panel to the bumper and ensure that the four hooks on the top edge engage with the holes in the bumper. Rotate the lower edge backwards ensuring that the lower edge is located in the bumper channel.

Tighten the fasteners by turning each clockwise through a quarter turn.

Rear towing eye

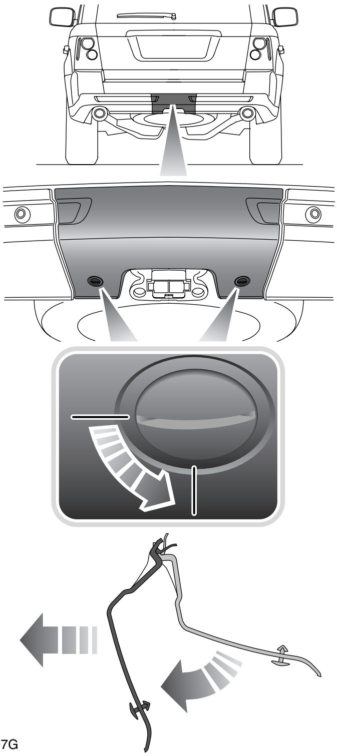


LAN0299G

The towing eye provided at the rear of the vehicle can be used for towing your vehicle or towing another vehicle in recovery situations.

Towing Eyes

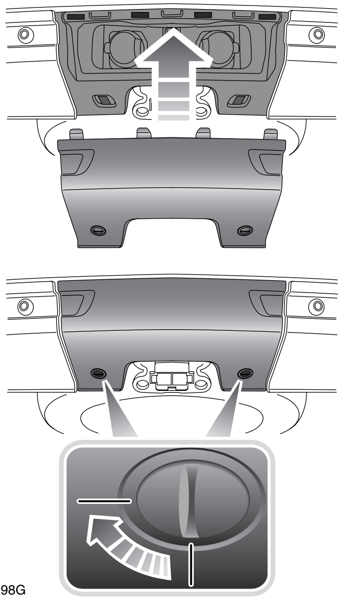
Removing the rear cover



LAN0297G

Rotate each of the fasteners through a quarter turn with a coin (or something similar) to release the lower edge. The cover can then be rotated to release the hooks at the top.

Refitting the rear cover



LAN0298G

Offer up the cover and ensure that the four hooks on the top edge engage with the holes in the bumper.

Tighten the fasteners by turning each clockwise through a quarter turn.

TOWING FOR RECOVERY

Caution: Under no circumstances must your vehicle be towed with only two wheels in contact with the ground. It must be towed with all four wheels on the ground, recovered onto a trailer, or have a combined wheel lift and towing dolly arrangement to lift it clear of the ground.

Most vehicle recovery specialists will load your vehicle onto a trailer - this is the recommended method. However, if it is necessary to recover the vehicle by towing with all four wheels on the ground, use the following procedure:

Towing the vehicle on four wheels

WARNING

DO NOT remove the key or turn the starter switch to position 0 while the vehicle is in motion.

Without the engine running, the brake servo and power steering pump cannot provide assistance; greater effort will therefore be required to operate the brake pedal and turn the steering wheel. Longer stopping distances will also be experienced.

Caution: ALWAYS adhere to the following procedure when towing the vehicle with all four wheels on the ground. Failure to do so could result in unintended vehicle movement or unanticipated vehicle conditions.

When preparing to tow the vehicle on four wheels, it is essential that N is selected on the transmission. Before selecting N, ensure that the parkbrake is applied and properly secured.

Note: *Your vehicle has permanent four-wheel drive and is fitted with a steering lock. The following procedure must be carried out carefully to prevent damage to the vehicle.*

1. Secure the towing attachment from the recovery vehicle to the front towing eye. See **TOWING EYES, 205**.
2. With the parkbrake applied, insert the starter key and turn it to position **II**.
3. Apply the foot brake and place the gear selector lever into the **N** (neutral) position.
4. Turn the starter switch to position **I**. Do not turn the starter switch to position **0**.
5. If required, the starter switch may be turned to position **II**, to operate the brake lamps and direction indicators.

   Note: *Leaving the starter switch in position* ***I*** *or* ***II*** *for extended periods may drain the vehicle battery.*
6. Release the parkbrake before towing the vehicle.

If the above conditions are met, the vehicle may only be towed for a distance of 50 km (30 miles) at a maximum speed of 50 km/h (30 mph).

If the gearbox cannot be set in **N**, the vehicle must not be towed under any circumstances.

If the rear electronic differential has failed while locked, the vehicle must not be towed under any circumstances.

After towing on four wheels

After towing, perform the following steps:

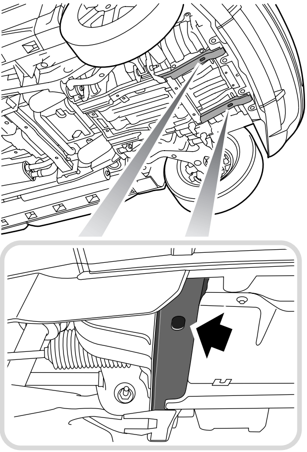
1. Apply the parkbrake.
2. Turn the starter switch to position **II** and apply the foot brake.
3. Place the auto selector lever in the Park position.
4. Turn the starter switch to position **0**.
5. Remove the towing attachment and replace the panel in the front bumper.

RECOVERY ON A TRAILER

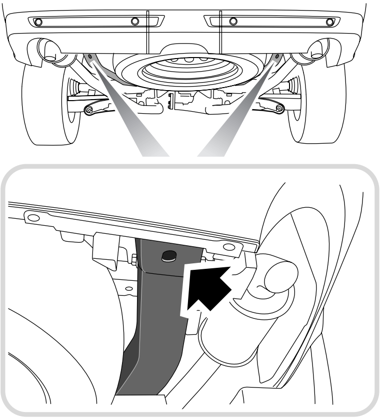
Caution: Once the vehicle is loaded onto the trailer and if the vehicle electronics are operational, the air suspension must be set to Access height. This should be done BEFORE securing the vehicle to the trailer.

Recovery by trailer is the recommended method. Most vehicle recovery specialists will load the vehicle onto a trailer or have a combined wheel lift and dolly arrangement, to lift it clear of the ground.

Lashing eyes



Front lashing eyes



Rear lashing eyes

Pairs of lashing eyes are fixed to the underside of the vehicle - at the front (to the rear of the front wheels) and at the rear (either side of the towbar attachment bracket). DO NOT secure lashing hooks or trailer fixings to any other part of the vehicle.

Note: *The front and rear lashing eyes are for lashing only and must NOT be used for towing.*

ROOF RACKS

WARNING

The MAXIMUM load for approved roof rack systems is 75 kg (165 lb). This weight includes the mass of the roof rack system.

A loaded roof rack can reduce the stability of the vehicle, particularly when cornering and encountering cross winds.

Check to ensure the roof rack and load are secure after 50 km (30 miles) of any journey.

Driving off-road with a loaded roof rack is not recommended. If it is necessary to stow luggage on the roof rack while driving off-road, all loads must be removed before traversing side slopes.

A range of roof rack systems are available as Land Rover approved accessories. For further information about roof rack systems approved for use with your vehicle and advice as to which system would suit your requirements best, please consult your Land Rover Dealer/ Authorised Repairer.

Always observe the following precautions:

- Only fit a roof rack that have been designed for your vehicle. If in doubt, consult your Land Rover Dealer/Authorised Repairer.
- All loads should be evenly distributed, side to side, with any weight bias towards the front of the roof rack system.
- Ensure all loads are secured within the periphery of the roof rack system.

HEADLAMPS

WARNING

Bi-Xenon lamp units operate at a high temperature. If they have recently been in use, allow sufficient time for them to cool down before touching them.

Used Xenon lamp units contain mercury, which is hazardous and can be injurious to health.

The Xenon system generates up to 28 000 volts and contact with this voltage could lead to fatality. Ensure that the headlamps are switched off and turn off the starter switch, before working on the system.

Replacement or maintenance of Xenon lamps should be carried out only be qualified personnel.

There are three types of headlamp systems:

- Halogen high/low beam main lamp with a fill-in high beam halogen lamp alongside.
- Bi-Xenon high/low beam main lamps with a fill-in high beam halogen lamp alongside.
- An Adaptive Front Lighting System (AFS).

Bi-Xenon headlamps

Bi-Xenon units use a Xenon bulb for both high beam and low beam, while a halogen bulb is used for high-beam fill-in. A shutter, operated by a solenoid, changes the direction of the Xenon light beam, to give either low or high beam.

The operational life of a Bi-Xenon lamp is significantly longer than that of a conventional or halogen bulb.

♻ *Seek advice about the proper disposal of Bi-Xenon lamp units, from a Land Rover dealer or your local authority.*

Adaptive Front lighting System (AFS)

AFS is a new lighting system designed to give the driver improved visibility. It has two main components: A swivelling headlamp unit and a static bending lamp, with a beam set to 45 degrees from the centre line of the vehicle.

The headlamp units can swivel left or right, to improve light spread on bends in the road and they operate throughout the vehicle speed range. They also react to braking or acceleration in the vertical plane, to maximise headlamp performance. Additional lighting is supplied by the static bending lamps, at speeds between 30 km/h (18 mph) and 70 km/h (44 mph). If the higher speed is exceeded, the static bending lamps will only reactivate when speed reduces to 60 km/h (37 mph). These headlamps broaden the beam of the headlamps when cornering.

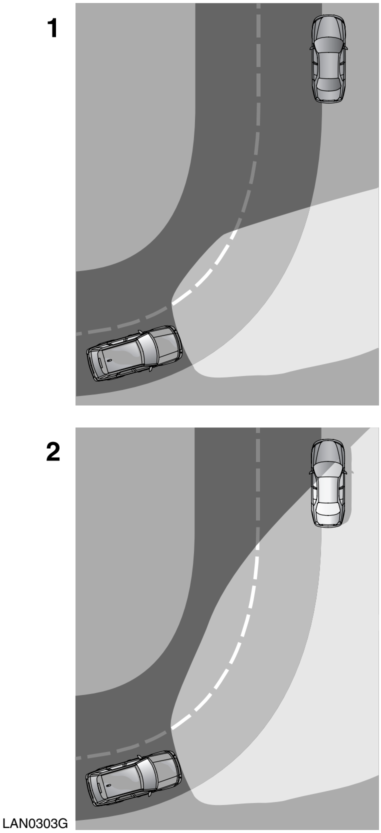
The system takes inputs from the vehicle's road speed and steering angle, to determine the amount of horizontal swivel. The amount of swivel is highest at low manoeuvring speeds and reduces as speed increases.

Static bending lamps operate when the system detects a steering wheel rotation of 70 degrees or more.

If reverse gear is selected, the lamps return to the central position and the unit's swivelling capability is disabled.

The AFS advantage

1. Shows the light spread of a vehicle not fitted with AFS.
2. Shows the light spread of a vehicle fitted with AFS.



Static bending lamps

These lamps broaden the beam of the headlamps when cornering during normal night driving.

Additional lighting comes from the static bending lamps which have a beam set to 45 degrees outward from the centre line of the vehicle.

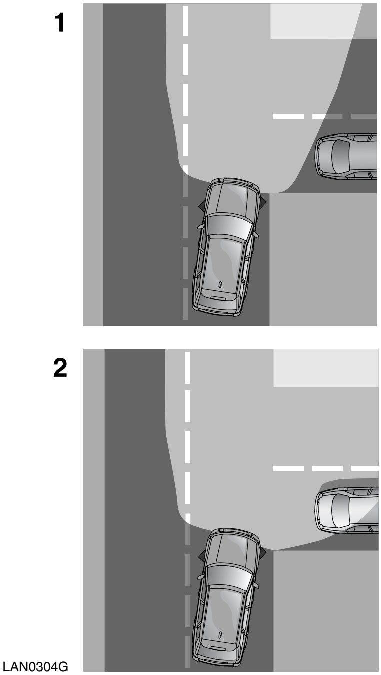
The system switches on the lamp if it has received an input from the direction indicator. As the system is ignition-based, the lamps will not stay on, even if the vehicle is parked with the direction indicator lever in the operating position.

Only the lamp on the same side as the operating direction indicator comes on.

Operating the direction indicators will also activate the relevant lamp.

If reverse gear is selected, the lamps return to the central position and the unit's swivelling capability is disabled unless the direction indicators are operating.

1. Shows the light spread of a vehicle not fitted with AFS.
2. Shows the light spread of a vehicle fitted with AFS.



ROUTINE MAINTENANCE

Regular systematic maintenance is the key to ensuring the continued reliability and efficiency of your vehicle.

Maintenance is the owner's responsibility and you must ensure that owner maintenance operations, oil services, inspections and brake fluid and coolant changes are carried out when required and according to the manufacturer's recommendations.

The routine maintenance requirements for your vehicle are shown in the Service Portfolio book. Most of this necessary workshop maintenance requires specialised knowledge and equipment, and should preferably be entrusted to a Land Rover Dealer/Authorised Repairer.

Service Portfolio

The Service Portfolio book includes a Service Record section, which enables a record to be kept of all the oil services and inspections that are carried out on the vehicle. This section of the book also provides a facility for the Land Rover Dealer/Authorised Repairer to record brake fluid changes.

Ensure your Land Rover Dealer/Authorised Repairer signs and stamps the book after each oil service and inspection.

OWNER MAINTENANCE

Caution: Any significant or sudden drop in fluid levels, or uneven tyre wear, should be reported to a Land Rover Dealer/Authorised Repairer without delay.

In addition to the routine services and inspections referred to previously, a number of simple checks must be carried out more frequently. You can carry out these checks yourself and advice is given on the pages that follow.

Daily checks

- Operation of lamps, horn, direction indicators, wipers, washers and warning indicators.
- Operation of seat belts and brakes.
- Look for fluid deposits underneath the vehicle that might indicate a leak.

Weekly checks

- Engine oil level.

  Note: *The engine oil level should be checked more frequently if the vehicle is driven for prolonged periods at high speeds.*
- Brake fluid level.
- Power steering fluid level.
- Dynamic Response fluid level.
- Screen washer fluid level.
- Tyre pressures and condition.
- Operate air conditioning.

All fluid specifications and capacities are shown in **LUBRICANTS AND FLUIDS, 286**.

SAFETY IN THE GARAGE

WARNING

Under no circumstances should any part of the fuel system be dismantled or replaced by anyone other than a suitably qualified motor vehicle technician. Failure to comply with this instruction may result in fuel spillage with a consequent serious risk of fire.

- **DO NOT work beneath the vehicle with the wheel changing jack as the only means of support.**
- **Ensure sparks and naked lights are kept away from the engine compartment.**
- **Wear protective clothing, including, where practicable, gloves made from an impervious material.**
- **Remove metal wrist bands and jewellery before working in the engine compartment.**
- **DO NOT allow tools or metal parts of the vehicle to make contact with the battery leads or terminals.**
- **NEVER leave the engine running in an unventilated area - exhaust gases are poisonous and extremely dangerous.**

WARNING

- **Keep clear of all fans while working in the engine compartment.**
- **Keep your hands and clothing away from drive belts and pulleys.**
- **If the vehicle has been driven recently, DO NOT touch exhaust and cooling system components until the engine has cooled.**
- **DO NOT touch electrical leads or components while the engine is running, or with the starter switch turned on.**

Poisonous fluids

Fluids used in motor vehicles are poisonous and should not be consumed or brought into contact with open wounds. These include; battery acid, antifreeze, brake and power steering fluid, petrol, diesel, engine oil and windscreen washer additives.

For your own safety, ALWAYS read and obey all instructions printed on labels and containers.

Used engine oil

Prolonged contact with engine oil may cause serious skin disorders, including dermatitis and cancer of the skin. ALWAYS wash thoroughly after contact.

♻ *It is illegal to pollute drains, water courses or soil. Use authorised waste disposal sites to dispose of used oil and toxic chemicals.*

EMISSION CONTROL

Your vehicle is fitted with various items of emission and evaporative control equipment designed to meet specific territorial requirements. You should be aware that unauthorised replacement, modification or tampering with this equipment by an owner or repair shop may be unlawful and subject to legal penalties.

In addition, engine settings must not be tampered with. These have been established to ensure that your vehicle complies with stringent exhaust emission regulations. Incorrect engine settings may adversely affect exhaust emissions, engine performance and fuel consumption, as well as causing high temperatures, which will result in damage to the catalytic converter and the vehicle.

ROAD TESTING DYNAMOMETERS (rolling roads)

Because your vehicle is equipped with anti-lock brakes and permanent four-wheel drive, it is essential that any dynamometer testing is carried out ONLY by a qualified person familiar with the dynamometer testing and safety procedures practised by Land Rover Dealers/Authorised Repairers. Contact your Land Rover Dealer/Authorised Repairer for further information.

DRIVING IN ARDUOUS CONDITIONS

Special operation conditions

When a vehicle is operated in extremely arduous conditions, more frequent attention must be paid to servicing requirements.

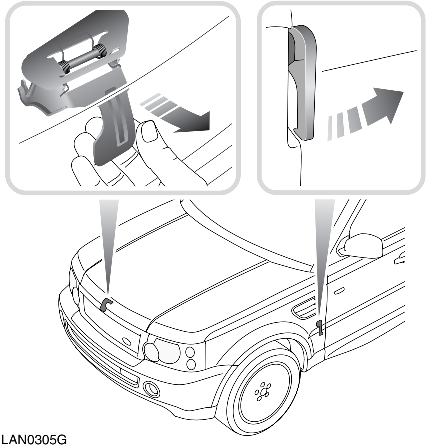
For example: if your vehicle experiences deep wading conditions, even DAILY servicing could be necessary to ensure the continued safe and reliable operation of the vehicle.

Arduous driving conditions include:

- Driving in dusty and/or sandy conditions.
- Driving on rough and/or muddy roads and/or wading.
- Driving in extremely hot conditions.
- Towing a trailer or driving in mountainous conditions.

Contact a Land Rover Dealer/Authorised Repairer for advice.

BONNET OPENING



1. From inside the vehicle on the left hand side, pull the bonnet release handle (see upper inset).
2. Lift the bonnet safety catch lever located below the centre point of the words LAND ROVER (lower inset). While holding the lever, raise the bonnet.

Closing the bonnet

WARNING

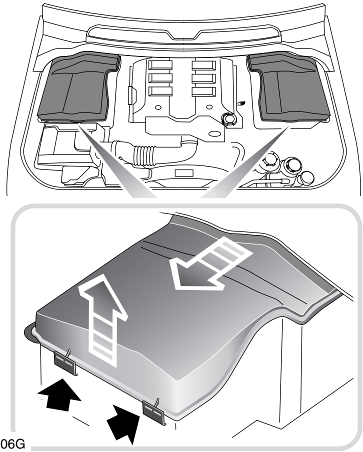
DO NOT drive with the bonnet retained by the safety catch alone.

Lower the bonnet until the safety catch engages, then using both hands, press the bonnet down until the catches click.

After closing the bonnet, check that the lock is fully engaged by attempting to lift the front edge of the bonnet. This should be free from all movement.

UNDER-BONNET COVERS

Removal



Press the two forward tabs and lift the front edge of the cover. Once the front edge of the cover is free, slide the cover towards the front of the vehicle.

Fitting

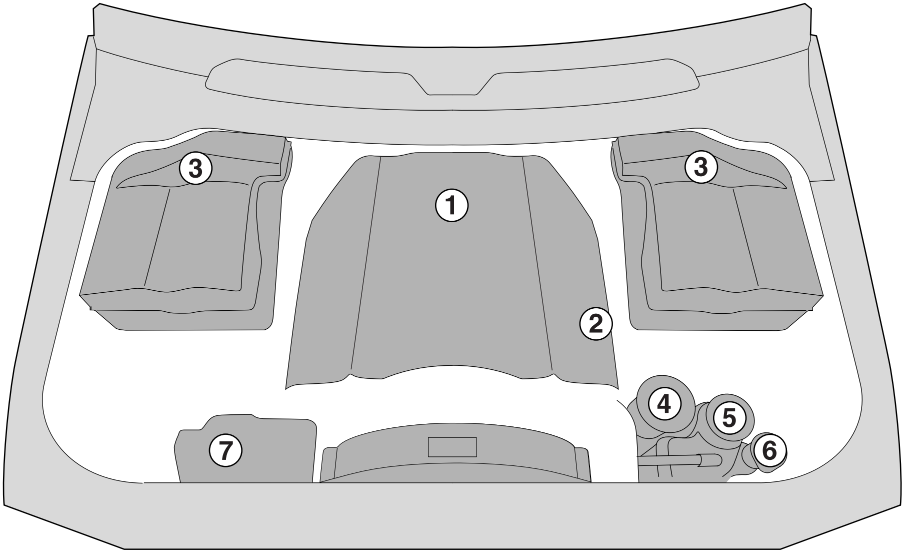
Caution: Ensure that no pipes, cables, or other items have been trapped between the cover and casing.

Slide the rear edge of the cover under the rubber trim fitted to the scuttle panel. Once the front edge of the cover is aligned with the front edge of the casing, press the front of the cover down until the two tabs click into place.

WEEKLY FLUID CHECKS

WARNING

While working in the engine compartment, ALWAYS observe the safety precautions listed under SAFETY IN THE GARAGE, 215.



LAN0307G

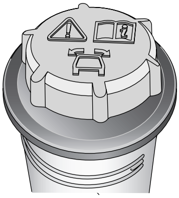
7. Dynamic Response reservoir (Yellow cap)



LAN0314G

CHECK AND TOP-UP

The oil consumption of your engine is influenced by many factors. Diesel engines consume slightly more oil than petrol engines. Under high loads your engine will also consume more oil.

Check the oil level at least every 400 km (250 miles), when the engine is COLD and with the vehicle resting on level ground.

Note: *If it is necessary to check the oil level when the engine is hot, switch off the engine and let the vehicle stand for five minutes to allow the oil to drain back into the sump. DO NOT start the engine.*

As a general guide, if the level on the dipstick:

- is nearer to the upper mark or hole than the lower, add no oil.
- is nearer to the lower mark or hole than the upper, add half a litre (one pint) of oil.
- is below the lower mark or hole, add one litre (two pints) of oil and re-check the level after a further five minutes.

Oil specification

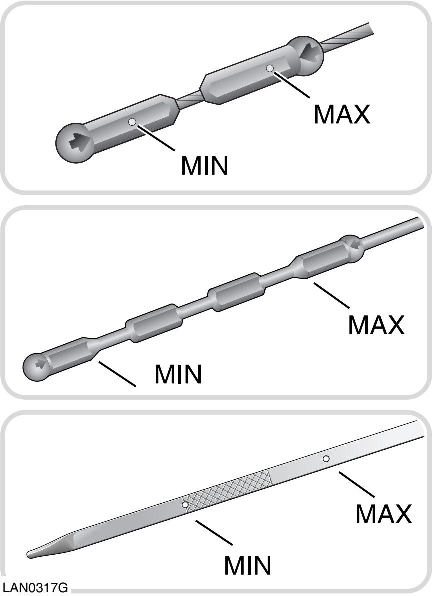
Caution: Your vehicle warranty may be invalidated if damage is caused by use of improper engine oil. Low quality or obsolete oils DO NOT provide the protection required by modern, high performance engines. Failure to use an oil that meets the required specification could cause excessive engine wear, a build up of sludge and deposits, and increase pollution. It could also lead to engine failure.

It is essential to use an oil suitable for the climatic conditions in which the vehicle is to be operated. Precise specifications are shown in **LUBRICANTS AND FLUIDS, 286**. If in doubt, contact your Land Rover Dealer/Authorised Repairer.

Checking oil level

1. Withdraw the dipstick and wipe the blade clean.
2. Fully re-insert the dipstick and withdraw again to check the level, which should NEVER be allowed to fall below the lower mark or hole on the dipstick.
3. To top-up, unscrew the oil filler cap and add oil to maintain the level between the UPPER and LOWER marks or holes on the dipstick.

   DO NOT OVERFILL! Clean up any oil spillage incurred when topping-up.
4. Check the oil level again.



ENGINE COOLANT

WARNING

NEVER remove the filler cap when the engine is hot - escaping steam or scalding water could cause serious personal injury.

Unscrew the filler cap slowly, allowing the pressure to escape before removing completely.

Avoid spilling antifreeze onto a hot engine - a fire may result.

Caution: NEVER run the engine without coolant.

Antifreeze will damage painted surfaces; soak up any spillage with an absorbent cloth immediately and wash the area with a mixture of car shampoo and water.

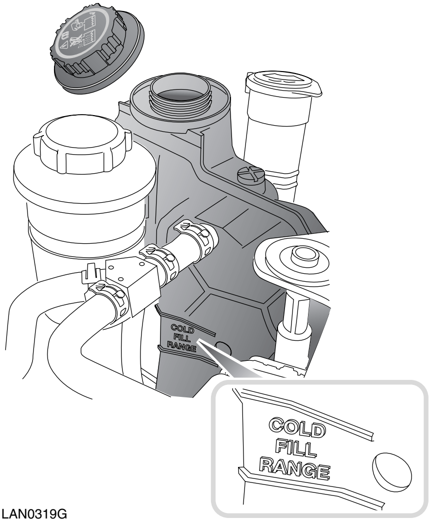
NEVER top-up with salt water. When travelling in territories where the water supply contains salt, always ensure you carry a supply of fresh (rain or distilled) water.

The coolant level in the expansion tank should be checked at least weekly (more frequently in high mileage or arduous operating conditions).

Always check the level WHEN THE SYSTEM IS COLD. Coolant expands when hot and may cause the level to extend beyond the upper level indicator mark.

If it is necessary to remove the filler cap before the system has fully cooled, loosen the cap slowly, allowing the air pressure to escape gradually.

TOP-UP



Top-up with a 50% mixture of antifreeze and water. See **LUBRICANTS AND FLUIDS, 286**. Top-up to the upper level indicator mark located above the COLD FILL RANGE text, on the side of the expansion tank. This should be viewed from standing in front of the vehicle. Ignore any coolant visible in the top section of the tank.

Ensure the cap is tightened fully after top-up is completed by turning the cap until the ratchet cap clicks.

If the level has fallen appreciably, suspect leakage or overheating and arrange for your Land Rover Dealer/Authorised Repairer to examine the vehicle.

ANTIFREEZE

WARNING

Antifreeze is poisonous and can be fatal if swallowed - keep containers sealed and out of the reach of children. If accidental consumption is suspected, seek medical attention immediately.

If the fluid comes into contact with the skin or eyes, rinse immediately with plenty of water.

Antifreeze contains important corrosion inhibitors. The antifreeze content of the coolant must be maintained at 50% ± 5% all year round (not just in cold conditions). To ensure the anti-corrosion properties of the coolant are retained, the antifreeze content should be checked once a year and completely renewed every ten years, regardless of distance travelled. Failure to do so may cause corrosion of the radiator and engine components.

The specific gravity of a 50% antifreeze solution at 20°C (68°F) is 1.075 and protects against frost down to -40°C (-40°F).

Coolant specification

Use ONLY a 50% mix of water and an approved antifreeze. See **LUBRICANTS AND FLUIDS, 286**.

In an emergency - and only if this type of antifreeze is unavailable - top-up the cooling system with clean water, but be aware of the resultant reduction in frost protection. DO NOT top-up or refill with conventional antifreeze formulations. If in doubt consult a Land Rover Dealer/Authorised Repairer.

BRAKE FLUID

WARNING

Brake fluid is highly toxic - keep containers sealed and out of the reach of children. If accidental consumption of fluid is suspected, seek medical attention immediately.

If the fluid comes into contact with the skin or eyes, rinse immediately with plenty of water.

Take care not to spill the fluid onto a hot engine - a fire may result.

DO NOT drive the vehicle with the fluid level below the MIN mark.

WARNING

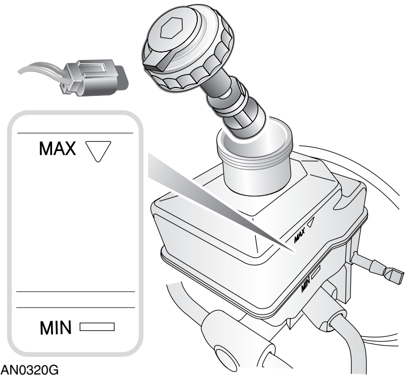
Contact your Land Rover Dealer/Authorised Repairer immediately if brake pedal travel is unusually long or if there is any appreciable drop in brake fluid level.

Caution: Brake fluid will damage painted surfaces; soak up any spillage with an absorbent cloth immediately and wash the area with a mixture of car shampoo and water.

The fluid level may fall slightly during normal use as a result of brake pad wear but should not be allowed to fall below the **MIN** mark. Any substantial drop in fluid indicates a leak in the system, in which case the vehicle must NOT be driven and you should contact your Land Rover Dealer/Authorised Repairer.

With the vehicle on level ground, check the fluid level at least every week (more frequently in high mileage or arduous operating conditions). Check the level visually through the side of the transparent reservoir without removing the filler cap.

Top-up



Wipe the filler cap clean before removing to prevent dirt from entering the reservoir.

Disconnect the electrical lead.

Unscrew the cap (1/8 turn) and top-up the reservoir to the **MAX** mark using a specified brake fluid. See **LUBRICANTS AND FLUIDS, 286**.

Use only new fluid from an airtight container. Old fluid from opened containers or fluid previously bled from the system will have absorbed moisture, which will adversely affect performance, and must NOT be used. **DO NOT OVERFILL!**

Replace the cap and reconnect the electrical lead, ensuring that the lead points to the centre-line of the vehicle.

Brake fluid must be completely renewed every two years regardless of distance travelled.

Brake pedal free travel: No adjustable free travel.

POWER STEERING FLUID

WARNING

Power steering fluid is highly toxic - keep containers sealed and out of reach of children. If accidental consumption of fluid is suspected, seek medical attention immediately.

If the fluid comes into contact with the skin or eyes, rinse immediately with plenty of water.

Do not spill the fluid onto a hot engine - a fire may result.

Caution: Power steering fluid will damage painted surfaces: Soak up any spillage with an absorbent cloth immediately and wash the area with a mixture of car shampoo and water.

Caution: The engine must NOT be started if the fluid level has dropped below the lower mark - severe damage to the steering pump could result.

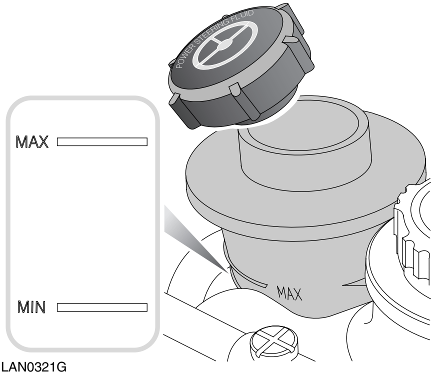
Any large or sudden drop in the fluid level must be investigated by a qualified Land Rover Dealer/Authorised Repairer.

If it can be established that fluid loss is slow, then the reservoir may be topped-up to the upper level mark to enable the vehicle to be driven to the nearest qualified Land Rover Dealer/Authorised Repairer for examination.

Driving of the vehicle to repair should not be attempted if there is danger that the leaked fluid will come into contact with a hot surface such as the exhaust.

Check and top-up

Check and top-up the fluid level ONLY with the engine switched off and the system cold, and ensure that the steering wheel is not turned after stopping the engine.



LAN0321G

The level of fluid can be seen through the translucent body of the reservoir which has two marks on it to indicate maximum and minimum levels.

If necessary, add fluid to the reservoir until the level is between the upper and the lower marks. **DO NOT fill above the upper mark.** See **LUBRICANTS AND FLUIDS, 286**.

DYNAMIC RESPONSE FLUID

WARNING

Dynamic Response fluid is highly toxic - keep containers sealed and out of reach of children. If accidental consumption of fluid is suspected, seek medical attention immediately.

If the fluid comes into contact with the skin or eyes, rinse immediately with plenty of water.

Do not spill the fluid onto a hot engine - a fire may result.

Caution: Dynamic Response fluid will damage painted surfaces: Soak up any spillage with an absorbent cloth immediately and wash the area with a mixture of car shampoo and water.

Caution: The engine must NOT be started if the fluid level has dropped below the lower mark - severe damage to the Dynamic Response system could result.

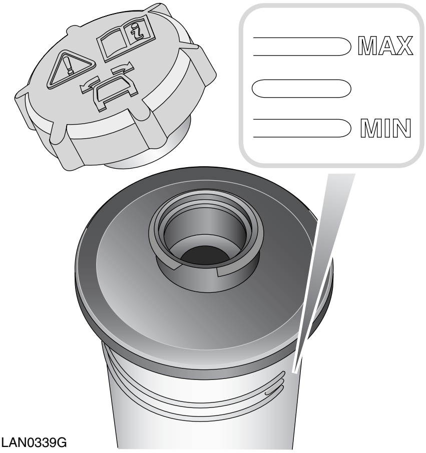
Any large or sudden drop in the fluid level must be investigated by a qualified Land Rover Dealer/Authorised Repairer.

If it can be established that fluid loss is slow, then the reservoir may be topped-up to the upper level mark to enable the vehicle to be driven to the nearest qualified Land Rover Dealer/Authorised Repairer for examination.

Driving of the vehicle to repair should not be attempted if there is danger that the leaked fluid will come into contact with a hot surface such as the exhaust.

Check and top-up

Check and top-up the fluid level ONLY with the engine switched off and the system cold.



The level of fluid can be seen through the translucent body of the reservoir which has two marks on it to indicate maximum and minimum levels.

If more fluid is needed, first wipe the filler cap clean to prevent dirt from entering the reservoir, then twist the cap a quarter turn anti-clockwise and pull to remove. Add fluid to the reservoir until the level is between the upper and the lower marks. **DO NOT fill above the upper mark.** See **LUBRICANTS AND FLUIDS, 286**.

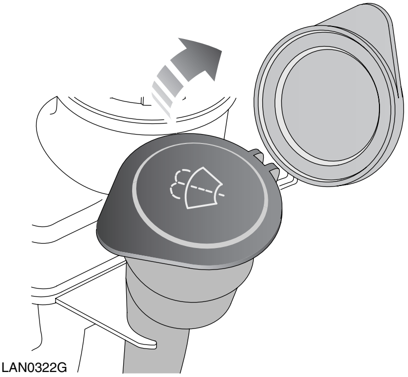
WINDSCREEN WASHER TOP-UP

WARNING

Some windscreen wash products are inflammable, particularly if high or undiluted concentrations are exposed to sparking. DO NOT allow windscreen wash to come into contact with naked flames or sources of ignition.

Caution: DO NOT use an antifreeze or vinegar/water solution in the washer reservoir - antifreeze will damage painted surfaces, while vinegar can damage the windscreen washer pump.

Body panels may suffer discolouration as a result of screenwash spillage. Take care to avoid spillage, particularly if an undiluted or high concentration is being used. If spillage occurs, wash the affected area immediately with water.



The windscreen washer reservoir supplies both front and rear screen washer jets and headlamp washer jets.

Check the reservoir level at least every week and top-up with a mixture of water and Land Rover Parts STC 8249 Screenwash. Preferably mix the recommended quantities of water and screenwash in a separate container before topping-up, and always follow the instructions on the container. Note that an approved screenwash is necessary to prevent freezing in very cold weather.

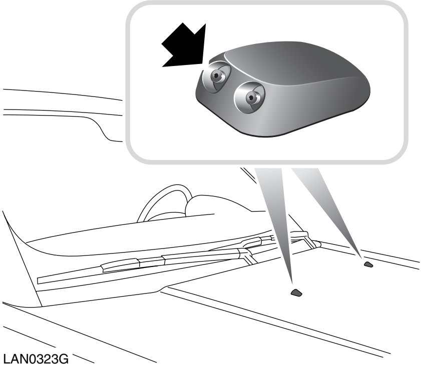
Operate the washer switches periodically to check the nozzles are clear and properly directed.

Note: *Ensure an approved screen washer solvent is used in the windscreen washer reservoir to prevent freezing.*

WASHER JETS

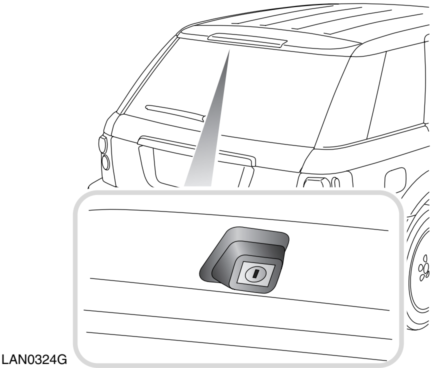
Front

The windscreen washer jets are set during manufacture and should not need adjusting. However, if adjustment is ever necessary, insert a needle into the jet orifice and lever gently to position each jet, so that the spray is directed towards the centre of the windscreen.



Should any jet become obstructed, insert a needle or thin strand of wire into the orifice to clear the blockage.

Rear



Headlamp

The spray jets are set during manufacture and should not need to be adjusted.

WIPER BLADE REPLACEMENT

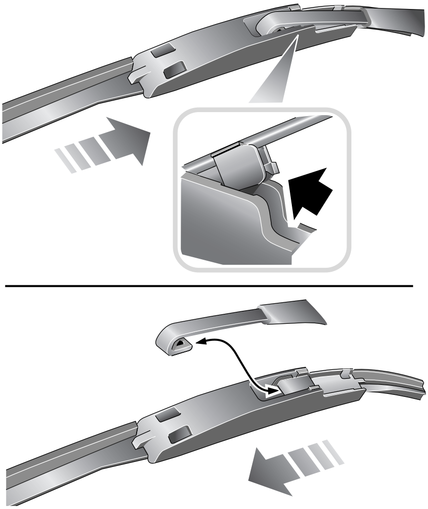
Only fit replacement wiper blades that are identical to the original specification.

Grease, silicone and petrol-based products impair the blade's wiping capability. Wash the wiper blades in warm soapy water and periodically check their condition.

If signs of hardness or cracking in the rubber are found, or if the wipers leave streaks or unwiped areas on the windscreen during use, then the wiper blades should be replaced.

Clean the windscreen regularly with an approved glass cleaner and ensure the screen is thoroughly cleaned before fitting replacement wiper blades.

Front

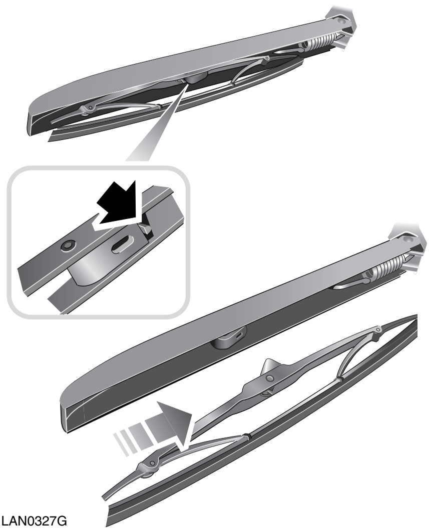


LAN0325G

Lift the wiper arm away from the screen and pivot the blade assembly away from the arm. Press the tab (arrowed in inset), to release the blade assembly and slide the assembly off the end of the wiper arm. Carefully replace the arm to its stowed position.

To replace, position the wiper arm into the aperture in the middle of the blade assembly and push firmly into position until the blade clips into place.

Rear



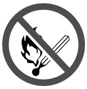
Lift the wiper arm away from the rear window.

Press the tab (arrowed in inset), to release the blade assembly and slide the assembly off the end of the wiper arm. Carefully replace the arm to its stowed position.

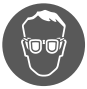
To replace, position the blade assembly onto the inside of the wiper arm and push firmly into position until the blade clips into place.

BATTERY WARNING SYMBOLS

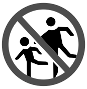
There is a label on the battery, depicting a number of warning symbols. The warning symbols are as follows:



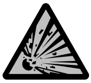
No smoking, flames, no sparks (Red).



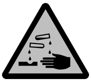
Shield eyes (Blue).



Keep away from children (Red).



Explosive gas (Yellow).



Battery acid (Yellow).

BATTERY CARE

WARNING

Batteries contain acid, which is both corrosive and poisonous. If spillage occurs:

- **On clothing or the skin - remove any contaminated clothing immediately, flush the skin with large amounts of water, and seek medical attention urgently.**
- **In the eyes - flush with clean water immediately for at least 15 minutes. Seek medical attention urgently.**

Swallowing battery acid can be fatal unless immediate action is taken - seek medical attention urgently.

Always wear eye protection when working with batteries.

For your safety, remove all metal wrist bands and jewellery before working in the engine compartment and never allow the battery terminals or vehicle leads to make contact with tools or metal parts of the vehicle.

Battery posts, terminals and related accessories contain lead and lead compounds. Wash hands after handling.

A low maintenance battery, specifically designed for use with this vehicle, is fitted in the engine compartment.

In hot climates, more frequent checks of the battery electrolyte level are required. If necessary, the battery cells can be topped up with distilled water.

The exterior of the battery should occasionally be wiped clean, to remove any dirt or grease.

If a new battery is to be fitted, it must be the same type as the original. The use of unapproved batteries is not recommended and could invalidate the vehicle warranty.

We recommend that the battery charge is checked frequently if the vehicle is used mostly for short distance trips or if it is not used for long periods of time.

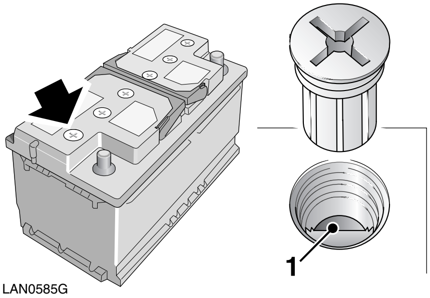
Note: *The service life of the battery is dependent on its condition of charge. It must always be sufficiently charged for the battery to last the optimum length of time.*

Note: *Do not connect any 12 volt equipment (for example, a 12 volt lamp), directly to the battery terminals. Use one of the accessory sockets located within the vehicle for connecting Land Rover approved accessories.*

Check and replenish battery electrolyte

WARNING

Do not allow naked lights near the battery (batteries generate hydrogen gas which is highly flammable).



Unscrew the six cell plugs.

Check that the electrolyte is level with the plastic level indicator **1**. If necessary, top up with distilled water, but do not overfill.

Note: *In normal climates this must be carried out at least once a year. During hot weather or in hot climates the electrolyte level must be checked at least every three months.*

Note: *If illumination is required, use a hand held flashlight to inspect the electrolyte level.*

Refit the six cell plugs.

CHARGING THE VEHICLE BATTERY

WARNING

Batteries generate explosive gases, contain corrosive acid and produce levels of electric current sufficient to cause serious injury.

While charging, shield your eyes or avoid leaning over the battery and keep the area around the top of the battery well ventilated.

While charging, always heed the precautions:

- Before charging, disconnect and remove the battery from the vehicle - charging the battery with the cables connected may damage the vehicle's electrical system.
- Make sure the battery charger leads are securely clamped to the battery terminals before switching on the battery charger. Do not move the leads once the charger is switched on.
- When charging is finished, switch off the battery charger before disconnecting the leads from the battery terminals.

Note: *Be aware that a battery will take longer to charge in a cold environment.*

After charging, leave the battery for one hour before reconnecting to the vehicle - this will allow time for explosive gases to disperse, thereby minimising the risk of fire or explosion.

Disconnecting the battery

If the vehicle is already locked and alarmed, you will first have to unlock and disarm it using the remote control.
See **LOCKING/UNLOCKING, 47**.

Note: *If the battery is flat and the vehicle is locked and alarmed, you will first have to unlock the left-hand front door using the starter key.*

Insert the starter key and turn it to position **II**.

Engage the Electric Parking Brake (EPB) or fit wheel chocks. See **CHANGING A WHEEL, 255**.

Remove the starter key and wait two minutes for the engine management system to power down.

Open the bonnet. See **BONNET OPENING, 217**.

Disconnect only the negative (**-**) terminal of the battery.

Reconnecting the battery

Ensure that everything requiring power from the battery - lights, audio, etc - is switched off.

Reconnect the battery lead.

Note: *If the battery was disconnected while it had an insufficient charge to disarm the alarm, the alarm could sound on reconnecting. Operating the remote control or inserting the key into the starter switch will disarm the alarm.*

Insert the starter key and turn to position **II**.

Operate the Electric Parking Brake (EPB) to extinguish the amber warning lamp.

Effects of battery disconnection

After reconnecting the battery, a number of the vehicle systems will be reset automatically. This may take a few minutes. Some systems have to detect certain conditions while the vehicle is being driven before full operability returns. This in no way affects the safe operation of the vehicle.

Battery warning indicator

The red warning indicator in the instrument pack illuminates as a bulb check when the starter switch is turned to position **II** and extinguishes once the engine is running. If it remains on, or illuminates whilst driving, a fault with the battery charging system is indicated. Seek qualified assistance urgently.

CHANGING THE VEHICLE BATTERY

WARNING

Always remove the starter key before disconnecting the battery. Failure to do this may cause a failure of the airbag SRS.

Do not reverse the polarity of the battery - the electrical system may be damaged if the battery leads are connected to the wrong terminals.

Caution: Keep the battery upright at all times - damage will be caused if the battery is tilted more than 45 degrees.

Do not run the engine with the battery disconnected; or disconnect the battery with the engine running.

Disconnect the negative (-) cable first and then the positive (+) cable. When reconnecting, connect the positive cable first and then the negative cable. Do not allow the battery terminals to make contact with metal parts of the vehicle.

Removal

To release the battery from the vehicle, undo the nuts securing the battery clamping plate and remove the clamping plate.

Replacement

Ensure that the battery is fitted the right way round (terminal posts towards the rear of the vehicle) and that the clamping plate is secure. Tighten the clamping plate nuts until the clamping plate is free from movement, but do not over tighten.

Replacement batteries

Only fit a replacement battery of the same type and specification as the original - other batteries could cause a fire hazard when connected to the vehicle's electrical system.

Petrol vehicles	H7 75 amp/hr
Diesel vehicles	H8 90 amp/hr

Battery disposal

Used batteries should be recycled. However, batteries are hazardous - you should seek advice about disposal from a Land Rover Dealer or your Local Authority.

TYRE CARE

WARNING

Defective tyres are dangerous. Do not drive the vehicle if a tyre is damaged, excessively worn, or incorrectly inflated.

Avoid contaminating the tyres with vehicle fluids, as they may cause damage to the tyre.

Avoid spinning the wheels. The forces released, can damage the structure of the tyre and cause it to fail.

If wheel spin is unavoidable due to loss of traction (in deep snow, for example), do not exceed the 50 km/h (30 mph) point on the speedometer.

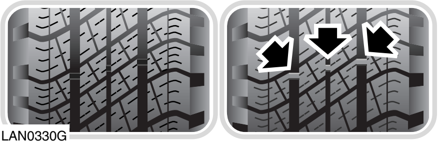
All of the vehicle's tyres (including the spare) should be checked regularly for damage, wear and distortion. If you are in any doubt about the condition of a tyre, have it checked immediately by a tyre repair centre or your Land Rover Dealer/Authorised Repairer.

Tyre wear

Good driving practise will improve the distance you obtain from your tyres and avoid unnecessary damage.

- Always ensure that the tyre pressures are correctly adjusted.
- Always observe the posted speed limits and advisory speeds for bends.
- Avoid pulling away quickly and hard acceleration.
- Avoid making fast turns or braking sharply.
- Wherever possible, avoid potholes and obstacles on the road.
- Do not drive up kerbs or rub the tyres against them when parking.

Wear indicators



WARNING

Wear indicators show at the point of minimum tread. Tyres which have worn to this point will have reduced grip and poor water displacement characteristics.

Caution: If tread wear is uneven across a tyre, or if the tyre wears excessively, the vehicle should be checked by your Land Rover Dealer/Authorised Repairer as soon as possible.

Note: *Tyre condition should be checked after the vehicle has been used off-road. As soon as the vehicle returns to a normal, hard road surface, stop the vehicle and check for damage to the tyres.*

When the tread has worn down to approximately 1.6 mm, wear indicators start to appear at the surface of the tread pattern. This produces a continuous band of rubber across the tread as a visual indicator.

The tyre must be replaced as soon as the wear indicator becomes visible, or sooner, if legislation requires replacement.

Note: *Tread depth should be checked regularly, in some cases more frequently than the service intervals.*

Age degradation

Tyres degrade over time, even when they are not being used. It is recommended that tyres generally be replaced after six years of normal service. Degradation can be caused by ultra violet (U.V.) exposure, hot climates or frequent high loading conditions.

Replace the spare tyre when you replace the other road tyres, due to ageing of the spare tyre.

Punctured tyres

WARNING

Do not drive the vehicle with a punctured tyre. Even if the punctured tyre has not deflated, it is unsafe to use as the tyre may deflate suddenly at any time.

Not all punctures result in the tyre deflating immediately. Therefore, it is important to check the tyres for damage and foreign objects regularly.

When driving, if a sudden vibration or change to the vehicle's handling is noticed, reduce speed immediately. Do not brake or make any sudden manoeuvres or direction changes. Drive slowly to an area away from the main highway and stop the vehicle.

***Note:** Driving the vehicle to a safe area may cause damage to the punctured tyre, but occupant safety is far more important.*

Inspect the tyres for signs of punctures, damage or under-inflation. If any damage or deformity is detected, the tyre should be replaced. If a spare tyre is not available, then the vehicle should be recovered to a tyre repair centre or Land Rover Dealer/Approved repairer.

Replacement tyres

WARNING

Do not fit cross-ply tyres.

Do not fit tubed tyres.

Do not swap tyres around the vehicle. Tyres bed in to the specific characteristics of each wheel position. Swapping them around may affect the vehicle's handling and traction.

Always fit replacement tyres of the same type, and wherever possible, of the same make and tread pattern.

Replacement wheels should be genuine Land Rover parts. This will maintain the designed driving characteristics, both on and off road.

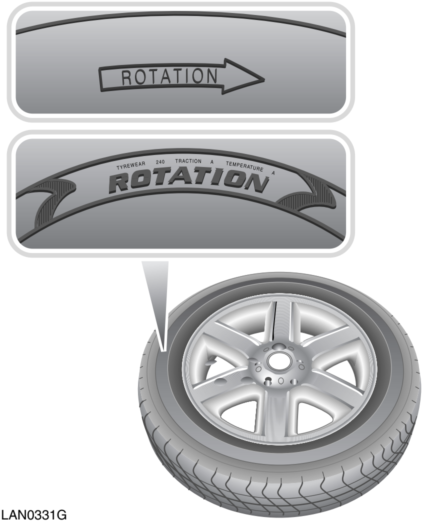
If the use of tyres not recommended by Land Rover is unavoidable, ensure that you read and fully comply with the tyre manufacturer's instructions.

Ideally, tyres should be replaced in sets of four. If this is not possible, replace the tyres in pairs (front and rear). When tyres are replaced, the wheels should always be re-balanced and alignment checked.

The correct tyre specification for your vehicle can be found on the tyre information label. See **Tyre pressure and loading label, 239**. For an explanation of the label information, see **WHEELS AND TYRES, 290**.

Directional tyres

Directional tyres are designed to operate correctly when rotating forwards (when the vehicle is travelling forwards).



ROTATION
TYREWEAR 240 TRACTION A TEMPERATURE A
ROTATION
LAN0331G

Typical directional tyre indicators

Temporary spare tyre

WARNING

If a temporary spare is in use, the vehicle must be driven with caution at reduced speed (80 km/h [50 mph] maximum). A standard wheel and tyre should be fitted as soon as possible, and only one temporary spare wheel should be fitted to the vehicle at any one time.

Tyre pressures

WARNING

If the vehicle has been parked in strong sunlight or used in high ambient temperatures, do not reduce tyre pressures; instead, move the vehicle into the shade and allow the tyres to cool before checking.

Under-inflation causes excessive flexing and uneven wear to the tyre. This can lead to sudden failure. Over-inflation causes a harsh ride, uneven tyre wear and poor handling.

A hot tyre, at or below the recommended cold inflation pressure, is dangerously under-inflated.

Correctly inflated tyres will ensure that you enjoy the best combination of tyre life, ride comfort, fuel economy and road handling.

Under-inflated tyres wear more rapidly, can seriously affect the vehicle's road handling characteristics and fuel consumption, as well as increasing the risk of tyre failure. Over-inflated tyres give a harsher ride and wear unevenly.

Tyre pressures should be checked at least once a week with normal road use, but should be checked daily if the vehicle is used off-road.

It is impossible to determine if a tyre is properly inflated just by looking at it.

The recommended tyre pressures are listed on a label on the B pillar on the driver's side (visible with the driver's door open). See **Tyre pressure and loading label, 239**.

Tyre pressures listed on the tyre information label are considered to be the recommended cold tyre inflation pressure, at maximum gross vehicle weight condition, measured when the tyres are **cold**, after the vehicle has been parked for at least 3 hours or driven less than 3 miles (5 km).

Check the pressures (including the spare wheel) when the tyres are cold - be aware that it only takes 1.5 km (1 mile) of driving to warm up the tyres sufficiently to affect the tyre pressures.

When you drive for more than 3 miles (5 km), the tyres and the air inside them, warm up and it is normal for the tyre pressure to increase above the recommended cold pressure. When checking tyre pressure in this condition, never reduce air pressure.

Note: *Air pressure naturally increases in warm tyres; if it is necessary to check the tyres when they are warm (after the vehicle has been driven for a while), you should expect the pressures to have increased by up to 30 - 40 kPa (0.3 - 0.4 bar/4 - 6 lbf/in^2). In this circumstance, do not let air out of the tyres in order to match the recommended cold tyre pressures.*

Note: *The pressure for your spare tyre should be set to the highest value given for your vehicle's wheel/tyre size combination, and adjusted after fitment.*

Note: *When towing heavy trailers or with the tow vehicle loaded, the additional imposed nose weight may cause the GVW tyre loading to be exceeded. This is permissible provided that road speeds are limited to 100 km/h (60 mph) and rear tyre pressures are increased by at least 20 kPa (3 lbf/in^2). This excludes the temporary spare, where 80 km/h (50 mph) is the maximum permitted speed and tyre pressure should be maintained at the pressures shown on the tyre information label. See* ***Tyre pressure and loading label, 239****.*

Checking tyre pressures

Where possible, always check the tyre pressures when the tyres are cold, using the following procedure:

1. Remove the valve cap.
2. Firmly attach a tyre pressure gauge/inflator to the valve.
3. Read the tyre pressure from the gauge. If required add air to the tyre.
4. If air is added to the tyre, remove the gauge from the valve and re-attach it before checking that the pressure is correct.

   Failure to remove and re-attach the gauge to the valve could cause the gauge to show an incorrect reading.
5. If too much air is added, remove the gauge from the valve and allow air out of the tyre by pressing the centre of the valve.

   Reconnect the gauge to the valve and check that the air pressure is correct. If the pressure is still not correct, repeat this process and re-check.
6. Refit the valve cap.

Note: *It is an offence in certain countries to drive a vehicle with tyres that are not properly inflated in accordance with the vehicle’s proper use.*

Valves

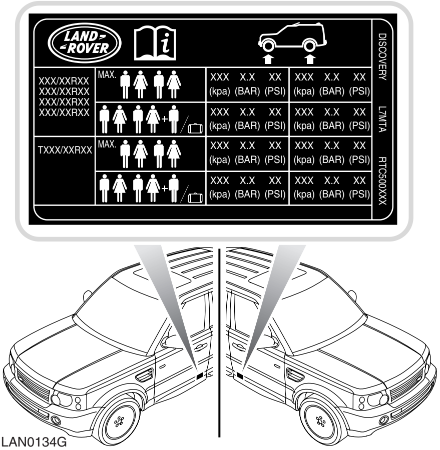
Keep the valve caps screwed down firmly - they prevent dirt from entering the valve. Check the valve for leaks (listen for a tell-tale hissing) when you check the tyre pressure.

Tyre pressure and loading label

WARNING

Tyre pressures should be checked regularly, when cold, using an accurate pressure gauge.

Failure to properly maintain your pressures could increase the risk of tyre failure, with consequential loss of vehicle control and personal injury.

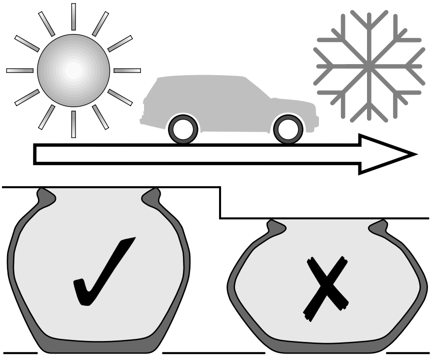


LAN0134G

The tyre pressure and loading label is visible on the pillar behind the drivers door (also known as the B pillar), giving information specific to the wheel and tyre equipment fitted to the vehicle when it was built.

This label contains information relating to tyre and wheel sizes along with recommended pressures for all wheel and tyre combinations.

Pressure compensation for ambient temperature changes



LAN0599G

If the ambient temperature drops, the tyre pressures will decrease, which may cause under-inflation. This should be borne in mind when travelling to, or through, areas of lower temperature.

Under-inflation causes the tyre side wall height to reduce which, in turn, results in uneven tyre wear and a risk of tyre failure.

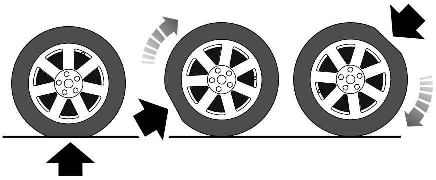
Tyre pressures may be adjusted before setting off on a journey to, or through, areas of low temperature. Alternatively, the tyre pressures can be adjusted when low temperature areas are reached.

Note: *If the tyre pressures are to be adjusted in the lower temperature area, the vehicle should be left standing for at least one hour prior to adjustment.*

Tyre pressures should be increased by 0.14 bar/14 kPa (2 lbf/in^2) for each 10°C (20°F) temperature decrease.

Flat spots

If the vehicle is stationary for a long period when the ambient temperature is high, the tyres may form flat spots. When the vehicle is driven, these flat spots will cause a vibration, which will steadily disappear as the tyres regain their original shape.



LAN0600G

In order to minimise flat-spotting, the tyre pressures can be increased.

Tyre pressures should be increased by 0.14 bar/14 kPa (2 lbf/in^2) for each 10°C (20°F) temperature increase.

Long-term storage

Flat-spotting can be minimised during long-term storage, by increasing the tyre pressures to the maximum indicated on the tyre sidewall.

Note: *The tyre pressures should be reduced to the correct pressure, before the vehicle is driven.*

High performance tyre and wheel combinations

Caution: This vehicle may be fitted with a high performance wheel and low profile tyre combination, designed to give enhanced dry road performance, with consideration for aquaplaning resistance.

Low profile, high speed rated tyres have a softer tread compound. If driven aggressively, they may suffer increased tread wear and a shorter life than can be expected from other tyre types. This wheel and tyre combination is susceptible to damage if driven off-road. This combination has less performace in snow and ice conditions than M and S tyres. High performance tyres must be replaced with winter tyres when weather conditions dictate.

USING WINTER TYRES

Winter tyres are more suitable during extremes of low temperatures, snow and ice and will considerably improve the vehicle's handling during these conditions.

Winter tyres must be fitted on all four wheels.

Approved winter tyres

18 inch wheels:
235/65 R18 110H Dunlop Winter Sport M3

235/65 R18 110H Michelin Pilot Alpine XSE

19 inch wheels:
255/55 R19 111H Goodyear Ultra Grip

Note: *If your vehicle is fitted with 20 inch wheels, it will be necessary to fit a set of 18 or 19 inch wheels before winter tyres can be fitted.*

Winter tyre pressures

The cold tyre inflation pressures for winter tyres are the same as those for normal tyres of the same size.

SNOW CHAINS

WARNING

DO NOT fit unapproved snow chains - this could damage tyres, wheels, suspension and brake components and could result in damage to the bodywork of the vehicle.

Snow chains are designed for use on hard-surface roads in extreme snow conditions only, and are not recommended for off-road use.

Snow chains MUST NOT be fitted to a temporary spare wheel.

NEVER exceed 50 km/h (30 mph).

If it is necessary to fit snow chains to your vehicle, ALWAYS observe the following:

- **Front wheels:** Snow chains can only be fitted to the front wheels of vehicles equipped with 17, 18 and 19 x 8 inch wheels.

  Note: *If your vehicle is fitted with 20 inch wheels, it will be necessary to fit a set of 19 inch wheels before snow chains can be used.*
- **Rear wheels:** Snow chains MUST NOT be fitted to the rear wheels of any vehicle.
- ONLY Land Rover approved chains should be used. These are designed for your vehicle and will eliminate any risk of damage to other components. Approved snow chains are only available from a Land Rover Dealer/Authorised Repairer.
- Always adhere to the snow chain fitting and retensioning instructions and the speed limitations recommended for varying road conditions. NEVER exceed 50 km/h (30 mph).
- ONLY fit snow chains in pairs.
- Avoid tyre damage by removing the chains as soon as the road is free from snow.
- In some driving conditions, it may be beneficial to deactivate Dynamic Stability Control (DSC) in order to maximise traction.

TYRE PRESSURE MONITORING (TPM) SYSTEM

WARNING

The Tyre Pressure Monitoring (TPM) system is not a substitute for manually checking tyre pressures.

The TPM system only provides a low tyre pressure warning and does NOT re-inflate the tyres.

The TPM system cannot register damage to a tyre. Regularly check the condition of your tyres, especially if the vehicle is driven off-road.

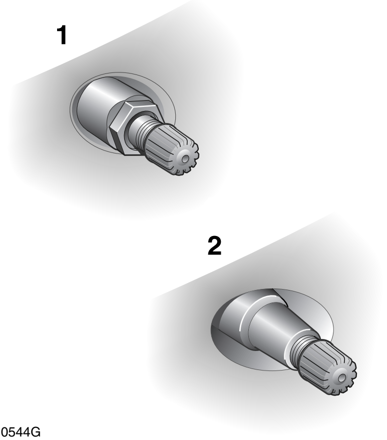
Caution: When inflating tyres, care should be taken to avoid bending or damaging the TPM system valves. Always ensure correct alignment of the inflation head to the valve stem.

Note: *Non-approved accessories may interfere with the system. If this occurs,* ***TYRE MONITORING SYSTEM FAULT*** *is displayed in the message centre.*
See ***MESSAGE CENTRE MESSAGES, 92****.*

Different types of tyre may affect the performance of the TPM system. Always replace tyres in accordance with recommendations.
See ***Tyre pressure and loading label, 239****.*

Your vehicle may be equipped with a TPM system which monitors pressure in each tyre, including the full-size spare tyre. Temporary spare tyres are not fitted with sensors and are consequently not monitored.

Note: *The TPM system only provides a low tyre pressure warning and does* ***NOT*** *re-inflate the tyres.*



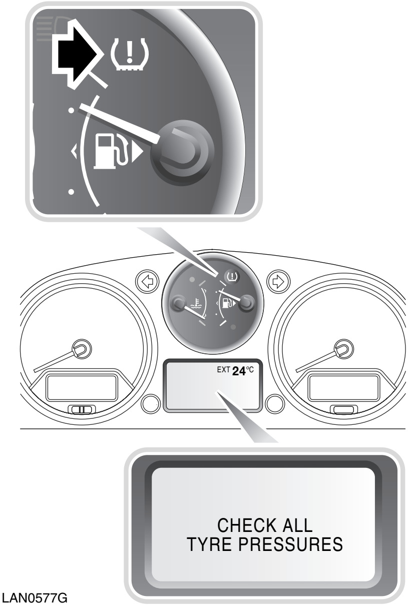
Wheels fitted with a TPM system can be easily visually identified by the external metal lock nut and valve **1**. All Land Rover non-TPM system wheels have a rubber valve fitted **2**.

TPM system operation

The TPM system monitors the pressure of the tyres via sensors located in each wheel and a receiver located within the vehicle. Communication between sensor and receiver is via Radio Frequency (RF) signals.

(!) The tyre pressure warning comprises a yellow warning indicator (telltale) within the instrument pack and an associated message within the message centre.

Each tyre, including the spare (if provided), should be checked regularly, when cold, and inflated to the recommended pressure. When the low tyre pressure warning is indicated, one or more of your tyres is significantly under-inflated.



If the telltale light illuminates, you should stop and check your tyres as soon as possible and inflate them to the recommended pressure. See **Tyre pressure and loading label, 239**. If low pressure warnings occur frequently, the cause must be determined and rectified. Driving on a significantly under-inflated tyre causes the tyre to overheat and can lead to tyre failure. Under-inflation also reduces fuel efficiency and tyre tread life, and may affect the vehicle's handling and stopping ability.

The TPM system also monitors the full size spare tyre pressure. If the pressure for the spare tyre is incorrect, the message **CHECK SPARE TYRE PRESSURE** will be displayed, accompanied by illumination of the warning telltale.

When driving through variable climatic conditions, the TPM system warnings may be intermittent.

TPM system malfunction

Your vehicle will also indicate a TPM system malfunction by initial flashing and subsequent continuous illumination of the warning telltale. A text message will accompany the system malfunction and will display **TYRE MONITORING SYSTEM FAULT**. The TPM system fault sequence will be activated at every ignition cycle until the fault is rectified. When a malfunction occurs, the system may not be able to detect or signal low tyre pressure as intended.

TPM system malfunctions may occur for a variety of reasons which may include other radio frequency systems causing interference or the installation of incompatible replacement tyres on the vehicle.

Spare tyre pressure

The full size spare tyre should be inflated to the highest pressure for the specified tyre size, when not in use on the vehicle.

Full size spare wheel and tyre change

Should it be necessary to change a wheel and tyre with the spare then the system will automatically recognise the change in wheel positions. The vehicle needs to be stationary for 15 minutes during the wheel and tyre change, before the system is ready to detect the change in positions. After driving above 25 km/h (18 mph) any deflation warning will clear typically within 5 minutes.

Temporary spare wheel and tyre change

If the temporary spare wheel is fitted, the system will automatically recognise the change in wheel positions. Then, after approximately ten minutes of driving above 18 mph (25 km/h), the message **TYRE FRONT (REAR) RIGHT (LEFT) NOT MONITORED** will be displayed, accompanied by illumination of the warning telltale.

The warning telltale will initially flash and will subsequently revert to continuous illumination. Extended use of the temporary spare wheel, will produce an additional text message **TYRE MONITORING SYSTEM FAULT**.

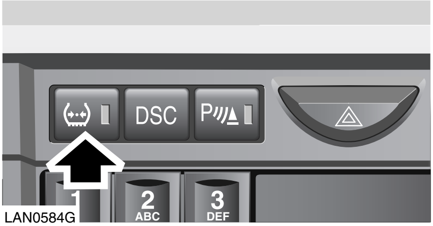
This TPM system display sequence will be activated at every ignition cycle until the temporary spare wheel is replaced by a fully operational full size wheel and tyre assembly.

Always replace the temporary spare wheel before having TPM system faults investigated. The fault may well be rectified with the fitment of a fully operational full size running tyre in lieu of the temporary spare wheel assembly.

Vehicle loading

It is possible to select different pressure levels that correspond to the placard pressures for a lightly laden and a heavily laden vehicle. The indicator on the TPM system button will display the system status.

If the indicator is illuminated, the system is in lightly laden mode and if the indicator is not illuminated then the system is in heavily laden mode. If the vehicle is to be used heavily laden or for towing, the tyre pressures must be increased to cope with the additional load, and the tyre pressure monitoring system must be set into heavily laden mode.



This can be accomplished by pressing the TPM system button on the switch pack for at least 4 seconds with the ignition in position **II** and the engine NOT running.

To indicate that the system has switched to heavily laden mode, the indicator in the switch will extinguish and the message **TYRE PRESSURE MONITORING SET FOR HEAVY LOAD** will be displayed in the message centre.

When the vehicle load is returned to normal and the tyre pressures are reset, the system should be put back into lightly laden mode by pressing the button as before. The indicator indicator in the switch will lluminate and the message **TYRE PRESSURE MONITORING SET FOR LIGHT LOAD** will be displayed in the message centre. This change to and from heavily laden mode can be operated only when the ignition is in position **II** and the engine is not running.

See **Tyre pressures, 237**, **Tyre pressure and loading label, 239**, **WHEELS AND TYRES, 290** and **VEHICLE WEIGHTS, 291**.

If a tyre needs to be changed

It is recommended that you should always have your tyres serviced by a dealer or qualified technician. If a TPM system is fitted, each wheel and tyre assembly, with the exception of a temporary spare is equipped with a tyre pressure sensor connected to the tyre valve stem.

In order to avoid damage to the sensor, the tyres must be removed and refitted to the road wheel in a specified manner. Care must be taken to avoid contact between the bead of the tyre and the sensor during removal and refitting of the tyre, otherwise the sensor may become damaged and/or inoperable.

Caution: Valve stem seal, washer, nut, valve core and cap should be replaced at every tyre change.

Valve stem seal, washer and nut must be replaced if valve retention nut is loosened.

Sensor units and nuts must be refitted using the correct torque figures and associated profile.

Sensors can be removed from the wheel by the unscrewing of the valve retention nut.

Damage to the vehicle may result if these precautions are not taken.

Replacement sensor fitment procedure

Sensor replacement should be carried out by a Land Rover Dealer/Authorised Repairer.

A replacement sensor must be fitted to a running wheel in order to be recognised by the TPM system. Recognition only occurs when the vehicle is driven above 25 km/h (18 mph) for approximately ten minutes.

Should the TPM system warning for any wheel not clear, even after ensuring correct inflation and driving for more than ten minutes above 25 km/h (18 mph), consult your Land Rover Dealer/Authorised Repairer.

WASHING YOUR VEHICLE

Caution: Never aim a high pressure water jet directly at the engine air intake, heater air intakes, body and sunroof seals, or at any components that might easily be damaged. Do not use a high pressure washer in the engine bay area. Damage to components could occur.

Remove heavy deposits of mud and dirt with a hose, before washing the vehicle.

Wash your vehicle frequently using a sponge and generous quantities of cold or lukewarm water containing a car shampoo. Rinse and dry off with a chamois leather.

- Do not use hot water.
- Do not use detergent soap products or washing-up liquid.
- In hot weather, do not wash the vehicle in direct sunlight.

Removing tar spots

Use white spirit to remove tar spots and stubborn grease stains from paintwork. Then wash immediately with soapy water to remove all traces of spirit.

Underbody maintenance

Corrosive materials used for snow and ice removal and dust control can collect on underbody parts. If these materials are not removed, accelerated rusting can occur. Use a hose to regularly flush the underbody with plain water, taking particular care to thoroughly clean those areas where mud and other debris can easily collect.

Similarly, after off-road driving or wading in muddy or salt water conditions, use a hose to wash underbody components and other exposed parts of the vehicle.

When using a hose, do not direct the jet into the engine air intake, which is located on the right-hand-side front wing (viewed from driver's position), or the heater air intake ducts, or through the wheel trim apertures onto the brake components, or at the door, window or sunroof seals, where water pressure could penetrate the seals.

If damage or corrosion to the underbody area is detected, please have the vehicle checked by a Land Rover Dealer/Authorised Repairer at the earliest opportunity.

Cleaning after off-road driving

Caution: After driving off-road, ensure that areas around air intakes and the front grille are clean and clear of debris. Failure to do so may cause the engine to overheat.

Ensure that the vehicle and underside is cleaned soon after off-road driving, taking particular care to clean areas where mud and debris has compacted.

Use a low pressure hose to flush water through the lower grille area, to clean the cooling system components.

Body protection

After washing, inspect the paintwork for damage. Any stone chips, fractures or deep scratches in the bodywork should be repaired promptly. Bare metal will corrode quickly and can develop into major repair expense. Some exterior panels of your vehicle are made of aluminium which will not corrode in the same manner as steel. However, any damage should still receive prompt attention. Minor chips and scratches can be repaired with touch-up materials available from your Land Rover Dealer/Authorised Repairer. Larger areas of damage need to be corrected to professional standards immediately.

Polishing

Caution: DO NOT apply car polish to the unpainted areas of the bumper mouldings - polish will become ingrained in the textured finished.

Occasionally treat the paint surface with an approved polish containing the following properties:

- Very mild abrasives to remove surface contamination without removing or damaging the paint.
- Filling compounds that will fill scratches and reduce their visibility.
- Wax to provide a protective coating between the paint and the elements.

Glass and mirrors

Clean the rear window with a soft cloth to avoid damaging the heating elements. DO NOT scrape the glass or use an abrasive cleaning fluid.

Mirror glass is particularly susceptible to damage. Wash with soapy water. DO NOT use abrasive cleaning compounds or metal scrapers to remove ice.

CLEANING THE INTERIOR

WARNING

Read individual product warnings before using any car cleaning or washing products.

CAR CARE PRODUCTS	
Facia cleaner (300 ml aerosol)	STC4683
Fabric cleaner (300 ml aerosol)	STC4685
Leather cleaning kit	BAC500490
Insect remover (300 ml aerosol)	STC4686
Glass cleaner (300 ml aerosol)	STC4681
Bumper cleaner (300 ml aerosol)	STC4679
De-icer (300 ml aerosol)	STC4677
De-icer (500 ml trigger spray)	STC4676
Screenwash (250 ml bottle)	STC4672
Screenwash (500 ml bottle)	STC4687
Alloy wheel cleaner (500 ml trigger spray)	STC4675
Wash and Wax (300 ml bottle)	STC4680
Wax polish (300 ml bottle)	STC4682

Plastic materials

WARNING

DO NOT polish instrument panel components - for safety, these should remain non-reflective.

Clean plastic-faced or cloth-covered surfaces with warm water and a non-detergent soap and wipe with a clean cloth.

Leather

Caution: Some materials/fabrics are prone to dye-transfer which can cause unsightly discolouration of lighter coloured leathers. Affected areas should be cleaned and re-protected as soon as possible.

Land Rover recommends that leather is cleaned and protected at least every six months, but maybe as often as every one to two months for high mileage vehicles, or vehicles kept in a hostile environment.

Leather cleaning kit, BAC500490, is recommended and endorsed by Land Rover for this purpose. Use in accordance with the instructions printed on the label.

DO NOT use chemical or abrasive materials to clean leather. Petrol, white spirit, alcohol, detergents, washing-up liquid, household cleaners, furniture polishes/creams or solvents should never be used on leather. While these products may give initially impressive results, their use will lead to rapid deterioration of the leather and will invalidate the warranty.

Carpet and fabrics

Clean with diluted nylon upholstery cleaner - test on a concealed area first.

Instrument pack, clock and radio

Clean with a dry cloth only. DO NOT use cleaning fluids or sprays.

Seat belts

Extend the belts, then use warm water and a non-detergent soap to clean. Allow the belts to dry naturally, and do not retract them or use the vehicle until they are completely dry.

Airbag module covers

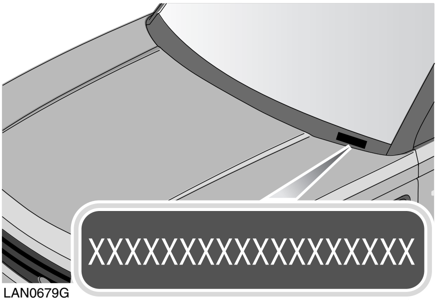
WARNING

To prevent airbag damage, the steering wheel centre pad, side airbags and area of the instrument panel containing the passenger airbag should ONLY be cleaned sparingly with a damp cloth and upholstery cleaner.

DO NOT allow these areas to be flooded with liquid, and DO NOT use petrol, detergent, cleaning solvents, furniture cream or polishes.

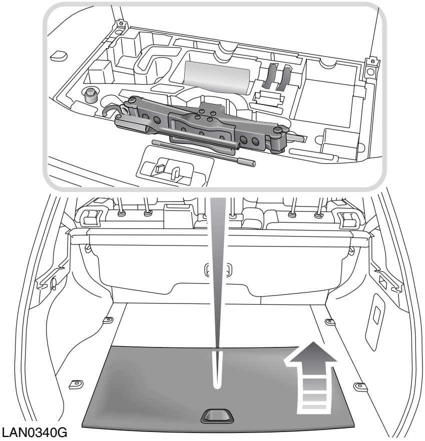
VEHICLE IDENTIFICATION NUMBER (VIN)

If you need to communicate with a Land Rover Dealer/Authorised Repairer, you may be asked to quote the Vehicle Identification Number (VIN).



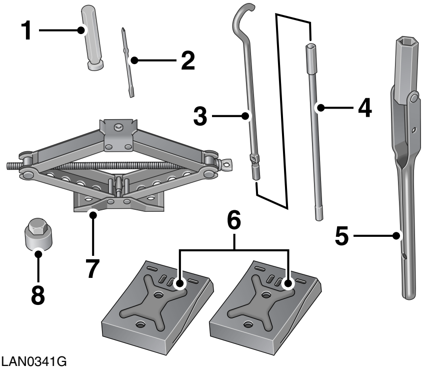
The VIN is stamped on a plate which is visible through the lowest part of the left side of the windscreen (this should match the VIN recorded in the Service Portfolio book). VIN information may also be found in areas such as: Bonnet locking platform, Suspension tower and Door shut faces.

TOOL KIT



The tool tray is located under a lift-up panel set in the loadspace floor.

Note: *Take careful note of the stowage position of each of the tools as it is important to return them to their correct position after use.*



The tool kit consists of:

1. Screwdriver handle.
2. Screwdriver blade.
3. Jack screw rotating hook.
4. Extension piece.
5. Wheel nut brace.
6. Wheel chocks.
7. Wheel change jack.
8. Locking wheel nut key.

Care of the jack

WARNING

After wheel changing, always secure tools, chocks, jack and replaced wheel in their correct storage positions.

Examine the jack occasionally, clean and grease the moving parts, particularly the screw thread, to prevent corrosion.

To avoid contamination, the jack should always be stowed in its fully closed position.

PUNCTURED TYRES

If you have a flat tyre while driving:

- Do not brake heavily.
- Gradually decrease the vehicle's speed.
- Hold the steering wheel firmly.
- Slowly move to a safe and suitable place at the side of the road.

Wheel changing safety

WARNING

Switch on the hazard warning lamps and set the hazard warning triangle a suitable distance behind the vehicle to alert other road users.

If possible, choose a safe place to stop away from the main road. Always ask your passengers to get out of the vehicle and wait in a safe area away from other traffic.

Before changing a wheel, ensure that the front wheels are in the straight-ahead position (if possible), apply the parkbrake, select **P** (Park) and select LOW range in the transfer box.

Turn off the starter switch, remove the key and engage the steering lock. Observe the following precautions:

- Ensure that the jack will be positioned on firm, level ground; NEVER on soft ground, or over metal gratings or manhole covers. DO NOT place additional material between the jack and the ground; this may jeopardise the safety of the jacking operation.
- Chock the wheel(s). See **Using wheel chocks, 252**.
- NEVER raise the vehicle with passengers inside, or with a caravan or trailer connected!

Tilt sensor

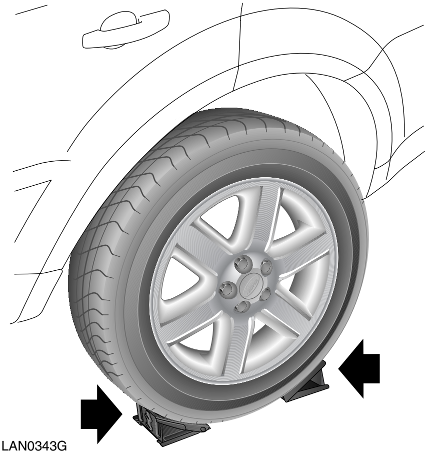
Your vehicle is fitted with a tilt sensor which activates the alarm if the vehicle is tilted fore and aft, or side to side, after it has been locked.

If you wish to have the doors locked while jacking up the vehicle, for any reason, lock the doors by pressing the lock button on the remote control twice within three seconds.

Using wheel chocks

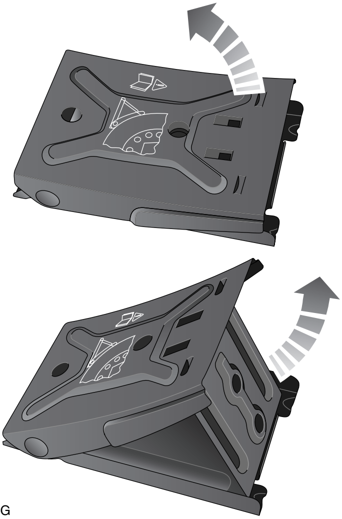
WARNING

As an additional safety precaution, it is necessary to chock the road wheels in two places before raising the vehicle.



LAN0343G

If possible, position the vehicle on level ground, chocking both sides of the wheel diagonally opposite the one to be removed.



LAN0344G

If jacking the vehicle on a slope is unavoidable, place the chocks on the downhill side of the two opposite wheels.

The wheel chocks are stowed in the tool kit, as shown in **TOOL KIT, 250**.

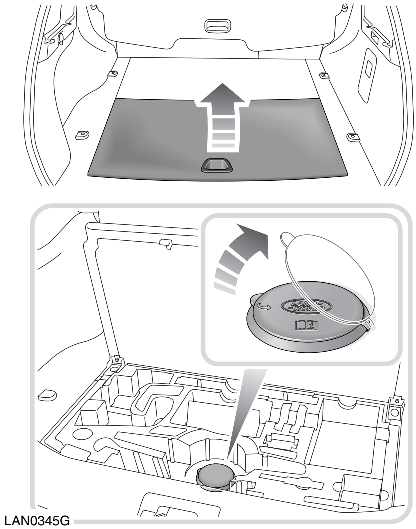
REMOVING THE SPARE WHEEL

WARNING

The wheels are extremely heavy. Take care when manoeuvring the spare wheel.

Always remove the spare wheel before jacking up the vehicle.

Note: *Before removing the spare wheel from the vehicle, take a look at the position that the spare wheel is stowed in, as you will need to check that the wheel about to be removed from the vehicle is returned to the correct storage position.*

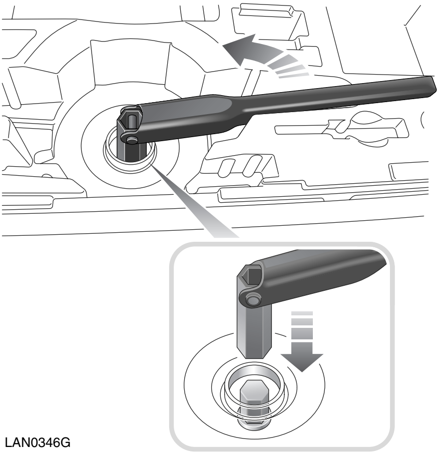


LAN0345G

With the tailgate open:

1. Lift open the spare wheel mechanism access hatch in the rear loadspace.

   Remove the jack from the tool tray.
2. Tilt up the circular locking cap covering the spare-wheel storage nut.



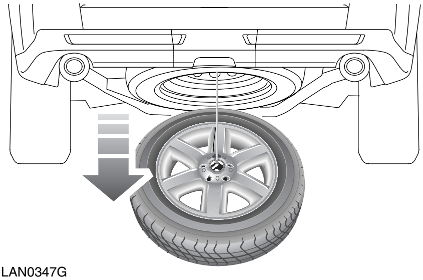
LAN0346G

3. Fit the wheel nut brace to the wheel-hoist winch nut and rotate anticlockwise to lower the spare wheel.

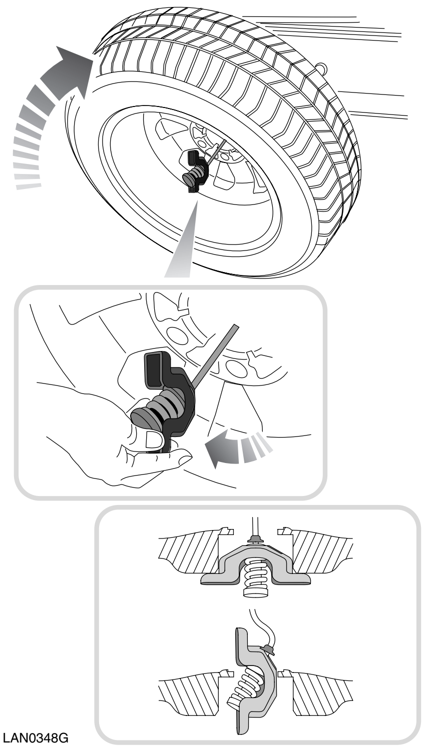
Caution: The mechanism has been designed for use with the wheel nut brace. DO NOT use power tools on the wheel-hoist winch.

When the wheel has reached the ground, continue to wind the handle until the cable is slack.

Do not attempt to turn the winch beyond the physical stop.



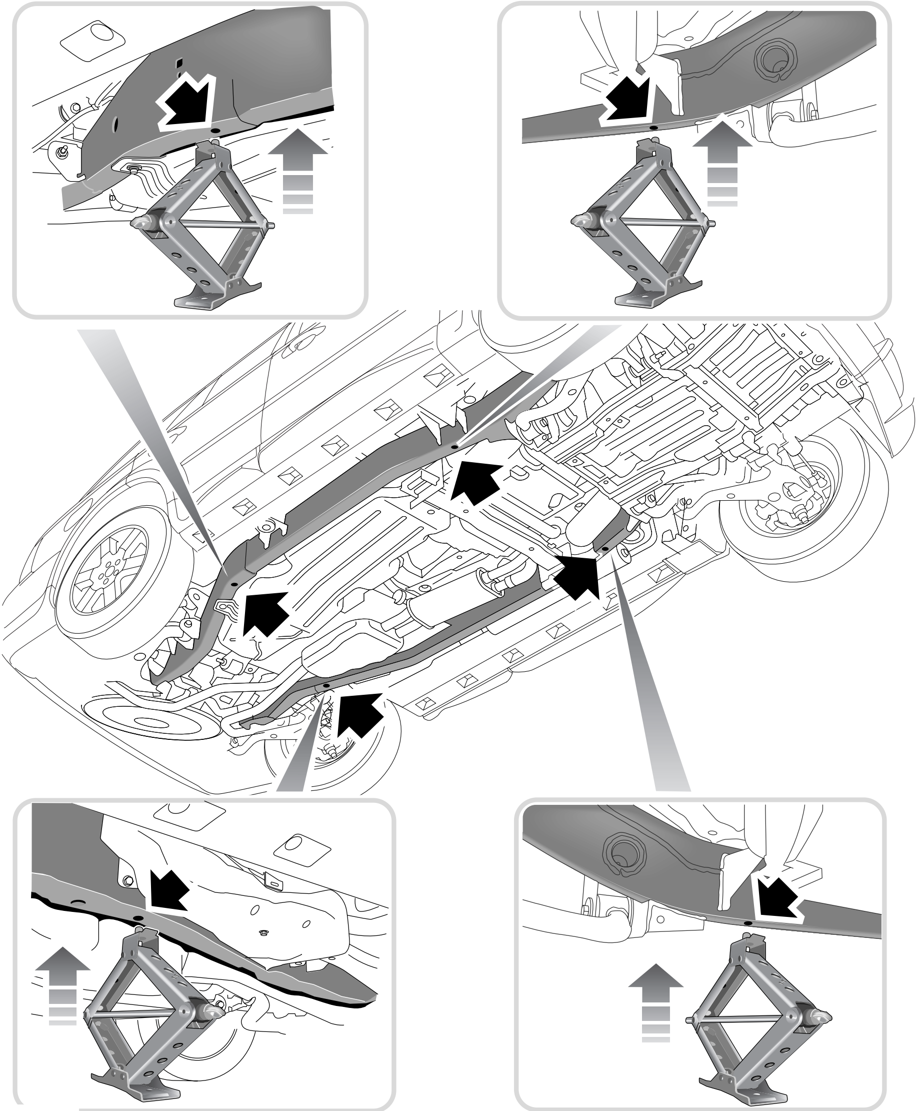
LAN0347G



4. Hold the cable and tilt the lifting lug until it can be lifted through the hole in the wheel, as shown above.

CHANGING A WHEEL

Positioning the jack



WARNING

NEVER work beneath the vehicle with the jack as the only means of support. The jack is designed for wheel changing only.

Always remove the spare wheel before jacking up the vehicle.

WARNING

Always:

- **Place the jack on firm, level ground.**
- **Position the jack from the side of the vehicle, in line with the appropriate jacking point.**
- **Raise the jack so that the pin in the head of the jack engages with a hole in the chassis rail at the points shown in the illustrations.**

WARNING

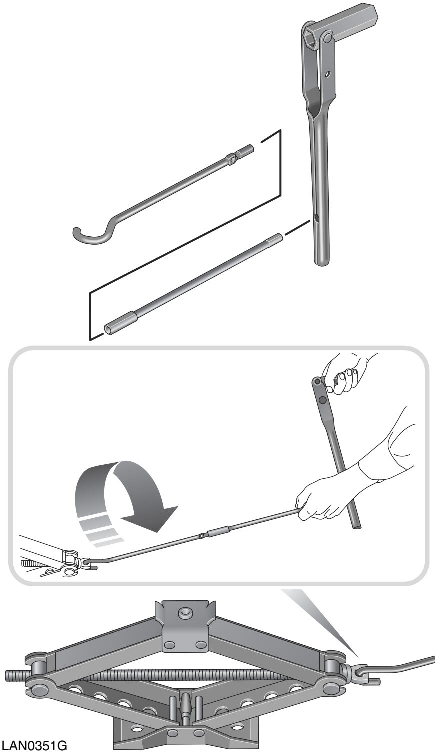
ALWAYS use the complete, two-piece, jack lever throughout to minimise any chance of accidental damage or injury.

WARNING

ONLY jack the vehicle using the jack location points described, or damage to the vehicle could occur.

Caution: Before positioning the jack under the vehicle, ensure that the air suspension is set to Off-road height.

Operating the jack



Before raising the vehicle, use the wheel nut brace to slacken the wheel nuts half a turn anticlockwise.

Attach the jack cranking lever to the jack. Fit the wheel nut brace onto the end of the cranking lever.

Turn the jack lever clockwise to raise the jack cradle until it engages with the jacking point. Ensure that the base of the jack is in full contact with the road surface.

Changing a wheel

WARNING

When fitting a wheel, ensure that the mating faces of the hub and wheel are clean and free from rust or anti-seize compound - any accumulation of dirt or rust could cause the wheel nuts to become loose.

Always remove the spare wheel before jacking up the vehicle.

1. Raise the vehicle until the tyre is clear of the ground.
2. Remove the wheel nuts and place to one side to prevent them from being lost.
3. Remove the road wheel.

   Note: *DO NOT damage the style surface of the wheel by placing it face down on the road.*
4. On alloy wheels, use an approved anti-seize compound to treat the wheel mounting bore. This will minimise any tendency for adhesion between the wheel and the bore.

   Ensure that no compound comes into contact with the brake components or the flat mounting surfaces of the wheel.

   If, due to an emergency situation, this treatment is not practicable; refit the spare wheel for the time being, but remove and treat the wheel at the earliest opportunity.
5. Fit the spare wheel with the valve stem outwards and lightly tighten the wheel nuts, ensuring they are firmly seated. DO NOT fully tighten whilst the tyre is clear of the ground.

6. Ensure that the space under and around the vehicle is free from obstructions then lower the vehicle and remove the jack and wheel chocks.
7. Fully tighten the wheel nuts in an alternating pattern until all are tightened. DO NOT OVERTIGHTEN by using foot pressure or extension bars on the wheel nut brace, as this could overstress the wheel nuts. Check the wheel nut torque at the earliest opportunity.

Road wheel nut torque to hub	140 Nm (± 10 Nm)

8. Using a suitable blunt tool, apply light pressure to the rear of the displaced wheel centre cap and remove. Using hand pressure only, fit the centre cap into the newly fitted wheel. Return tools, chocks, jack and the displaced wheel to their correct storage positions.
9. REMEMBER to change to **H** (HIGH range) before driving.
10. Finally, check the tyre pressure at the earliest opportunity. See **WHEELS AND TYRES, 290**.

Note: *During jacking, the air suspension system may enter an automatic freeze state. See* ***Suspension freeze, 188****.*

Temporary spare wheel

WARNING

The following precautions must be observed when the temporary spare wheel is in use:

- **DRIVE CAUTIOUSLY; the temporary spare wheel tyre is smaller in size and higher in pressure than a regular tyre. It will cause a harsher ride and may have less traction on some road surfaces. If driving off-road on a temporary spare wheel, drive with extra caution.**
- **The temporary spare wheel is for TEMPORARY use only. It MUST be replaced by a normal-sized wheel and tyre as soon as possible.**
- **Only ONE temporary spare wheel is to be used on the vehicle at any one time.**
- **DO NOT drive at a speed exceeding 80 km/h (50 mph).**
- **The tyre pressure in the temporary spare wheel/tyre should be as detailed on the tyre pressures label. See Tyre pressure and loading label, 239.**
- **The temporary spare wheel has a shorter life than a regular tyre. Replace the tyre with one of the same type and specification.**
- **The use of snow chains is not permitted on a temporary spare wheel.**

Stowing the changed wheel

WARNING

DO NOT stow the wheel while the vehicle is still raised on the jack.

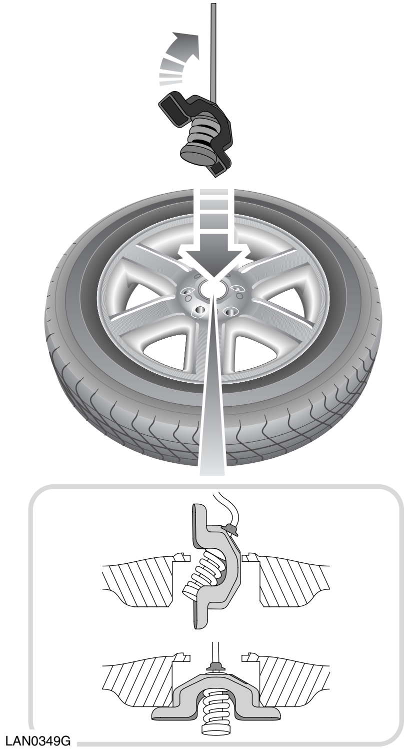
WARNING

The wheel must be securely retained in its correct position by the winch mechanism or it could become loose.

Caution: DO NOT stow 20 inch wheel and tyre assemblies under the vehicle as this may result in damage to the wheel face.

1. Place the wheel under the rear of the vehicle with its style surface uppermost.
2. Place the lifting lug through the wheel aperture and locate it in position.
3. Winch up the wheel using the wheel-hoist mechanism.

   The mechanism has been designed for use with the wheel nut brace. DO NOT use power tools on the wheel-hoist winch.
4. Continue to wind up until the mechanism clutches out. This is confirmed by a clear physical feedback from the wheel nut brace and an audible noise.
5. Check that the wheel has returned to the same position as the spare wheel as previously noted. If in any doubt, unwind the winch slightly and repeat the previous step.
6. Replace the circular locking cap over the wheel-hoist nut. As the underside of this cap is exposed to the same conditions as the underside of the vehicle, ensure that it is firmly in place.
7. Place the tools back into their stowage location.

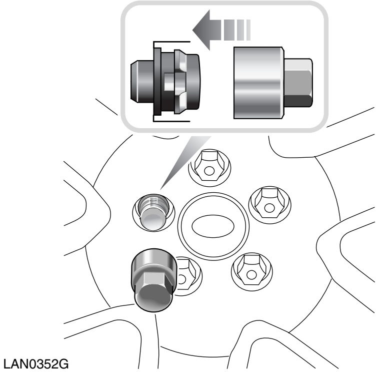


Note: *If, for any reason, the spare wheel is not to be fitted back under the vehicle, the wheel hoist should be rewound as follows.*

Position the lifting lug level on the cable and wind up the wheel hoist mechanism until it clutches out.

LOCKING WHEEL NUTS

Vehicles may be equipped with a locking wheel nut on each wheel. These are similar to standard wheel nuts, and can only be removed using the special adaptor provided in the tool kit.



Note: *A code number is stamped on the side of the side of the locking nut. Ensure the number is recorded on the Security Information card supplied with the literature pack. Quote this number if a replacement is required. DO NOT keep the Security Information card in the vehicle.*

Insert the adaptor firmly onto the locking wheel nut.

Using the wheel nut brace, unscrew the wheel nut and adaptor.

Be sure to return the locking wheel nut adaptor to the correct storage position.

STARTING AN ENGINE WITH A DISCHARGED BATTERY

WARNING

Always wear eye protection when working around batteries.

During normal operation batteries emit explosive hydrogen gas - ensure sparks and naked lights are kept away from the engine compartment.

DO NOT attempt to start the vehicle if the electrolyte in the battery is suspected of being frozen.

Make sure BOTH batteries are of the same voltage (12 volts), and that the booster cables have insulated clamps and are approved for use with 12 volt batteries.

DO NOT disconnect the discharged battery.

DO NOT connect positive (+) terminals to negative (-) terminals, and ensure booster cables are kept away from any moving parts in the engine compartment.

Take care when working near rotating parts of the engine.

WARNING

DO NOT use a 24 volt booster start system.

These produce excessive voltage and can damage the vehicles electrical system.

Caution: DO NOT push or tow start!

Using booster cables

Using booster cables (jump leads) from a donor battery, or a battery fitted to a donor vehicle, is the only approved method of starting a vehicle with a discharged battery.

Boosting from another vehicle

If a donor vehicle is to be used, both vehicles should be parked with their battery locations adjacent to each other. Ensure that the two vehicles do not touch.

Apply the handbrakes and ensure that the transmission of both vehicles is set in neutral (**P** or Park for vehicles with automatic transmission).

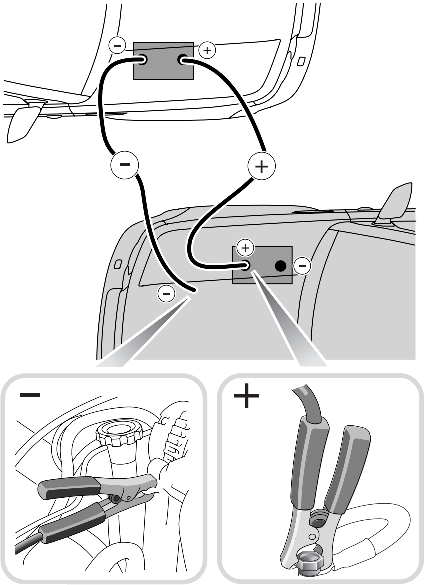
Turn off the starter switch and ALL electrical equipment of BOTH vehicles.

Boosting procedure

WARNING

For safety reasons:

- **DO NOT connect the black cable to the negative terminal of the discharged battery. If in doubt, seek qualified assistance.**
- **ENSURE that each connection is securely made and that there is no risk of the clips accidentally slipping or being pulled from the battery terminals. This could cause sparking, which can lead to a fire or explosion.**



LAN0353G

Always adopt the following procedure, ensuring the cables are connected in the order shown below:

1. On the donor vehicle, connect one end of the RED booster cable to the positive (+) terminal of the battery or the vehicle's positive (+) connection point.
2. On the disabled vehicle, connect the other end of the RED booster cable to the positive (+) battery terminal.
3. On the donor vehicle, connect one end of the BLACK booster cable to the negative (-) terminal of the battery or the vehicle's negative (-) connection point.
4. On the disabled vehicle, connect the other end of the BLACK booster cable to a good earth point (e.g. an engine mounting or other unpainted metal surface) at least 0.5 m (20 in.) from the battery and well away from fuel and brake lines.

Check that the cables are clear of any moving parts of both engines, then start the engine of the donor vehicle and allow it to idle for a few minutes.

Now start the vehicle with the discharged battery. Once both engines are running normally, allow them to idle for two minutes before switching off the donor vehicle engine.

DO NOT switch on any electrical circuits on the previously disabled vehicle until AFTER the booster cables have been removed.

Disconnecting the booster cables must be an EXACT reversal of the procedure used to connect them, i.e. disconnect the black cable from the negative (-) connection terminal on the donor vehicle first.

FUSES

Fuses are simple circuit devices which protect electrical equipment against the effects of excess current.

A blown fuse is indicated when the electrical equipment it protects becomes inoperative.

Fuses are colour coded to help identify their amperage, as follows:

Blade fuse colours

VIOLET	3 amp
TAN	5 amp
BROWN	7.5 amp
RED	10 amp
BLUE	15 amp
YELLOW	20 amp
WHITE	25 amp
GREEN	30 amp

Cartridge fuse colours (engine bay only)

BLUE	20 amp
PINK	30 amp
GREEN	40 amp
RED	50 amp
YELLOW	60 amp

Note: *Owners are advised against removing or replacing the relays (identified as R1-R19 on the relays) and fusible links (identified as FL1-FL20 on the fusible links). Failure of any of these items should be investigated by a qualified technician.*

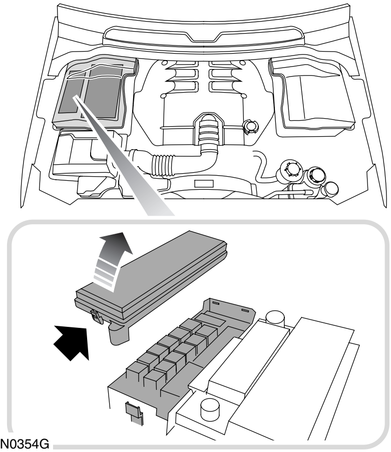
Checking or renewing a fuse

WARNING

To prevent a possible fire or damage to the electrical system, fit only replacement fuses of the same rating and type. Do not replace a blown fuse with a fuse of a higher amperage rating. Always rectify the cause of the failure before replacing a fuse. Seek qualified assistance if necessary.

Always turn the starter switch to position **O** and switch off the affected electrical circuit before removing a fuse.

Engine compartment fuse box



The engine compartment fuse box is located at the rear of the engine bay. To view the fuse box, the under-bonnet cover will have to be removed. See **UNDER-BONNET COVERS, 218**. The plastic lid of the box is removed by pressing the plastic tabs in.

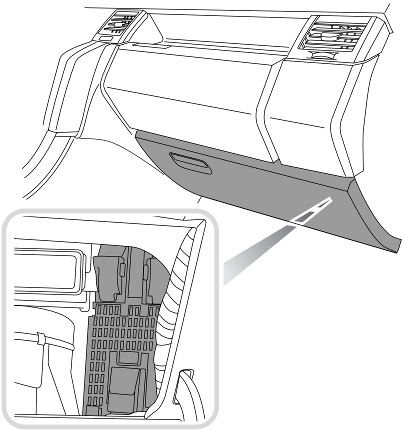
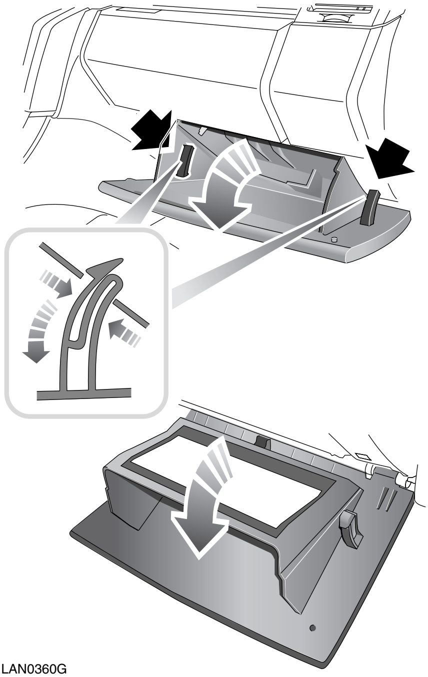
Passenger compartment fuse box



LAN0357G



LAN0360G

The passenger compartment fuse box is fitted behind the glovebox. To access the fuses, open the glovebox to the service position.

This is done by opening the glovebox normally and then pinching the top of the support stays located either side of the hopper. This allows the glovebox to be lowered into the footwell.

A label on the rear of the glovebox shows the circuits protected, the fuse values and their locations. They are also listed on the following page.

Checking or renewing a fuse

WARNING

To prevent a possible fire or damage to the electrical system, fit only replacement fuses of the same rating and type. Do not replace a blown fuse with a fuse of a higher amperage rating. Always rectify the cause of the failure before replacing a fuse. Seek qualified assistance if necessary.

Always turn the starter switch to position **O** and switch off the affected electrical circuit before removing a fuse.

Passenger compartment fuses

The fuse removal tweezers are located in the passenger compartment fusebox. Place the tweezers onto the head of the suspect fuse (as shown), squeeze the middle (arrowed) and pull to remove. A break in the wire inside the fuse indicates that the fuse has blown and must be replaced.

Always replace a fuse with another of the same value, however, if the replacement fuse blows immediately the circuit MUST be checked by a qualified Land Rover Dealer/Authorised Repairer.

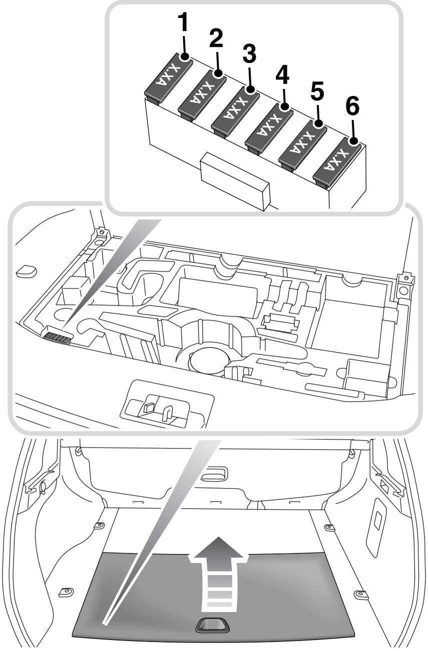
Tow hitch fuses



LAN0359G

Fuse number	Rating (amps)	Circuit protected
1	7.5	Brake lamp
2	15	Ignition feed
3	15	Battery feed
4	7.5	Rear fog lamps
5	5	Right-hand tail lamp
6	5	License plate and left-hand tail lamp

The supplementary fuse box that protects the tow hitch circuits, is located under the cover in the luggage compartment.

REPLACING BULBS

Caution: Before replacing a bulb, always switch off the starter switch and appropriate lighting switch to prevent any possibility of a short circuit. Only replace bulbs with the same type and specification.

Check the operation of all exterior lamps before you drive the vehicle.

Replacement bulbs

Note: *All bulbs must be rated at 12 volts.*

Bulb	Watts
Headlamps, low and high beam (Halogen)	55 (H7)
Headlamps, low and high beam (Xenon)	55 (D2S)
Cornering lamps (Halogen)	35 (H8)
Front side lamps	W5W
Front direction indicators	S8
Rear direction indicators	P21
Front fog lamps (Halogen)	55 (H11)
Side repeater lamps	W5W
Reverse lamps	P21
Rear fog guard lamps	P21
Stop/tail lamps	P21/5
Number plate lamps	W5W
Door/puddle lamps	W5W
Interior lamps	W5W
Luggage/footwell lamps	W5W
Luggage/tailgate lamps	W5W
Glovebox lamp	W5W
Vanity mirror lamp	1.2

Note: *In certain territories it is a legal requirement to carry spare bulbs, in case of bulb failure. A replacement bulb kit is available as an approved accessory from your Land Rover Dealer/Authorised Repairer.*

Halogen bulbs

Halogen bulbs are used for high beam, low beam and front fog lamps. Take care NOT to touch this type of bulb with your fingers; always use a cloth to handle them. If necessary, clean the bulb with methylated spirits to remove fingerprints.

Xenon lamp units

WARNING

- **Used Xenon lamp units contain mercury, which is hazardous and can be injurious to health.**
- **A very high voltage is required to ignite the gas and metal vapour used to power Xenon lamps. Contact with this voltage could cause very serious injury.**
- **Replacement or maintenance of Xenon lamps should be carried out only by qualified personnel.**

Some vehicles are fitted with Xenon low/high beam headlamp units. Xenon lamps provide significantly improved visibility, especially during adverse weather and driving conditions.

The operational life of a Xenon lamp is significantly longer than that of a conventional or Halogen bulb.

Seek advice about the proper disposal of Xenon lamp units from a Land Rover Dealer/Authorised Repairer or your local disposal authority.

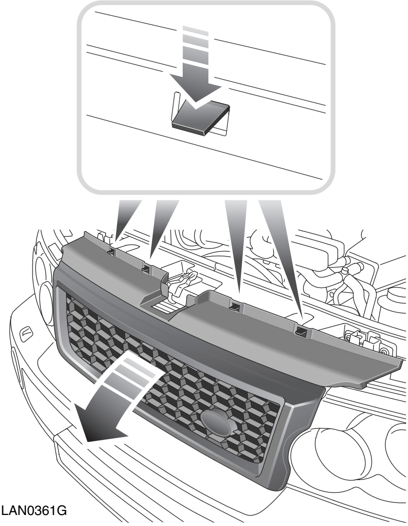
HEADLAMP UNIT

WARNING

Do not attempt to change any bulb with the lighting switched on. If the lighting has just been switched off, give the bulbs time to cool down. Handling them in a hot condition may cause personal injury.

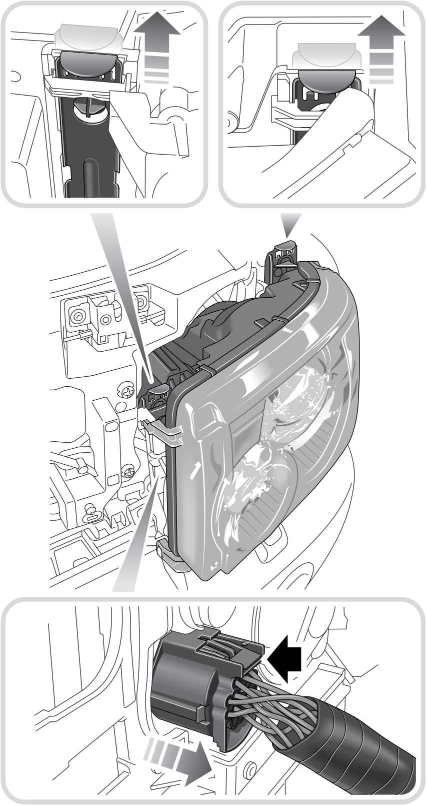
The headlamp unit contains four lamps and it is necessary to completely remove the unit from the vehicle in order to change any of the bulbs.

To remove the headlamp unit



LAN0361G

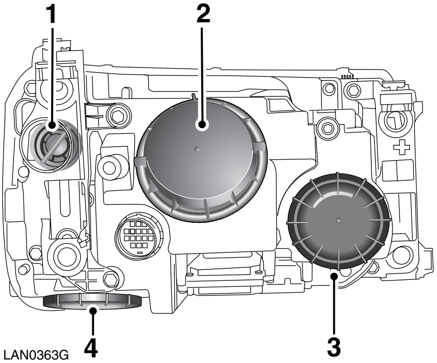
1. Remove the grille by pressing down on the four upper clips securing the grille to the vehicle body. Lift the grille clear of the vehicle and place it where it will not sustain any damage.



LAN0362G

2. Carefully pull up the two locking bars.
3. Disconnect the wiring plug from the back of the unit and remove the unit from the vehicle. Place face down on a flat surface covered in a soft material to prevent damage to the unit’s lenses.

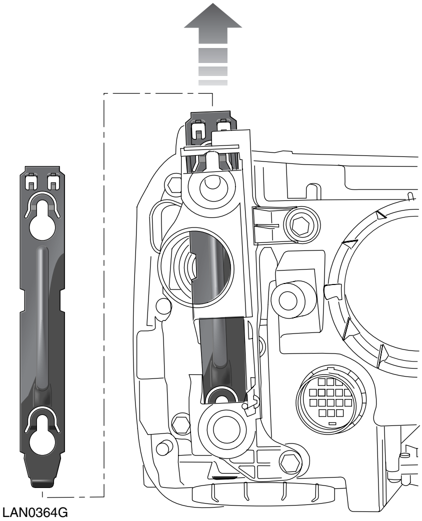
Bulb access



The four bulbs within the headlamp unit, accessible under domed caps are:

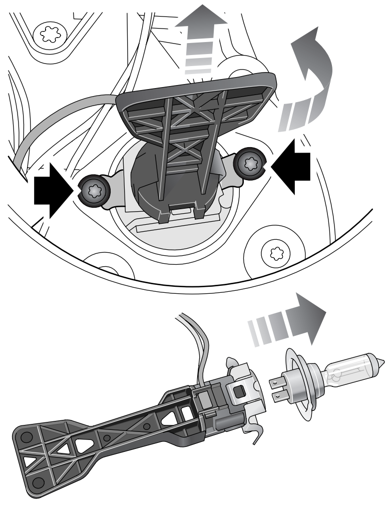
1. Direction indicator
2. Low beam/xenon
3. High beam
4. Side lamp and static bending lamp

See **Replacement bulbs, 271**.

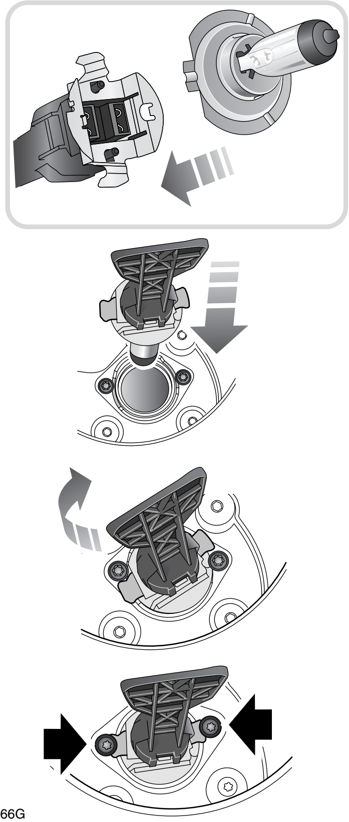


Note: *To access the direction indicator, the headlamp unit locking slide must be completely removed from the unit.*

To change a high beam bulb (Halogen only)



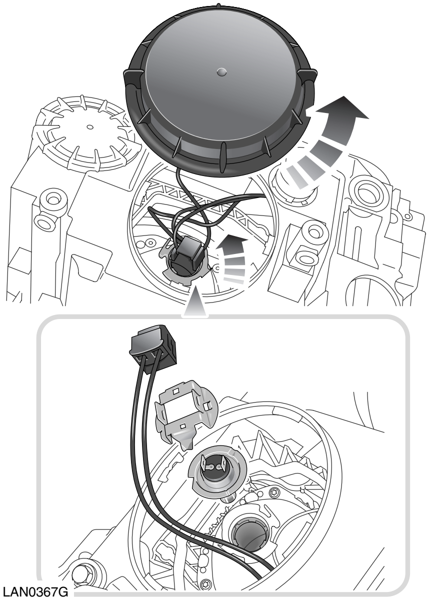
1. Twist and lift off the domed cap.
2. Note the position of the bulb locator extension. Two locking tabs at the sides of the locking ring locate under small bolt heads.
3. Turn the locator extension counter-clockwise and withdraw it, complete with bulb, from the headlamp unit.
4. Prise the bulb from the holder.



5. The new bulb will only fit in one position. As you press the new bulb into the electrical connections, squeeze the locking ring so that the two protruding pins locate with the bulb correctly.
6. Replace the bulb holder and locator extension into the headlamp unit and turn clockwise, ensuring the two locking ring tabs locate under the small bolt heads.

See **Replacement bulbs, 271**.

To change low beam bulb (Halogen only)



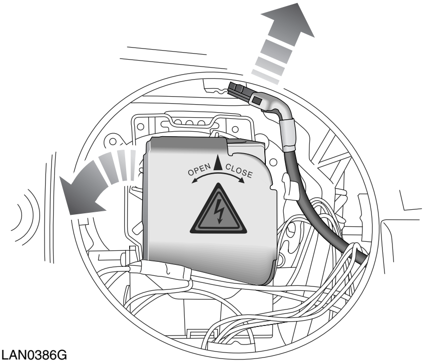
1. Twist and lift off the domed cap.
2. Pull off the electrical connector.
3. Release the spring clip holding the bulb in place and lift out the bulb.
4. Insert the new bulb and repeat the above procedure in reverse order. When replacing the cap, align the arrowheads on the cap and the body of the unit.

See **Replacement bulbs, 271**.

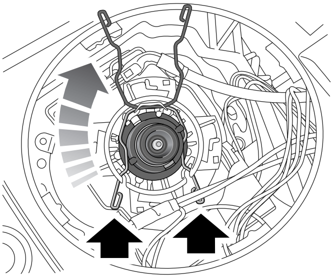
Note: *After the replacement of any high or low beam bulb, the alignment of the headlamps should be checked by a Land Rover Dealer/Authorised Repairer.*

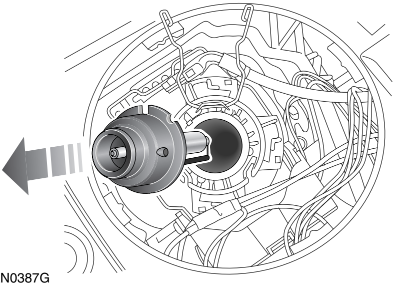
Bulb Replacement

To change a Xenon bulb



LAN0386G





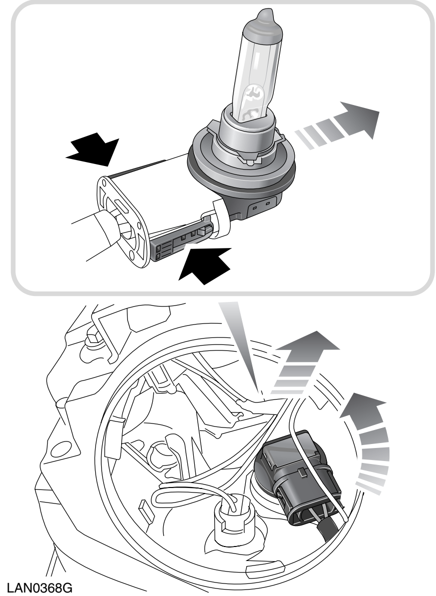
LAN0387G

1. Twist and lift off the domed cap.
2. Pull off the electrical connector.
3. Twist the connector cap anti-clockwise to unlock it. Pull clear of the bulb.
4. Release the spring clip holding the bulb in place and lift out the bulb.
5. Insert the new bulb and repeat the above procedure in reverse order. When replacing the cap, ensure that the lugs are in contact with the bulb base.

See **Replacement bulbs, 271**.

Note: *After the replacement of any main or dipped beam bulb, the alignment of the headlamps should be checked by a Land Rover Dealer/Authorised Repairer.*

To change a static bending bulb

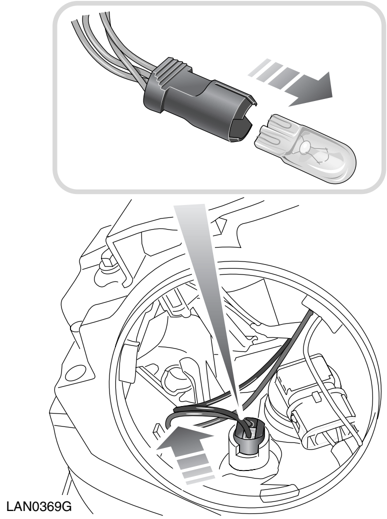


1. Twist and lift off the domed cap.
2. Twist the bulb holder anti-clockwise to unlock, then pull out the bulb complete with electrical connector.
3. To release the bulb, depress the two catches (solid arrows in inset), then pull to remove the bulb from the holder.
4. Insert the new bulb and repeat the above procedure in reverse order.

   See **Replacement bulbs, 271**.

   When replacing the cap, align the arrowheads on the cap and the body of the unit.

To change a front side lamp bulb



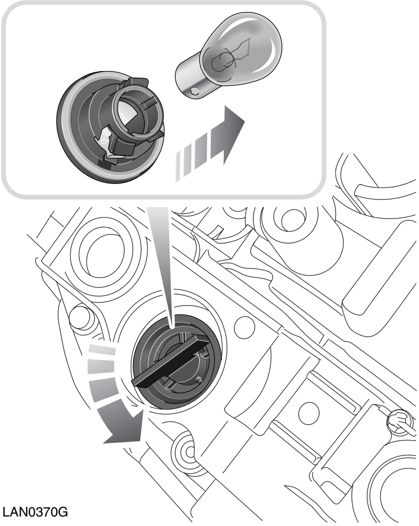
1. Twist and lift off the domed cap.
2. Pull out the bulb complete with electrical connector.
3. Pull the bulb out of the electrical connector.
4. Insert the new bulb and repeat the above procedure in reverse order.

   See **Replacement bulbs, 271**.

   When replacing the cap, align the arrowheads on the cap and the body of the unit.

Bulb Replacement

To change a front indicator lamp bulb

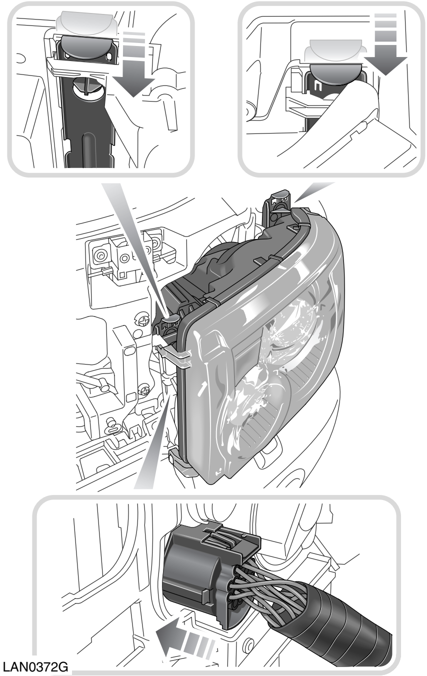


1. Twist and lift off the domed cap.
2. Twist the bulb holder anti-clockwise to unlock, then pull out the bulb complete with electrical connector.
3. Pull the bulb out of the electrical connector.
4. Insert the new bulb and repeat the above procedure in reverse order.

   See **Replacement bulbs, 271**.

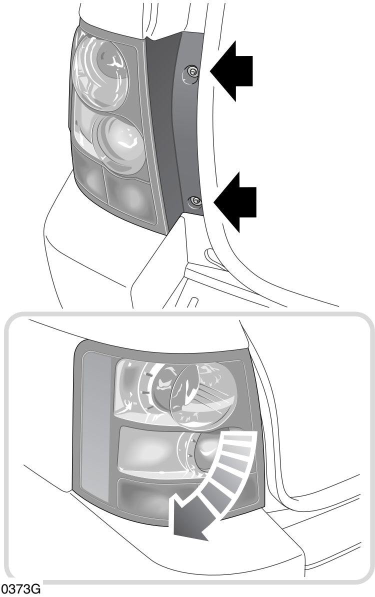
   When replacing the cap, align the arrowheads on the cap and the body of the unit.

To refit the headlamp unit



1. Reconnect the wiring plug.
2. Offer up the unit into position.
3. Push down on the two locking slides as shown.
4. Refit the grille.

REARLAMP UNIT

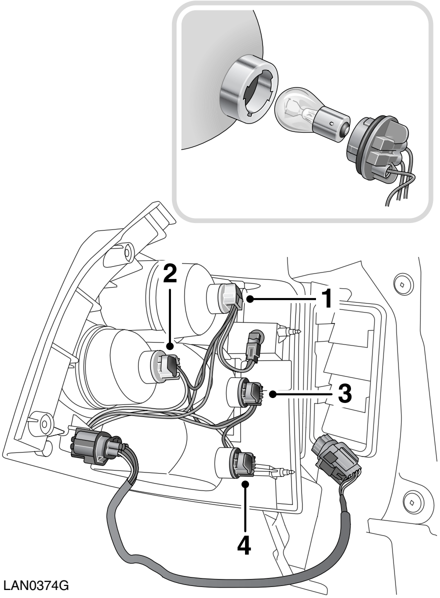


LAN0373G

The rearlamp unit contains four lamps and it is necessary to completely remove the unit from the vehicle in order to change any of the bulbs.

Removal of rearlamp unit

1. With the tailgate open, remove two screws from the edge of the unit nearer the tailgate aperture.
2. Pull the unit away from the vehicle.
3. Disconnect the wiring multi-plug and remove the unit from the vehicle. Place face down on a flat surface covered in a soft material to prevent damage to the unit's lenses.



LAN0374G

Each bulb is now accessible by twisting off its electrical connection cap. See **Replacement bulbs, 271**.

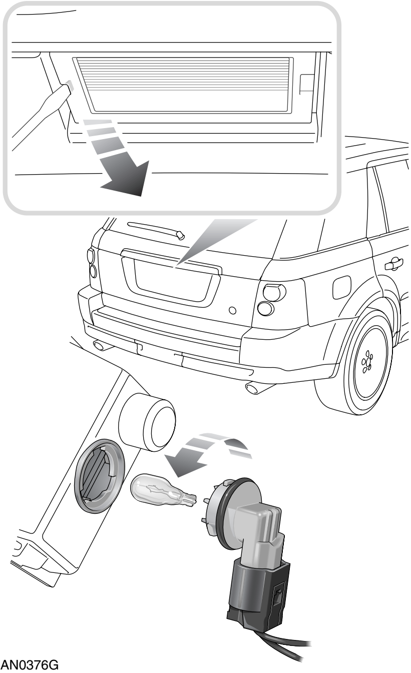
1. Stop/tail lamp
2. Reversing lamp
3. Direction indicator
4. Rear fog guard lamp

Refitting the rearlamp unit

1. Reconnect the electrical multi-plug.
2. Locate the unit's two studs in the sockets at the outer side of the mounting face.
3. Insert and tighten the two screws on the side of the unit nearer the tailgate aperture.
4. Check that all of the bulbs work.

NUMBER PLATE LAMP

To change a number plate lamp bulb



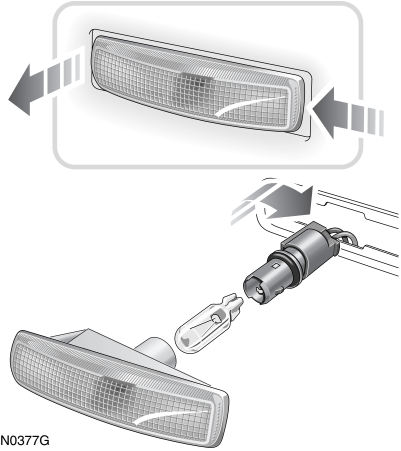
LAN0376G

1. Using a suitable tool, carefully lever the lens from the number plate lamp.
2. Twist the bulb holder anti-clockwise to unlock, then pull out the bulb complete with electrical connector.
3. Pull the bulb to remove it from the connector.
4. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

SIDE REPEATER LAMP

To change a side repeater lamp bulb



LAN0377G

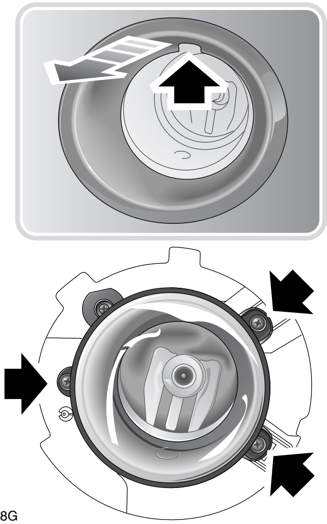
1. Push the lens firmly towards the front of the vehicle and withdraw the lamp unit from the wing.
2. Twist to release the bulb holder from the lens unit, then pull the bulb from its socket.
3. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

FRONT FOG LAMPS

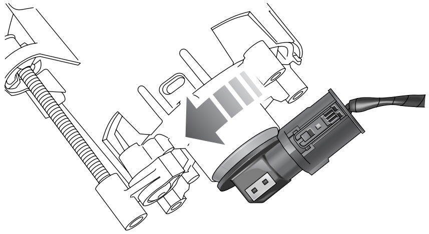
To change a front fog lamp bulb

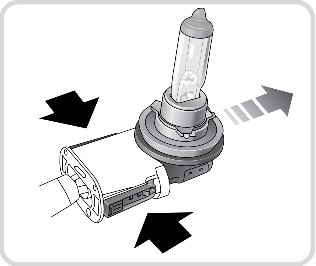
1. To gain access, use the finger slot at the top of the fog lamp surround and pull it forward to remove.



LAN0378G

2. Remove the three securing screws to release the lamp unit. Ease the unit out of the front bumper.
3. Twist the bulb holder counter-clockwise to unlock, then pull out the bulb complete with electrical connector.



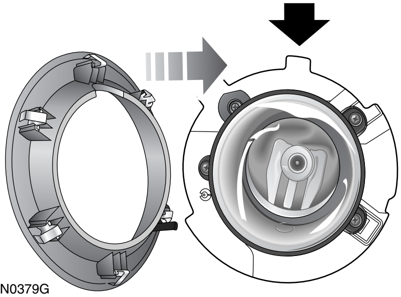


LAN0380G

4. To release the bulb, depress the two catches (solid arrows in inset), then pull to remove the bulb from the holder.
5. Before fitting the replacement bulb, note the flat and the tab on the otherwise circular shape of the bulb mounting flange. The tab acts as a key to enable correct positioning of the bulb in the bulb holder.

   Note: *Do not touch the bulb glass with your fingers. If necessary, clean the bulb with methylated spirits.*
6. Insert the new bulb and repeat the above procedure in reverse order.

   See **Replacement bulbs, 271**.



LAN0379G

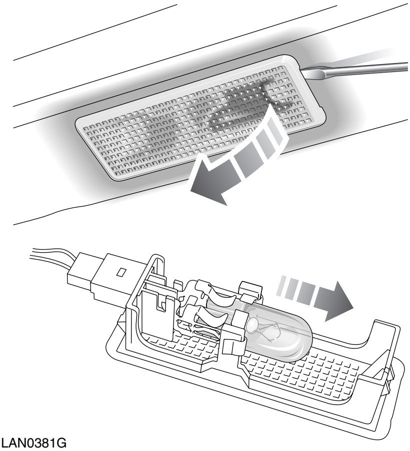
7. The fog lamp surround is uniquely shaped and will only fit in one position.

   Align the spring clip above the finger slot with the upper receiver shape in the bumper and push it into place. Now push the lower part of the fog lamp surround into place, applying some upward pressure.

Note: *After the replacement of a fog lamp bulb, the alignment of the lamp should be checked by a Land Rover Dealer/Authorised Repairer.*

DOOR/PUDDLE/FOOTWELL LAMPS

To change a door/puddle/footwell lamp bulb



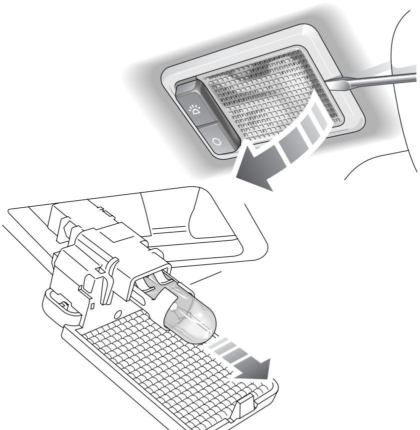
LAN0381G

1. With the relevant door open, insert a small flat-bladed screwdriver under the forward edge of the lens to carefully lever the lamp unit out.
2. Pull the bulb out of the electrical connector.
3. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

COURTESY LAMPS

To change a courtesy lamp bulb



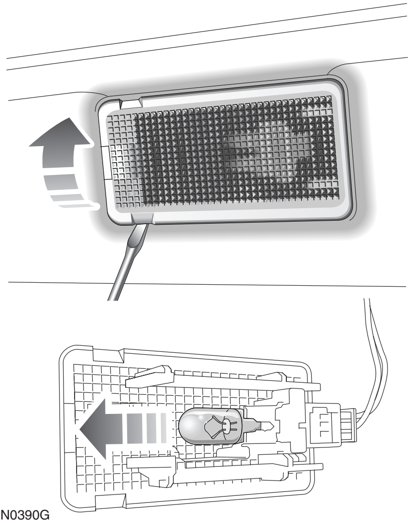
LAN0382G

1. Insert a small flat-bladed screwdriver into the indent on the side of the lens and carefully prise the lens from the lamp unit.
2. Pull the bulb out of the electrical connector.
3. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

TAILGATE LAMP

To change a tailgate lamp bulb



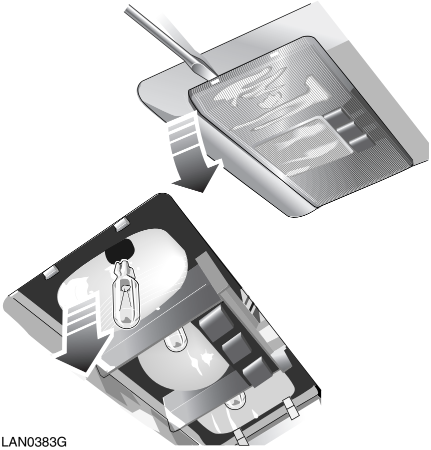
LAN0390G

1. Insert a small flat-bladed screwdriver under the lens and carefully prise the lens from the lamp unit.
2. Pull the bulb out of the electrical connector.
3. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

MAP LAMP

To change a map lamp bulb



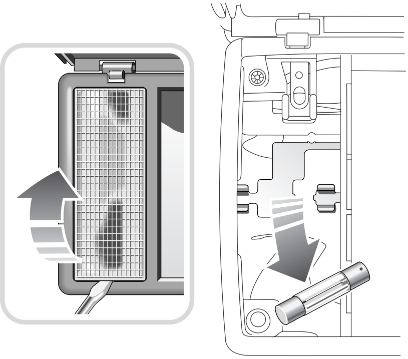
LAN0383G

1. Insert a small flat-bladed screwdriver into the indent on the side of the lens and carefully prise the lens from the lamp unit.
2. Pull the bulb out of the electrical connector.
3. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

VANITY MIRROR LAMP

To change a vanity mirror lamp bulb



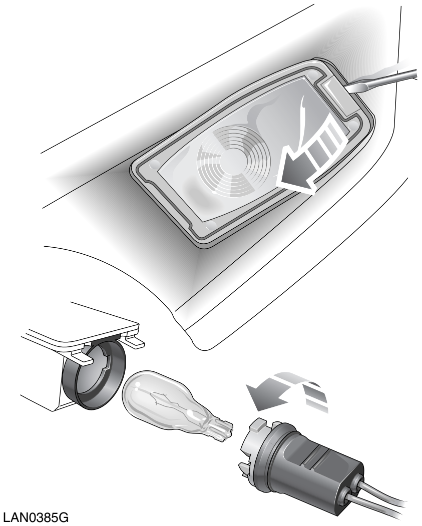
LAN0384G

1. With the vanity mirror cover open, use a small flat-bladed screwdriver to carefully lever the relevant lens from the mirror/lamp unit.
2. Pull the bulb out of the electrical connector.
3. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

MIRROR DOWNLIGHTER

To change a mirror downlighter bulb



1. Use a small flat-bladed screwdriver to carefully lever the lens from the mirror/ lamp unit.
2. Twist the bulb holder to reveal the bulb. Pull the bulb out of the electrical connector.
3. Insert a new bulb and refit the components.

See **Replacement bulbs, 271**.

LUBRICANTS AND FLUIDS

Recommendations for all climates and conditions.

Note: *Recommended oils are complete in themselves and additives should not be used.*

Note: *It is essential to change oil much more frequently if the vehicle is operated under severe conditions, especially if deep wading is carried out.*

Engine oil - Petrol vehicles

Use a 5W/30 oil meeting specification ACEA A3.

Land Rover oil to specification WSS M2C913B is recommended.

Engine oil - Diesel vehicles

Use 5W/30 oil meeting ACEA B1 or B3.

Power steering

Texaco Cold Climate PAS fluid.

Dynamic Response

Texaco Cold Climate PAS fluid.

Brake reservoir

Use Shell DOT4 ESL or a low viscosity DOT4 brake fluid that meets ISO 4925 class 6.

Brake pedal free travel: No adjustable free travel.

Windscreen washers

Screen washer fluid.

Engine cooling system

Caution: Be aware that different types of antifreeze are VERY different from each other; even different types from the same manufacturer.

The use of non-approved antifreeze will have an adverse effect on the engine cooling system and therefore engine durability.

Antifreeze: Use Havoline XLC to WSS-M97B44 (Texaco XLC), orange colour, with one part antifreeze to one part water for protection down to -40°C (-40°F).

CAPACITIES

The following capacities are approximate and provided as a guide only. All oil levels must be checked using the dipstick or level plugs as applicable.

Fuel tank:		
- Diesel vehicles	84 litres	18.4 gall
- Petrol vehicles	88 litres	19.3 gall
Engine oil refill and filter change:		
- Diesel vehicles	5.45 litres	9.6 pints
- Petrol vehicles	7.7 litres	13.6 pints
Washer reservoir	5.0 litres	8.8 pints
Cooling system (refill):		
- V6 Diesel vehicles	8 litres	14 pints
- V8 Diesel vehicles	12 litres	21.1 pints
- V8 NA Petrol vehicles	9.5 litres	16.7 pints
- V8 SC Petrol vehicles	12 litres	21.1 pints

ENGINES

V6 Diesel

Recommended fuel	Diesel or Automotive Gas Oil (AGO) to EN 590 specification. Maximum allowable Bio-diesel mix is 5%.
Capacity	2720 cm^3
Firing order	1-4-2-5-3-6
Bore	81.0 mm
Stroke	88.0 mm
Number of cylinders	6
Compression ratio	18.0:1

V8 Diesel

Recommended fuel	Diesel or Automotive Gas Oil (AGO) to EN 590 specification. Maximum allowable Bio-diesel mix is 5%.
Capacity	3626 cm^3
Firing order	1-5-4-2-6-3-7-8
Bore	81.0 mm
Stroke	88.0 mm
Number of cylinders	8
Compression ratio	17.3:1

V8 Petrol Naturally aspirated (NA)

Recommended fuel	UNLEADED 95 RON to EN 228 specification. Unleaded with a RON no lower than 90 may be used.
Capacity	4394 cm^3
Firing order	1-5-4-2-6-3-7-8
Bore	88.0 mm
Stroke	90.3 mm
Number of cylinders	8
Compression ratio	10.5:1
Spark plugs	NGK IFR5N10
Spark plug gap	Non-adjustable

Engines

V8 Petrol Supercharged (SC)

Recommended fuel	UNLEADED 95 RON to EN 228 specification Unleaded with a RON no lower than 90 may be used.
Capacity	4197 cm^3
Firing order	1-5-4-2-6-3-7-8
Bore	86.0 mm
Stroke	90.3 mm
Number of cylinders	8
Compression ratio	9.1:1
Spark plugs	NGK IFR5N10
Spark plug gap	Non-adjustable

WHEELS AND TYRES

Wheel size and tyre specification

Wheel size	Tyre	Load index
7J x 17 (alloy wheel)	235/65 R17 - All terrain tyre	108H
8J x 18 (alloy wheel)	255/55 R18 - All terrain tyre	109V
8J x 19 (alloy wheel)	255/50 R19 - All terrain tyre	107Y
9J x 19 (alloy wheel)	255/50 R19 - All terrain tyre	107Y
9.5J x 20 (alloy wheel)	275/40 R20 - All terrain tyre	106Y
5.5J x 19 (steel wheel)	T175/80 R19 - Temporary spare tyre	122M

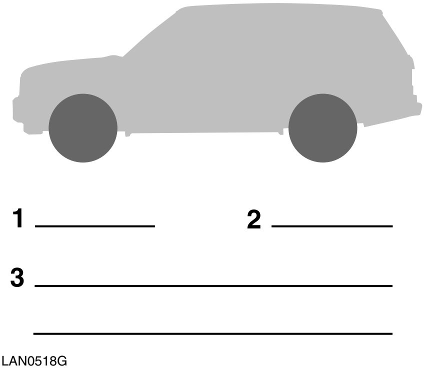
Caution: If a 9J x 19 alloy wheel requires balancing, the inner surface of the wheel must only be fitted with adhesive balance weights. Other types of weights will cause damage to the vehicle.

Tyre pressures

Tyre pressures are listed on a label on the B pillar on the driver's side (visible with the driver's door open). See **Tyre pressure and loading label, 239**.

Temporary spare tyre pressure	kPa	bar	lbf/in^2
Any position or load condition	420	4.2	60

Accessory wheels and tyres - insert details



1. Front tyre pressure.
2. Rear tyre pressure.
3. Wheel/tyre size, type and specification

Note: *Accessory fit off-road tyres (with a speed rating of Q or T) are subject to speed restrictions. Q-rated tyres should not be used at speeds greater than 160 km/h (100 mph), T-rated tyres should not be used at speeds greater than 190 km/h (118 mph).*

Note: *Consult your Land Rover Dealer/Authorised Repairer before you fit any accessory wheel or tyre.*

Vehicle Weights

VEHICLE WEIGHTS

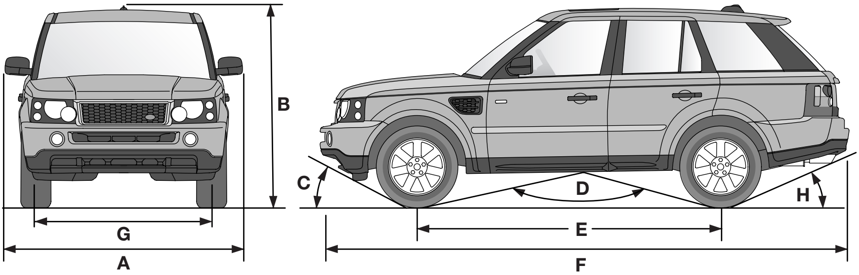
Approximate unladen vehicle weight (full fuel tank, excluding options)		
Petrol engine vehicles (NA)	2 480 - 2 485 kg	5 467 - 5 478 lb
Petrol engine vehicles (SC)	2 572 - 2 614 kg	5 671 - 5764 lb
Diesel engine vehicles	2 455 - 2 479 kg	5 412 - 5 465 lb
Maximum gross vehicle weight (GVW)		
Petrol engine vehicles (NA)	3 070 kg	6 768 lb
Petrol engine vehicles (SC)	3 125 kg	6 889 lb
V6 Diesel engine vehicles	3 070 kg	6 768 lb
V8 Diesel engine vehicles	3 175 kg	7 000 lb
Maximum front axle load		
All vehicles	1 470 kg	3 241 lb
Maximum rear axle load		
All vehicles	1 710 kg	3 770 lb
Gross Train Weight (Weight of vehicle plus trailer with overrun brakes)		
Petrol engine vehicles (NA)	6570 kg	14484 lb
Petrol engine vehicles (SC)	6625 kg	14605 lb
Diesel engine vehicles	6570 kg	14484 lb
Roof rack load (including the mass of roof rack)		
All vehicles	75 kg	165 lb

Note: *Axle weights are non-additive. The individual maximum axle weights and gross vehicle weight must not be exceeded.*

TOWING WEIGHTS

Maximum permissible towing weights	On-road	Off-road
Unbraked trailers	750 kg (1 654 lb)	750 kg (1 654 lb)
Trailers with overrun brakes	3 500 kg (7 716 lb)	1 000 kg (2 205 lb)
Nose weight	250 kg (550 lb)	250 kg (550 lb)

DIMENSIONS



LAN0391G

Dimensions

A	Overall width	2 170 mm	85.4 in.
	Overall width (mirrors folded)	1 928 mm	75.9 in.

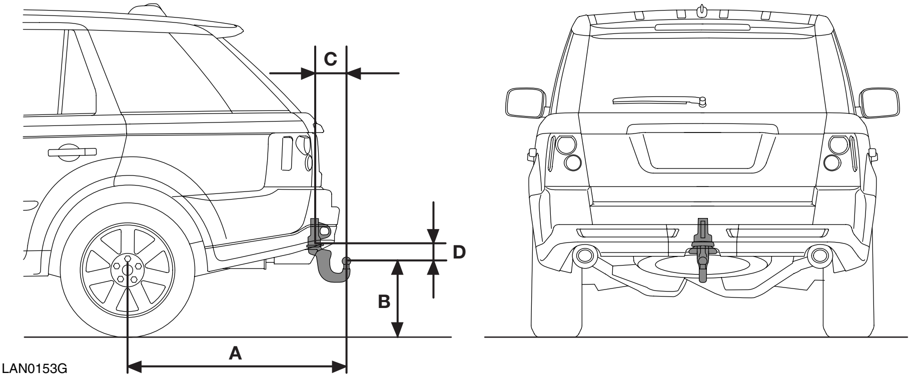
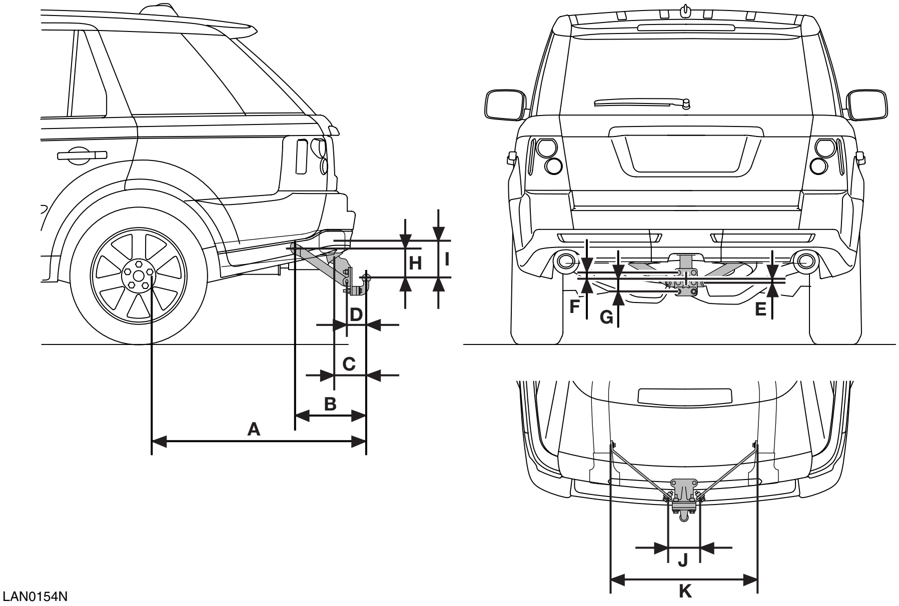
	Maximum gradient (at EEC kerb weight) - Continuous operation - Drive through operation	 35° 45°	
	Turning circle	10.96 m	35.96 ft.
	Wheel alignment: - Front - Rear	 -0.16° ±0.20° 0.16° ±0.20°	 -10' ±12' 10' ±12'

TOW BAR DIMENSIONS



A	Wheel centre to centre of towball	1,191 mm	46.9 in.
B	Ground to centre of towball	395 mm	15.55 in.
C	Centre of towball to tow bar attachment	170 mm	6.7 in.
D	Centre of towball to tow bar attachment	124 mm	4.9 in.

MULTI-HEIGHT DROP PLATE TOW BAR DIMENSIONS



A	Wheel centre to centre of towball (horiz)	1,210 mm	47.64 in.
B	Centre of outer attachment points to centre of towball (horiz)	403.6 mm	15.89 in.
C	Centreline of housing bayonet slot tip radius to centre of towball (horiz)	192.4 mm	7.57 in.
D	Centre of inner attachment points to centre of towball (horiz)	108 mm	4.25 in.
E	Centre of inner attachment points to centre of towball (vert)	20 mm	0.79 in.
F	Centre of upper towball plate bolt to centre of towball (vert)	36 mm	1.42 in.
G	Centre of lower towball plate bolt to centre of towball (vert)	70 mm	2.76 in.
H	Centre of outer attachment points to centre of towball (horiz)	167.3 mm	6.59 in.
I	Centreline of housing bayonet slot tip radius to centre of towball (vert)	174.3 mm	6.86 in.
J	Distance between inner attachment point centres	180.5 mm	7.10 in.
K	Distance between outer attachment point centres	822.5 mm	32.38 in.
Dimensions refer to towing equipment officially released by Land Rover			

FUEL CONSUMPTION

The fuel consumption figures shown below have been calculated using a standard testing procedure (the new EC test procedure from Directive 99/100/EC), and produced in accordance with The Passenger Car Fuel Consumption (Amendment) Order 1996.

Under normal use, a vehicle's actual fuel consumption figures may differ from those achieved through the test procedure, depending on driving technique, road and traffic conditions, environmental factors, vehicle load and condition.

Fuel consumption figures

	URBAN		EXTRA-URBAN		COMBINED	
	l/100km	mpg	l/100km	mpg	l/100km	mpg
Petrol S/Charged	22.8	12.4	11.9	23.8	15.9	17.8
Petrol	21.1	13.4	11.4	24.8	14.9	18.9
Diesel	13.2	21.4	8.5	33.2	10.2	27.6

Urban cycle

The urban test cycle is carried out from a cold start and consists of a series of accelerations, decelerations and periods of steady speed driving and engine idling. The maximum speed attained during the test is 50 km/h (30 mph) with an average speed of 19 km/h (12 mph).

Extra-urban cycle

The extra urban test cycle is carried out immediately after the urban test. Approximately half of the test comprises steady-speed driving, while the remainder consists of a series of accelerations, decelerations and engine idling. The maximum test speed is 120 km/h (75 mph) and the average speed 63 km/h (39 mph). The test is carried out over a distance of 7 km (4.3 miles).

Combined

The combined figure is an average of the urban and extra-urban test cycle results, which has been weighted to take account of the different distances covered during the two tests.

Note: *These figures should not be compared with the figures produced using the ECE/EEC procedure previously required by The Passenger Car Fuel Consumption Order 1983. Because of the changes in test procedure, even the urban figures would differ if the same car were subjected to both tests.*

DECLARATIONS OF CONFORMITY

The Declarations of Conformity are from manufacturers of RF (Radio Frequency) equipment, whose components are used in the manufacture of your Range Rover Sport.

These manufacturers state that their components comply with relevant rules of the R and TTE (Radio and Telecommunication Terminal Equipment) directive.

The directive requires the manufacturer of short range radio devices to self-certify that RF parts fitted to Land Rover vehicles are fit for use and that the declarations are supplied with the vehicle documentation. If at a future date a technical inspection is required, the declarations will provide all necessary information.

Note: *The Declarations of Conformity are published in the native language of the RF equipment manufacturer, in compliance with the R and TTE Directive.*

Conformity

Declaration of Conformity

We, the undersigned, declare that the

Receiver type 5WK4 8883 and 5WK4 8886 are based on receiver type 5WK4 8812.

The assembly and layout differs in the following items:

Data Filter
Data Slicer
VCC blocking capacitor
ESD protection

The changed assembly and layout does not influence the RF characteristics.

EC Declaration of Conformity according to Annex II of Directive 1999/5/EC

Manufacturer:	Siemens Automotive AG Access Control & Security Systems
Address:	Wernerwerkstrasse 2 D-93049 Regensburg Germany
Product type designation:	5WK4 8812
Intended use:	radio receiver for vehicle locking/unlocking systems

The product mentioned above complies with the following European Directive:

1999/5/EC: Directive of the European Parliament and of the Council on radio equipment and telecommunications terminal equipment and the mutual recognition of their conformity, dated 9th March 1999.

We, the undersigned, hereby declare that our above-mentioned product complies with all essential radio test suites according to Annex II of Directive 1999/5/EC. Proof is shown by:

- test report no. 00001036, issued by the accredited test laboratory M. Dudde Hochfrequenz-Technik, according to EN 300 220-1
- test report no. 00001038, issued by the accredited test laboratory M. Dudde Hochfrequenz-Technik, according to EN 301 489-1, -3

ICE 1527

RADIO RECEPTION

Your radio receives signals whilst on the move, and may experience widely differing reception characteristics. Because of this, some interference is to be expected from time to time during a journey.

FM transmitters can only broadcast over a limited range, and good clear signals will only be received in the immediate area of the transmitter. When travelling, occasionally it may be necessary to re-tune the radio to offset the effects of moving from one transmitter area to another.

While RDS automatic retuning helps to reduce the effects of signal changes, some manual retuning may still be required (especially for local stations) in areas of weak reception.

The broadcast range for good stereo reception is within approximately 48 - 64 km (30 - 40 miles) of the transmitter.

FM Signals travel in a straight line, so large obstacles, such as tall buildings, can shield the car from the signal causing distortion or loss of reception (known as dead spots).

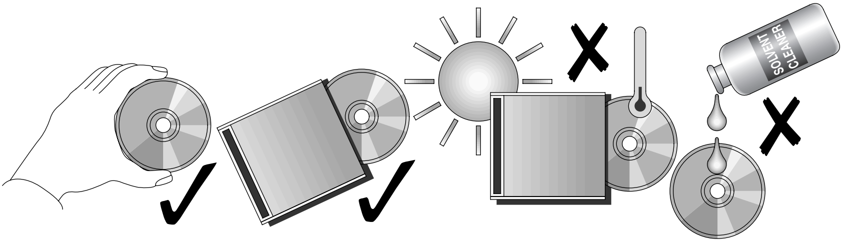
Distortion can also occur if FM signals received directly from the transmitter, mix with signals deflected by obstructions such as mountains, hills, and tall buildings. This is known as multi-path distortion.

Note: *Although distortion, interference and lack of signal clarity are sometimes attributed to a fault in the radio, this is rarely the case.*

RADIO AERIAL

The aerial is etched onto the surface of the glass of the left-hand rear side window.

No maintenance is possible; however it is important to ensure that the interior surface of the glass is protected from possible damage caused by contact with hard objects or from the injurious effects of abrasive cleaners.



ICE 0022

CARE OF COMPACT DISCS

Dirt, dust, condensation and heat can damage discs. Always observe the following precautions:

NEVER touch the playing surface (the unlabelled side) of a disc. Handle discs by holding the outer edges, or the edge of the central hole and the outer edge, between finger and thumb.

ALWAYS return discs to their case after use to prevent contamination reducing playback quality.

NEVER leave the disc or case exposed to excessive heat or direct sunlight.

NEVER use a solvent or abrasive cleaner. Dust or dirt should be removed from the playing surface by wiping with a clean, dry, lint-free cloth. Always wipe in a straight line from the centre to the edge of the disc.

If left, minor scratches on the surface of a compact disc can cause skipping or mis-tracking. It may be possible to use CD restorer polish to remove the scratches and improve the performance of the disc. When using CD restorer polish, always follow the manufacturer’s instructions.

Note: *Some music CD manufacturers are using data encryption to copy-protect their recordings and prevent the production of counterfeit copies. These CDs differ from the internationally agreed CD audio standard, RedBook, a standard that serves as the operating basis for all CD players and changers. Copy-protected CDs may fail to play in your CD changer or may be played subject to various limitations, e.g. sound quality may be impaired. If you do experience a problem, try the CD in other players before contacting the CD vendor.*

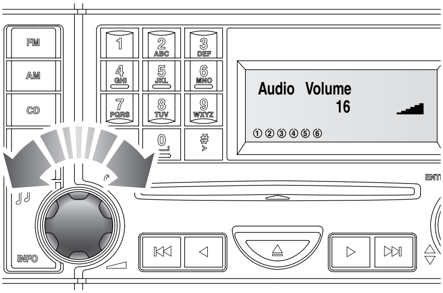
Note: *On Premium audio units, there are six circles at the bottom left-hand side of the display, which represent the six available CD slots. As soon as one has a CD in it, its number will appear in the circle.*

VOLUME SETTINGS

Volume control



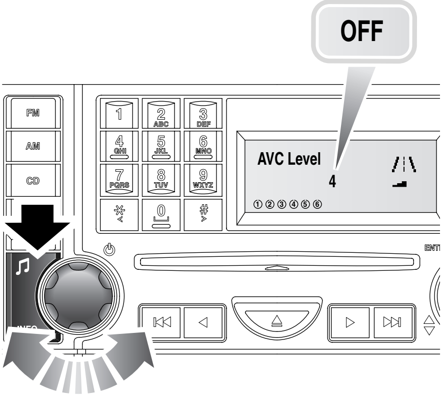
ICE1615 ENG

To increase or decrease the volume level, rotate the control.

With the engine running, the volume level can be adjusted between 0 and 35. If the audio unit is turned off, it will re-start at the previously selected volume level, provided that this is not too loud or too quiet.

The audio unit can be used with the engine off, but the volume available will be restricted. If the volume control is not adjusted during use with the starter switch off, the volume will resume at the last selected level when the starter switch is turned on.

Automatic Volume Control (AVC)



ICE1633 ENG

AVC adjusts the volume level to allow for the changes in road noise as the vehicle speed increases or decreases.

Note: *The AVC value (0-9) represents the volume increase, and not the volume level.*

The volume increase is proportional to speed increase. If the AVC level is set to zero, there will be no volume increase. An AVC setting of **1** will increase the volume by a small amount as the vehicle speed increases. An AVC setting of **9** will increase the volume by a large amount as the vehicle speed increases.

The AVC setting required will depend upon the expected speed (high or low) and the expected road conditions (rough or smooth).

To access the AVC Level settings, press the **Tone** button for approximately five seconds until the current **AVC Level** setting is displayed. Use the rotary control to increase or decrease the value.

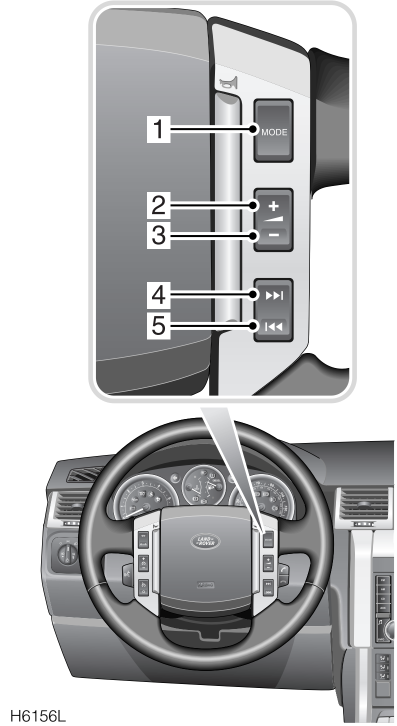
To adjust the hours, rotate the control clockwise to increase, or anti-clockwise to decrease. Press the rotary control to accept the value shown.

Once the hours have been set and accepted, the minutes will be highlighted and are set in the same way. Having set both hours and minutes, the display will return to the main menu.

Note: *The clock will remain illuminated for ten minutes after the starter key is turned to position **0**.*

AUDIO REMOTE CONTROLS



1. Audio mode switch

Press to change audio modes (radio to CD for example).

2. Volume increase control

Press to increase volume.

3. Volume decrease control

Press to decrease volume.

4. Search forward/track select control

Press to change to the next radio station on the selected waveband.

During CD play, press the control to move forward to the beginning of the next track. Operate the control repeatedly to move forwards through several tracks at a time.

5. Search backward/track select control

Press to change to the previous radio station on the selected waveband.

During CD play, press the control to move backward to the beginning of the current track on the disc. Operate the control repeatedly to move backwards through several tracks at a time.

REAR AUDIO CONTROLS

With the starter key in position **I** or **II**, the rear audio controls can operate, regardless of whether the audio system is switched on or not. However, the output can only be heard through the headphones.

If you are listening to the same source as the main audio unit, only the volume can be adjusted via the rear audio controls.

For example, if a music CD is selected on the main audio unit, you can also listen to that music and adjust the volume to suit your requirement. No other CD functions will be available. If however, the main audio unit is switched to another source, all CD adjustments achievable with the rear audio controls become available. If the main audio source is subsequently switched back to CD operation, the rear audio controls will again be limited to volume control only.

The same logic applies to radio functions.

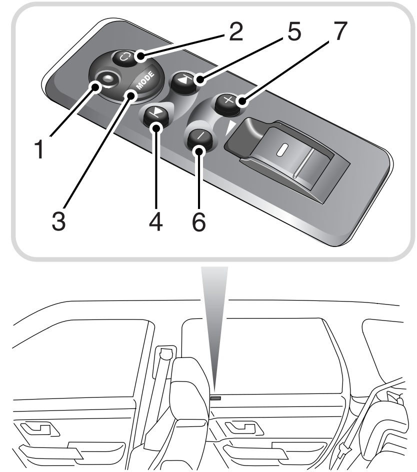
Adjustments can be made to other parts of the audio system.

For example, if a music CD is selected on the main audio unit, radio can be selected and controlled by a passenger using the rear audio controls. All radio adjustments achievable with the rear audio controls become available.

Headphones with volume control

The maximum volume available to this type of headphones is limited to the volume set at the rear audio controls.

Note: *Only headphones compatible with a 3.5 mm jack plug socket can be used. To obtain optimum sound quality, use headphones with an impedance of 32 ohms.*



H6158G

1. 3.5 mm headphone jack.
2. Pre-set/Disc select.
   During radio play, a short press will select the next pre-set radio station. A long press will change the frequency band (MW, FM, etc.).
   During CD play, a short press will select the next disc.
3. Mode control.
   A long press will select AUX.
   When in AUX mode, a short or long press will return to the previously selected mode.
   Press to toggle between radio, CD and Rear Seat Entertainment.

   Note: *When Rear Seat Entertainment is selected, all adjustments are made through the remote control.*

4. Seek down.
   During radio play, press to seek down through the frequency band to the next available station with good signal strength.
   During CD play, a short press will skip back to the beginning of the track being played. Press again to skip back to the previous track. A long press will search back through the track being played, until the button is released.
5. Seek up.
   During radio play, press to seek up through the frequency band to the next available station with good signal strength.
   During CD play, press to skip forward to the beginning of the next track.
   A long press will search forward through the track being played, until the button is released.
6. Volume decrease.
   Press to lower the headphone volume level.
7. Volume increase.
   Press to increase the headphone volume level.

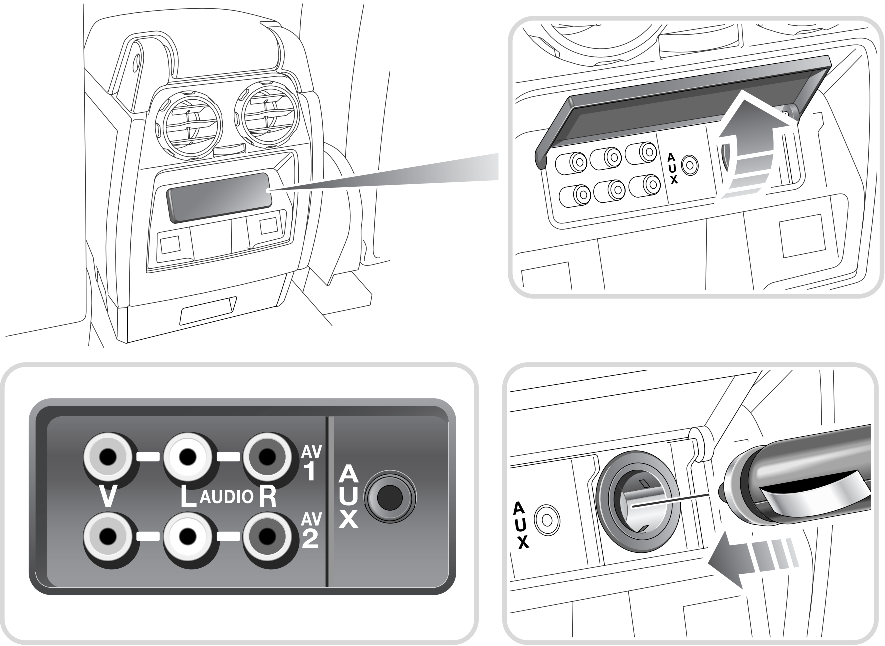
Note: *When the headphones are not connected, the buttons remain operational. This means that it is still possible to select CD, for example, whilst the radio is playing through the cabin speakers. The CD unit will remain operational until the mode control is pressed to select another mode.*

The mode in use when the starter key is removed will resume if the starter switch is turned on again (position ***I*** *or* ***II****) within two minutes. If the starter switch is turned off for longer than two minutes* ***AUX*** *mode will be selected when the starter switch is next turned on.*

Note: *Adjusting the volume on the main audio unit, does not alter the headphone volume. The volume level of each controller can be adjusted independently.*

Note: *Only headphones compatible with a 3.5 mm jack plug socket can be used. To obtain optimum sound quality, use headphones with an impedance of 32 ohms.*

AUXILIARY EQUIPMENT CONNECTIONS



ICE2254 ENG

AUX (Auxiliary Input) mode allows additional equipment to be connected to the vehicle's audio system. Items such as a personal stereo, MP3 player, hand-held navigation unit etc. can be plugged in to the vehicle's audio system.

The auxiliary connector is situated at the rear of the centre console. To gain access, lift the lower edge of the cover.

Auxiliary audio devices are connected via the 3.5 mm stereo jack plug marked **AUX**.

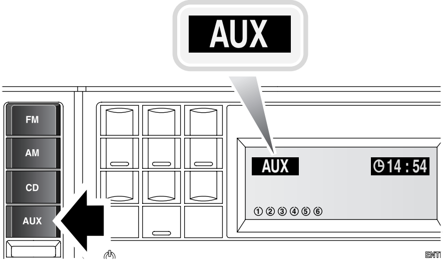
The auxiliary power socket, situated next to the auxiliary input connector, can be used to power or charge any suitable device.

Auxiliary mode

WARNING

- **Ensure that any auxiliary devices are stored securely whilst the vehicle is in motion. Any loose objects can present a serious hazard during sudden manoeuvres, emergency braking, or an accident.**
- **Do not place any item connected to the auxiliary input socket, or the auxiliary power socket, on the vehicle's seats, carpets, or other upholstery. The heat generated by these devices may cause damage to the upholstery, or in extreme cases, a vehicle fire.**
- **Do not leave any auxiliary input devices connected whilst the vehicle is left unattended. There is a risk of heat damage or fire, in addition to the risk of theft.**

Caution: Read the manufacturer's instructions for any device BEFORE it is connected to the vehicle's audio system. Ensure that the device is suitable, and comply with any instructions regarding connection and operation. Failure to do so may result in damage to the vehicle's audio/electrical system, and/or the auxiliary device.



ICE1864 ENG

To listen to an auxiliary input source, connect the device and briefly press the **AUX** button. The unit will playback audio via the 3.5 mm stereo jack plug.

Alternatively, press and hold the **MODE** button on the steering wheel or the rear audio controls.

Volume is controlled using the left rotary control, and tone settings are as described previously.

Note: *The volume levels and sound quality available from devices connected to the auxiliary inputs may vary widely.*

ICE2142 ENG

A frequency in either FM or AM can be directly input from the preset keypad.

Select a radio station in the desired waveband and give a short press on the **#** button. This will clear the frequency display.

Dial in the frequency required using the numbered keys (during this exercise, the unit will remained tuned to the current station).

Ignore the fact that the previous frequency might have had more, or fewer, digits than the new one as the system will cater for this.

Any inputs that are outside the frequency range will be ignored. If there is no user action for 5 seconds during the process, the display will return to the previous station display.

When the frequency has been full input, the tuner will change to the newly selected frequency. Once the change has been made, the new frequency can be stored manually.

RDS (RADIO DATA SYSTEM)

Your radio is equipped with RDS (Radio Data System), which enables the audio unit to receive additional information with the normal radio signals.

On the FM waveband, RDS enables the radio to receive information broadcasts. RDS also allows the radio to automatically re-tune to stations that are linked to the same network if that network allows this.

Note: *Not all FM radio stations broadcast RDS. If a non-RDS station is selected, RDS features will not be available.*

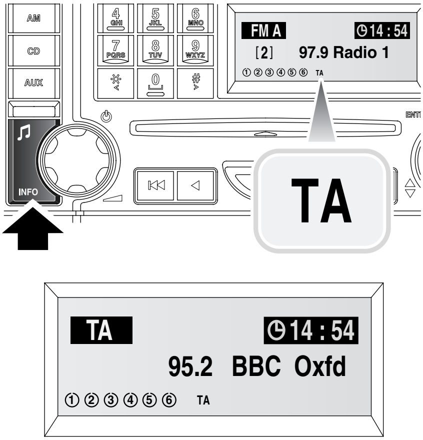
To turn RDS on or off, press the **MENU/OK** button to display the menu. With the settings menu displayed, rotate the control until **RDS** is displayed. Press the rotary control to display the **On** or **Off** options. Use the control to make your selection, and press the control to set the RDS status.

Note: *If RDS is turned off, the name of the selected radio station will not be displayed.*

INFORMATION BROADCASTS

Selecting traffic information



ICE1632 ENG

To toggle TA (Traffic Announcement) on or off, briefly press the **INFO** button.

As soon as a traffic announcement is received, normal radio reception (or CD play) is interrupted and **TA** appears in the main display area, along with the name of the station providing the information. At the end of the traffic announcement, radio, or CD play, will resume.

Tuning difficulties

- If the radio is tuned to a weak FM signal (in remote areas, for example) or a radio station that cannot provide traffic information, when the **INFO** button is pressed, the display will show **No TA/TP**.
- If a traffic information station cannot be found, the words **No Station** will be displayed. In this case the radio will return to the previously tuned frequency.
- If the signal from a traffic information station weakens, the **TP** indicator in the left side of the display will start to flash. In this case, press either of the Search controls to start searching for another radio station. If the traffic information signal weakens during CD play, the radio will automatically attempt to locate and re-tune to a traffic information station with a stronger signal.

Note: *If a non-traffic information station has been stored on one of the pre-set buttons, and is selected while the traffic information facility is switched on, the radio will remain on the selected station unless TA is turned off and on again.*

Selecting news information

Press the **MENU/OK** button to display the menu. Use the rotary control to scroll up or down through the menu to **NEWS**. Press the **MENU/OK** button to change the status to **ON** or **OFF**.

Alternatively, press and hold the **INFO** button to toggle news broadcasts on or off.

During news broadcasts the display shows **NEWS** with the name of the radio station providing the news information.

When the news information mode is active, and a news information broadcast is received, normal radio reception (or CD play) is interrupted and the display flashes **NEWS** alternately with the name of the radio station providing the news information.

The display will alternatively flash the station name and **NEWS**. At the end of each broadcast, CD play will resume from the point at which CD play was interrupted.

Note: *Both traffic and news information can be selected at the same time. However, the radio will always give priority to traffic information.*

INSERTING AND EJECTING DISCS

Dual and DVDPlus discs

Please be aware that a new generation of DVD discs is being adopted by the music industry. They are known as **Dual Discs** or **DVDPlus** discs. They have digital music on one side and video content on the other. Current in-car audio systems with a front loading CD player may load and play this type of disc, however, it is possible that the disc will not eject and will therefore block up the player. Such damage to a CD player will not be covered under warranty.

ICE1875 ENG

To insert a single disc into the CD player, first press the **CD** mode button.

***Note:** On Premium audio units, it is then necessary to use the numerical keypad to select the disc position number in which the CD is to be stored.*

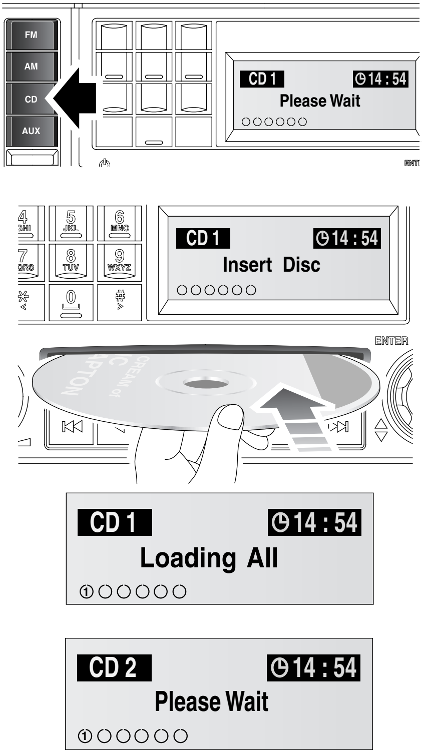
A message will appear in the display screen asking you to wait, followed by the instruction to **Insert Disc**.

Ensure that the label side of the disc is facing upwards then partially insert it without pushing it into the slot; the player mechanism will draw the disc in automatically.

Caution: DO NOT force the disc into the slot.

There will be a short pause whilst the player reads the information from the disc. Play will commence at the first track on the newly inserted disc.

Inserting multiple discs (Premium audio)



ICE1891 ENG

To insert more than one disc, briefly press the **CD** mode button. Then press and hold the **CD** mode button. The information display will show **Loading All**, followed by **Please Wait**.

When the message **Insert Disc** is displayed, the first disc can be presented to the player. The disc's position number will be highlighted on the Information display screen both during and after loading.

Note: *If a CD fails to be drawn in and the message **CD Error** is displayed, press the eject button to clear the error.*

If the error fails to clear, contact your Land Rover Dealer/Authorised Repairer.

This process is repeated until all six CD positions are occupied. If one or more of the disc positions is already occupied, that position will be skipped in the loading process.

Caution: DO NOT force the disc into the slot.

Note: *To stop the loading process for multiple discs, either press and hold the **CD** mode button or press the **C** button.*

Note: *If there is a problem with a disc that has been loaded (inserted upside down, wrong format etc.) **Disc Error** will appear in the message display, and the disc in question will be ejected. If the problem is obvious, and can be corrected (disc upside down for example), then re-insert the disc in the correct manner. If it cannot be rectified, or the problem is not apparent, do not re-insert the disc.*

Ejecting a single disc

Caution: Do not pull the disc from the player before it has stopped moving, as this may cause damage to the player mechanism.

Standard audio: With a CD loaded, start CD playback by briefly pressing the **CD** mode button. Playback will begin from the point at which it was stopped previously or, if the CD is newly inserted, from the beginning of the CD.

Premium audio: To start CD playback, briefly press the **CD** mode button, then select the required disc number. If no disc number is selected, playback will begin at one of two places:

- If the discs contained in the player have not been removed since their last use, playback will begin from the point at which it was stopped previously.
- If the discs contained in the player have not been used since they were inserted, playback will begin at the start of disc one.

If the slot position selected does not contain a disc, there will be a pause followed by a message on the display screen **Insert Disc**.

Once a disc has been inserted, there will be a pause whilst the unit reads the disc information. Playback will then begin at the start of track one.

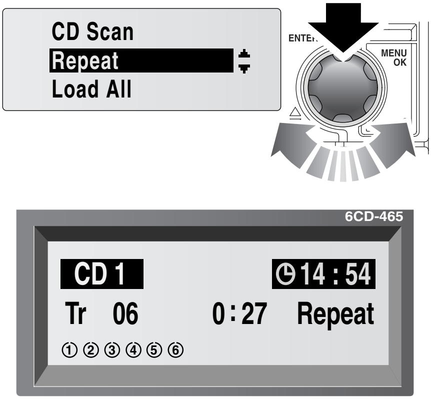
ICE1878 ENG

CD Scan will work through the tracks on the current CD in numerical order. Each track will be played for ten seconds, before moving on to the next track. Play will then begin at the start of track one. This feature is designed to allow you to sample the music available on a CD.

Use the right rotary control to scroll to **CD Scan**. Press the control to enable or disable the function as required.

Pressing the **C** button, or the **Skip Forward/Next Track** or **Return to Start/Previous** buttons, will also disable the function.

Repeat



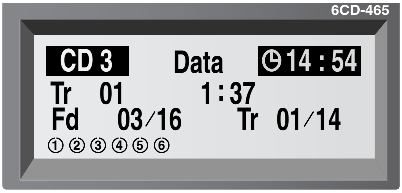
ICE1879 ENG

Repeat puts the current track into a loop. The track will play repeatedly until it is stopped or cancelled.

Use the right rotary control to scroll to **Repeat**. Press the control to enable or disable the function as required.

Pressing the **C** button, or the **Skip forward/Next track** or **Return to Start/Previous** buttons, will also disable the function.

DATA CD (MP-3)



ICE2141 ENG

When a data disc (containing MP-3 encrypted music data) is inserted into the unit, the display will show additional folder and track information.

The first line of the display shows that a data CD is inserted. The second line shows which track is being played and the play time of that track.

The third line shows which folder out of the total number of folders (03/16) and which track out of the total number of tracks available (01/14) is currently playing.

A short press on the **#** or ***** keys selects the next or previous folder respectively. The number of that folder will change accordingly.

When a new folder is selected, play will commence at the first track in that folder.

Within the current folder, track selection can be changed by use of the **Return to start/previous** and **Skip forward/next track** buttons. Track number in the display will change accordingly.

VOICE CONTROL

IMPORTANT

Voice control provides a safe and convenient way of operating the audio system without the need to operate the controls manually. This enables you to concentrate fully on driving the vehicle, and removes the need to divert your attention from the road ahead in order to change settings, or receive feedback from the system.

A number of voice commands are available, and, with a little experience, you will find them easy and convenient to use. Whenever you issue one of the defined commands with the system active, the voice control system converts your command into a control signal for the audio system. Your inputs take the form of dialogues or commands. You are guided through these dialogues by announcements or questions.

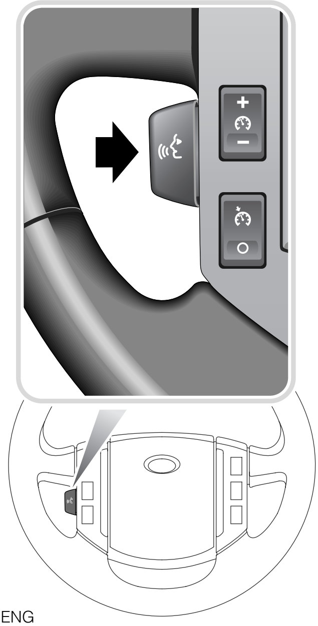
Please familiarise yourself with the functions of the audio system before using voice control.

Making yourself clearly understood

The voice control system includes a hands-free microphone mounted in the roof lining at the front of your vehicle. Although the microphone filters out some ambient noise, there are a few points to observe to ensure that the system understands your commands:

- Speak continuously and at normal volume, avoiding unnatural emphasis and pauses between words.
- Do not speak while the voice control system itself is giving an output. The voice system displays **LISTENING** on the message centre, and gives a beep when it is waiting for a speech input.
- It is possible that noise interference from outside the vehicle could affect commands. To avoid this, keep the doors, windows, and sunroof closed.
- If a command is not heard, or misunderstood, the voice system responds with >Sorry, Command not recognised< or >No speech detected<. If this happens, repeat the command.
- Avoid causing background noise in the vehicle while you are speaking, and ask your passengers not to talk while you are issuing voice commands.
- The hands-free microphone is positioned to pick up the driver’s voice. Commands made by other occupants may be picked up, but clarity and accuracy will be reduced.

Activating the system



ICE1900 ENG

To activate voice control:

- Briefly pull the control paddle (your Audio system will mute at this point). A brief acoustic signal will be heard, and **LISTENING** will be displayed on the main message centre to indicate that the system is now waiting for a voice command.

Note: *It is only necessary to use the steering wheel voice control paddle at the beginning of each voice session.*

Defined voice commands

The voice control system understands predefined commands which need to be quoted word for word.

An audio feedback of voice commands is available. To activate the feedback, pull the voice control paddle briefly and give one of the following commands:

- **Voice help** - To list all commands.
- **Radio help** - To list Radio commands.
- **CD help** - To list CD commands.
- **Navigation help** - To list Navigation commands.

  Please refer to the **Navigation, TV and Telephone Systems** Handbook.
- **Notepad Help** - To list Notepad commands.

  See **Using Notepad, 143**.

Interrupting voice control

A command can be interrupted by saying the word **Cancel** or by pressing the voice control paddle until the system responds by saying >Command cancelled<.

If you receive a telephone call (or Navigation route guidance instruction or TA announcement) while conducting a dialogue by voice control, the voice control dialogue is interrupted.

Command not recognised

If a command is not recognised by the speech recognition system, it responds with:

>Sorry. Please say your command again<.

GENERAL COMMANDS

Activating the user help function

The command
Radio help - recites a list of radio commands.

The command
CD help - recites a list of CD player commands.

Activating the user help function		
You say	**System response**	**Message centre display**
Radio help	Quotes the list of radio commands.	RADIO HELP
CD help	Quotes the list of CD commands.	CD HELP

STATION TUNING

Starting a dialogue

Hold the voice control paddle on the multi-functional steering wheel until the acoustic signal is heard. Any audio sources in the vehicle are muted.

Radio stations

Frequencies are said as in the following examples:

- **Radio Tune five thirty one AM**, or **Radio Tune five thirty one (531).**
- **Radio Tune nine hundred (900).**
- **Radio Tune fourteen forty (1440).**
- **Radio Tune fifteen oh three AM (1503).**
- **Radio Tune fifteen ten AM (1510).**
- **Radio Tune ten eighty (1080).**
- **Radio Tune eighty nine point nine FM** or **Radio Tune eighty nine point nine (89.9).**
- **Radio Tune eighty seven point nine FM** or **Radio Tune eighty seven point nine (87.9).**
- **Radio Tune ninety point zero** or **Radio Tune ninety (90.0).**
- **Radio Tune ninety point one (90.1).**
- **Radio Tune one hundred point five (100.5).**
- **Radio Tune one oh one point one FM (101.1).**
- **Radio Tune one oh eight point oh, Radio Tune one oh eight point zero**, or **Radio Tune one oh eight (108.0).**
- **Radio Tune one oh seven point nine (107.9).**

Note: *The word* ***Select*** *can be used in place of the word* ***Tune*** *if preferred.*

Nametags

Nametags are a unique name or phrase of your choice which can be used to recall a radio station. The nametags used can be the station name, or a completely separate name of your choosing.

Tuning to a radio station		
You say	**System response**	**Message centre display**
Radio play	>Radio play<	RADIO PLAY
Radio tune ninety six point nine (96.9) FM (or AM or Medium Wave)	>Radio tune 96.9 FM (or AM or Medium Wave)<	96.9 FM
Radio tune <nametag>	>Radio tune <nametag><	Station frequency

STORING RADIO STATIONS

Storing via voice command

Once you have tuned to a radio station, it is possible to store that station for future use as a pre-set. The following commands apply to the currently tuned station.

The command
Radio store preset <say number (1-9)>
calls up the dialogue for storing a pre-set station.

The command
Radio autostore
enters the autostore function for the selected frequency band (e.g. FM).

Nametags

Nametags are a unique name or phrase of your choice which can be used to recall a radio station. The nametags used can be the station name, or a completely separate name of your choosing.

The names are stored in a directory by using the **Radio store name** command. The system responds with >Name please<. You say the name that you have chosen (e.g. Radio 1).

The system will read out a list of current nametags when given the command **Radio directory**.

Radio tune <nametag> is used to select a station that has been previously stored.

Storing via voice command		
You say	**System response**	**Message centre display**
Radio store preset <preset number (1-9)>	>Radio store preset< <preset number (1-9)>	RADIO STORE PRESET (1-9).
1. Radio store name **2.Name**	>Radio store name, name please< >Name<	RADIO STORE NAME, NAME PLEASE STORED
Radio autostore	>Radio autostore<	RADIO AUTOSTORE
Radio tune <name>	>Radio tune <name><	RADIO TUNE

RADIO PLAY DIRECTORY

Tune or Delete from the radio directory

The commands **Radio play directory** or **Radio directory** prompt the system to read aloud the entire list of nametag entries in the radio directory.

The nametag list is read out in stored order, and commands can be entered during the system response.

Replay

After a nametag has been read out by the system, give the command **Replay** and the nametag will be repeated.

Tune

After a nametag has been read out by the system, give the command **Tune** and the radio tunes to the station saved under that nametag.

Delete

After a nametag has been read out by the system, give the command **Delete** and the nametag will be removed from the directory.

Cancel

After a nametag has been read out by the system, give the command **Cancel** and the current Voice session will end.

Tuning from the radio directory		
You say	**System response**	**Message centre display**
Radio play directory You can say **Replay, Tune, Delete** or **Cancel** after each name.	>Radio play directory< Reads out directory.	RADIO DIRECTORY Station frequency

RADIO DELETE DIRECTORY

Deleting the directory

The command **Radio delete directory** deletes all entries in the radio directory.

Deleting the radio directory		
You say	**System response**	**Message centre display**
1. Radio delete directory	>Radio delete directory, confirm yes or no<	DELETE DIRECTORY SAY YES OR NO
2. Yes	>Are you sure that you want to delete the whole directory?<	SAY YES OR NO
3. Yes	>Directory deleted<	DIRECTORY DELETED

CD Commands

CD OPERATION

Selecting disc and track numbers
For CD player commands, say disc and track numbers as in the following examples:

- **CD play disc one.**
- **CD play disc six track ten**.
- **CD play track twenty five**.
- **CD play track forty seven**.

Note: *Commands relating to disc numbers and selection, refer only to Premium audio units.*

Operating the CD player via voice command		
You say	**System response**	**Message centre display**
CD help	>List of CD commands<	CD HELP
CD play	>CD play<	CD PLAY
CD play disc <say number (1-6)>	>CD play disc <say number (1-6)><	DISC <disc number (1-6)>
CD play next disc	>CD play next disc<	NEXT DISC
CD play previous disc	>CD play previous disc<	PREVIOUS DISC
CD play track <say number (1-99)>	>CD play track <say number (1-99)><	TRACK <track number (1-99)>
CD play disc <say number (1-6)> Track <say number (1-99)>	>CD play disc <say number (1-6) track <say number (1-99)><	DISC <disc number (1-6)> TRACK <track number (1-99)>

REAR SEAT ENTERTAINMENT

Rear seat entertainment operation

When rear seat entertainment is fitted, it can be controlled by the following voice commands:

Operating the rear seat entertainment via voice command		
You say	**System response**	**Message centre display**
Radio auxiliary on/play	Selects auxiliary input to allow an external device, such as a portable CD/MD player plugged into the Aux socket, to be played through the cabin speakers	AUXILIARY PLAY
Headphones on/play	Switches on both headphone outputs	HEADPHONES PLAY
Headphones off	Switches off both headphone outputs	HEADPHONES OFF
Rear entertainment on/play	Switches on rear entertainment system	RSE PLAY
Rear entertainment off	Switches off rear entertainment system	RSE OFF

General Information - About This Manual

Description and Operation

Notes, Cautions and Warnings

Throughout this manual, important information is highlighted by the use of NOTES, CAUTIONS and WARNINGS. NOTES give additional information on a topic or procedure, CAUTIONS are given to prevent damage to the vehicle, and WARNINGS are given to prevent personal injury.

Published: 11-May-2011

General Information - About This Manual

Description and Operation

Introduction

This manual has been written in a format that is designed to meet the needs of technicians worldwide. The objective is to use common formats and include similar content in each manual.

This manual provides general descriptions for accomplishing diagnosis and testing, service and repair work with tested and effective techniques. Following them will help to ensure reliability.

Important Safety Instructions

Appropriate service methods and correct repair procedures are essential for the safe, reliable operation of all motor vehicles as well as the personal safety of the individual carrying out the work.

Anyone who departs from the instructions provided in this manual must first establish that personal safety or vehicle integrity is not compromised by the choice of method, tools or components.

Warnings, Cautions and Notes in This Manual

⚠ WARNING: Warnings are used to indicate that failure to follow a procedure correctly may result in personal injury.

⚠ CAUTION: Cautions are used to indicate that failure to follow a procedure correctly may result in damage to the vehicle or equipment being used.

• NOTE: Notes are used to provide additional essential information required to carry out a complete and satisfactory repair.

Generic warnings or cautions are in their relevant description and operation procedure within section 100-00. If the generic warnings or cautions are required for a procedure, there will be a referral to the appropriate description and operation procedure.

If a warning, caution or note only applies to one step, it is placed at the beginning of the specific step.

Trustmark Authoring Standards (TAS) Removal and Installation Procedures

• NOTE: TAS style procedures can be identified by steps that have no accompanying step text and the magenta color of the electrical connectors and fasteners such as nuts, bolts, clamps or clips.

A TAS removal and installation procedure uses a sequence of color illustrations to indicate the order to be followed when removing/disassembling or installing/assembling a component.

Many of the TAS procedures will have the installation information within the removal steps. These procedures will have the following note at the beginning of the procedure:

• NOTE: Removal steps in this procedure may contain installation details.

Items such as O-ring seals, gaskets, seals, self-locking nuts and bolts are to be discarded and new components installed unless otherwise stated within the procedure. Coated nuts or bolts are to be reused, unless damaged or otherwise stated within the procedure.

Specification procedures will contain all technical data that are not part of a repair procedure.

TAS Graphics

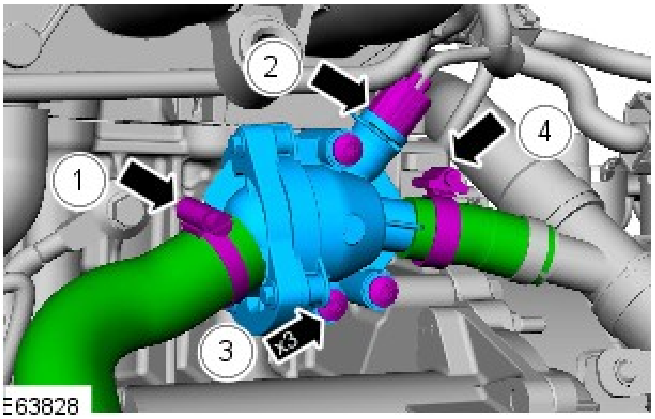
Colors used in the graphic are as follows:

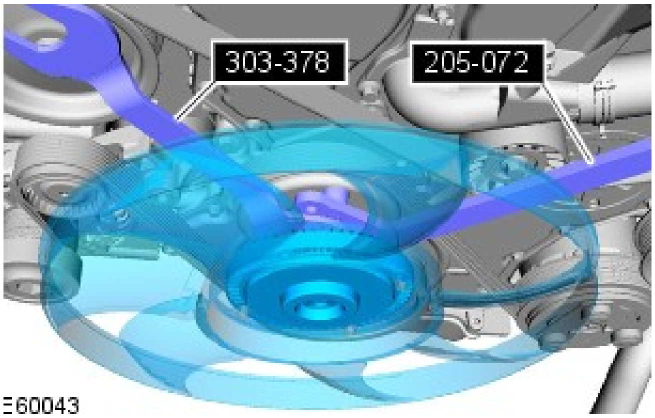
- Blue - Indicates the target item, item to be removed/installed or disassembled/assembled
- Green and Brown - Indicates a secondary item that needs to be detached, removed/installed or disassembled/assembled prior to the target item
- Magenta - Indicates electrical connectors and fasteners such as nuts, bolts, clamps or clips
- Pale Blue - is for the special tool(s) and general equipment.

There may be multiple steps assigned to one illustration.

Numbered pointers are used to indicate the number of electrical connectors and fasteners such as nuts, bolts, clamps or clips.

Items in the illustration can be transparent or use cutouts to show hidden detail(s).

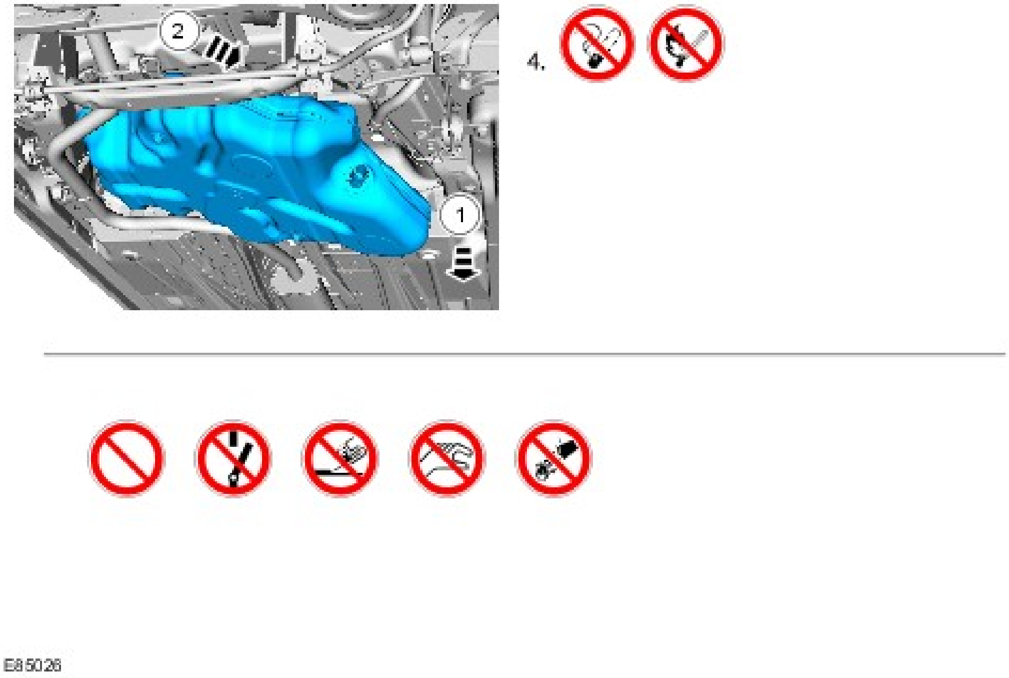




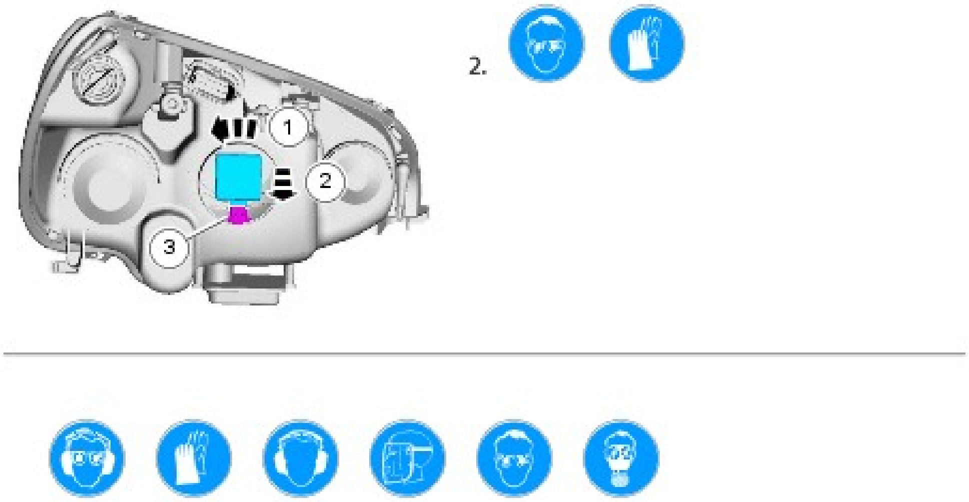
TAS Symbols

Symbols are used inside the graphics and in the text area to enhance the information display. The following paragraphs describe the various types and categories of symbols.

Prohibition symbols advise on prohibited actions to either avoid damage or health and safety related risks.

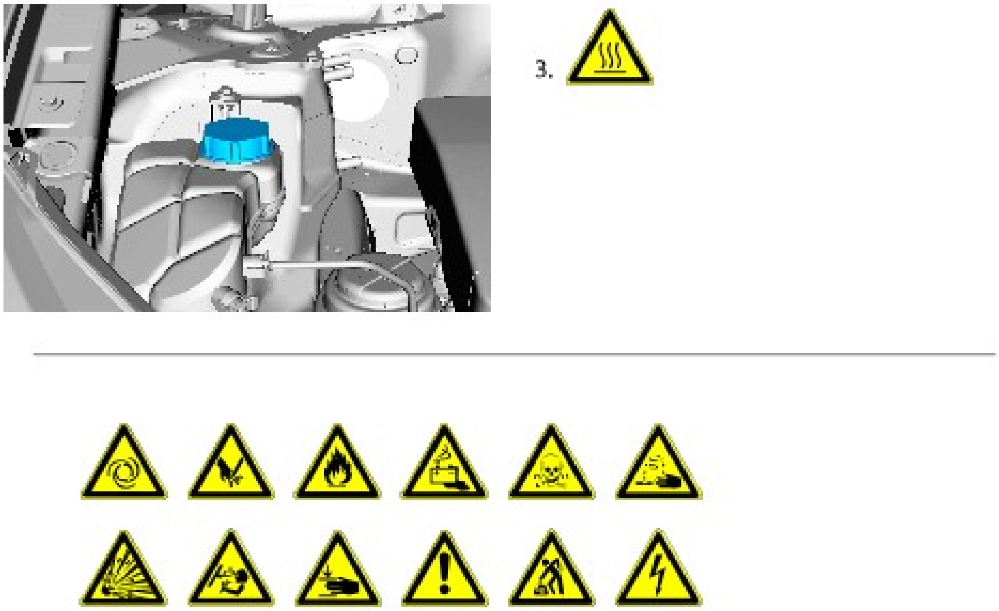


Health and Safety symbols recommend the use of particular protection equipment to avoid or at least reduce the risk or severity of possible injuries.



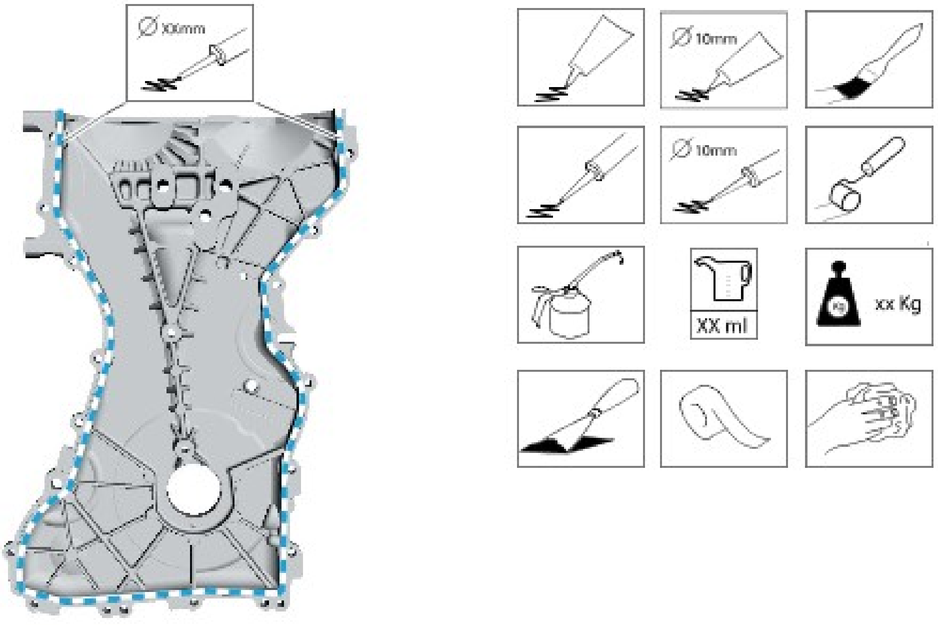
E85027

Warning symbols are used to indicate potential risks resulting from a certain component or area.



E85028

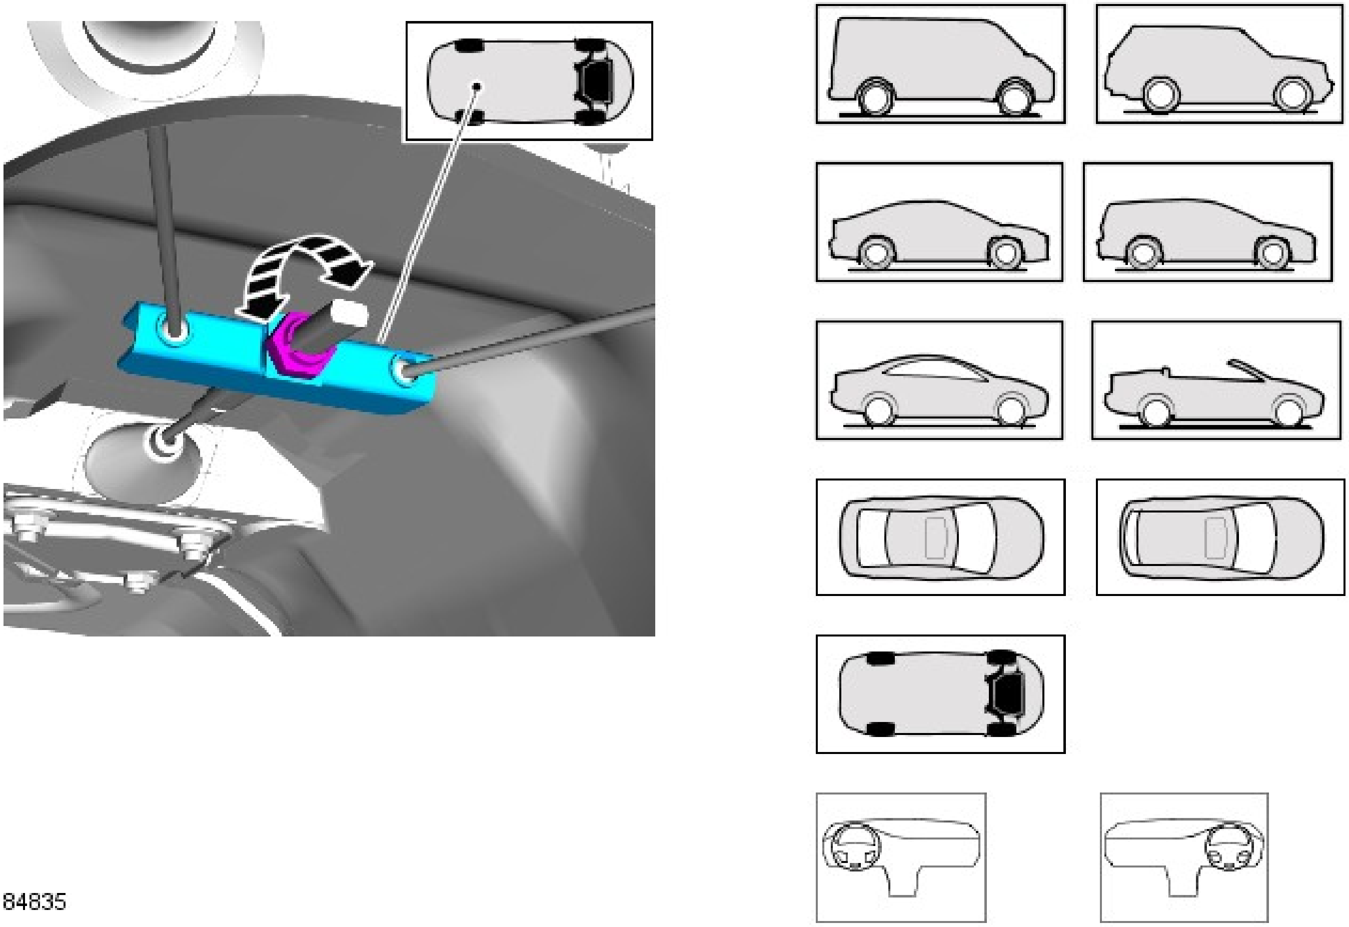
Instruction symbols are used to apply sealer, lubricant, weight, tape or cleaning detergent to a component.



Ø XXmm
Ø 10mm
Ø 10mm
XX ml
xx Kg

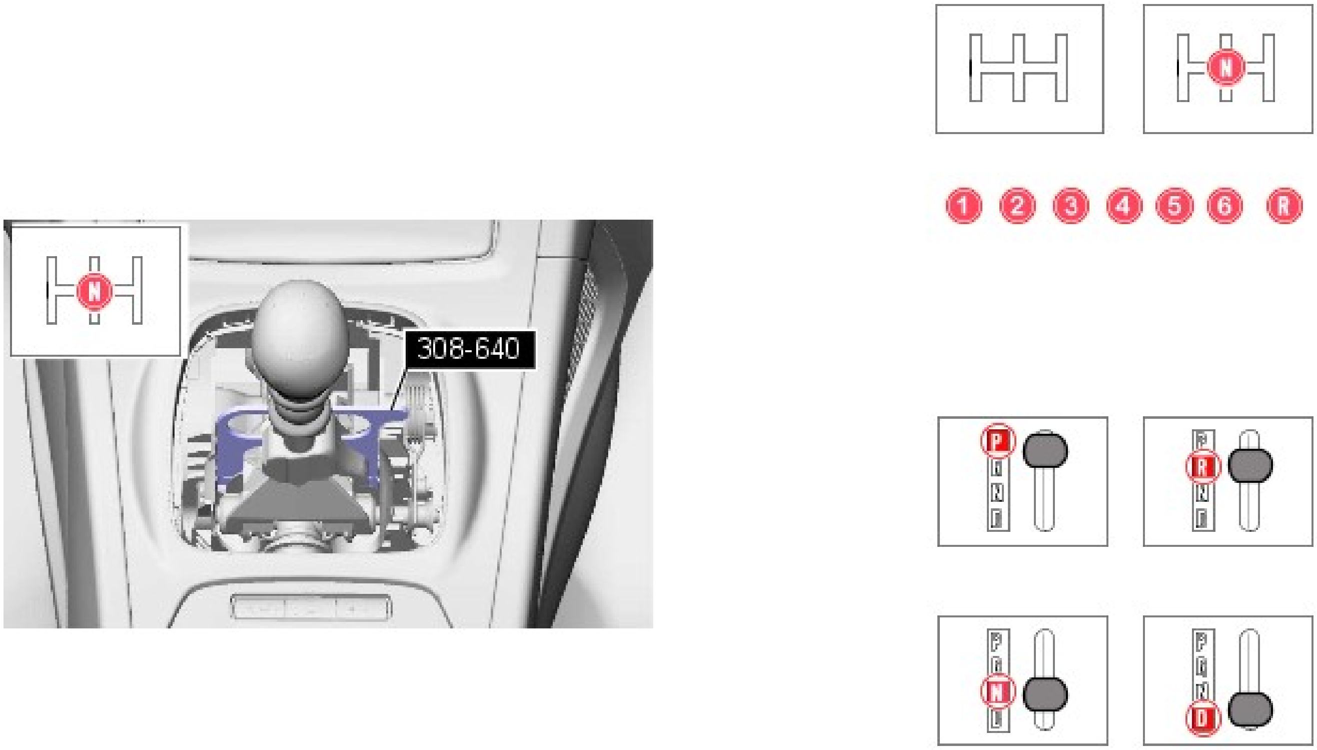
E84834

Location symbols are used to show the location of a component or system within the vehicle.



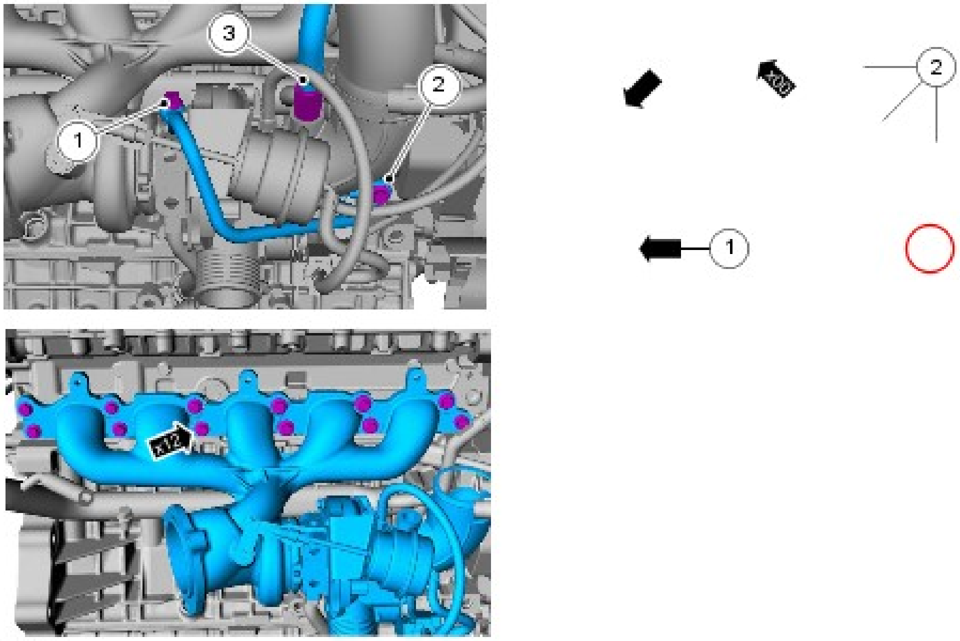
E84835

Gearshift lever or selector lever position symbols are used to show which gearshift lever or selector lever position is to be set.



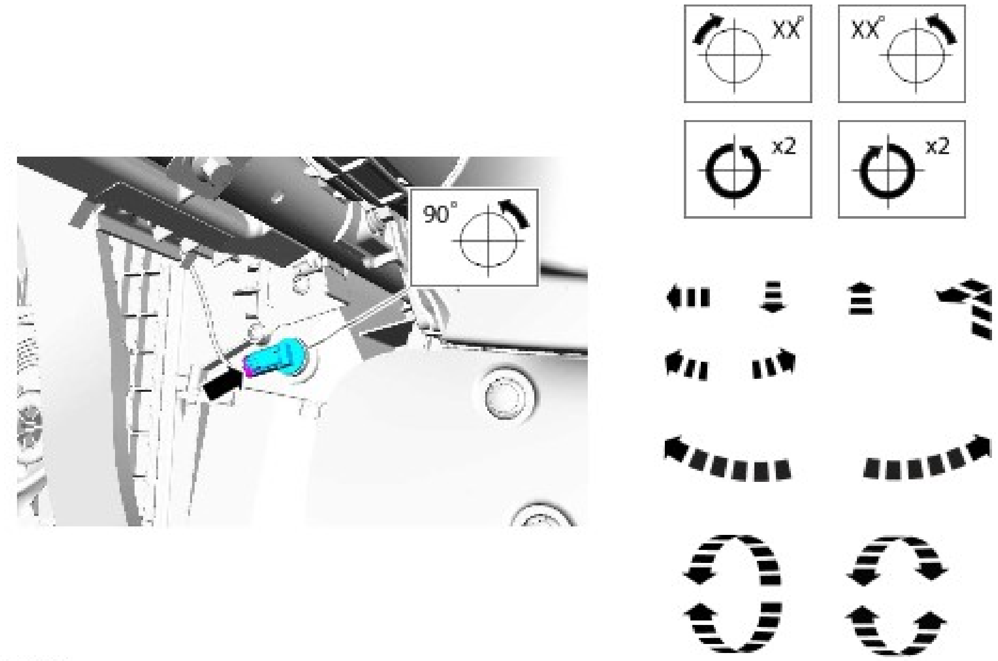
E84836

Pointer symbols are used to draw the attention to components and give special instructions such as a required sequence or number of components. The number of components is reflected by the value inside the luty arrow. A sequence number is located inside the circle. Numbers inside circles are also used to allocate special information such as tightening torques or chemicals to a particular component.



E84837

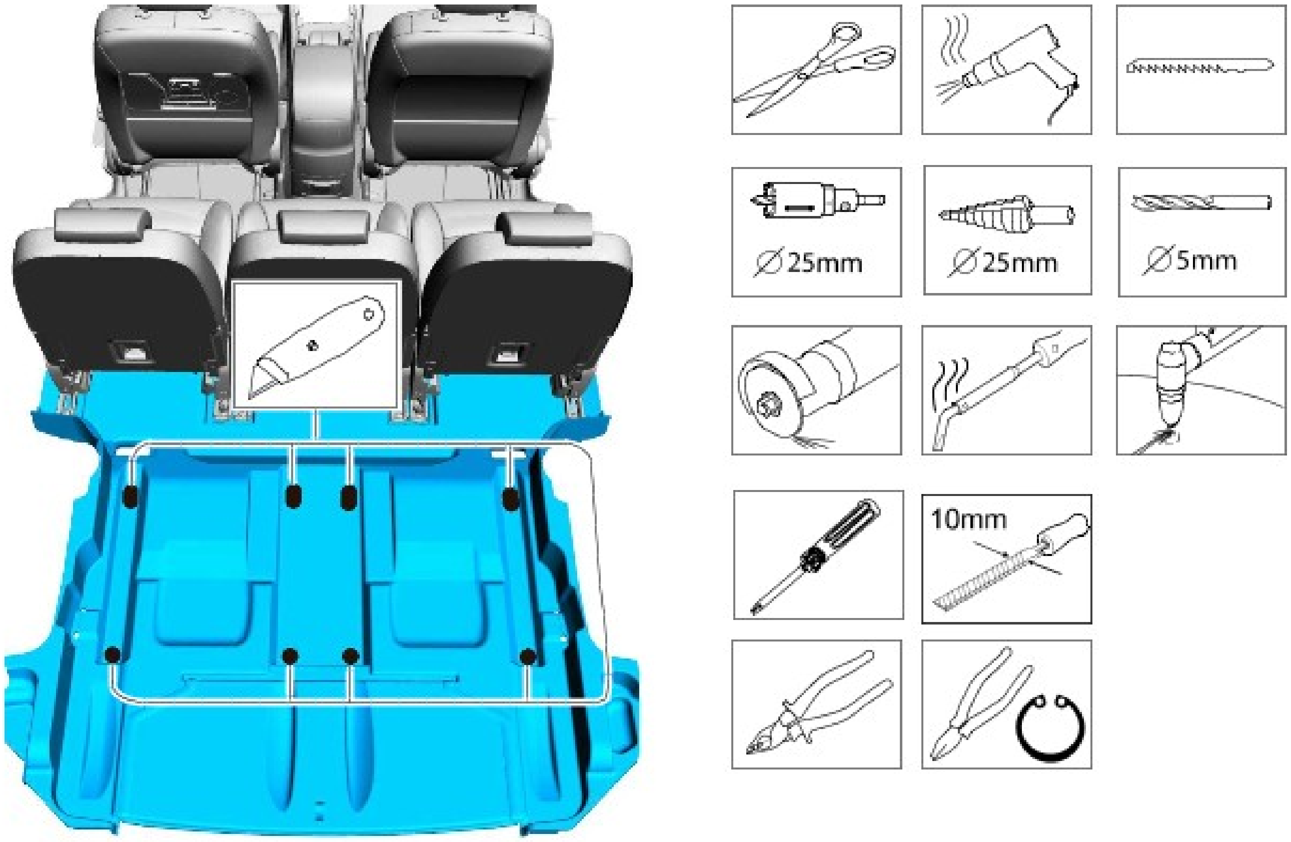
Movement arrows are used to show three dimensional or rotational movements. These movements can include specific values inside the symbol if required.



90°
XX°
XX°
x2
x2

E84838

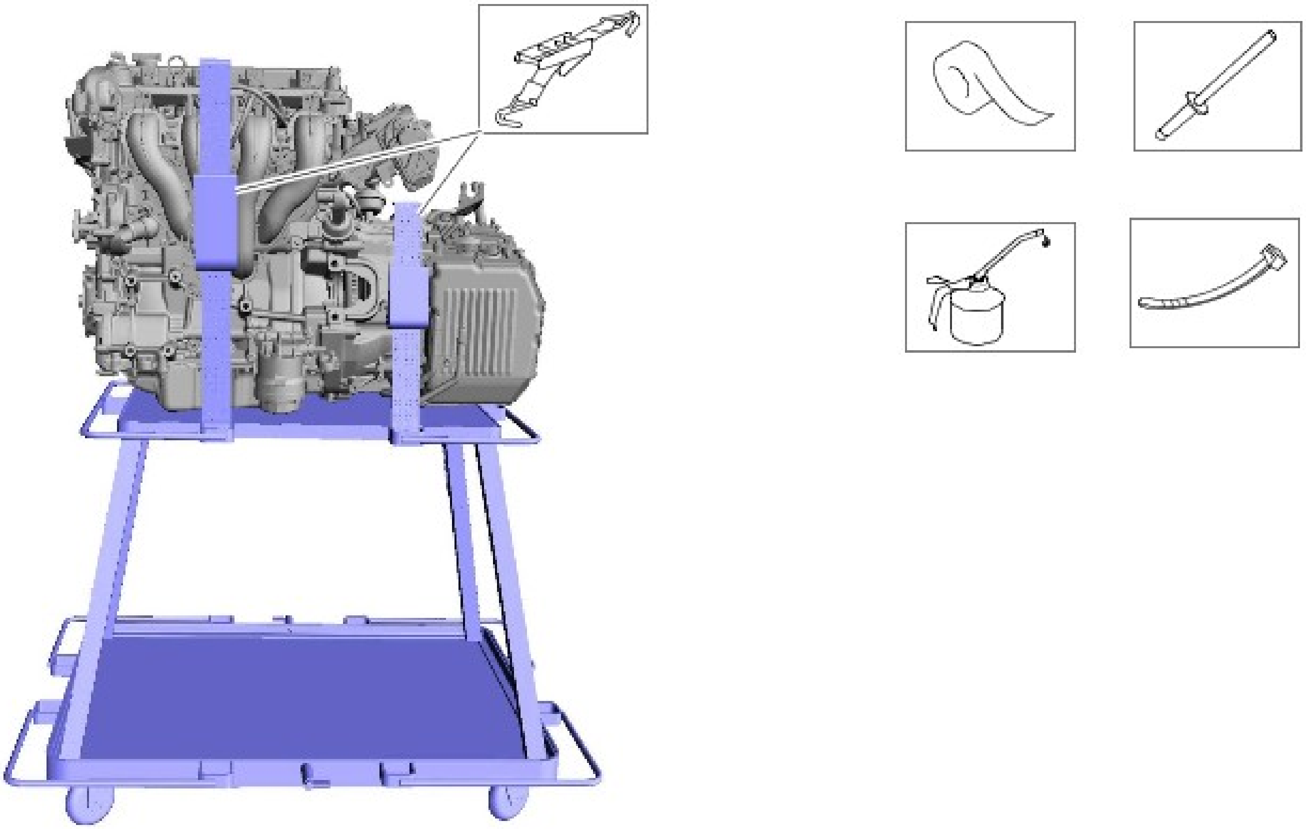
Standard tool symbols recommend the use of certain standard tools. These tools can include dimension values if required.



Ø25mm
Ø25mm
Ø5mm
10mm

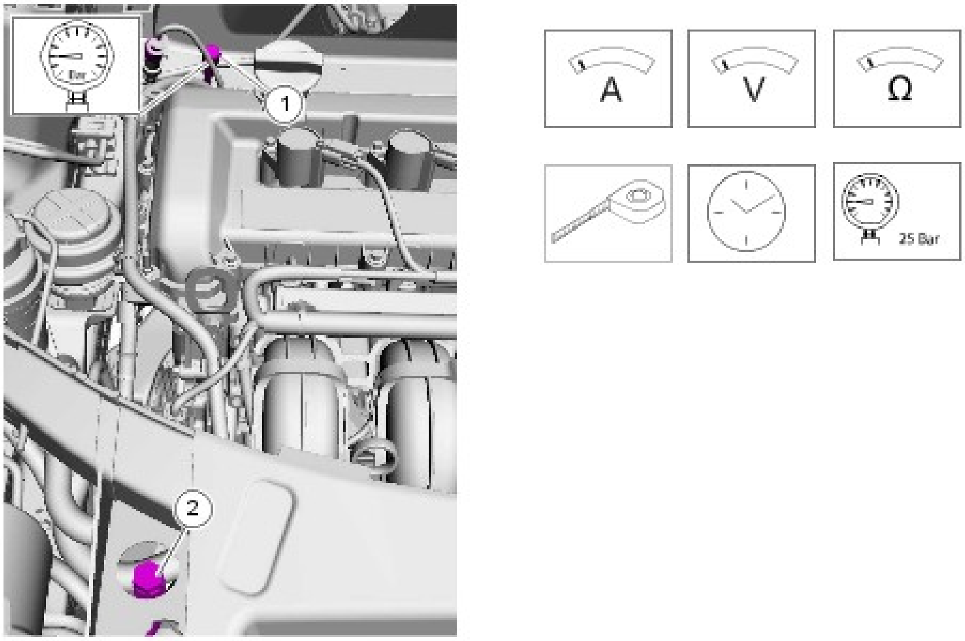
E84839

The following graphic illustrates a set of symbols that are used to provide detailed information on where to apply a material.



E84840

Measurement symbols provide detailed information on where to carry out a specific measurement. These symbols can include specific values if required.



E84841

Special Tools and Torque Figure(s)

Special tools will be shown with the tool number in the illustration. The special tool number(s), general equipment, material(s) and torque figure(s) used for the procedure step will be shown in the text column.

General Information - Important Safety Instructions

Description and Operation

Safety Notice

Appropriate service methods and correct repair procedures are essential for the safe, reliable operation of all motor vehicles, as well as the safety of the person doing the work. This manual provides general directions for accomplishing service and repair work with tested effective techniques. Following them will help assure reliability.

There are numerous variations in procedures, techniques, tools, and parts for servicing vehicles, as well as in the skill of the person doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in the manual must first establish that neither personal safety or vehicle integrity is compromised from choices of methods, tools or parts.

How to use This Manual

This manual covers all aspects necessary in order to service the vehicle effectively.

The manual is structured into five main sections, General Information, Chassis, Powertrain, Electrical and Body and Paint with each section dealing with a specific part of a vehicle system.

Each of the five main sections contain sub-sections dealing with items which form a part of that specific system.

Pages at the start of the manual list all sections available. Each section has a contents list detailing, where applicable, Specifications, Description and Operation, Diagnosis and Testing, General Procedures and Repair Procedures.

Where components need to be removed or disassembled in sequence, each operation in the sequence will be identified numerically and also graphically in an accompanying illustration.

- NOTE: Dimensions quoted are to design engineering specifications with service limits quoted, where applicable.

Workshop Manual Organization

The five main sections, together with the areas which they cover are given below:

- **Section 1** - General Information.
- **Section 2** - Chassis.
- **Section 3** - Powertrain.
- **Section 4** - Electrical.
- **Section 5** - Body and Paint.

Sub-section numbers appear after the initial section number, for example, **Section 412-03** covers air conditioning, which is part of the electrical section.

In the number given above, the first digit of the number **'4'** indicates the section **i.e. Electrical**.

The second and third digits **'12'** of the number indicate the vehicle system **i.e. Air Conditioning**.

The last two digits of the number **'03'** indicate the part of the system covered by the sub-section **i.e. Air Conditioning Compressor**.

General Information - General Service Information

Description and Operation

Introduction

This manual has been written in a format that is designed to meet the needs of Land Rover technicians worldwide and to assist them in the efficient repair and maintenance of Land Rover vehicles.

This manual provides descriptions and methods for accomplishing adjustment, service and repair work using tested and effective procedures. Following these procedures will help ensure product reliability.

Special Tools

The Special Tool(s) Table provided at the beginning of each procedure lists the special tool(s) required to carry out repair operations within that specific procedure. Wherever possible, illustrations are provided which will assist technicians in identifying the special tool(s) required and also showing such tool(s) in use.

Special tools may be obtained from the manufacturer, SPX Tools, the addresses of their branches will be found in the Special Tools Glossary contained within this Section.

Important Safety Instructions

Appropriate service methods and correct repair procedures are essential for the safe and reliable operation of all motor vehicles as well as ensuring the personal safety of the individual carrying out the work.

This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Any person who departs from the instructions provided in this manual must first establish that they compromise neither their personal safety nor the vehicle integrity by their choice of methods, tools or parts.

Individuals who undertake their own repairs should have some skill or training and limit repairs to components which could not affect the safety of the vehicle or its passengers. Any repairs required to safety critical items such as steering, brakes, suspension or supplemental restraint system should be carried out by a Land Rover Dealer. Repairs to such items should NEVER be attempted by untrained individuals.

Warnings, Cautions and Notes which appear in this manual

As you read through this manual, you will come across Warnings, Cautions and Notes. A Warning, Caution or Note is placed at the beginning of a series of steps. If the warning, caution or note only applies to one step, it is placed at the beginning of the specific step after the step number.

Warnings, Cautions and Notes have the following meanings:

Warning: Procedures which must be followed to avoid the possibility of personal injury.

Caution: Calls attention to procedures which must be followed to avoid damage to components.

Note: Gives helpful information.

References

References to the Left Hand (LH) or Right Hand (RH) side given in this manual are made when viewing the vehicle or unit from the rear.

Fault Diagnostic Equipment

The vehicle is equipped with a number of electronic control systems to provide optimum performance of the vehicle's systems.

Diagnostic Equipment (T4) is available and must be used where specified. The use of this equipment will assist with the fault diagnostic abilities of the Dealer workshop. In particular, the equipment can be used to interrogate the electronic systems for diagnosis of faults which may become evident during the life of the vehicle.

This manual is produced as a reference source to supplement T4.

Features of the equipment include:

a. Fully upgradeable support for the technician

b. Structured diagnostics to accommodate all skill levels

c. Direct print-out of screen information and test results

Testing the vehicle

Operations covered in this manual do not include reference to testing the vehicle after repair. It is essential that work is inspected and tested after completion and if necessary, a road test of the vehicle is carried out, particularly where safety related items are concerned.

Repairs and Replacement Parts

Land Rover parts are manufactured to the same exacting standards as the original factory fitted components. For this reason, it is essential that only genuine Land Rover parts are used during maintenance or repair.

Attention is particularly drawn to the following points concerning repairs and the fitting of replacement parts and accessories.

Safety features and corrosion prevention treatments embodied in the vehicle may be impaired if other than Land Rover recommended parts are fitted. In certain territories, legislation prohibits the fitting of parts not to manufacturer's specification. Torque wrench setting figures, where given, must be adhered to and locking devices, where specified must be used. If the efficiency of a locking device is impaired during removal it must be replaced.

Owners purchasing accessories whilst travelling abroad must ensure that the accessory and its fitted location on the vehicle conform to legal requirements.

The terms of the vehicle warranty may be invalidated by the fitting of parts other than those recommended by Land Rover.

- NOTE: The fitting of non-approved Land Rover parts and accessories or the carrying out of non-approved alterations or conversions may be dangerous. Any of the foregoing could affect the safety of the vehicle and occupants; also, the terms and conditions of the vehicle warranty may also be invalidated .

All Land Rover recommended parts have the full backing of the vehicle warranty.

Land Rover Dealers are obliged to supply only Land Rover recommended parts.

Specifications

Land Rover are constantly seeking to improve the specification, design and production of their vehicles and alterations take place accordingly. Whilst every effort is made to ensure the accuracy of this Manual, it should not be regarded as an infallible guide to current specifications of any particular vehicle.

This Manual does not constitute an offer for sale of any particular vehicle. Land Rover dealers are not agents of Land Rover and have no authority to bind the manufacturer by any expressed or implied undertaking or representation.

Published: 11-May-2011

General Information - Standard Workshop Practices

Description and Operation

Vehicle in Workshop

When working on a vehicle in the workshop always make sure that:

- Where practicable, the parking brake is applied and the wheels are securely chocked to prevent the vehicle moving forwards or backwards.
- Whenever possible, the ignition key is removed before any work is carried out on the vehicle.
- If the engine is to be run, there is adequate ventilation, or an extraction hose is used to remove exhaust fumes.
- There is adequate room to raise the vehicle and remove the wheels, if necessary.
- Fender covers are always installed if any work is to be carried out in the engine compartment.
- Where practicable, the battery is disconnected if working on the engine, underneath the vehicle, or if the vehicle is raised.

• CAUTIONS:

⚠ Prior to disconnecting the battery, refer to the Electrical Section of this manual - Battery disconnection/connection.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

⚠ When electric arc welding on a vehicle, always disconnect the generator wiring to prevent the possibility of a surge of current causing damage to the internal components of the generator.

- If using welding equipment on the vehicle, a suitable fire extinguisher is readily available.

Towing the Vehicle

⚠WARNING: When towing is necessary, reference must be made to the Jacking, Lifting and Towing Section of this Manual.

When the vehicle is being towed the ignition switch must be in position II (steering lock released and warning lights illuminated). Only then will the steering, turn signal lamps, horn and stop lamps be operational. Failure to follow these instructions may result in personal injury. It must be noted that with the engine not running, the power steering and brake booster will be inoperative therefore, greater effort will be needed to steer the vehicle and apply the brakes.

Battery - General

• CAUTIONS:

⚠ Prior to carrying out any procedures which involve disconnecting/ or connecting the battery, refer to the Electrical Section of this manual - Battery disconnection/connection.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

⚠ A discharged battery condition may have been caused by an electrical short circuit. If this condition exists there will be an apparently live circuit on the vehicle even when all normal circuits are switched off. This can cause arcing when the jumper cables are connected.

⚠ While it is not recommended that the vehicle is jump started, it is recognized that this may occasionally be the only practical way to mobilize a vehicle. Prior to attempting a jump start, refence must be made to the Electrical Section of this manual - Jump Starting.

Following jump starting of a disabled vehicle, the discharged battery must be checked for serviceability and recharged off the vehicle as soon as possible to avoid permanent damage.

Do not rely on the generator to restore a discharged battery. For a generator to recharge a battery, it would take in excess of eight hours continuous driving with no additional loads placed on the battery.

- Always make sure that the jumper cables are adequate for the task.
- Always make sure that the slave battery is of the same voltage as the vehicle battery. The batteries must be connected in parallel.

- Always make sure that switchable electric circuits are switched off before connecting jumper cables. This reduces the risk of arcing occurring when the final connection is made.

General Installation Instructions

Component removal

Whenever possible, clean components and the surrounding area before removal.

- Blank off openings exposed by component removal.
- Following disconnection, seal fuel, oil or hydraulic lines immediately using suitable blanking plugs or caps.
- Seal open ends of exposed oilways using suitable tapered hardwood plugs or conspicuous plastic plugs.
- Immediately a component is removed, place it in a suitable container; use a separate container for each component and its associated parts.
- Clean bench and provide marking materials, labels and containers before disassembling components.

Disassembling

Observe scrupulous cleanliness when disassembling components, particularly when brake, fuel, air suspension or hydraulic system parts are disassembled. A particle of dirt or cloth fragment could cause a serious malfunction if trapped in these systems.

- Blow out all tapped holes, crevices, oilways and fluid passages with dry, compressed air.

⚠ WARNING: Suitable eye protection must be worn.

- Use suitable marker ink to identify mating parts, do not use a scriber or centre punch as they could initiate cracks or distortion.
- Wire or tape mating parts together where necessary to prevent accidental interchange.
- Suitably identify parts which are to be renewed and to those parts requiring further inspection. Keep these parts separate.
- To make sure that the correct replacement part has been obtained, do not discard a part due for renewal until after comparing it with the new part.

Cleaning components

Always use cleaning agents which are suitable for the work being undertaken and the components being cleaned. NEVER use gasoline (petrol) as a cleaning agent (degreaser). Always make sure that the component being cleaned is compatible with the cleaning agent.

Always follow the manufacturer's instructions regarding the use of cleaning agents and make sure that the environment in which the work is being undertaken is suitable. See Health and Safety Precautions for further information regarding cleaning.

General inspection of components

All components should be inspected for wear or damage before reassembling.

- Always make sure that component to be inspected is clean and free from oil or grease.
- When a component is to be checked dimensionally against design specified values, use the appropriate measuring equipment i.e. micrometers, verniers, surface plates, dial test indicators (DTI).
- Always make sure that all measuring equipment is correctly calibrated before use.
- Reject a component which is not within specified values/limits or if it appears to be damaged.
- A component may be reinstalled if dimensions obtained during checking are at the maximum tolerance limit and it is in an undamaged condition.
- Bearing journal clearances should be checked where necessary using Plastigage.
- Gaskets, seals and O-ring seals are to be re-used unless damaged.

Joints and Joint Faces

All gaskets should be installed dry unless stated otherwise. Always apply the specified lubricant to O-rings and install O-rings using the fingers only.

Use gasket removal spray and/or plastic scrapers to remove traces of old gasket.

⚠ CAUTION: DO NOT use metal scrapers or emery cloth as these may damage the sealing surfaces.

Many joints use sealants instead of gaskets as the sealing medium. Where this is the case, the sealant together with its part number will be found listed in the relevant repair operation and also in the sealants table.

⚠CAUTION: Always remove all traces of the old sealant prior to reassembly. Use plastic scrapers, specified solvents where available or dry, lint free cloth. DO NOT use metal scrapers or emery cloth as these may damage the sealing surfaces. Make sure that sealing surfaces are free from oil or grease as sealants will not adhere properly to contaminated surfaces.

Do not allow sealant to enter tapped holes or oilways.

Locking Devices

Always replace locking devices with one of the same design and of the correct size.

Tab washers

Always release locking tabs before loosening fixings, do not reuse tab washers.

Locknuts

Always use a backing spanner when loosening and tightening locknuts, brake and fuel pipe unions.

Roll pins

Always install new roll pins of the correct size.

Circlips

Always install new circlips ensuring that they are of the correct size for the groove.

Woodruff keys

Woodruff keys may be reused provided there is no indication of wear or distortion.

Remove any burrs from edges of keyways using a fine file.

Split pins

Never attempt to straighten and reuse a split pin, always make sure that replacement pins are of the correct size for the hole in which they are to be installed.

Screw Threads

- Damaged nuts, bolts and screws must always be discarded. Attempting to recut or repair damaged threads with a tap or die impairs the strength and fit of the threads and is not recommended.

• NOTE: During certain repair operations, it may be necessary to remove traces of thread locking agents using a tap. Where this is necessary, the instruction to do so will appear in the relevant operation and it is essential that a tap of the correct size and thread is used.

- Some bolts are coated with a thread locking agent and unless stated otherwise, they must not be reused. New bolts having the same part number as the original must always be installed. When nuts or bolts are to be discarded, the repair operation and relevant torque chart will include an instruction to that effect. Do not use proprietary thread locking agents as they may not meet the specification required. See also Encapsulated ('Patched') Bolts and Screws.
- Always make sure that replacement nuts and bolts are at least equal in strength to those that they are replacing. Castellated nuts must not be loosened to accept a split pin except in recommended cases when this forms part of an adjustment.
- Do not allow oil or grease to enter blind holes, the hydraulic action resulting from tightening the bolt or stud can split the housing and also give a false torque reading.
- Always tighten a nut, bolt or screw to the specified torque figure, damaged or corroded threads can give a false torque reading.
- Nut and bolt loosening and tightening sequences, where given, must ALWAYS be followed. Distortion of components or faulty sealing of joints will result if the sequences are not followed. Where an instruction is given to tighten in stages, these stages must be adhered to; do not attempt to combine stages particularly where certain stages involve tightening by degrees.
- To check or re-tighten a fixing to a specified torque, first loosen a quarter of a turn, then retighten to the specified torque figure.
- Unless instructed otherwise, do not lubricate bolt or nut threads prior to installing.

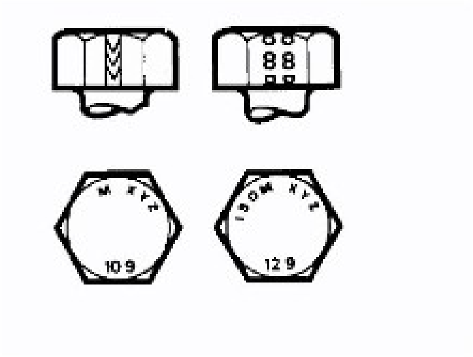
Where it is stated that bolts and screws may be reused, the following procedures must be carried out:

- Check that threads are undamaged.
- Remove all traces of locking agent from the threads.

CAUTION: DO NOT use a wire brush; take care that threads are not damaged.

- Make sure that threads are clean and free from oil or grease.
- Apply the specified locking agent to the bolt threads.

Bolt and Nut Identification

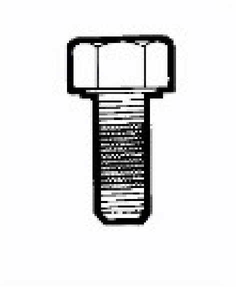


E48627

An ISO metric bolt or screw made of steel and larger than 6 mm in diameter can be identified by either of the symbols ISO M or M embossed or indented on top of the bolt head.

In addition to marks identifying the manufacturer, the top of the bolt head is also marked with symbols indicating the strength grade e.g. 8.8, 10.9, 12.9, 14.9. Alternatively, some bolts and screws have the M and strength grade symbol stamped on the flats of the hexagon.

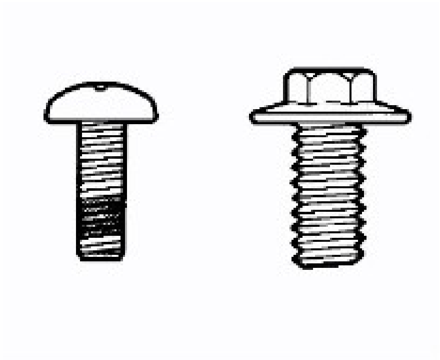
Encapsulated ('Patched') bolts and screws



E48628

Encapsulated ('patched') bolts and screws have a thread locking agent applied to the threads during manufacture. Most thread locking agents are colored, the band of color extending for 360 degrees around the thread. Some locking agents however, are neutral in color and may not be so easily identified apart from a slightly darker area of thread where the locking agent has been applied. The locking agent is released and activated by the tightening process and is then chemically cured to provide the locking action.

Self-locking bolts and screws



E48629

Unless stated in a specific repair procedure, self-locking bolts and screws i.e. nylon patched or trilobular thread can be reused provided that resistance is felt when the locking portion enters the female thread.

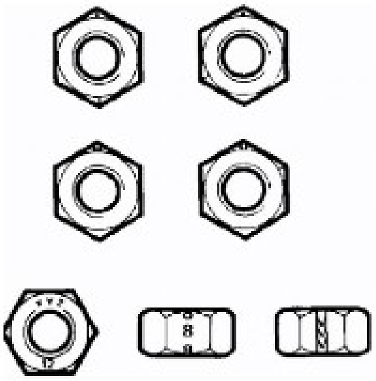
Nylon patched bolts and screws have a locking agent either applied to, or inserted in the threaded portion. They are identified by the presence of a colored section of thread extending approximately 180 degrees around the thread or by a colored plug inserted into the bolt.

Trilobular bolts have a special thread form which creates a slight interference with the thread of the hole or nut into which it is screwed.

CAUTION: Do Not reuse self-locking fasteners in critical locations e.g. drive plates/flywheel or engine bearings. Do not install non self-locking fasteners where a self-locking fastener is specified.

Trilobular bolts should not be used as a substitute for patched bolts.

Nut identification



E48630

A nut with an ISO metric thread is marked on one face or one of the hexagonal flats with the strength grade symbol 8, 12, 14. Some nuts with the strength grade 4, 5 or 6 are also marked and some have the metric symbol M on the hexagonal flat opposite the strength grade marking.

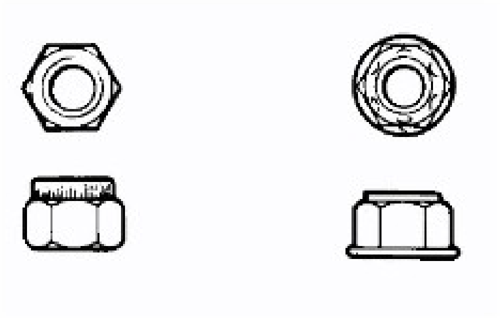
A clock face system is sometimes used as an alternative method of indicating the strength grade. The external chamfers or a face of the nut is marked in a position relative to the appropriate hour mark on a clock face to indicate the strength grade.

A dot is used to locate the 12 o'clock position and a dash to indicate the strength grade. If the grade is above 12, two dots identify the 12 o'clock position.

When tightening a slotted or castellated nut, never loosen it to insert a split pin except where specified as part of an adjustment procedure. If difficulty is experienced in correctly positioning the slot, alternative washers or nuts should be selected.

Where a nut is tightened to adjust or maintain bearing pre-load, the tightening procedure must be adhered to.

Self-locking nuts



E48631

Unless stated otherwise, self-locking nuts once removed must be discarded and new nuts of the same type and strength grade installed.

Air Suspension

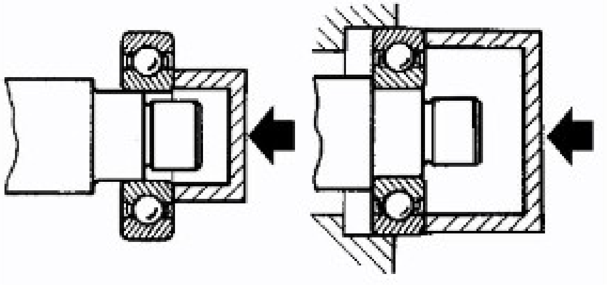
Always make sure that suitable eye protection is worn when working on the air suspension system.

Ball and Roller Bearings

When removing and installing bearings, make sure that the following practices are observed to make sure component serviceability:

⚠CAUTION: Service tools have been developed for removing the majority of bearings; these must always be used where specified.

- Remove all traces from bearing under inspection by cleaning with a suitable degreasant; maintain absolute cleanliness throughout operations.
- Conduct a visual inspection for markings on rolling elements, raceways, outer surfaces of outer or inner surfaces of inner rings. Reject any bearings found to be marked since marking in these areas indicates onset of wear.
- Hold inner race of bearing between finger and thumb of one hand and rotate outer race to check that it revolves absolutely smoothly. Repeat holding outer race and rotating inner race. DO NOT spin the bearing.
- Rotate outer ring gently using a reciprocating movement whilst holding inner ring; feel for any check or obstruction to rotation. Reject bearing if movement is not absolutely smooth.
- Check bearing for blueing or signs of overheating.
- Lubricate bearing with the specified lubricant.
- Inspect bearing surface of shaft and bearing housing for discoloration or other markings which indicate overheating of bearing or movement between bearing and seating.
- Before installing bearing, make sure that shaft and bearing housing are clean and free from burrs.
- If one bearing of a pair shows signs of wear, overheating etc., it is advisable to replace bearings as a pair unless it is suspected that one bearing may have been faulty when installed, was installed incorrectly or the fault arose due to oil seal failure.
- Never reinstall a bearing unless it is in a fully serviceable condition.



E48560

- When installing a bearing to a shaft, only apply force to the inner ring of the bearing. When installing a bearing into a housing, only apply force to the outer ring of the bearing.

⚠CAUTION: Service tools have been developed for installing the majority of bearings; these must always be used where specified.

- In the case of grease lubricated bearings, fill the space between the bearing and outer seal with the recommended grade of grease before installing the seal.

⚠CAUTION: When a waxed oil seal (installed dry) type of oil seal is to be installed, take great care that grease does not contaminate the running surface of the seal.

- Always make suitable reference marks between the components of separable bearings e.g. taper roller bearings when disassembling to make sure correct location of components when assembling. Never install new rollers in an outer ring, always install a new bearing assembly.

Brake Pads and Linings

Always install the correct grade and specification of brake pads and linings. When replacing these items, always replace as complete axle sets.

Brake Hydraulics

Always observe the following recommendations when working on the braking system:

⚠WARNING: Do not intermix brake fluid of different specifications.

- Always use two spanners when loosening or tightening brake pipes or hose connections.
- Make sure that hoses run in a natural curve and are not kinked or twisted.
- Install brake pipes and hoses securely in their retaining clips and make sure that they cannot contact a potential chafing point.
- Containers used for brake fluid must be kept absolutely clean.
- Do not store brake fluid in unsealed containers, the fluid will absorb water which will lower the boiling point of the fluid.
- Do not allow brake fluid to be contaminated with other fluids such as mineral oil and do not put brake fluid in a container which has previously been used for storing other fluids.
- Do not reuse brake fluid which has been bled from the system.
- Always use brake fluid or a suitable brake cleaning fluid to clean hydraulic components.
- Unless stated otherwise, use only clean brake fluid to lubricate hydraulic seals and components.
- Always install blanking plugs to hoses, pipes or components immediately after disconnection.
- Check thread compatibility of original equipment with replacement components.
- Observe absolute cleanliness when working with hydraulic components.

Pipes and Hoses

When removing or installing flexible hydraulic pipes and hoses, make sure that the following procedures are observed to make sure component serviceability:

- Prior to removal, clean area around hose or pipe end which is to be disconnected.
- Obtain appropriate blanking plugs or caps before disconnecting hose or pipe end fittings in order that connections can be plugged immediately following disconnection.
- Always install blanking plugs or caps to pipes and unions immediately following disconnection.
- Clean hose or pipe and blow through with an air line.

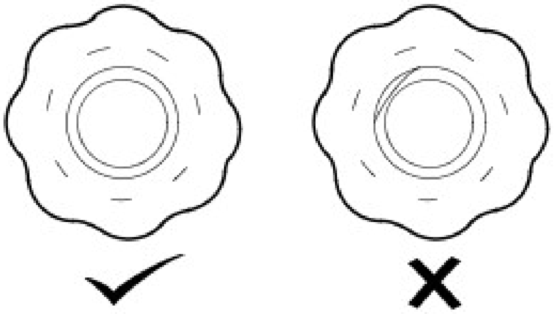
⚠WARNING: Suitable eye protection must be worn.

- Check hoses externally for cracks, separation of plies, security of end fittings and external damage; replace faulty hoses.
- Check pipes for signs of corrosion and chafing, replace as necessary.

⚠CAUTION: If pipes are found to be chafed, rectify clips, mounting points etc., to prevent further problems in service.

- When installing hoses, make sure that no unnecesary bends are introduced and that hoses are not kinked, twisted or positioned close to potential chafing points.
- When installing pipes, make sure that pipes are positioned and clipped clear of potential chafing points.
- Always replace sealing washers installed to banjo bolts, sealing plugs etc.
- Always use a backing spanner when tightening unions and do not overtighten union nuts or banjo bolts.
- After any work on hydraulic systems, always check for fluid leaks whilst a second operator applies working pressure to the brake pedal or operates the system that has been worked on.

Fuel system hoses

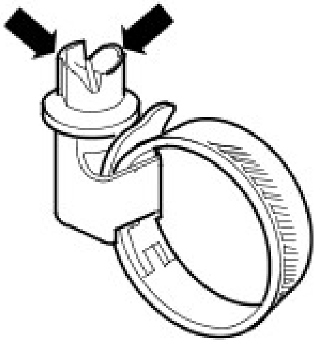


E48632

All fuel hoses are made up of two laminations, an armored rubber outer sleeve and an inner viton core. Whenever a hose is removed, make sure that the inner bore is inspected to check that the viton lining has not become separated from the outer sleeve.

WARNING: Never attempt to repair fuel foses or rectify leaking 'quick-fit' connectors the fuel hose and connectors must be replaced as an assembly.

Fuel system hose clips



E48636

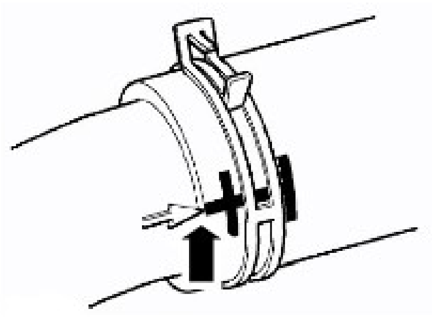
Certain fuel system hose clips are of the 'break-off head' type where a slot in the screw head shears off when the clip is tightened to a specific torque. These clips may be removed using a screwdriver and must be replaced with new clips on reassembly. Clips must be tightened until the portion of the slot shears off. Do not attempt to tighten clips by any other method, do not install any other type of clip.

Cooling system hoses

CAUTION: The following precautions must be observed to make sure that the integrity of the cooling system hoses and their connection to the system is maintained.

Hose orientation and connection

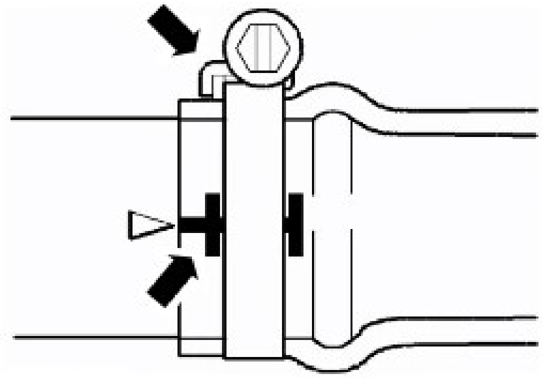
Correct orientation of cooling system hoses is important to make sure that hoses do not become fatigued or damaged through contact with adjacent components.



E48633

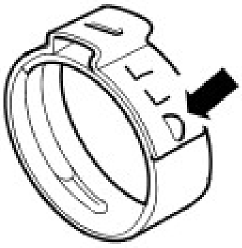
Where orientation marks are provided on the hose and corresponding component, the marks must be aligned when the hose is installed. Hoses must be installed fully on to their connection points, usually a moulded form on a pipe provides a positive indicator.

Hose clips



E48634

Markings are usually provided on the hose to indicate the correct clip position. If no markings are provided, position the clip directly behind the retaining lip at the end of the stub pipe. Worm drive clips should be orientated with the crimped side of the drive housing facing towards the end of the hose or the hose may become pinched between the clip and the stub pipe retaining lip. Unless otherwise stated, worm drive clips should be tightened to 3 Nm (2 lbf.ft). Make sure that hose clips do not foul adjacent components.



E48635

Oetiker clips may be removed by bending the tag (arrowed) and releasing the free end of the clip. Clips must not be reused. When installing new clips, make sure clip is positioned on hose before tightening and make sure that when clip is tightened, the tag is located in the longitudinal slot in the free end of the clip (arrowed in illustration).

Heat protection

Always make sure that heatshields and protective sheathing are in good condition; replace if damage is evident. Particular care must be taken when routing hoses close to hot engine components such as the exhaust manifolds and exhaust gas recirculation (EGR) pipes. Hoses will relax and deflect slightly when hot, make sure this movement is taken into account when routing and securing hoses.

Electrical Precautions

General

The following guidelines are intended to make sure the safety of the operator whilst preventing damage to the electrical and electronic components of this vehicle.

Equipment

Prior to commencing any test procedure on the vehicle, make sure that the relevant test equipment is working correctly and that any harness or connectors are in good condition. It is particularly important to check the condition of all plugs and leads of mains operated equipment.

Polarity

Never reverse connect the vehicle battery and always make sure the correct polarity when connecting test equipment.

High voltage circuits

Whenever disconnecting live ht circuits, always use insulated pliers and never allow the open end of the ht lead to contact other components, particularly ECU's.

Vehicles installed with Bi-Xenon headlamp bulbs

WARNING: The following precautions must be observed as failure to comply may result in exposure to ultra-violet rays, severe electric shock, burns or risk of an explosion.

- Safety goggles and gloves must be worn.
- Make sure that headlamps are switched off before removing bulbs.
- Do not touch the glass portion of the bulb.
- On no account should headlamps be switched on with the bulb removed from the headlamp.
- Bulb testing may only be carried out with the bulb installed in the headlamp.
- Bulbs must be disposed of in accordance with the local authority bye-laws.

Connectors and harnesses

The engine compartment of a vehicle is a particularly hostile environment for electrical components and connectors. Always observe the following:

- Make sure electrically related items are dry and oil free before disconnecting/connecting test equipment.
- Make sure that disconnected multiplugs and sensors are protected from any possible oil, coolant or other liquid contamination. Any such contamination could impair performance or lead to component failure.
- Never force connectors apart or pull on the wiring harness.
- Always make sure locking tabs are disengaged before disconnecting multiplugs etc. and make sure that correct orientation is achieved before connection.
- Make sure that any protection covers, insulation etc. are replaced if disturbed.

Having confirmed that a component is faulty, carry out the following:

- Switch off the ignition and disconnect the battery.
- Remove the component and support the disconnected harness.
- When replacing electrical components, keep oily hands away from electrical connections and make sure that locking tabs on connectors are fully engaged.

Battery Disconnection/Connection

Always refer to the Electrical Section of this manual - Battery Connection/Disconnection prior to attempting to connect or disconnect the battery.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Fuel Handling Precautions

The following information lists basic precautions which must be observed if fuel is to be handled safely. It also outlines other areas of risk which must not be ignored. As this information is issued for basic guidance only, consult your local Fire Department where any doubt as to personal and environmental safety exists - See also Health and Safety Precautions.

General precautions

Always have the correct type of fire extinguisher containing Foam, CO2, Gas or powder accessible when handling or draining fuel or dismantling fuel systems. Fire extinguishers must also be located in areas where fuel is stored.

Make sure that suitable warning signs are exhibited.

Keep all sources of ignition well away from areas where fuel is being handled.

Make sure that any leadlamps are flameproof and kept clear of spillage.

- WARNINGS:

⚠ Do not disassemble or reassemble fuel system components whilst vehicle is over a pit.

⚠ No one should be permitted to repair components associated with fuel without first having specialist training.

Always disconnect the vehicle battery before carrying out disassembly, reassembly or draining work on a fuel system.

Fuel tank and system draining

Draining must be carried out in accordance with the procedures given in the relevant Fuel System section of this manual.

- WARNINGS:

⚠ Never drain fuel or work on a fuel system while the vehicle is over a pit. Extraction or draining of fuel must be carried out in a well ventilated area.

⚠ Always attach fuel vapor warning labels to fuel tanks immediately after draining.

⚠ Containers used for storing fuel must be clearly marked with the contents and placed in a safe storage area which meets the requirements of the local authority.

⚠CAUTION: Some fuel lines are now installed with 'quick release' connectors. If a connector is damaged, no attempt must be made to repair the connector, a new fuel line and connector(s) assembly must be installed.

Always release pipe clips fully before attempting to disconnect fuel pipes.

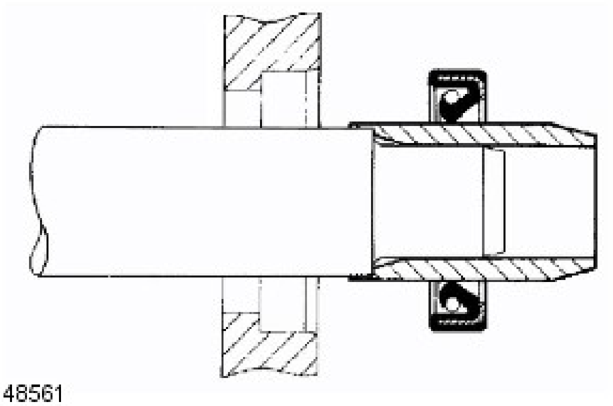
Fuel tank repairs

⚠CAUTION: No attempt should be made to repair a plastic fuel tank. If the structure of the tank is damaged, a new tank must be installed.

Oil seals

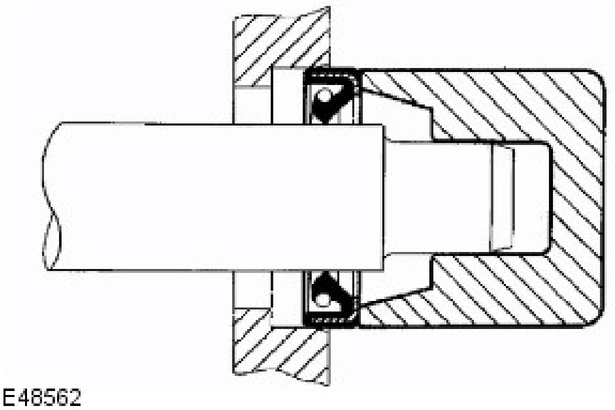
Never use a seal which has been improperly stored or handled.

- Take great care when removing old seals that the sealing surfaces and seal housing are not damaged.
- Carefully examine seal before installing to make sure that it is clean and undamaged.
- Make sure that the surface on which the seal is to run and also the seal housing is clean and free from burrs or scratches. Renew the component if the sealing surface cannot be restored.
- Special tools and protection sleeves are provided for installing the majority of seals and must be used when specified.
- Many seals are now coated with a protective wax and DO NOT need to be lubricated prior to installing. Always check the relevant repair procedure which will state if a seal must be installed dry. Never touch these seals with oily hands as the oil will contaminate the protective coating and affect the sealing properties of the seal; also, make sure that installing tools and protection sleeves are free from oil and grease. Seals which must be lubricated prior to installing should have the recommended lubricant applied to the areas specified in the repair procedure.
- Make sure that a seal is installed the correct way round. For example, the lip of the seal must face towards the lubricant which it is sealing.
- When installing an oil seal, make sure that it is positioned square to shaft and housing. Where the seal is to be installed to a housing prior to installing over a shaft, take care not to allow the weight of an unsupported shaft to rest on the seal.



E48561

- Always use the recommended special tool and protection sleeve to install an oil seal. If no tool is specified, use a suitable mandrel approximately 0.4 mm (0.015 in) smaller than the outside diameter of the seal. Use adhesive tape on the shaft to protect the sealing lip of the seal.



E48562

- Press or drift the seal in to the depth of its housing if the housing is shouldered or flush with the face of the housing where no shoulder is provided. Make sure that the seal is not tilted in the housing when it is installed.

Supplementary Restraint System (SRS) Precautions

WARNING: Do not install rear facing child seats in the front passenger seat.

The SRS contains components which are potentially hazardous to service personnel if not handled correctly. The following guidelines and precautions are intended to alert personnel to potential sources of danger and emphasise the importance of ensuring the integrity of the SRS components installed to the vehicle.

WARNING: The following precautions MUST be adhered to when working on the SRS system:

- **The correct procedures must always be used when working on SRS components.**
- **Persons working on the SRS system must be fully trained and have been issued with the safety guidelines.**
- **The airbag modules contain extremely flammable and hazardous compounds. Contact with water, acids or heavy metals may produce harmful or explosive results. Do not dismantle, incinerate or bring into contact with electricity before the unit has been deployed.**
- **Always replace a seat belt assembly that has withstood the strain of a severe vehicle impact or if the webbing shows signs of fraying.**
- **Always disconnect the vehicle battery before carrying out any electric welding on a vehicle installed with an SRS system.**

CAUTION: Do not expose airbag modules or seat belt pre-tensioners to temperatures exceeding 85° C (185° F).

It should be noted that these precautions are not restricted to operations performed when servicing the SRS system. The same care should be exercised when working on ancillary systems and components located in the vicinity of SRS components; these include but are not limited to:

- Steering wheel airbag, rotary coupler.

- Passenger front airbag.
- Head airbag modules - front and rear.
- Seat belt pre-tensioners.
- SRS harnesses, link leads and connectors.
- Side (thorax) air bags.

Making the system safe

Before working on or in the vicinity of SRS components, make sure the system is rendered safe by performing the following operations:

- Remove the ignition key.
- Disconnect battery, earth lead first.
- Wait 2 minutes for the SRS power circuit to discharge before commencing work.

• NOTE: The SRS uses energy reserve capacitors to keep the system active in the event of electrical supply failure under crash conditions. It is necessary to allow the capacitors sufficient time to discharge (2 minutes) in order to avoid the risk of accidental deployment.

Installation

In order to make sure system integrity, it is essential that the SRS system is regularly checked and maintained so that it is ready for effective operation in the event of a collision. Carefully inspect SRS components before installation. Do not install a part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.

⚠WARNING: The integrity of the SRS systems is critical for safety reasons. Make sure the following precautions are always adhered to:

- **Do not install accessories or other objects to trim panels which cover ITS airbags.**
- **Never install used SRS components from another vehicle or attempt to repair an SRS component.**
- **When repairing an SRS system, only use genuine new parts.**
- **Never apply electrical power to an SRS component unless instructed to do so as part of an approved test procedure.**
- **Special fixings are necessary for installing an airbag module – do not use other fixings and make sure that all fixings are tightened to the correct torque.**
- **Always use new fixings when replacing an SRS component.**

• CAUTIONS:

⚠ Take care not to trap airbag modules when installing interior trim components.

⚠ Make sure SRS components are not contaminated by oil or grease.

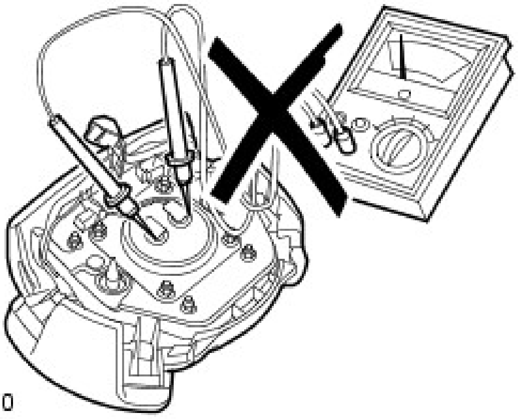
• NOTE: Following seat belt pre-tensioner deployment, the seat belts can still be used as conventional seat belts but will need to be replaced as soon as possible to make sure full SRS protection.

• NOTE: If the SRS components are to be replaced, the part number/bar code of the new unit must be recorded.

SRS component testing precautions

The SRS components are triggered using relatively low operating currents, always adhere to the following :

⚠WARNING: Never use a multimeter or other general purpose equipment on SRS components. Use only T4 to diagnose system faults.

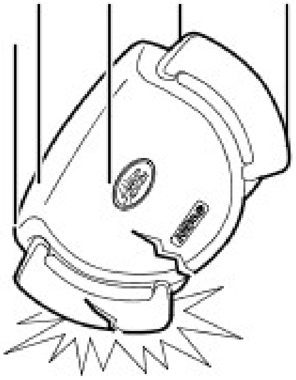


E48960

WARNING: Do not use electrical test equipment on the SRS harness while it is connected to any of the SRS components, it may cause accidental deployment and injury.

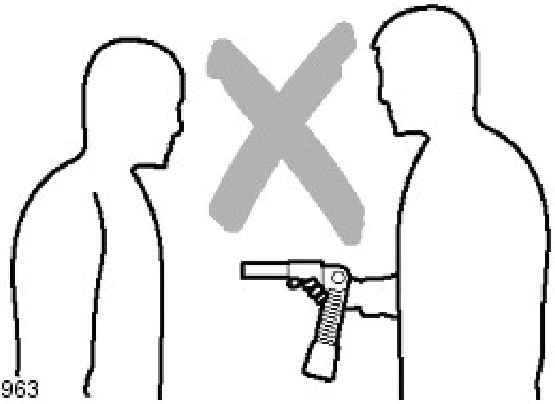
Handling and storage

Always observe the following precautions when handling SRS components:



E48961

- Never drop an SRS component. The airbag diagnostic control unit is a particularly shock sensitive device and must be handled with extreme care. Airbag modules and seat belt pre-tensioners could deploy if subjected to a strong shock.
- Never wrap your arms around an airbag module. If a module has to be carried, hold it by the cover with the cover uppermost and the base away from your body.
- Never transport airbag modules or seat belt pre-tensioners in the passenger compartment of a vehicle. Always use the luggage compartment of the vehicle for carrying airbag modules and seat belt pre-tensioner units.
- Never attach anything to an airbag cover or any trim component covering an airbag module. Do not allow anything to rest on top of an airbag module.
- Always keep components cool, dry and free from contamination.
- Never apply grease or cleaning solvents to seat belt pre-tensioner units, component failure could result.
- Always store an airbag module with the deployment side uppermost. If it is stored deployment side down, accidental deployment will propel the airbag module with sufficient force to cause serious injury.
- Keep new airbag modules in their original packaging until just prior to installing. Place the old module in the empty packaging for carriage.



E48963

- WARNINGS:

⚠ When handling an inflatable tubular structure (ITS) airbag module, hold by the gas generator housing, DO NOT hold by the airbag. Do not wrap the thumb around the gas generator while holding. Do not drape airbag over shoulder or around neck. For seat buckle type pre-tensioners, hold by the piston tube, with the open end of the piston tube pointing towards the ground and the buckle facing away from your body. Do not cover the end of the piston tube. DO NOT hold buckle type pre-tensioners by the bracket assembly or cable. Never point the piston tube towards your body or other people.

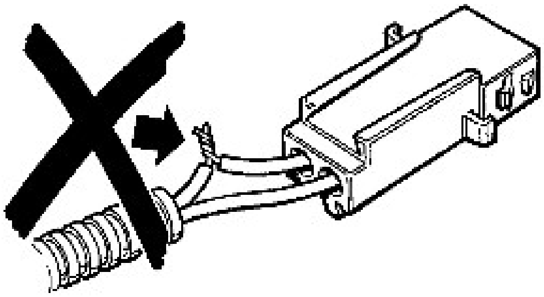
⚠ Airbag modules and seat belt pre-tensioners are classed as explosive devices. For overnight and longer term storage, they must be stored in a secure steel cabinet which has been approved as suitable for the purpose and has been registered with the local authority.

⚠ Store airbag modules or seat belt pre-tensioners in a designated storage area. If there is no designated storage area available, store in the locked luggage compartment of the vehicle and inform the workshop supervisor.

⚠CAUTION: Improper handling or storage can internally damage the airbag module making it inoperative. If you suspect the airbag module has been damaged, install a new module and refer to the deployment/disposal procedures for disposal of the damaged module.

SRS harness and connectors

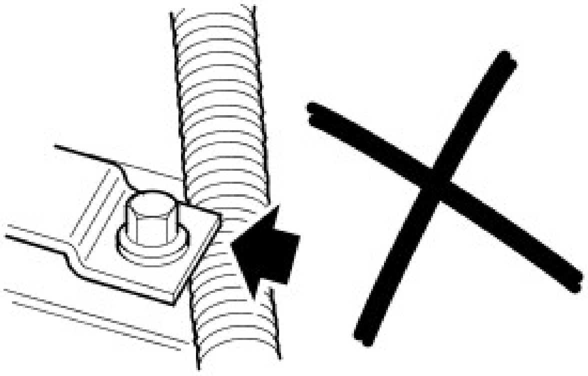
Always observe the following precautions with regards to SRS system electrical wiring:



E48965

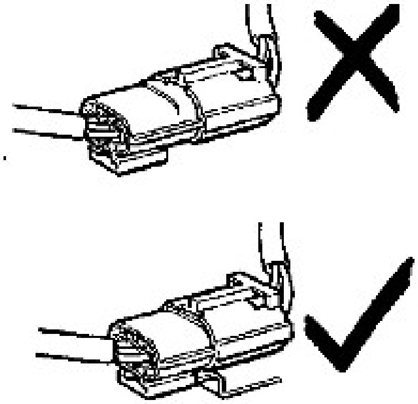
- Never attempt to modify, splice or repair SRS wiring.
- Never install electrical equipment such as a mobile telephone, two-way radio or in-car entertainment system in such a way that it could generate electrical interference in the airbag harness. Seek specialist advice when installing such equipment.

- NOTE: SRS wiring can be identified by a special yellow outer sleeve protecting the wires (black with yellow stripe protective coverings are sometimes used).



E48964

⚠WARNING: Always make sure SRS wiring is routed correctly. Be careful to avoid trapping or pinching the SRS wiring.



E48966

⚠WARNING: Do not leave the connectors hanging loose or allow SRS components to hang from their harnesses. Look for possible chafing points.

Side impact crash sensor inspection

After any degree of side body damage, inspect the side impact crash sensors. Replace a crash sensor if there is any sign of damage.

⚠CAUTION: Take extra care when painting or carrying out bodywork repairs in the vicinity of the crash sensors. Avoid direct exposure of the crash sensors or link harnesses to heat guns, welding or spraying equipment. Take care not to damage sensor or harness when reinstalling components.

Rotary coupler

⚠CAUTION: Always follow the procedure for installing and checking the rotary coupler as instructed in the SRS repairs section. Comply with all safety and installation procedures to make sure the system functions correctly. Observe the following precautions:

- Do not unlock and rotate the rotary coupler when it is removed from the vehicle.
- Do not turn the road wheels when the rotary coupler is removed from the vehicle.
- Always make sure the rotary coupler is removed and installed in its central position and with the front road wheels in the straight ahead position - refer to SRS repair section for the correct removal and installation procedure.
- If a new rotary coupler is being installed, make sure the locking tab holding the coupler's rotational position is not broken; units with a broken locking tab must not be used.

Airbag location labels

WAITING AIRBAG LOCATION AND DESIGN LABELS - DUE MARCH - NEIL HARRISON 46404

Airbag and pre-tensioner deployment

WARNING: During deployment parts of the airbag module become hot enough to burn you. Wait 30 minutes after deployment before touching the airbag module.

Deployment procedures and precautions as detailed in this manual should be strictly adhered to. Only personnel who have undergone the appropriate training should undertake deployment of airbag and pre-tensioner modules. The following precautions must be complied with:

- Only use deployment equipment approved for the intended purpose.
- Deployment of airbag / pre-tensioner modules must be performed in a well ventilated area which has been designated for the purpose.
- Make sure airbag / pre-tensioner modules are not damaged or ruptured before attempting to deploy.
- Where local legislation exists, notify the relevant authorities of intention to deploy airbag and pretensioner units.
- When deploying airbag pre-tensioner units, make sure that all personnel are at least 15 metres (45 feet) away from the deployment zone.
- Make sure deployment tool is connected correctly, in compliance with the instructions detailed in the SRS section of this manual. In particular, make sure deployment tool is NOT connected to battery supply before connecting to airbag module connector.
- When deploying seat belt pre-tensioners, make sure pre-tensioner unit is secured correctly to the seat.
- When removing deployed airbag modules and pre-tensioner units, wear protective clothing. Use gloves and seal deployed units in a plastic bag.
- Following deployment of any component of the SRS system within the vehicle, all SRS components must be replaced. DO NOT reuse or salvage any parts of the SRS system.
- Do not lean over an airbag module when connecting deployment equipment.

If a vehicle is to be scrapped, undeployed airbag modules and pre-tensioner units must be manually deployed. In this case airbags can be deployed in the vehicle. Before deployment, make sure the airbag module is secure within its correct mounting position. Deployment of the driver's airbag in the vehicle may damage the steering wheel; if the vehicle is not being scrapped, deploy the module outside of the vehicle.

SRS Component Replacement Policy

• CAUTIONS:

The Restraints Control Module (RCM) will log a crash fault after every impact which is severe enough to cause airbag deployment. **It is possible to have three crashes/impacts logged after one event where, for example, a front, side and rollover has occurred. After the third fault is logged, the SRS warning lamp will be illuminated and the restraints control module (RCM) must be replaced.**

The SRS side impact sensor must be replaced if there are any signs of physical damage or if the restraints control module (RCM) is registering a fault.

The following information details the policy for replacement of SRS components as a result of a vehicle accident.

Impacts which do not deploy the airbags or pre-tensioners

Check for structural damage in the area of the impact paying particular attention to bumper armatures, longitudinals and bracketry.

Impacts which deploy the airbags or pre-tensioners

The replacement and inspection policy is dependent on the type and severity of the crash condition. The following guidelines are the minimum that should be exercised as a result of the deployment of specific SRS components.

Check for structural damage in the area of impact paying particular attention to bumper armatures, longitudinals and bracketry.

Front Airbag Deployment - Driver and Passenger

CAUTION: If the front airbags are deployed, the following components must be replaced:

- Driver airbag module
- Passenger airbag module
- Fly leads (where applicable) connecting front airbag modules to SRS harness
- Front seat belt buckle pre-tensioner
- Rear seat belt pre-tensioners - if installed
- Driver's seat belt retractor - if installed
- Rotary coupler
- Any front impact sensors that have been physically damaged or if a fault is being registered

- Restraints control module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Front passenger's seat belt retractor and webbing, tongue latching function, 'D' loop and body anchorage point
- Rear seat belt buckles, webbing, buckle covers, body anchorage points and tongue latching function
- Fascia moulding adjacent to passenger airbag module
- Steering wheel
- Front seat frames and head restraints
- Steering column - if adjustment is lost or if there are signs of collapse
- Seat belt height adjusters
- Rear seat belts

Side Air Bags

CAUTION: If the side (thorax) air bags are deployed, the following components must be replaced on the side of the vehicle on which the deployment occurred:

- Side (thorax) airbag
- Any side impact sensors that have been physically damaged or if a fault is being registered
- Restraints Control Module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Front seat belts, retractors and webbing, tongue latching function, 'D' loop and body anchorage points
- Rear seat belt buckles, webbing, buckle covers, tongue latching function, and body anchorage points
- Front seat frame and head restraints
- Door trim casing
- Seat belt height adjusters
- Rear seat belts

Head airbag modules

CAUTION: If the head airbag modules are deployed, the following components must be replaced on the side of the vehicle on which the deployment occurred:

- Head airbag modules
- Link lead between airbag gas generator and restraints control module (RCM) harness
- Airbag retaining clips
- Internal trim finisher
- Front seat belt buckle pre-tensioners
- Any side impact sensors that have been physically damaged or if a fault is being registered
- Restraints Control Module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Headlining
- Component mounting brackets
- Front seat belts, retractors and webbing, tongue latching function, 'D' loop and body anchorage points
- Rear seat belt buckles, webbing, buckle covers, tongue latching function, and body anchorage points
- Adjacent trim components
- Seat belt height adjusters

Rear impacts

CAUTION: If the seat belt pre-tensioners are deployed during a rear impact, the following components must be replaced:

- Seat belt pre-tensioners
- Front and rear seat belt retractors used during the impact
- Restraints Control Module (RCM) if the three crashes/impacts have been stored

Additionally, the following items must be inspected for damage and replaced as necessary:

- Seat belt height adjusters
- Front seat belts, retractors and webbing, tongue latching function, 'D' loop and body anchorage points
- Rear seat belt buckles, webbing, buckle covers, tongue latching function, and body anchorage points

Air Conditioning System Precautions

The air conditioning system contains fluids and components which could be potentially hazardous to the service engineer or the environment if not serviced and handled correctly. The following guidelines are intended to alert the service engineer to potential sources of danger and emphasise the importance of ensuring the integrity of the Air Conditioning operating conditions and components installed to the vehicle.

Where necessary, additional specific precautions are detailed in the relevant sections of this Manual and also in the Health and Safety Section. These precautions must be referred to prior to commencing repair operations.

The refrigerant used in the air conditioning system is HFC-134a (Hydrofluorocarbon) R134a.

- WARNINGS:

Servicing must only be carried out by personnel familiar with both the vehicle system and the charging and testing equipment. All operations must be carried out in a well ventilated area away from open flame and heat sources.

R134a is a hazardous liquid and when handled incorrectly can cause serious injury. Suitable protective clothing, consisting of face protection, heat proof gloves, rubber boots and rubber apron or waterproof overalls, must be worn when carrying out operations on the air conditioning system.

Remedial actions

WARNING: Due to its low evaporating temperature, R134a must be handled with care. R134a splashed on any part of the body will cause immediate freezing of that area. Also, refrigerant cylinders and replenishment trolleys when discharging will freeze skin to them if contact is made.

If an accident involving R134a should occur, conduct the following remedial actions:

- If liquid R134a enters the eye, do not rub it. Gently run large quantities of eye wash over affected eye to raise the temperature. If an eye wash is not available, cool, clean water may be used to flush the eye. After rinsing, cover the eye with a clean pad and seek immediate medical attention.
- If liquid R134a is splashed onto the skin, run large quantities of water over the affected area to raise the temperature. Implement the same action if the skin comes in contact with discharging cylinders. Wrap the contaminated body parts in blankets (or similar materials) and seek immediate medical attention.
- If the debilitating effects of inhalation of R134a vapour are suspected, seek fresh air. If the affected person is unconscious, move them away from the contaminated area to fresh air and apply artificial respiration and/or oxygen and seek immediate medical attention.

Service precautions

Observe the following precautions when handling components used in the air conditioning system:

- Air conditioning units must not be lifted by their hoses, pipes or capillary lines.
- Hoses and lines must not be subjected to any twist or stress; the efficiency of the system will be impaired by kinks or restrictions. Make sure that hoses are correctly positioned before tightening couplings, and make sure that all clips and supports are utilised.
- Flexible hoses should not be positioned closer than 100 mm (4.0 in) to the exhaust manifold unless protected by heat shielding.
- Completed assemblies must be checked for refrigeration lines touching metal panels. Any direct contact of components and panels may transmit noise and so must be eliminated.
- The appropriate torque wrench must be used when tightening refrigerant connections to the stipulated value. An additional spanner must be used to hold the union to prevent twisting of the pipe when tightening connections.
- Before connecting any hose or pipe, make sure that refrigerant oil is applied to the seat of the new O-rings, **BUT NOT** to the threads of the connection.
- All protective plugs or caps must remain in place in the component until immediately prior to connection.
- Make sure components are at room temperature before uncapping/unplugging, to prevent condensation of moisture from the air that enters it.
- When disconnecting, immediately plug or cap all air conditioning pipes to prevent ingress of dirt and moisture into the system.
- Components must not remain uncapped/unplugged, if a system has been left uncapped/unplugged for 20 minutes or longer, a new receiver/drier must be installed.
- The receiver/drier contains desiccant which absorbs moisture. It must be positively sealed at all times. A receiver/drier that has been left uncapped for longer than 20 minutes must not be used; install a new unit.
- The receiver/drier should be the last component connected to the system to make sure optimum dehydration and maximum moisture protection of the system.
- Whenever a component of the refrigeration system is replaced, it will also be necessary to install a new receiver/drier unit.
- Use alcohol and a clean lint-free cloth to clean dirty connections.
- Make sure that all new parts installed are marked for use with R134a.
- When a major repair has been completed, a leak test should be conducted; refer to the Repairs Section of this

manual for the correct procedure.

Refrigerant oil

CAUTION: Refrigerant oil easily absorbs water and must not be stored for long periods. Do not pour unused refrigerant oil back into the container. Always use an approved refrigerant oil.

When replacing components in the air conditioning system, drain the refrigerant oil from the component being replaced into a graduated container. On assembly, add the quantity of refrigerant oil drained to the new component - See Air Conditioning Compressor Replacement in this Section.

Compressor

A new compressor is sealed and pressurised with Nitrogen gas. When installing a new compressor, slowly release the sealing cap; gas pressure should be heard to vent as the seal is broken.

CAUTION: A new compressor should always be sealed and could be pressurised with nitrogen gas. To avoid possible oil loss, release the sealing cap(s) slowly. Do not remove the cap(s) until immediately prior to connecting the air conditioning pipes to the compressor.

Rapid refrigerant discharge

If the air conditioning system is involved in accident damage and the system is punctured, the refrigerant will discharge rapidly. The rapid discharge of refrigerant will also result in the loss of most of the oil from the system. The compressor must be removed and all the remaining oil in the compressor drained and refilled as instructed in the air conditioning section of this manual.

Precautions for refrigerant recovery, recycling and recharging

When the air conditioning system is recharged, any existing refrigerant is first recovered from the system and recycled. The system is then charged with the required weight of refrigerant and volume of refrigerant oil.

WARNING: Refrigerant must always be recycled before reuse to make sure that the purity of the refrigerant is high enough for safe use in the air conditioning system. Recycling should always be carried out with equipment which is design certified by Underwriter Laboratory Inc. for compliance with SAE J1991. Other equipment may not recycle refrigerant to the required level of purity.

- CAUTIONS:

A R134a Refrigerant Recovery Recycling Recharging Station must not be used with any other type of refrigerant. Refrigerant R134a from domestic and commercial sources must not be used in motor vehicle air conditioning systems.

The system must be evacuated immediately before recharging commences. Delay between evacuation and recharging is not permitted.

Air Conditioning Compressor Replacement

A new compressor is supplied filled with a full charge (X cm^3) of refrigerant oil.

A calculated quantity of oil must be drained from the new compressor before installing. To calculate the quantity of oil to be drained:

- Remove the drain plug from the old compressor.
- Invert the compressor and gravity drain the oil into a calibrated measuring cylinder. Rotate the compressor clutch to make sure the compressor is completely drained.
- Note the quantity of oil drained (Y cm^3).
- Calculate the quantity of oil to be drained from the new compressor using the following formula:**$X\ cm^3 - (Y\ cm^3 + 20\ cm^3) = Q\ cm^3$**
- Remove the drain plug from the new compressor and drain Q cm3 of oil. install and tighten the compressor drain plug.

Vehicle Weights

Item	kg	lb
Maximum Gross Vehicle Weight (GVW)		
Petrol engine vehicles naturally aspirated	3070	6768
Petrol engine vehicles supercharged	3125	6889

Diesel engine vehicles	3070	6768
Maximum weight of unbraked trailer:		
On-road	750	1650
Off-road	750	1650
Maximum towable weight (mass) - Trailers with overrun brakes		
On-road	3500	7700
Off-road	1000	2205
Maximum roof rack load (Including the mass of the roof rack):		
On-road	75	110
Off-road	75	110

Vehicle Dimensions

Item	mm	in
Length - including number plate plinth - All models	4798	188.9
Width - All models:		
Mirrors extended	2170	85.4
Mirrors folded	1983	78.1
Maximum height - At standard ride height - All models:		
With roof rack and rails	1784	70.2
With roof antenna module	1812	71.3
With sunroof open	1817	71.5
Wheelbase - All models	2745	108
Front overhang - All models	880	45.8
Rear overhang - All models	1163	44.5
Track - All models:		
Front	1605	63.2
Rear	1612	63.5
Underbody Clearences:		
Standard ride height - Running clearance to exhaust - Minimum - Kerb weight	172	6.8
Standard ride height - Ground to front undertray clearance	188	7.4
Standard ride height - Ground to rear differential casing clearance	200	7.9
Off-road height - Running clearance to exhaust - Minimum - Kerb weight	227	8.9
Off-road height - Ground to front undertray clearance	243	9.6
Off-road height - Ground to rear differential casing clearance	255	10
Suspension articulation - All models:		
Front	255	10.03
Rear	310	12.2
Departure angle - Towbar NOT installed:		
Standard ride height with full size spare wheel	24.1°	24.1°
Standard ride height with space saver wheel	26°	26°
Off-road height with full size spare wheel	27.4°	27.4°
Off-road height with full space saver wheel	29°	29°
Departure angle - Towbar installed - NOT NAS vehicles:		
Standard ride height	15.1°	15.1°
Off-road ride height	17.8°	17.8°
Departure angle - Towbar installed - NAS vehicles:		
Standard ride height	13.9°	13.9°
Off-road ride height	16.9°	16.9°
Departure angle - Adjustable height towbar installed:		
Standard ride height	13.3°	13.3°
Off-road ride height	16°	16°
Wading depth:		
Off-road height	700	27.5
Approach angle:		
Standard ride height	30.2°	30.2°
Off-road ride height	34°	34°
Ramp angle:		
Standard ride height	20°	20°
Off-road ride height	25°	25°

General Information - Health and Safety Precautions

Description and Operation

Introduction

Modern vehicles contain many materials and liquids which if not handled with care can be hazardous to both personal health and the environment. Also, many of the procedures associated with vehicle maintenance and repair involve physical hazards or other risks to health.

This subsection lists some of these hazardous operations and the materials and equipment associated with them. Precautions necessary to avoid these hazards are identified.

The list is not exhaustive and all operations and procedures and the handling of materials, should be carried out with health and safety in mind.

Before using any product the Materials Safety Data Sheet supplied by the manufacturer or supplier should be consulted.

WARNING: Many liquids and other substances used in motor vehicles are poisonous and should under no circumstances be consumed and should, as far as possible, be kept from contact with the skin. These liquids and substances include acid, anti-freeze, brake fluid, fuel, windscreen washer additives, lubricants, refrigerants and various adhesives.

Acids and Alkalis

For example - alkalis such as caustic soda used in cleaning materials; acids such as sulphuric acid used in batteries.

Both alkalis and acids are irritant and corrosive to the skin, eyes, nose and throat. They cause burns and can destroy ordinary protective clothing.

Avoid splashes to the skin, eyes and clothing. Wear suitable protective impervious apron, gloves and goggles. Do not breath mists.

Make sure access to eye wash bottles, shower and soap are readily available for splashing accidents.

Display Eye Hazard sign.

Air Bags

Highly flammable, explosive – observe No Smoking policy.

Used within the vehicle as safety restraints.

The inflator contains a high-energy propellant which, when ignited, produces a VERY HOT GAS (2500°C).

The gas inflator (generator) used in air bags is Sodium Azide. This material is hermetically sealed in each air bag module and is completely consumed during deployment. No attempt should be made to open an air bag inflator as this will lead to the risk of exposure to Sodium Azide. If a gas generator is ruptured, full protective clothing should be worn when dealing with the spillage.

After normal deployment, gloves and safety goggles should be worn during the handling process.

Deployed air bags should be disposed of in a plastic bag in accordance with local regulations at an approved chemical waste site.

Following any direct contact with Sodium Azide:

- Wash affected areas thoroughly with water.
- **SEEK IMMEDIATE MEDICAL ASSISTANCE.**

Air Bags - Do's

- Do store modules in an upright position.
- Do keep modules dry.
- Do carry modules with the cover side pointing away from the body.
- Do place modules with their cover side upwards.
- Do carefully inspect modules for damage.
- Do stand to one side when connecting modules.
- Do make sure all test equipment is properly calibrated and maintained.
- Do wash hands after handling deployed air bags.

Air Bags - Do Not

- Do Not store highly flammable material together with modules or gas generators.
- Do Not store gas generators at temperatures exceeding 80°C.
- Do Not store modules upside down.
- Do Not attempt to open a gas generator housing.
- Do Not expose gas generators to open flame or sources of heat.
- Do Not place anything on top of a module cover.
- Do Not use damaged modules.
- Do Not touch a fired module or gas generator for at least 10 minutes after firing.
- Do Not use any electrical probes on the wiring circuit.

Air Suspension

Whenever work is being undertaken on the air suspension system, suitable eye protection must be worn.

Air Conditioning Refrigerant

Highly flammable, combustible – observe No Smoking policy.

Skin contact may result in frostbite.

Instructions given by the manufacturer must be followed. Avoid naked lights, wear suitable protective gloves and goggles.

If refrigerant comes into contact with the skin or eyes, rinse the affected areas with water immediately. Eyes should also be rinsed with an appropriate irrigation solution such as a solution of 9% Sodium Chloride and Purified Water. **DO NOT RUB THE EYES AND SEEK IMMEDIATE MEDICAL ATTENTION.**

Air Conditioning Refrigerant

Do Not

- Do Not expose refrigerant bottles to sunlight or heat.
- Do Not expose refrigerant bottles to frost.
- Do Not drop refrigerant bottles.
- Do Not vent refrigerant to atmosphere under any circumstance.
- Do Not mix refrigerants.

Adhesives and Sealants

Many adhesives and sealants are highly flammable – OBSERVE NO SMOKING POLICY. These items, should be stored in flameproof cabinets in No Smoking areas. Cleanliness and tidiness in use should be observed, for example disposable paper covering benches. All adhesives and sealants should be dispensed from applicators where possible; containers, including secondary containers, should be labelled appropriately.

Anaerobic, Cyanoacrylate (super-glues) and other Acrylic Adhesives

Many are irritant, sensitizing or harmful to the skin and respiratory tract. Some are eye irritants.

Skin and eye contact should be avoided and the manufacturer's instructions followed.

Cyanoacrylate adhesives (super-glues) MUST NOT contact the skin or eyes. If skin or eye tissue is bonded, cover with a clean moist pad and **SEEK IMMEDIATE MEDICAL ATTENTION.** Do not attempt to pull skin tissue apart. Use in well ventilated areas as vapors can cause irritation to the nose and eyes.

For two-pack systems see Resin-based and Isocyanate Adhesives/Sealers.

Solvent-based Adhesives/Sealers - See Solvents

Follow manufacturers instructions.

Water-based Adhesives/Sealers

Those based on polymer emulsions and rubber/latex may contain small amounts of volatile, toxic and harmful chemicals. Skin and eye contact should be avoided and adequate ventilation provided during use.

Hot Melt Adhesives

In the solid state, they are safe. In the molten state they may cause burns and health hazards may arise from the inhalation of toxic fumes.

Use appropriate protective clothing and a thermostatically controlled heater with a thermal cut-out and adequate extraction.

Resin-based Adhesives/Sealers, for example Epoxide and Formaldehyde Resin-based

Mixing should be carried out in well ventilated areas as harmful or toxic volatile chemicals may be released.

Skin contact with uncured resins and hardeners can result in irritation, dermatitis, and absorption of toxic or harmful chemicals through the skin. Splashes can damage the eyes.

Provide adequate ventilation and avoid skin and eye contact.

Isocyanate (Polyurethane) Adhesives/Sealers

See also Resin-based Adhesives

Individuals suffering from asthma or respiratory allergies should not work with or near these materials as sensitivity reactions can occur.

Over exposure is irritating to the eyes and respiratory system. Excessive concentrations may produce effects on the nervous system including drowsiness. In extreme cases, loss of consciousness may result. Long term exposure to vapour concentrations may result in adverse health effects.

Prolonged contact with the skin may lead to skin irritation and in some cases, dermatitis.

Splashes entering the eye will cause discomfort and possible damage.

Any spraying should preferably be carried out in ventilated booths which incorporate facilities for removing vapors and spray droplets from the breathing zone.

Wear appropriate gloves, eye and respiratory protection.

Antifreeze

May be flammable when undiluted.

Vapors may be given off from coolant antifreeze when heated. Avoid breathing these vapors.

Antifreeze may be absorbed through the skin in toxic or harmful quantities. Antifreeze, if swallowed, can be fatal; **SEEK IMMEDIATE MEDICAL ATTENTION.**

Battery Acids

See also Alkalis and Acids.

Gases released during battery charging are explosive. Always remove the battery from the vehicle prior to charging. Never use naked flames or allow sparks near charging or recently charged batteries. NEVER add acid to a battery, the chemical reaction produced will be violent and explosive. In cases of eye contact, wash affected area with copious amounts of water and **SEEK IMMEDIATE MEDICAL ATTENTION.**

Make sure there is adequate ventilation during battery charging, observe NO SMOKING POLICY.

Brake Pads and Linings

Always fit the correct grade and specification of brake pads and linings. When renewing pads and linings, always replace as complete axle sets.

Brake and Clutch Fluid

Splashes to the skin and eyes are irritating and in the long term can be damaging, avoid prolonged skin contact. In cases of eye contact, wash affected area with copious amounts of water and SEEK IMMEDIATE MEDICAL ATTENTION.

Chemical Materials

All chemical materials should always be used with caution and stored and handled with care. They may be toxic, harmful, corrosive, irritant or highly flammable and give rise to hazardous fumes and dusts.

The effects of excessive exposure to chemicals may be immediate or delayed; briefly experienced or permanent; cumulative; superficial; life threatening; or may reduce life expectancy.

Chemical Materials - Do's

- Do carefully read and observe hazard and precaution warnings given on material containers (labels) and in any accompanying leaflets, posters or other instructions. Material health and safety data sheets can be obtained from manufacturers.

- Do remove chemical materials from the skin and clothing as soon as practicable after soiling. Change heavily soiled clothing and have it cleaned.
- Do organise work practices and protective clothing to avoid soiling of the skin and eyes.
- Do avoid breathing vapors, aerosols, dusts or fumes; inadequate container labelling; fire and explosion hazards.
- Do wash before job breaks, before eating, smoking, drinking or using toilet facilities when handling chemical materials.
- Do keep work areas clean, uncluttered and free of spills.
- Do store chemical materials according to national and local regulations.
- Do keep chemical materials out of the reach of children.

Chemical Materials - Do Not

- Do Not mix chemical materials except under the manufacturers instructions; some chemicals can form other toxic or harmful chemicals, give off toxic or harmful fumes or become explosive when mixed together.
- Do Not spray chemical materials, particularly those based on solvents, in confined spaces, for example when people are inside a vehicle.
- Do Not apply heat or flame to chemical materials except under the manufacturers instructions. Some are highly flammable and some may release toxic or harmful fumes.
- Do Not leave containers open. Fumes given off can build up to toxic, harmful or explosive concentrations. Some fumes are heavier than air and will accumulate in confined areas such as pits.
- Do Not transfer chemical materials to unlabelled containers.
- Do Not clean hands or clothing with chemicals. Chemicals, particularly solvents and fuels, will dry skin and may cause irritation leading to dermatitis or be absorbed through the skin in toxic or harmful quantities.
- Do Not use emptied containers for other materials except when they have been cleaned under supervised conditions.
- Do Not sniff or smell chemical materials, even brief exposure to high concentrations of fumes can be toxic or harmful.

Corrosion Protection Materials

Some corrosion protection materials are highly flammable – observe NO SMOKING POLICY.

These materials are varied and the manufacturers instructions must always be followed. The materials may contain solvents, resins or petroleum products. Skin and eye contact should be avoided. They should only be sprayed in conditions of adequate ventilation and not in confined spaces.

Dust

Dust or powder produced during repair operations may be irritant, harmful or toxic. Avoid breathing dusts from powdery chemical materials or those arising from dry abrasion operations. Wear respiratory protection if ventilation is inadequate.

Fine dusts of combustible material can present an explosion hazard. Avoid explosive limits and sources of ignition.

Electrical Equipment

Electric shock can result from the use of faulty electrical equipment or from the misuse of equipment in good condition.

Make sure that electrical equipment is maintained in good condition and frequently tested. Faulty equipment should be labelled and preferably removed from the work station.

Make sure that flexes, cables, plugs and sockets are not frayed, kinked, cut, cracked or otherwise damaged. If using cable reel extension equipment, ALWAYS ensure that the cable is fully unwound from the reel.

Make sure that electrical equipment and flexes do not come into contact with water.

Make sure that electrical equipment is protected by the correct rated fuse.

Never misuse electrical equipment and never use equipment which is in any way faulty. The results could be fatal.

Make sure that the cables of mobile electrical equipment cannot get trapped and damaged, such as in a vehicle hoist.

Make sure that the designated electrical workers are trained in basic First Aid.

In cases of electrocution:

- Switch off the power supply before approaching the victim.
- If this is not possible, **DO NOT TOUCH THE VICTIM** but push or drag the person from the source of electricity using dry, non-conductive material.
- Commence resuscitation if trained to do so.
- **SEEK IMMEDIATE MEDICAL ATTENTION.**

Exhaust Fumes

These contain asphyxiating, harmful and toxic chemicals and particles such as carbon oxides, nitrogen oxides, aldehydes, lead and aromatic hydrocarbons. Engines should be run only under conditions of adequate exhaust extraction or general ventilation and not in confined spaces.

Gasoline (Petrol) engine

There may not be adequate warning of odour or of irritation before toxic or harmful effects arise. These may be immediate or delayed.

Gas Oil (Diesel engine)

Soot, discomfort and irritation usually give adequate warning of hazardous fume concentrations.

Fibre Insulation

The fibrous nature of surfaces and cut edges can cause skin irritation. This is usually a physical and not a chemical effect.

Precautions should be taken to avoid excessive skin contact through careful organization of work practices and the use of gloves.

Fire

Many of the materials found on or associated with the repair of vehicles are highly flammable. Some give off toxic or harmful fumes if burnt; others such as fluoroelastomers when burnt or damaged by excessive heat can break down and produce highly corrosive hydrofluoric acid - See Fluoroelastomers.

Should any material be in a burnt or overheated condition, handle with extreme caution and wear protective clothing when handling such items. Dispose of such material in accordance with local regulations.

Decontaminate and dispose of protective clothing immediately after use.

Observe strict fire safety when storing and handling flammable materials or solvents, particularly near electrical equipment or welding processes.

Make sure, before using electrical or welding equipment, that there is no fire hazard present.

Have a suitable fire extinguisher available when using welding or heating equipment.

First Aid

Apart from meeting any legal requirements it is desirable for someone in the workshop to be trained in First Aid procedures.

Splashes in the eye should be flushed carefully with clean water for at least ten minutes.

Soiled skin should be washed with soap and water.

In case of cold burns, from alternative fuels, place affected area in cool to cold water.

Individuals affected by inhalation of gases and fumes should be removed to fresh air immediately. If effects persist, consult a doctor.

If liquids are swallowed inadvertently, consult a doctor giving him the information on the container or label. Do not induce vomiting unless this action is indicated on the label.

Fluoroelastomers (Synthetic Rubber)

Many 'O' rings, seals, hoses, flexible pipes and other similar which appear to be manufactured from natural rubber are, in fact, made of synthetic materials called Fluoroelastomers.

Under normal operating conditions, these materials are safe and do not constitute a health hazard. However, if the materials are damaged by burning or exposure to excessive heat, they can break down and produce highly corrosive hydrofluoric acid.

⚠ WARNING: Contact with hydrofluoric acid can cause serious burns on contact with the skin. If skin contact does occur, carry out the following steps immediately:

Remove any contaminated clothing.

SEEK IMMEDIATE MEDICAL ATTENTION

Irrigate affected area of skin with copious amounts of cold water or limewater for 15 to 60 minutes.

Foams - Polyurethane

Used in sound and noise insulation. Cured foams used in seat and trim cushioning.

Unreacted components are irritating and may be harmful to the skin and eyes. Wear gloves and goggles.

Individuals with chronic respiratory diseases, asthma, bronchial medical problems, or histories of allergic diseases should not work in or near uncured materials.

The components, vapors or spray mists can cause direct irritation, sensitivity reactions and may be toxic or harmful.

Vapors and spray mists must not be inhaled. These materials must be applied with adequate ventilation and respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapour/mists have cleared.

Burning of the uncured components and the cured foams can generate toxic and harmful fumes. Smoking, naked flames or the use of electrical equipment during foaming operations and until vapors/mists have cleared should not be allowed. Any heat cutting of cured foams or partially cured foams should be carried out in areas having suitable fume extraction equipment.

Fuels

Avoid skin contact with fuel where possible. Should contact occur, wash the affected skin with soap and water.

Gasoline (Petrol)

Highly flammable - OBSERVE NO SMOKING POLICY.

Swallowing gasoline (petrol) can result in mouth and throat irritation and absorption from the stomach can result in drowsiness and unconsciousness. Small amounts can be fatal to children. Inhalation into the lungs, through vomiting, is a very serious hazard.

Gasoline (petrol) dries the skin and can cause irritation and prolonged or repeated contact may cause dermatitis; if it is allowed to enter the eyes, it will cause severe smarting. Wash affected area with copious amounts of water and **SEEK IMMEDIATE MEDICAL ATTENTION.**

Gasoline (petrol) may contain appreciable quantities of benzene, which is toxic upon inhalation and the concentration of vapors must be kept very low. High concentrations will cause eye, nose and throat irritation, nausea, headache, depression and symptoms of drunkenness. Very high concentrations will result in rapid loss of consciousness.

Make sure there is adequate ventilation when handling and using gasoline (petrol). Great care must be taken to avoid the serious consequences of inhalation in the event of vapour build up arising from spillages in confined spaces.

Special precautions apply to cleaning and maintenance operations on gasoline (petrol) storage tanks.

Gasoline (petrol) should not be used as a cleaning agent. It must not be siphoned by mouth.

Gas-oil (Diesel Fuel)

Combustible.

Prolonged skin contact with high boiling point gas oils (diesel fuel) may cause serious skin disorders including skin cancer.

Inhalation into the lungs will cause internal bleeding **- SEEK IMMEDIATE MEDICAL ATTENTION.**

If swallowed, DO NOT induce vomiting - SEEK IMMEDIATE MEDICAL ATTENTION.

Kerosene (Paraffin)

Used also as heating fuel, solvent and cleaning agent.

Flammable - OBSERVE NO SMOKING POLICY.

Irritation of the mouth and throat may result from swallowing. The main hazard from swallowing arises if liquid aspiration into the lungs occurs.

Liquid contact dries the skin and can cause irritation or dermatitis. Splashes in the eye may be slightly irritating.

In normal circumstances the low volatility does not give rise to harmful vapors. Exposure to mists and vapors from kerosene at elevated temperature should be avoided (mists may arise in dewaxing). Avoid skin and eye contact and make sure there is adequate ventilation.

If swallowed, DO NOT induce vomiting - SEEK IMMEDIATE MEDICAL ATTENTION.

Gas Cylinders

Gases such as oxygen, acetylene, argon and propane are normally stored in cylinders at pressures of up to 138 bar (13800 kPa) (2000 lbf/in^2) and great care should be taken in handling these cylinders to avoid mechanical damage to them or to the valve gear attached. The contents of each cylinder should be clearly identified by appropriate markings.

Cylinders should be stored in well ventilated enclosures, and protected from ice and snow or direct sunlight. Fuel gases, for example acetylene and propane should not be stored in close proximity to oxygen cylinders.

Care should be exercised to prevent leaks from gas cylinders and lines and also to avoid sources of ignition.

Only trained personnel should undertake work involving gas cylinders.

General Workshop Tools and Equipment

It is essential that all tools and equipment are maintained in good condition and the correct safety equipment is used where required.

Never use tools or equipment for any purpose other than that for which they were designed. Never overload equipment such as hoists, jacks, axle and chassis stands or lifting slings. Damage caused by overloading is not always immediately apparent and may result in a fatal failure the next time that the equipment is used.

Do not use damaged or defective tools or equipment, particularly high speed equipment such as grinding wheels. A damaged grinding wheel can disintegrate without warning and cause serious injury.

Wear suitable eye protection when using grinding, chiselling or sand blasting equipment.

Wear a suitable breathing mask when using abrasive blasting equipment or using spraying equipment.

Make sure there is adequate ventilation to control dusts, mists and fumes.

High Pressure Air, Lubrication and Oil Test Equipment

Always keep high pressure equipment in good condition, and regularly maintained, particularly at joints and unions.

Never direct a high pressure nozzle, for example diesel injector, at the skin as the fluid may penetrate to the underlying tissue and cause serious injury.

Jacking

Always refer to the Jacking and Lifting section of this manual prior to raising the vehicle off the ground.

When vehicle is to be raised by means of a jack, ensure that it is standing on level ground, that parking brake is applied and wheels are chocked. ALWAYS use the recommended jacking points and ensure that vehicle jack has sufficient load capacity for the weight of the vehicle.

⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Ensure that hoists have sufficient load capacity for the weight of the vehicle.

Legal Aspects

There are many laws and regulations relating to health and safety in the use and disposal of materials and equipment in a workshop.

For a safe working environment and to avoid environmental pollution, workshops should be familiar, in detail, with the many health and safety laws and regulations within their country, published by both national and local authorities.

Lubricants and Greases

Avoid all prolonged and repeated contact with mineral oils. All lubricants and greases may be irritating to the eyes and skin.

Used Engine Oil

Prolonged and repeated contact with engine oil will result in the removal of natural fats from the skin, leading to dryness, irritation and dermatitis. In addition, used engine oil contains potentially harmful contaminants which may cause skin cancer. Adequate means of skin protection and washing facilities must be provided.

Do not employ used engine oils as lubricants or for any application where appreciable skin contact is likely to occur.

Health Protection Precautions

- Avoid prolonged and repeated contact with oils, particularly used engine oils.
- Wear protective clothing, including impervious gloves where practicable.
- Do not put oily rags into pockets.
- Avoid contaminating clothes, particularly underpants, with oil.
- Heavily soiled clothing and oil-impregnated footwear should not be worn. Overalls must be cleaned regularly.
- First Aid treatment should be obtained immediately for open cuts and wounds.
- Use barrier creams, applying them before each work period, to help the removal of oil from the skin.
- Wash with soap and water to make sure all oil is removed (skin cleansers and nail brushes will help). Preparations containing lanoline replace the natural skin oils which have been removed.
- Do not use gasoline (petrol), kerosene (paraffin), diesel fuel (gas oil), thinners or solvents for cleaning skin.
- If skin disorders develop, obtain medical advice without delay.
- Where practicable, degrease components prior to handling.
- Where there is a risk of eye contact, eye protection should be worn, for example chemical goggles or face shields; in addition an eye wash facility should be provided.

Environmental Precautions

This section provides general information which can help to reduce the environmental impacts from the activities carried out in workshops.

Emissions to air

Many of the activities that are carried out in workshops emit gases and fumes which can contribute to global warming, depletion of the ozone layer and/or the formation of photochemical smog at ground level. By considering how the workshop activities are carried out, these gases and fumes can be minimised, thus reducing the impact on the environment.

Exhaust fumes

Running car engines is an essential part of workshop activities and exhaust fumes need to be ventilated to atmosphere. However, the amount of time engines are running and the position of the vehicle should be carefully considered at all times, to reduce the release of poisonous gases and minimise the inconvenience to people living nearby.

Solvents

Some of the cleaning agents used are solvent based and will evaporate rapidly to atmosphere if used carelessly, or if containers are left unsealed. All containers must be firmly closed when not required and solvent should be used sparingly. Wherever possible, solvents having a low toxicity and flammability should be selected. Always follow the instructions supplied by the solvent manufacturer. Similarly, many paints are solvent based and the spray should be used in such a way as to reduce emissions to a minimum.

Refrigerant

It is illegal to release any refrigerant into the atmosphere. Discharge and replacement of these materials from air conditioning units should only be carried out using the appropriate equipment.

Discharges to water

Most workshops will have two systems for discharging waste water - storm drains and foul drains. Storm drains should only receive clean water i.e. rainwater. Foul drains will accept many of the normal waste water i.e. washing water, detergents and domestic type waste BUT NOT oil, petrol, solvent, acids, hydraulic fluid, antifreeze and similar fluids. If in doubt, always consult the local authority or water company.

Spillages

Every precaution must be taken to prevent spillage of oil, fuel, solvents etc., reaching the drains. All handling of such materials must take place well away from drains and preferably in an area with a suitable containing wall to prevent discharge into drains or watercourses. If a spillage occurs, it must be soaked up immediately using a spill kit where provided.

Checklist

Spillage prevention:

- Store liquids in a secure area.
- Make sure that taps on liquid containers are secure and cannot be accidentally turned on.
- Protect bulk storage tanks from vandalism by locking the valves.

- Transfer liquids from one container to another in an area away from open drains.
- Ensure lids are replaced securely on containers.
- Have spill kits available near to points of storage and liquid handling areas.

Spill Kits

Special materials are available to absorb a number of different substances. They can be in granular form, ready to use and are supplied in suitable containers. Disposal of used spill absorbing material is dealt with in Waste management.

Land contamination

Oils, fuels and solvents etc. can contaminate any soil with which they come into contact. Such materials MUST never be disposed of by pouring on to soil and every precaution must be taken to avoid spillage reaching soil. Waste materials stored on open ground could either leak or have contaminating substances washed off them that would contaminate the land. Always store these materials in suitable skips or similarly robust containers.

Legal compliance

Some sites may have a discharge consent for effluent discharge to the foul drain for a car wash etc. It is essential to know the types of effluent which are allowed to be discharged into the drain and to check the results of any monitoring carried out by the Water Company.

Where paint spraying operations are carried out it may be necessary to apply to the Local Authority for an air emissions licence to operate the plant. If such a licence is necessary, additional precautions will be necessary to comply with the requirements and the results of any air quality monitoring must be checked regularly.

Checklist

Always adhere to the following:

- Know what legal consents and licences apply to the operations.
- Check that the emissions and discharges comply with legal requirements.

Waste Management

Pollution can be reduced by careful handling, storage and disposal of all waste materials that occur on sites. Legislation makes it illegal to dispose of waste materials other than to licensed waste carriers and disposal sites.

This means that it is necessary to not only know what the waste materials are but also to have the necessary documentation and licences.

Handling and storage of waste

Ensure that waste materials are not poured down the drain or on to soil and are stored in such a way that they do not escape on to land or soil.

All waste must be segregated into individual types e.g. oils, metals, batteries, scrap components etc. This will prevent any reaction between different materials and assist in disposal.

Disposal of waste

Dispose of waste in accordance with the following guidelines:

- **Fuel, hydraulic fluid, anti-freeze and oil:** Keep separate and dispose of to specialist contractors.
- **Refrigerant:** Collect in specialist equipment and reuse.
- **Detergents:** Safe to pour down the foul drain if diluted.
- **Paint, thinners:** Keep separate and dispose of to specialist contractor.
- **Components:** Return to supplier for refurbishment or disassemble and reuse any suitable parts. Dispose of remainder in ordinary waste.
- **Small parts:** Reuse any suitable parts, dispose of the remainder in ordinary waste.
- **Metals:** Can be sold if separate from general waste.
- **Tyres:** Keep separate and dispose of to specialist contractor. DO NOT attempt to dispose of tyres by burning.
- **Components/materials containing asbestos:** Keep separate and dispose of to specialist contractor.

- **Oil and fuel wastes (e.g. rags, used spill kit material):** Keep separate and dispose of to specialist contractors.
- **Air filters:** Keep separate and dispose of to specialist contractors.
- **Rubber/plastics:** Dispose of in ordinary waste.
- **Hoses:** Dispose of in ordinary waste.
- **Batteries:** Keep separate and dispose of to specialist contractors.
- **Air bags - DANGER EXPLOSIVES:** Keep separate and dispose of to specialist contractors.
- **Electrical components:** Return to supplier for refurbishment or disassemble and reuse any suitable components. Dispose of remainder in ordinary waste.
- **Catalytic converters:** May be sold if kept separate from general waste.
- **Packaging:** Compact/recycle as much as possible and dispose of in ordinary waste.
- **Office/paper waste:** Recycle paper and toner and ink cartridges, dispose of remainder in ordinary waste.

Noise

Car alarm testing, panel beating, running engines, using air tools etc. are operations which invariably produce a large amount of noise. The location of such activities and also the time of day must be carefully considered having regard to the proximity of houses schools etc.

Some operations may produce high noise levels which could, in time, damage hearing. In these cases, suitable ear protection must be worn.

Solder

Solders are mixtures of metals such that the melting point of the mixture is below that of the constituent metals (normally lead and tin). Solder application does not normally give rise to toxic lead fumes, provided a gas/air flame is used. Oxy-acetylene flames should not be used, as they are much hotter and will cause lead fumes to be produced.

Some fumes may be produced by the application of any flame to surfaces coated with grease, and inhalation of these should be avoided.

Removal of excess solder should be undertaken with care, to make sure that fine lead dust is not produced, which can give toxic effects if inhaled. Respiratory protection may be necessary.

Solder spillage and filings should be collected and removed promptly to prevent general air contamination by lead.

High standards of personal hygiene are necessary in order to avoid ingestion of lead or inhalation of solder dust from clothing.

Solvents

For example acetone, white spirit, toluene, xylene, trichloroethane.

Used in cleaning and dewaxing materials, paints, plastics, resins and thinners.

Some may be highly flammable or flammable.

Skin contact will degrease the skin and may result in irritation and dermatitis following repeated or prolonged contact. Some can be absorbed through the skin in toxic or harmful quantities.

Splashes in the eye may cause severe irritation and could lead to loss of vision.

Brief exposure of high concentrations of vapors or mists will cause eye and throat irritation, drowsiness, dizziness, headaches and, in the worst circumstances, unconsciousness.

Repeated or prolonged exposure to excessive but lower concentrations of vapors or mists, for which there might not be adequate warning indications, can cause more serious toxic or harmful effects.

Aspiration into the lungs, for example through vomiting, is the most serious consequence of swallowing.

Avoid splashes to the skin, eyes and clothing. Wear protective gloves, goggles and clothing if necessary.

Make sure there is good ventilation when in use, avoid breathing fumes, vapors and spray mists and keep containers tightly sealed. Do not use in confined spaces.

When spraying materials containing solvents, for example paints, adhesives, and metal coatings, use extraction ventilation or personal respiratory protection in the absence of adequate general ventilation.

Do not apply heat or flame except under specific and detailed manufacturers instructions.

Suspended Loads

⚠CAUTION: Never improvise lifting tackle.

There is always a danger when loads are lifted or suspended. Never work under an unsupported, suspended or raised load, for example a suspended engine.

Always make sure that lifting equipment such as jacks, hoists, axle stands and slings are adequate and suitable for the job, in good condition and regularly maintained.

Viton

In common with many other manufacturers vehicles, some components installed to Land Rover vehicles have seals, 'O' rings or gaskets which contain a material known as 'Viton'.

Viton is a fluoroelastomer, that is a synthetic rubber type which contains Fluorine. Although Viton is the most well known fluoroelastomer, there are others, including Fluorel and Tecmoflon.

When used under design conditions fluoroelastomers are perfectly safe. If, however, they are exposed to temperatures in excess of 400°C, the material will not burn, but will decompose, and one of the products formed is hydrofluoric acid.

This acid is extremely corrosive and may be absorbed directly, through contact, into the general body system. **WHERE CASES OF SKIN CONTACT OCCUR, SEEK IMMEDIATE MEDICAL HELP.**

O-rings, seals or gaskets which have been exposed to very high temperatures will appear charred or as a black sticky substance.

DO NOT, under any circumstances touch them or the attached components.

Enquiries should be made to determine whether Viton or any other fluoroelastomer has been used in the affected O-ring, seal or gasket. If they are of natural rubber or nitrile there is no hazard. If in doubt, be cautious as the material may be Viton or any fluoroelastomer.

If Viton or any other fluoroelastomers have been used, the affected area should be decontaminated before the commencement of work.

Disposable heavy duty plastic gloves should be worn at all times, and the affected area washed down using wire wool and a limewater (calcium hydroxide) solution to neutralise the acid before disposing of the decomposed Viton residue and final cleaning of the area. After use, the plastic gloves should be discarded carefully and safely.

Welding

Welding processes include Resistance Welding (Spot Welding), Arc Welding and Gas Welding.

Resistance Welding

This process may cause particles of molten metal to be emitted at a high velocity, and the eyes and skin must be protected.

Arc Welding

This process emits a high level of ultra-violet radiation which may cause arc-eye and skin burns to the operator and to other persons nearby. Gas-shielded welding processes are particularly hazardous in this respect. Personal protection must be worn, and screens used to shield other people.

CONTACT LENS WEARERS ARE ADVISED TO REVERT TO ORDINARY SPECTACLES WHEN ARC WELDING as the arc spectrum is believed to emit microwaves which dry out the fluid between the lens and the eye. This may result in blindness when the lens is removed from the eye.

Metal spatter will also occur, and appropriate eye and skin protection is necessary.

The heat of the welding arc will produce fumes and gases from the metals being welded, the rods and from any applied coatings or contamination on the surfaces being worked on. These gases and fumes may be toxic and inhalation of these should be avoided. The use of extraction ventilation to remove the fumes from the working area may be necessary particularly in cases where the general ventilation is poor, or where considerable welding work is anticipated. In extreme cases or confined spaces where adequate ventilation cannot be provided, air-fed respirators may be necessary.

⚠CAUTION: Some of the components installed to the vehicle e.g. the interior cross beam and underbonnet cross member are manufactured from magnesium alloy. On no account should any welding operations be attempted on these components.

Gas Welding (and Cutting)

Oxy-acetylene torches may be used for welding and cutting, and special care must be taken to prevent leakage of these gases, with consequent risk of fire and explosion.

The process will produce metal spatter and eye and skin protection is necessary.

The flame is bright, and eye protection should be used, but the ultra-violet emission is much less than that from arc welding, and lighter filters may be used.

The process itself produces few toxic fumes, but such fumes and gases may be produced from coatings on the work, particularly during cutting away of damaged body parts, and inhalation of the fumes should be avoided.

In brazing, toxic fumes may be produced from the metals in the brazing rod, and a severe hazard may arise if brazing rods containing cadmium are used. In this event particular care must be taken to avoid inhalation of fumes and expert advice may be required.

SPECIAL PRECAUTIONS MUST BE TAKEN BEFORE ANY WELDING OR CUTTING TAKES PLACE ON VESSELS WHICH HAVE CONTAINED COMBUSTIBLE MATERIALS, FOR EXAMPLE BOILING OR STEAMING OUT OF FUEL TANKS.

Warning Symbols on Vehicles

Decals showing warning symbols will be found on various vehicle components.

These decals must not be removed. The warnings are for the attention of owners/operators and persons carrying out service or repair operations on the vehicle.

Published: 11-May-2011

General Information - Solvents, Sealants and Adhesives

Description and Operation

Solvents

WARNING: Always handle all solvents, sealers and adhesives with extreme care. Some contain chemicals or give off fumes which can be dangerous to health. Always follow the manufacturers instructions. If in doubt about any substance, particularly a solvent, DO NOT use it.

CAUTION: If in doubt about the suitability of any proprietary solvent or sealer for a particular application, contact the manufacturer of the product for information.

The Health and Safety Precautions subsection refers to some commonly used chemicals and materials, hazards associated with their use, and safety measures to be taken. Some of these chemicals may be included as an ingredient in a sealer or adhesive.

Sealers

Certain procedures in this manual involve the use of sealants during installation of components. Where a sealant is required, the application, together with the Land Rover part number is given in the General Specification at the start of each section and an instruction that a sealant must be used appears in the relevant repair procedure.

It is essential that the sealant(s) specified for a particular procedure are used, DO NOT use any other sealant.

Always remove traces of old sealant using a plastic scraper or suitable solvent, never use emery cloth or metal scrapers.

Adhesives

Whenever a procedure involves the use of an adhesive, the adhesive specified must be used and the manufacturer's instructions regarding application together with any health and safety precautions must be followed.

Published: 11-May-2011

General Information - Road/Roller Testing

Description and Operation

Road or rolling road testing may be carried out for various reasons and a procedure detailing pre-test checks, through engine starting and stopping, pre-driving checks, on-test checks to final checks on completion of the test are given.

Unless complete vehicle performance is being checked, the full road test procedure need not be carried out. Instead, those items particularly relevant to the system(s) being checked can be extracted.

Pre-Test Checks

WARNING: If the brake system hydraulic fluid level is low, pedal travel is excessive or a hydraulic leak is found, do not attempt to road test the vehicle until the reason for the low fluid level, excessive pedal travel or hydraulic leak is found and rectified.

It is suggested that pre-test and functional tests of those systems/circuits which affect the safe and legal operations of the vehicle, such as brakes, lights and steering, should always be carried out before the road or rolling road test.

- Engine oil level
- Engine coolant level
- Tires, for correct pressure, compatible types and tread patterns, and wear within limits.
- There is sufficient fuel in the tank to complete the test.
- Check all around the engine, transmission and under the vehicle for oil, coolant, hydraulic and fuel leaks. Make a note of any apparent leaks and wipe off the surrounding areas to make it easier to identify the extent of the leak on completion of the test.

Starting the Engine

• NOTE: On initial drive away from cold and within the first 1.5 km (1 mile), do not depress accelerator pedal beyond half travel until the vehicle has attained a minimum speed of 25 km/h (15 miles/h). Never operate at high engine speed or with the accelerator pedal at full travel whilst the engine is cold.

With the ignition switched off, check:

- The parking brake is applied.
- **Automatic gearbox:** The selector lever is in 'P' - Park
- **Transfer case:** 'H' - High is selected
- All instrument gauges read zero.

With the ignition switched on, check:

- Ignition controlled warning lights come on.
- Engine temperature gauge registers a reading compatible with the engine temperature.
- Fuel gauge registers a reading appropriate to the fuel level in the tank.
- The operation of the parking brake warning light and fluid level warning indicator light.

On Road Test Check:

CAUTION: At commencement of road testing, check the brake operation while still travelling at low speed before continuing with the test. If the brakes pull to one side, or appear to be otherwise faulty, do not continue with the road test until the fault has been found and rectified.

- The parking brake releases completely.
- Gear changing is smooth, and there are no abnormal noises or vibrations from the gearbox.
- The engine power output is satisfactory, acceleration is smooth and accelerator pedal operation is not stiff or heavy, and engine speed returns to idle correctly.
- There is no excessive or abnormally colored smoke from the engine under normal driving, heavy load or overrun conditions.
- Steering operation is smooth, accurate, not excessively heavy or with excessive free play or vibration. Does not pull to one side and self centres smoothly after cornering.
- All instruments register the correct readings and operate correctly.
- Switches and controls operate smoothly and positively, warning or indicator lights operate correctly and the direction indicator control self cancels when the steering is returned to the straight ahead position.
- Heating and ventilation systems work correctly and effectively.
- Brakes operate efficiently.

Brake Testing

Avoid brake testing on busy roads where it can cause inconvenience or danger to other road users.

CAUTION: Brake testing which includes heavy brake applications should not be carried out with new brake pads/discs until the components have bedded-in. New brake friction components will not reach full efficiency until the bedding-in process is complete. Note that when new parking brake shoes or rear brake discs have been installed, it is essential that the 'bedding-in' procedure given in Section 206-05 - Parking Brake Removal and Installation is carried out.

Test the brakes at several speeds within the normal operating range using both light and heavy pedal pressure. Note any tendency to snatch, pull or drag, and any undue delay in application or release.

Allow the vehicle to coast and note any tendency to pull to one side, or evidence that the brakes are binding.

After stopping the vehicle (not immediately after a period of heavy braking), carefully check the brake temperature. A disc which feels appreciably hotter than the others, could indicate that the pads on that disc are binding.

After completion of the test, check for:

- Oil, coolant, hydraulic, air and fuel leaks.
- Abnormal temperature of any moving components or assemblies, e.g. wheel hubs, transmission etc., which might indicate over tightness or lack of lubrication.

Rolling Road Testing

Four-Wheel Rolling Road

CAUTION: When utilising a four-wheel rolling road for testing, ensure all relevant health and safety requirements are adhered to.

Provided that front and rear rollers are rotating at identical speeds and that normal workshop safety standards are applied, there is no speed restriction during testing except any that may apply to the tires.

Ensure that the parking brake is released prior to engaging roller driving mechanism.

Two-Wheel Rolling Road

CAUTION: On no account should an attempt be made to carry out any form of testing on a two-wheel rolling road.

General Information - Special Tool Glossary

Description and Operation

Service Tools

Special service tools have been developed to facilitate removal, dismantling and assembly of mechanical components in a cost effective and time efficient manner. The use of such special tools also helps prevent the potential for damage to components.

Some operations described in this manual cannot be carried out properly without the aid of the relevant service tools.

Identification Codes - Identification Codes

Description and Operation

VIN Number

The VIN number will be found in three locations:

- **1.** Stamped on the side of the RH longitudinal member, rearward of the body front mounting.
- **2.** At the bottom of the windshield glass on the LH side of the vehicle and visible from the outside.
- **3. UK, Europe and ROW - Not NAS/Canada -**On the VIN plate attached to the bonnet locking platform.
- **4. NAS/Canada -** On the Tire Data/Specification label attached to the front of the LH B-pillar.

Jacking and Lifting - Jacking

Description and Operation

General

⚠ WARNING: The following instructions must be adhered to before raising the vehicle off the ground:

- Position vehicle on a solid, level surface.
- Apply the parking brake.
- Select 'P' - PARK on automatic transmission selector and 'H' High on transfer case.

⚠ WARNING: If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ground in order that the shaft(s) can be rotated. DO NOT use the customer jack and ensure that the vehicle is adequately supported on axle stands. With the vehicle raised, it will be necessary to release the park brake and select Neutral - 'N' in the main transmission to enable the drive shaft(s) to be rotated

• CAUTIONS:

⚠ To avoid damage to the underbody components of the vehicle, the following instructions must be adhered to:

⚠ Do not position jacks or axle stands under the following components:

- Body structure other than any approved jacking or lifting points
- Bumpers
- Fuel lines
- Fuel tank
- Brake lines
- Front or rear suspension arms
- Steering linkage
- Transfer case
- Front or rear differential units
- Transmission
- Engine oil pan - See note below

• NOTE: For certain repair operations, it may be necessary to support the engine under the oil pan. In this case, a block of hardwood or a rubber pad must be positioned on the jack lifting pad to protect the oil pan.

Vehicle jack

The jack provided with the vehicle is only intended for use in an emergency such as changing a tire. DO NOT use the jack for any other purpose. Refer to the Owner's Handbook for the vehicle jack location points and jacking procedures.

⚠ WARNING: Never work under a vehicle supported solely by the vehicle jack.

Hydraulic jack

A hydraulic jack with a minimum lifting capacity of 1500 kg, (3,300 lbs) must be used.

• WARNINGS:

⚠ Do not commence work on the underside of the vehicle until suitable axle stands have been placed in the correct position.

⚠ Always chock the wheels when jacking. The parking brake may be ineffective when the wheel(s) are off the ground.

Raising and Supporting the Vehicle

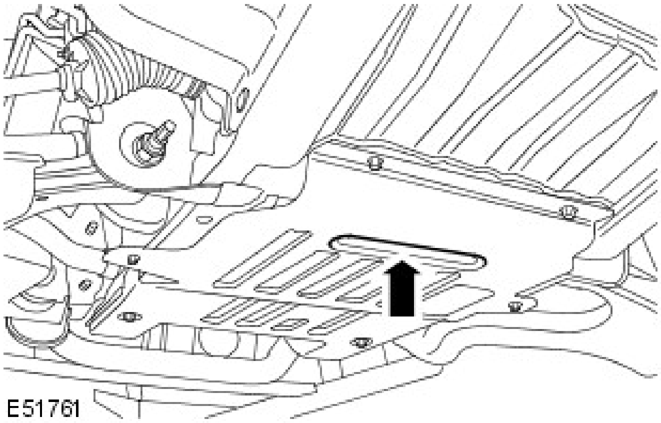
To assist in raising the vehicle, jacking points are provided as shown in the following illustrations.

Raising the Front of the Vehicle

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

WARNING: Always chock the rear wheels when jacking the front of the vehicle.

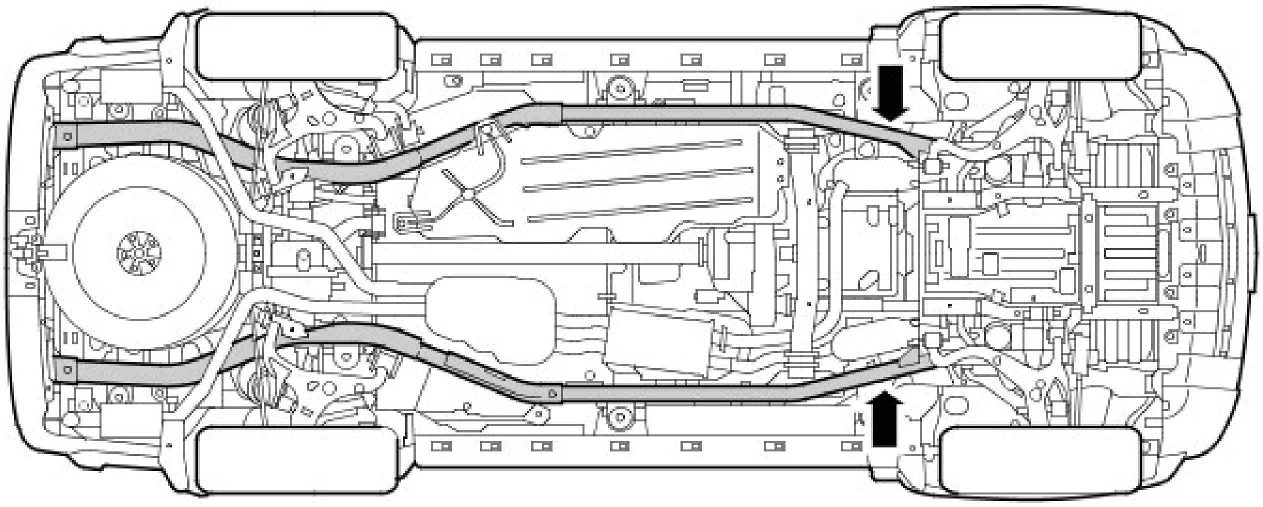


E51761

Position the lifting pad of the hydraulic jack in the centre of the recess in the engine undershield.

• NOTE: If the engine undershield has been removed, position the jack lifting pad in the centre of the front cross beam.

With the vehicle raised to the desired height, position axle stands at positions shown.



E53784

CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

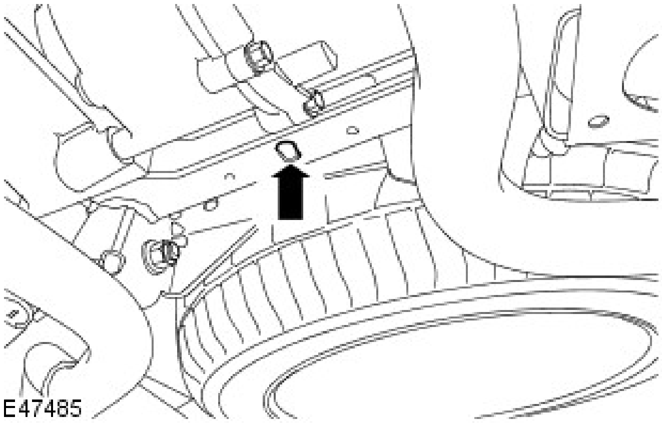
WARNING: Before commencing work on the underside of the vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Raising the Rear of the Vehicle

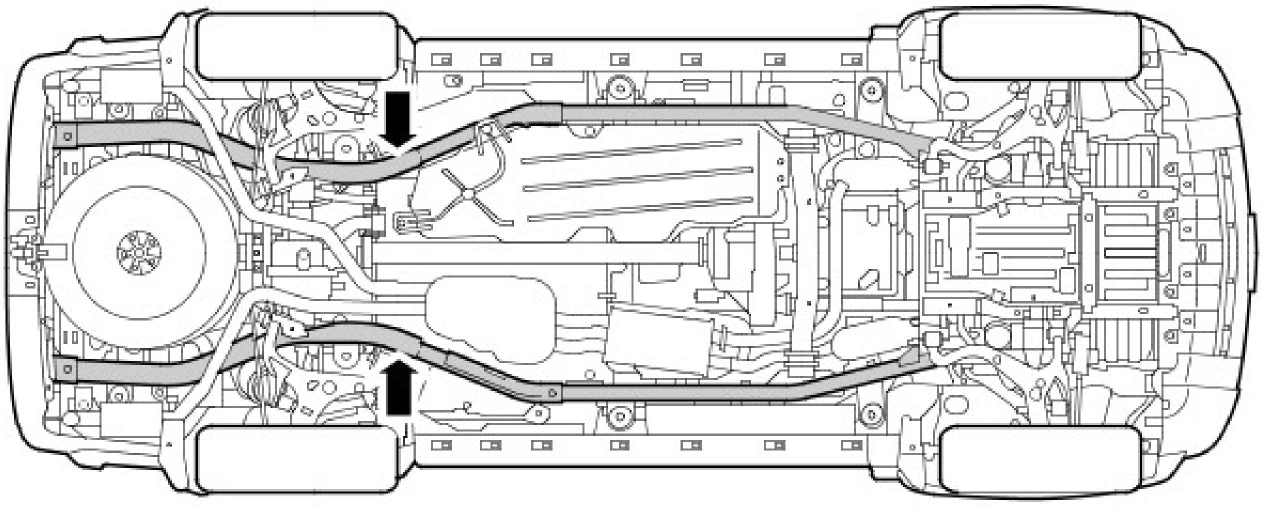
Select 'P' - PARK on automatic transmission selector.

WARNING: Always chock the front wheels when jacking the rear of the vehicle.



Position the lifting pad of the hydraulic jack under the centre of the rear cross member as shown.

CAUTION: Take care that the lifting pad of the jack is of a suitable size to avoid damaging the heat shield. It is not advisable to use a spacer block between the lifting pad and the rear cross member as this may result in some vehicle instability.



With vehicle raised to desired height, position axle stands at positions shown.

CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

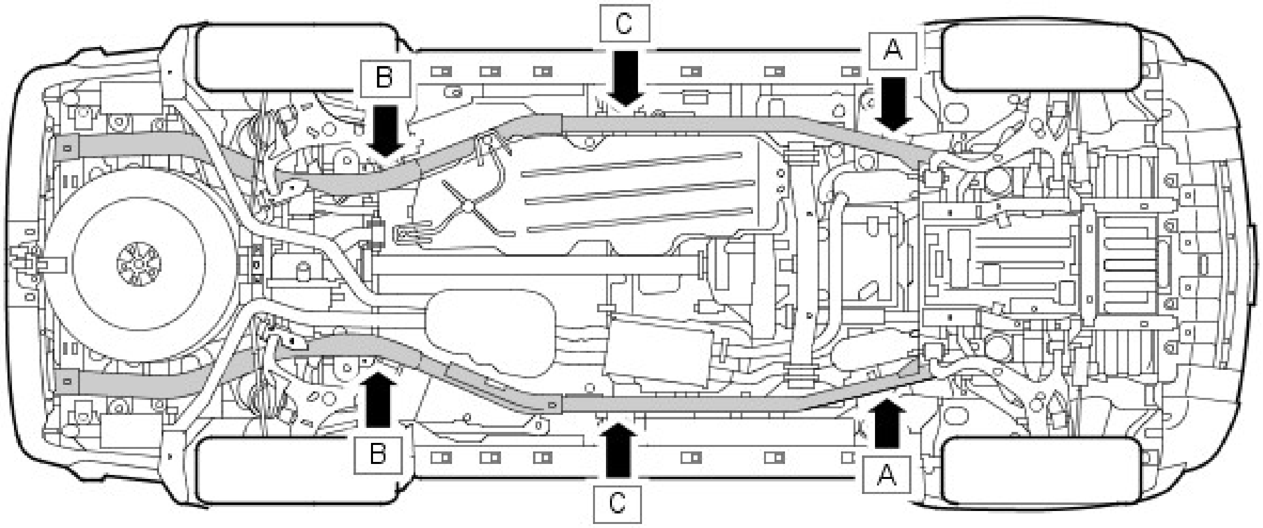
Reverse procedure when removing vehicle from stands.

Raising Vehicle - One Wheel/side

Apply the parking brake.

Select 'P' - PARK on automatic transmission selector.

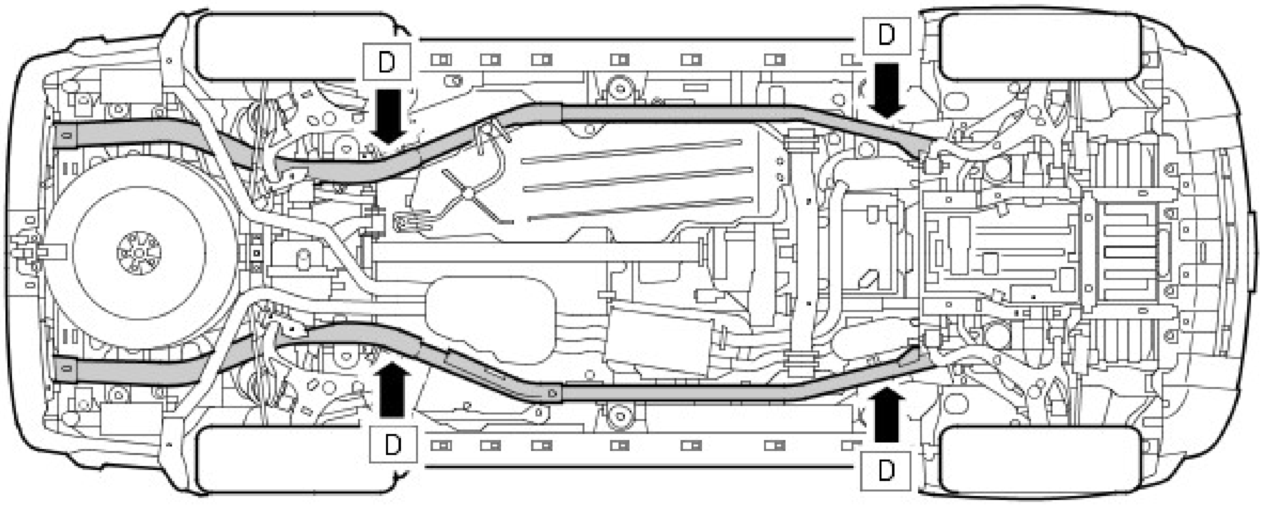
WARNING: Always chock the wheels which are not to be raised.



E47487

- **One front wheel** - position lifting pad of hydraulic jack beneath longitudinal member on the side to be raised at Point 'A'
- **One rear wheel** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'B'
- **Front and rear wheels - ONE SIDE** - position lifting pad of jack beneath longitudinal member on the side to be raised at Point 'C'

• NOTE: Point 'C' is in line with number 3 body mounting.



E47488

With vehicle at desired height, position axle stand(s) beneath longitudinal members and adjacent to the lifting pad of the jack at appropriate point(s) D.

CAUTION: Position suitable material between axle stands and longitudinal members to prevent damage to the longitudinal members.

Carefully lower jack until vehicle rests on axle stands.

⚠ WARNING: Before commencing work on underside of vehicle, ensure that axle stands are correctly positioned and vehicle is securely supported.

Reverse procedure when removing vehicle from stands.

Jacking and Lifting - Lifting

Description and Operation

Vehicle on Wheels - Four Post Ramp

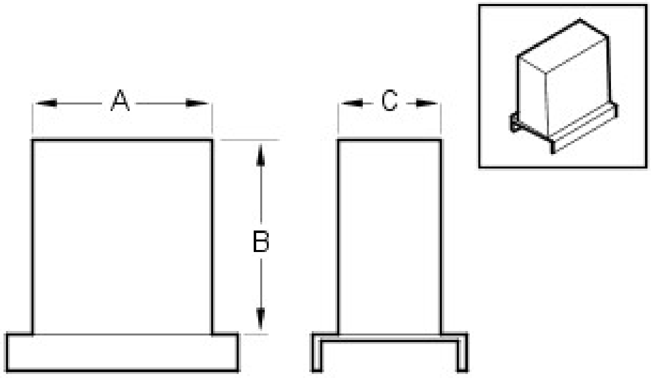
WARNING: If the drive shaft(s) are to be disconnected, it will be necessary to raise all four wheels off the ramp in order that the shaft(s) can be rotated. If the wheel free facility is not to be used, raise the vehicle off the ramp using suitable equipment. With the vehicle raised, position axle stands in the positions shown for the front and rear support blocks - see illustration in Jacking. With the axle stands positioned, release the parking brake and select NEUTRAL 'N' in the transmission.

WARNING: Do not push the vehicle backwards and forwards along the ramp in order to gain access to the drive shaft fixings.

Position the vehicle on the ramp with the front and rear of the vehicle equidistant from the ends of the ramp. Chock the wheels, select NEUTRAL in the transmission and where practicable, apply the parking brake.

Wheel Free Lift - Four Post Ramp

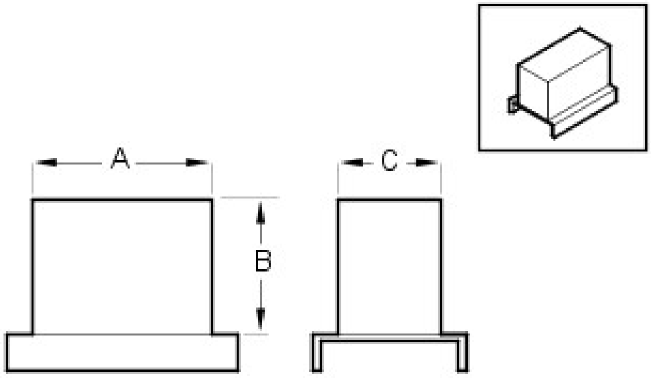
• NOTE: To enable the vehicle to be supported correctly on the wheel free longitudinals, it will be necessary to produce 2 off each of the support blocks to the dimensions given in the accompanying illustrations. The supporting part of each block must be manufactured from suitable hardwood or metal and the 'U' shaped base of each block must be manufactured from metal. Note that it is essential to ensure that the 'U' shaped base of each block is wide enough to fit over the wheel free longitudinals.



E48763

Front Support Block Dimensions

- **'A'** = 127.0 mm (5.0 in)
- **'B'** = 146.0 mm (5.75 in)
- **'C'** = 89.0 mm (3.5 in)



E48764

Rear support block dimensions

- **'A'** = 152.0 mm (6.0 in)
- **'B'** = 101.0 mm (4.0 in)
- **'C'** = 76.0 mm (3.0 in)

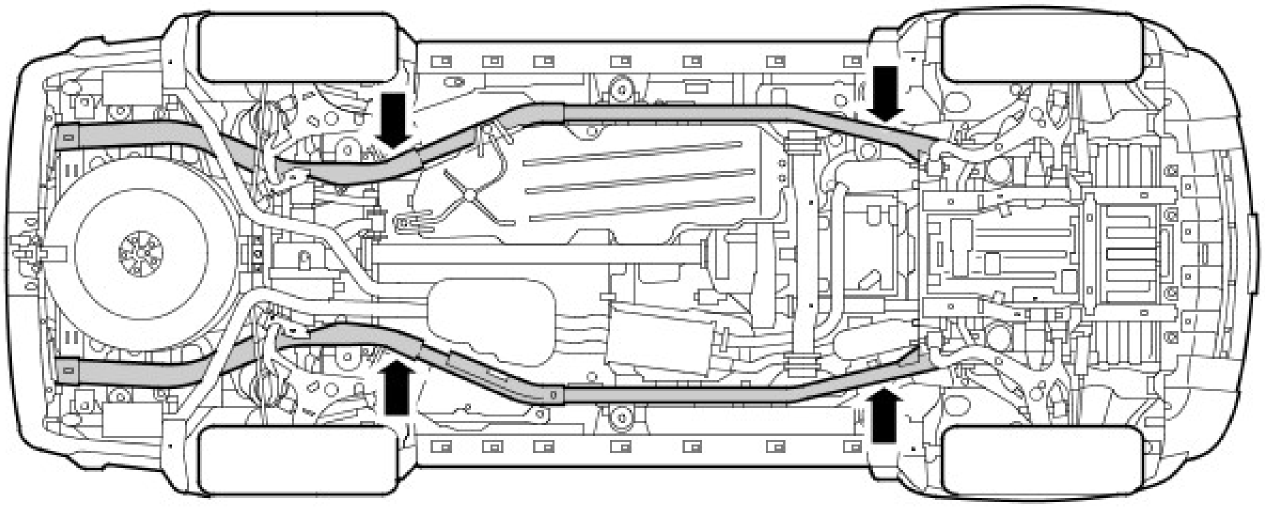
Raising and Supporting the Vehicle

1. Position vehicle on ramp.

2. Position suspension in 'off-road' height.

3. Apply parking brake.

4. Raise ramp to desired height.



E47489

5. Align the wheel free longitudinals beneath the body frame longitudinals and position the support blocks beneath the longitudinals in the positions shown.

⚠ CAUTION: Ensure that the front and rear support blocks are correctly oriented to front and rear of vehicle.

6. Engage wheel free and lower ramp slowly until weight of vehicle rests on support blocks and road wheels are just clear of ramp.

7. Ensure that the vehicle is correctly supported on all four support blocks, that blocks are still correctly positioned and are in full contact with the body frame longitudinals.

8. Lower the ramp.

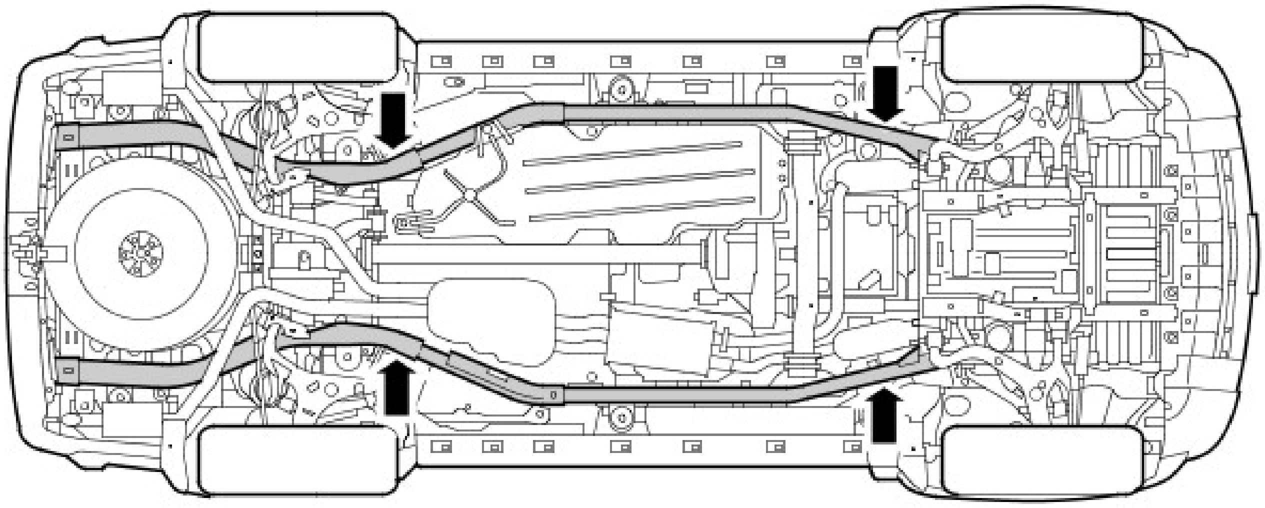
⚠ WARNING: Make sure that the vehicle is stable before commencing work.

• NOTE: Return the suspension to 'normal ride height' when the vehicle is removed from the ramp.

Two Post Lift

⚠ CAUTION: If the drive shaft(s) are to be removed, release the parking brake and select NEUTRAL 'N' in the transmission in order that the shaft(s) can be rotated when the vehicle is raised to the desired height.

1. Position the vehicle with the centre of the lift pillars aligned approximately with the front of the driver/passenger seat cushions.



E47489

2. Extend the lifting arms and position the pad of each lifting arm beneath the body frame longitudinal lifting points.

3. Raise the vehicle until the wheels are just clear of the ground and check that the pads of each lifting arm are still correctly positioned.

4. Raise the vehicle to the desired height.

5. Ensure that vehicle is correctly supported on all four lifting pads, that pads are still correctly positioned and are in full contact with the body frame longitudinals.

WARNING: Make sure that the vehicle is stable before commencing work.

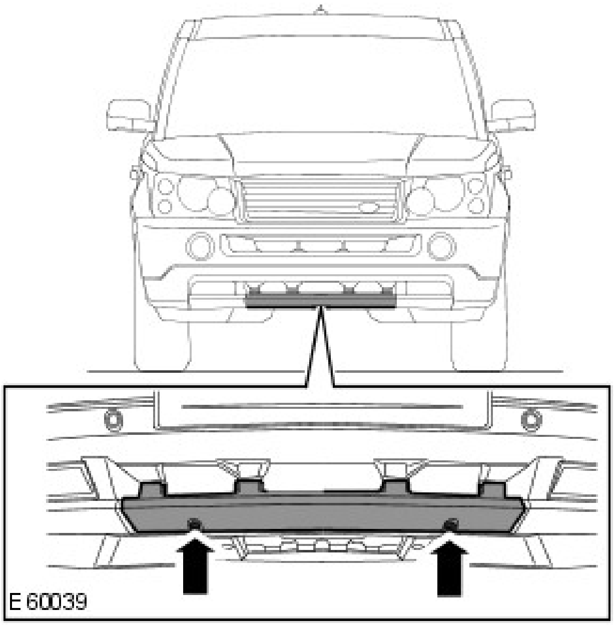
Published: 11-May-2011

Jacking and Lifting - Vehicle Recovery

Description and Operation

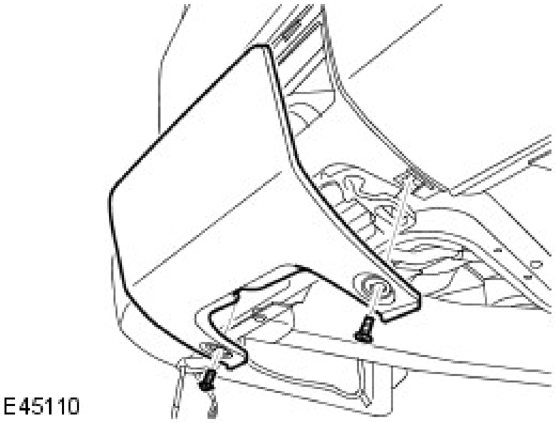
Towing/Lashing eyes

⚠CAUTION: The single towing/lashing eyes at the front and rear of the vehicle are designed for vehicle recovery purposes only and MUST not be used to tow a trailer or caravan.



The front towing/lashing eye is accessible after releasing the 2 toggle fasteners securing the towing eye access panel and removing the panel.

⚠CAUTION: Ensure that during towing, the towing attachment does not contact the bumper.



The rear towing/lashing eye 'A' is accessible after releasing the 2 fasteners securing the access panel to the bumper and removing the panel.

⚠CAUTION: This towing/lashing eye should only be used for towing another vehicle or for recovery purposes to enable this vehicle to be positioned in order that the front towing eye may be used for recovery/towing.

4 Wheel Towing

- CAUTIONS:

⚠ Suspended towing of this vehicle MUST NOT be attempted, if 4 wheel towing is not possible, vehicle must be recovered on a suitable trailer.

⚠ The vehicle may be towed for a maximum of 3 hours or 90 miles (150 km) at a maximum speed of 30 mph (50 km/h), these limits MUST NOT be exceeded.

⚠ The following procedures must be followed to ensure that the vehicle is towed in a safe condition and damage to the vehicle transmission system is prevented.

1. Remove the front towing/lashing eye access panel.

2. Secure the towing attachment from the recovery vehicle to the towing/lashing eye.

⚠CAUTION: Ensure that the towing attachment will not contact the front bumper during towing.

3. Apply the parking brake.

4. Insert ignition key and turn the ignition switch to position 'II'.

⚠CAUTION: If 'N' - Neutral cannot be selected, front and rear propeller shafts must be removed before vehicle is towed.

6. Apply the footbrake and move the selector lever to the 'N' Neutral position.

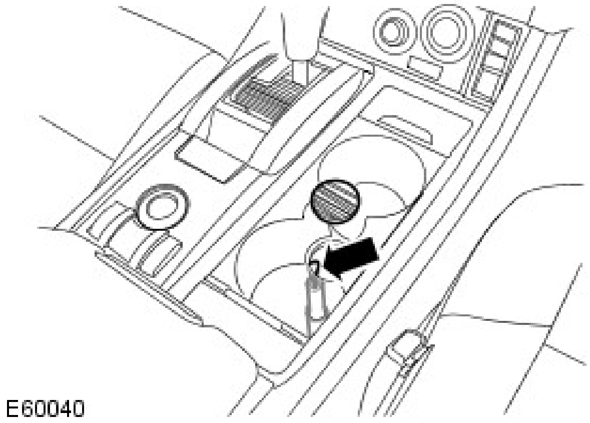
- NOTE: If electrical power is not available, use the manual interlock release tab on the selector lever to move the selector lever to the Neutral position.

7. Select 'H' - HIGH on the transfer case.

⚠CAUTION: If electrical power is not available, and 'H' - HIGH cannot be selected, the vehicle may not be towed but must be recovered on a suitable trailer. If, however, transfer case was in 'H' - HIGH when electrical power was lost, vehicle may still be towed.

8. Release the parking brake.

- NOTE: If electrical power is not available, it will be necessary to release the parking brake manually using the following procedures:



- NOTE: Left hand drive illustrated, right hand drive on opposite side of centre console.

9. Lift out the cup holder inserts from the centre console

10. Remove the access panel from the centre console.

11. Locate the electric parking brake release cable, insert a suitable tool through the cable eye and pull the cable upwards to release the parking brake.

⚠CAUTION: The electric parking brake will not function until electrical power is restored. It will, therefore, be necessary to chock the wheels when vehicle is at a standstill.

⚠WARNING: Do not release the parking brake until towing is about to commence. Whilst towing, do not attempt to remove the ignition key and do not turn the key to any position other than 'II'. With the engine switched off, the power assisted steering system and brake booster will be inoperative thereby resulting in an increase in the effort required to turn the steering wheel and apply the brakes.

⚠CAUTION: The vehicle tow connections should only be used in normal road conditions, 'snatch' recovery must be avoided.

On completion of 4 wheel towing

1. Apply the parking brake or if electrical power is not available, securely chock the wheels.

2. Detach towing equipment from towing/lashing eyes.

3. Fit the towing eye access panel and secure the toggle fasteners.

Transporting by trailer

⚠CAUTION: Use the towing/lashing eyes at the front and rear of the vehicle, DO NOT secure lashing hooks or restraints to any other part of the vehicle.

Position the vehicle, apply the parking brake and select 'N' - Neutral on the automatic transmission selector lever

⚠CAUTION: If electrical power is not available and the parking brake is released, it will not be possible to re-apply the parking brake. It will, therefore be necessary to select 'P' Park and ensure that the vehicle wheels are adequately chocked to prevent vehicle movement.

Published: 11-May-2011

Maintenance Schedules - Maintenance Schedules - Gasoline Engines

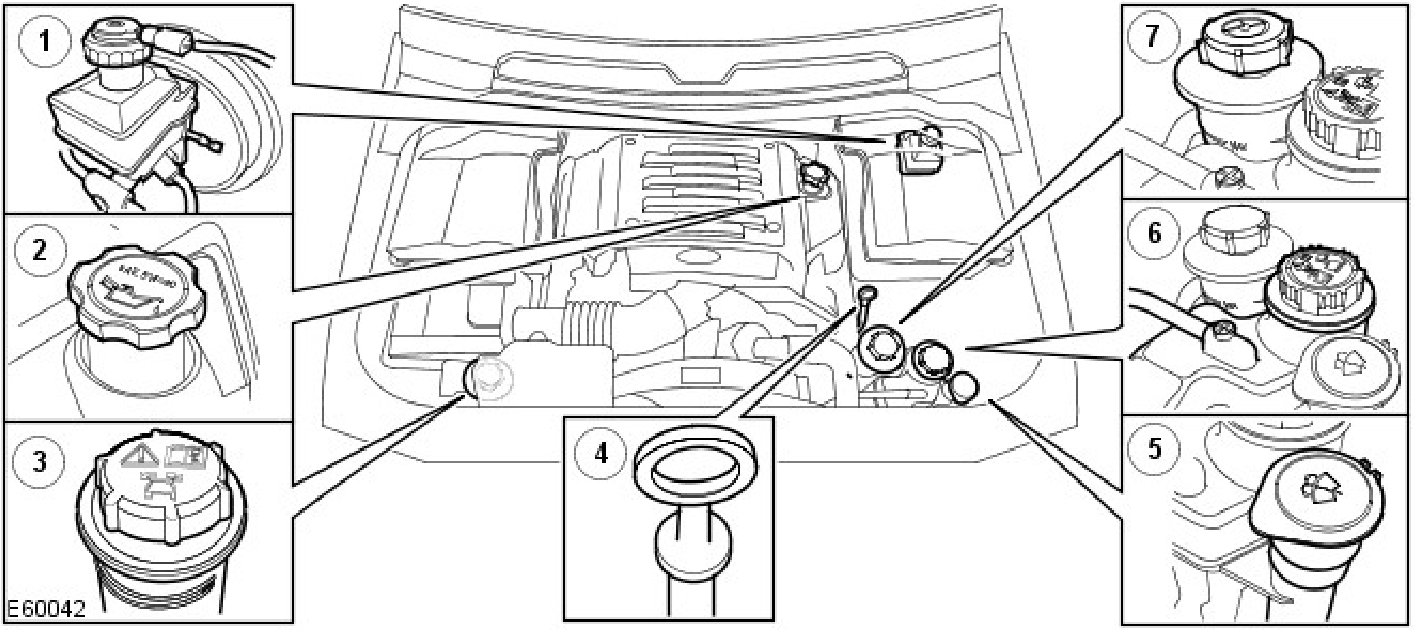
Description and Operation

Torque Specifications

Description	Nm	lb-ft
Seat frame fixing Torx screws	40	30
Seat belt fixing Torx screws	40	30
Road wheel nuts	140	103
M12 tie rod end nuts	76	56

⚠ CAUTION: Unless stated otherwise, the following operations must be carried out at every service interval. Note that the 'A' and 'B' Service Intervals listed on the 'Maintenance Check Sheet' for vehicles operating under arduous conditions, vary from those specified for vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions Maintenance Check Sheet' for vehicles operating under these conditions.

Under Bonnet View - 4.4 Litre and 4.2 Litre Supercharged

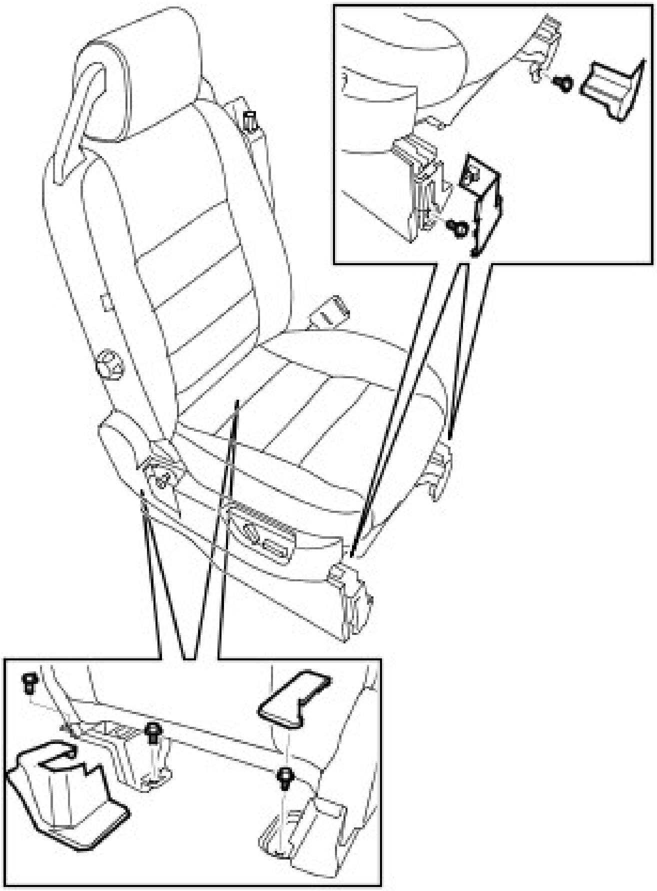


- **1.** Brake fluid reservoir (LH drive illustrated - RH drive on opposite side)
- **2.** Engine oil filler cap
- **3.** Dynamic Response fluid reservoir
- **4.** Engine oil level indicator
- **5.** Windshield washer fluid reservoir
- **6.** Coolant expansion tank
- **7.** Power steering fluid reservoir

Maintenance Operations

Seats and Safety Belts

Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km)



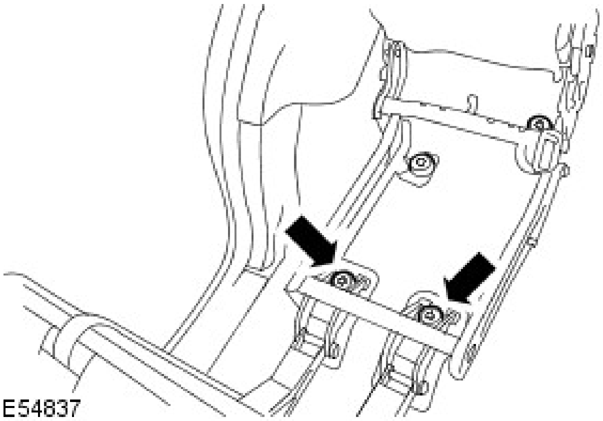
E45101

1. Carefully remove the trim panels covering the seat frame fixing Torx screws.

2. Check that the front seat frame fixing Torx screws are secure and that the seat frames show no signs of movement.

3.Install the trim panels on completion.

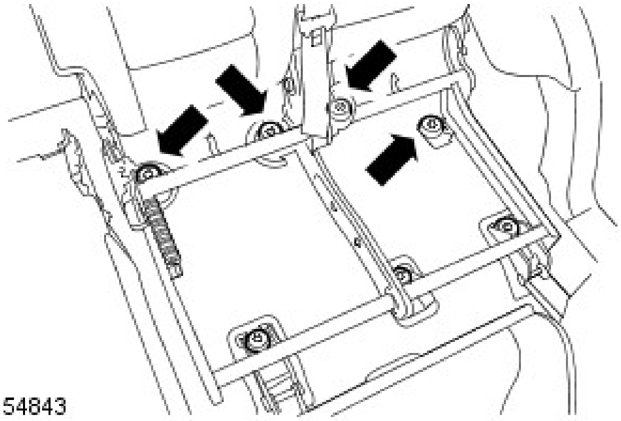
Rear seat frame front fixings - Every 2 years or 30,000 miles (48,000 km)



E54837

4. Check that the rear seat frame front fixings are secure and that the seat frames show no signs of movement.

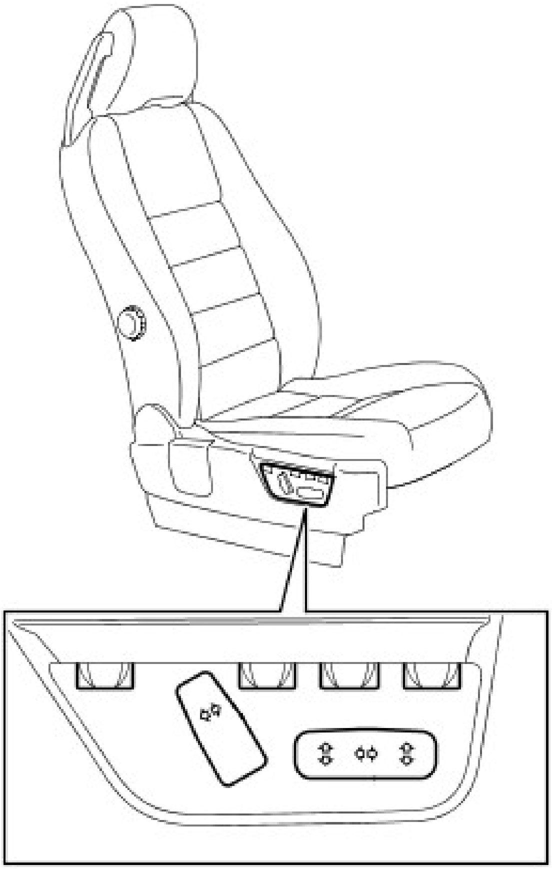
Rear seat frame rear fixings - Every 2 years or 30,000 miles (48,000 km)



5. Fold the seat cushions forwards and check that the rear seat frame rear fixings are secure and that the seat frames show no signs of movement.

6. Fold the seat cushions back on completion.

Front seat controls



7. Check operation of all seat controls.

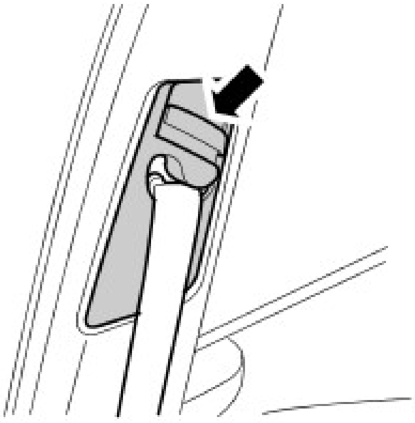
Safety belts - Every 2 years or 30,000 miles (48,000 km)

8. Fully extend each safety belt and check that it returns unassisted; repeat for all belts.

9. Check entire length of safety belt webbing for signs of fraying or damage; repeat for all belts.

10. Connect each safety belt to the correct buckle, check safety belt buckle and tongue are secure; check that buckle releases tongue correctly.

11. Check all safety belt and buckle mountings and fixings for security.



E54871

12. Check front safety belt height adjusters for correct operation.

Lamps, Horns and Warning Indicators

1. Check side, head, fog, reversing and tail lamps for correct operation.

2. Check operation of headlamp automatic levelling system - if installed.

3. Check turn signals and hazard warning lamps for correct operation.

4. Check brake (stop) lamps for correct operation.

5. Check all exterior lamp lenses for clarity and condition; pay particular attention to headlamp and fog lamp lenses for stone chips or damage.

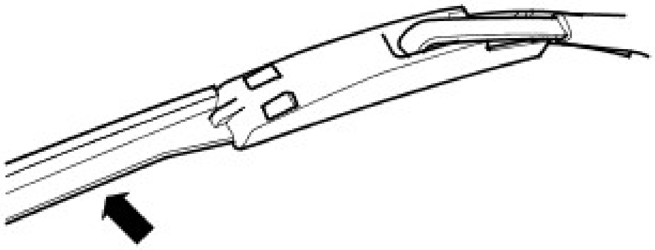
6. Check horn for loud, clear sound.

7. Switch on headlamps and check that side/headlamp reminder warning sounds when door is opened.

8. Check operation of interior courtesy lamps.

9. Check operation of all instrument pack warning and indicator lamps.

Washers and Wipers



E54838

1. Check all wiper blades for condition and signs of splits or damage.

2. Check security of wiper arms.

3. Operate front and rear screen washers, check that jets are clear and correctly aimed.

4. Operate front and rear wipers at all speeds and check for smooth, smear free operation.

Check High/Low Gear Engagement

1. Select LOW range gear, drive vehicle forwards 3 to 4 vehicle lengths, stop vehicle and select HIGH range gear - gears must engage smoothly.

Pollen Filter

1. Replace pollen filter.
For additional information, refer to: Pollen Filter (412-01 Air Distribution and Filtering, Removal and Installation).

Corrosion/Cosmetic Inspection

1. Carry out the annual corrosion/cosmetic inspection using the Annual Corrosion Inspection Sheet.

Wheels and Tires

1. Check that tires comply with manufacturer's specification.
For additional information, refer to: Wheels and Tires (204-04 Wheels and Tires, Description and Operation).

2. Check/adjust tire pressures including spare.
For additional information, refer to: Wheels and Tires (204-04 Wheels and Tires, Description and Operation).

3. Vehicle fitted with Uni-directional tires: Mark the wheel to stud relationship of each road wheel and note location of each road wheel to its respective hub.

4. Loosen road wheel nuts. Raise vehicle to a wheel free condition.
For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

5. Remove the road wheels.

6. Visually check tires for condition, lumps or bulges. Check tread depth across the width of the tire and around the circumference; make sure that remaining tread depth does not contravene local legislative requirements.

- NOTE: Do not install wheels at this stage.

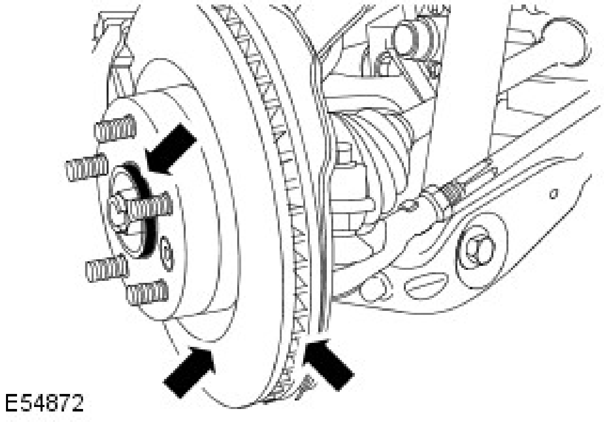
Braking System

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km)**

1. Inspect front brake pads for wear.
For additional information, refer to: Specifications (206-03 Front Disc Brake, Specifications).

2. Inspect rear brake pads for wear.
For additional information, refer to: Specifications (206-04 Rear Disc Brake, Specifications).

3. Check brake calipers for signs of fluid leaks.



4. Check brake discs for condition.

5. Check all brake booster and brake system pipes and hoses for condition, chafing and leaks.

6. Clean road wheel hub spigots and apply grease, Land Rover Part Number RYL 105020 to the wheel mating surface of each spigot.

7. Vehicles fitted with Uni-directional tires: Install road wheels on their respective hubs ensuring that stud to wheel relationship is maintained.

8. Vehicles fitted with NON uni-directional tires: Install wheels on the opposite side of the vehicle but make sure that they are on the same axle as they were originally installed.

9. Install road wheel nuts and tighten to 140 Nm (103 lb-ft).

CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 2 years or 30,000 miles (48,000 km).**

10. Every 3 years or 45,000 miles (72,000 km): Replace brake fluid.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures) /
Brake System Pressure Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures).

11. Every 6 years or 90,000 miles (144,000 km): Replace all flexible brake hoses.

Electric Parking Brake

CAUTION: **When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km)**

1. Check the adjustment of the electric parking brake.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

2. Vehicles operating under arduous conditions: Check the condition of the electric parking brake system.

Road Wheel Speed Sensors

CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 3 months or 3,750 miles (6,000 km).**

1. Inspect the road wheel speed sensor harnesses for damage.

Radiator and Cooling Fan

1. Vehicles operating under arduous conditions: Visually check radiator for external obstructions, check cooling fan blades for damage.

Air Suspension

1. Every 5 years or 75,000 miles (120,000 km) - Vehicles operating under arduous conditions: Replace air suspension compressor filter.
For additional information, refer to: Air Suspension Air Filter (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Door Locks and Hinges

1. Check operation of all door locks, bonnet lock and fuel filler flap.

2. Lubricate all door check straps, bonnet catch and fuel filler flap catch.

Cooling System

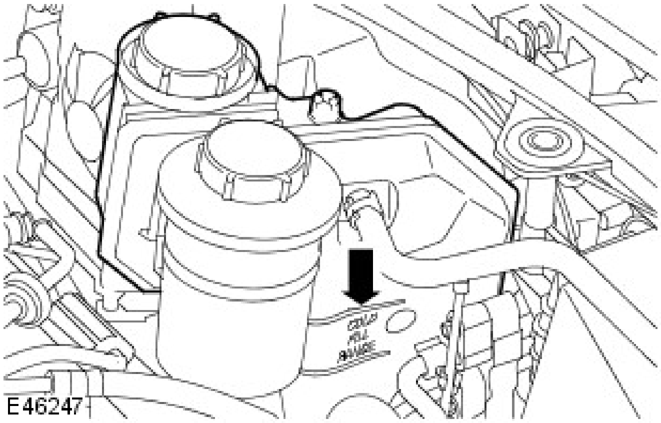
1. Check specific gravity of coolant using a hydrometer.

- NOTE: A suitable hydrometer is available from the Equipment Programme under Part Number 511 3302 001 00.

2. Top-up cooling system if necessary.
For additional information, refer to: Specifications (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Specifications) /
Specifications (303-03B Engine Cooling - V8 4.4L Petrol, Specifications).

CAUTION: **Anti-freeze concentration must be maintained at 50%.**

Cooling system - Check/Top-up



WARNING: **Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank whilst the system is hot.**

CAUTION: **Engine coolant will damage the paint finished surfaces. If coolant is spilled, immediately remove the coolant and wash the area with water.**

1. Check the level of coolant in the expansion tank. With the engine cold, the coolant level must be to the **'UPPER LEVEL'** indicator mark above the **'COLD FILL RANGE'** text on the side of the expansion tank. Ignore any coolant which may be visible in the top section of the tank.

2. If topping-up is required, remove expansion tank filler cap and top-up coolant level to the **'UPPER LEVEL'** indicator mark.
For additional information, refer to: Specifications (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Specifications) /
Specifications (303-03B Engine Cooling - V8 4.4L Petrol, Specifications).

CAUTION: **Always top-up with a 50% mixture of anti-freeze and water.**

3.Install expansion tank filler cap, tighten cap until ratchet is heard to 'click'.

Coolant - Replace

1. Every 10 years or 150,000 miles (240,000 km): Replace the coolant.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03A Engine Cooling - V8 S/C 4.2L Petrol, General Procedures) /
Cooling System Draining, Filling and Bleeding (303-03B Engine Cooling - V8 4.4L Petrol, General Procedures).

Ignition System

1. Every 12 months or 15,000 miles (24,000 km) Vehicles using LEADED fuel or those fitted with COPPER spark plugs: Replace spark plugs.
For additional information, refer to: Specifications (303-07A Engine Ignition - V8 S/C 4.2L Petrol, Specifications) /
Spark Plugs (303-07A Engine Ignition - V8 S/C 4.2L Petrol, Removal and Installation) /
Specifications (303-07B Engine Ignition - V8 4.4L Petrol, Specifications) /
Spark Plugs (303-07B Engine Ignition - V8 4.4L Petrol, Removal and Installation).

2. Every 3 years or 45,000 miles (72,000 km) - Vehicles operating under arduous conditions: Replace spark plugs.
For additional information, refer to: Specifications (303-07A Engine Ignition - V8 S/C 4.2L Petrol, Specifications) /
Spark Plugs (303-07A Engine Ignition - V8 S/C 4.2L Petrol, Removal and Installation) /
Specifications (303-07B Engine Ignition - V8 4.4L Petrol, Specifications) /
Spark Plugs (303-07B Engine Ignition - V8 4.4L Petrol, Removal and Installation).

3. Every 7 years or 105,000 miles (168,000 km) - 4.4 litre and 4.2 Litre Supercharged V8 engines: Replace spark plugs.
For additional information, refer to: Specifications (303-07B Engine Ignition - V8 4.4L Petrol, Specifications) /
Spark Plugs (303-07B Engine Ignition - V8 4.4L Petrol, Removal and Installation).

Air Filtering

CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 12 months or 15,000 miles (24,000 km).**

1. Every 4 years or 60,000 miles (96,000 km) - 4.4 Litre engine: Replace the air filter element.
For additional information, refer to: Air Cleaner Element (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

2. Every 3 years or 45,000 miles (72,000km) - 4.2 Litre Supercharged engine: Replace the air filter element.
For additional information, refer to: Air Cleaner Element (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

Ancillary Drive Belt

1. Check the condition of the ancillary drive belt.

2. Remove all traces of mud and dirt from the drive belt and pulleys.

3. Check the drive belt for signs of splitting and wear.

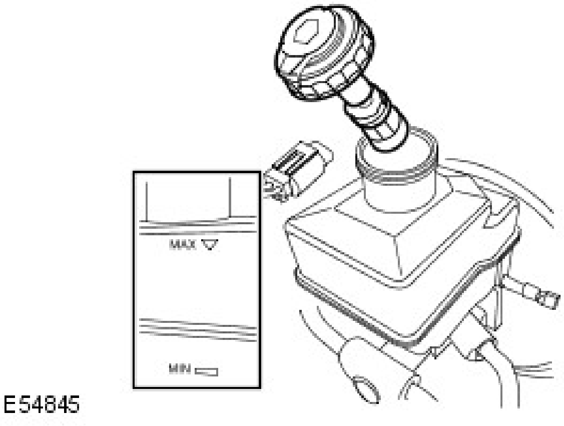
⚠ CAUTION: **When vehicles are operating under arduous conditions, the following service items must be carried out every 5 years or 75,000 miles (120,000 km).**

4. Every 7 years or 105,000 miles (168,000 km) - Vehicles with Dynamic Response installed: Replace the ancillary drive belt.
For additional information, refer to: Accessory Drive Belt (303-05A Accessory Drive - V8 S/C 4.2L Petrol, Removal and Installation).

5. Every 10 years or 150,000 miles (240,000 km) - Vehicles without Dynamic Response installed: Replace the ancillary drive belt.
For additional information, refer to: Accessory Drive Belt (303-05B Accessory Drive - V8 4.4L Petrol, Removal and Installation).

Fluid Levels

Brake fluid reservoir



1. Remove the brake fluid reservoir cover.

2. Check the fluid level in the brake fluid reservoir, the level must be to the **'MAX'** mark on the reservoir; top-up if necessary.

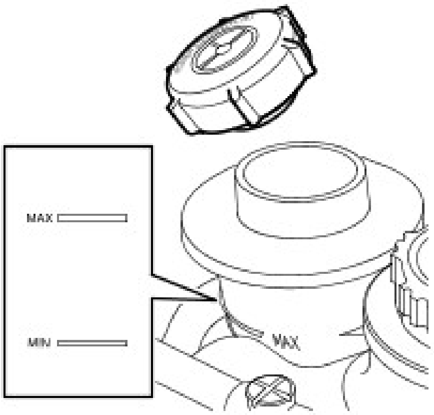
3. Clean the area around the reservoir filler cap, remove cap.

4. If necessary, top-up using the recommended fluid to the **'MAX'** mark on the reservoir.
For additional information, refer to: Specifications (206-00 Brake System - General Information, Specifications).

5. Install the reservoir filler cap.

6. Install the brake fluid reservoir cover.

Power steering fluid reservoir



E54846

⚠CAUTION: **To prevent over filling, check/top-up the system with the engine switched off and the system cold. Make sure that the steering wheel is in the straight ahead position, do not turn the steering wheel prior to checking the fluid level.**

1. Check that the fluid level is to the mid-way mark between the **'MAX'** and **'MIN'** marks on the fluid reservoir, top-up if necessary.

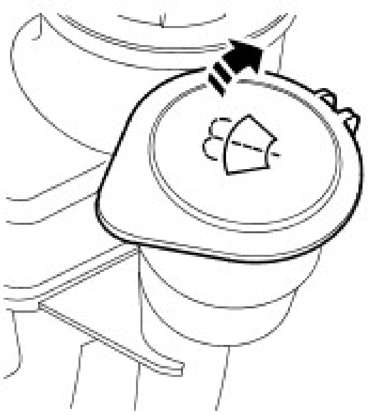
2. Clean the area around the reservoir filler cap, remove cap.

3. If necessary, top-up using the recommended fluid to the mid-way mark on the reservoir.
For additional information, refer to: Specifications (211-02 Power Steering, Specifications).

⚠CAUTION: **Do not fill reservoir above the 'MAX' mark.**

4. Install the reservoir filler cap.

Windshield washer reservoir



E54847

1. Remove the windshield washer reservoir filler cap.

2. Top-up the reservoir using a mixture of an approved windshield washer fluid and water until the level is to the bottom of the gauze filter in the reservoir filler neck.

3. Install the reservoir filler cap.

Dynamic Response reservoir

1. Check that the fluid level is to the mid-way mark between the **'MAX'** and **'MIN'** marks on the fluid reservoir, top-up if necessary.

2. Clean the area around the reservoir filler cap, remove cap.

3. If necessary, top-up using the recommended fluid to the mid-way mark on the reservoir.

Engine Oil and Filter

- CAUTIONS:

⚠ **NAS and Rest of World Vehicles - Not UK and Europe: The following service items must be carried out every 6 months or 7,500 miles (12,000 km).**

⚠ **When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km).**

1. Renew engine oil and filter - 4.2 litre supercharged engine.
For additional information, refer to: Specifications (303-01A Engine - V8 S/C 4.2L Petrol, Specifications) /
Engine Oil Draining and Filling (303-01A Engine - V8 S/C 4.2L Petrol, General Procedures).

2. Renew engine oil and filter - 4.4 litre engine.
For additional information, refer to: Specifications (303-01B Engine - V8 4.4L Petrol, Specifications) /
Engine Oil Draining and Filling (303-01A Engine - V8 S/C 4.2L Petrol, General Procedures).

Automatic Transmission

1. Every 10 years or 150,000 miles (240,000 km): Renew automatic transmission fluid - 4.4 litre engine. For additional information, refer to:

> Specifications (307-01B Automatic Transmission/Transaxle - V8 4.4L Petrol, Specifications),
> Transmission Fluid Drain and Refill (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Renew automatic transmission fluid - 4.2 Litre supercharged engine.
For additional information, refer to: Specifications (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, Specifications) /
Transmission Fluid Drain and Refill (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Transfer Case

1. Every 5 years or 75,000 miles (120,000 km): Renew transfer case oil.
For additional information, refer to: Specifications (308-07B Transfer Case, Specifications) /
Transfer Case Draining and Filling (308-07B Transfer Case, General Procedures).

Differential Assemblies

1. Every 10 years or 150,000 miles (240,000 km): Renew front differential oil.
For additional information, refer to: Specifications (205-03 Front Drive Axle/Differential, Specifications) /
Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

2. Every 5 years or 75,000 miles (120,000 km): Renew rear 'Electronic Torque Managed (ETM)' differential oil.
For additional information, refer to: Specifications (205-02 Rear Drive Axle/Differential, Specifications) /
Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

3. Every 10 years or 150,000 miles (240,000 km): Renew rear 'OPEN' differential oil.
For additional information, refer to: Specifications (205-02 Rear Drive Axle/Differential, Specifications) /
Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

Suspension and Body Mountings

1. Check for free play in all suspension and body mounting rubbers.

2. Check condition of suspension rubber boots and gaiters.

3.Lift the vehicle so that front wheels are clear of ground/ramp to enable insertion of a suitable lever (e.g. a 1200mm long steel tube). Check the lower ball joints for free play by placing the lever between the ground/ramp and the tire, and lifting the wheel assembly with the lever. A second person will be required to check simultaneously for any ball joint lift. If free play (knock) is noted in the ball joint, replacement is required.

Fuel System

1. Check fuel system pipes, hoses and unions for chafing, leaks and corrosion.

Electrical Harnesses

1. Check all electrical harnesses for chafing.

Oil/Fluid Leaks

1. Check for oil/fluid leaks.

Exhaust System

1. Check exhaust system for leaks, security and damage.

Power Steering

1. Check power steering rod ball joint fixings, gaiters and condition of ball joints and dust covers.

2. Check power steering pipes, hoses and unions for chafing, leaks and corrosion.

- NOTE: M14 tie rod end nuts **do not** require checking.

3. Check torque of the tie rod end nuts - M12 nuts tighten to 76 Nm (56 lb.ft).

Fault Lamp(s)

1. If fault lamp(s) are illuminated, test the associated system using approved Land Rover diagnositc equipment and report findings.

Road Test

1. Carry out road test of vehicle.
For additional information, refer to: Road/Roller Testing (100-00 General Information, Description and Operation).

General

1. Endorse Service Record.

2. Report any unusual features of vehicle condition and any additional work required.

Additional Items That May Require Attention

It is recommended that:

1. Every 6 years: All brake fluid hydraulic seals are replaced.

- NOTE: This is in addition to the maintenance requirement that flexible brake hoses MUST be replaced at this service interval.

2. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The electric parking brake should be cleaned and inspected.

3. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The ancillary drive belt should be cleaned and inspected.

4. Vehicles with air suspension: Vehicles used extensively in arduous or off road conditions will require the compressor air inlet filter to be renewed more frequently.

5. Vehicles used in dusty or field conditions or deep wading: More frequent attention to the air cleaner will be required.

Published: 11-May-2011

Maintenance Schedules - Maintenance Schedules - Diesel Engines

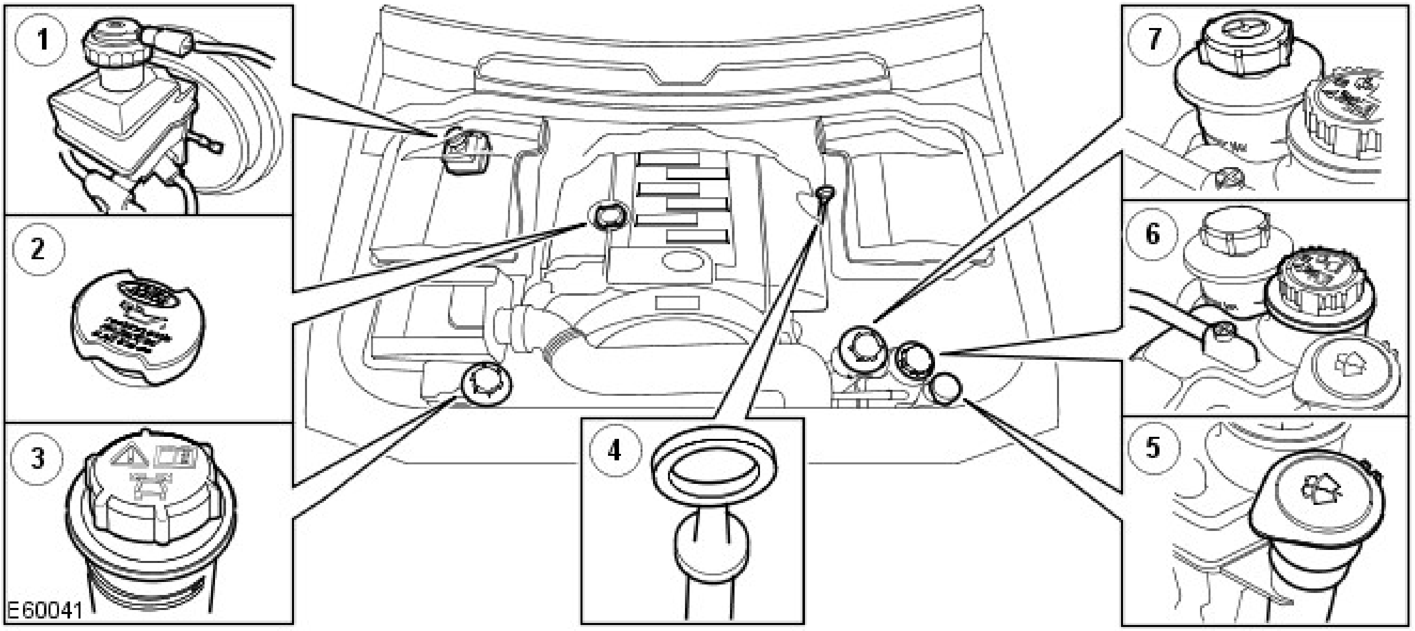
Description and Operation

Torque Specifications

Description	Nm	lb-ft
Seat frame fixing Torx screws	40	30
Seat belt fixing Torx screws	40	30
Road wheel nuts	140	103
M12 tie rod end nuts	76	56

⚠ CAUTION: Unless stated otherwise, the following operations must be carried out at every service interval. Note that the A and B Services listed on the Maintenance Check Sheet, applicable to vehicles operating under arduous conditions, vary both in period and mileage (kilometres) to the intervals specified for those vehicles operating under normal conditions. Reference must therefore, always be made to the 'Arduous Conditions Maintenance Check Sheet' for vehicles operating under these conditions.

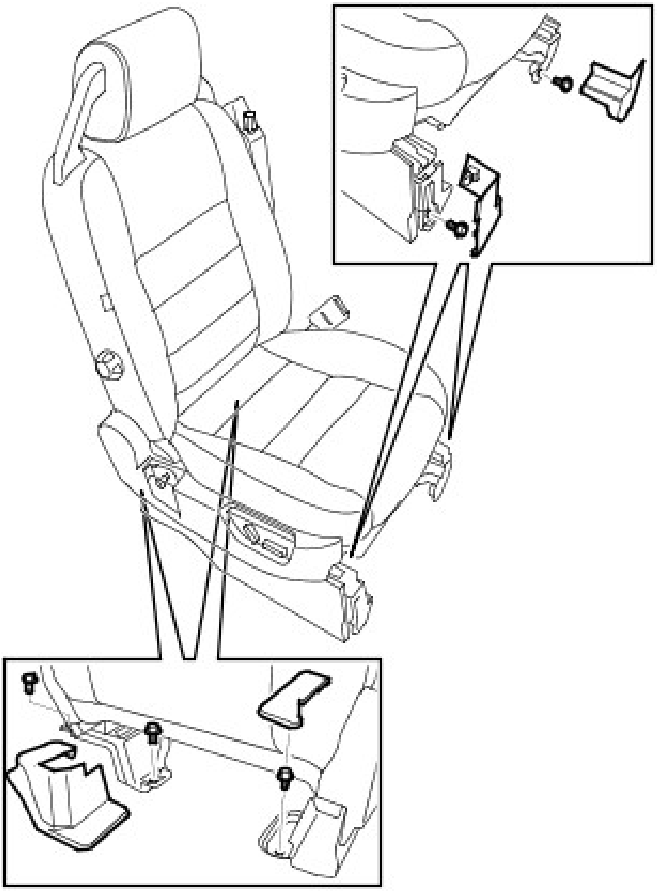
Under Bonnet View - 2.7 Litre



- **1.** Brake fluid reservoir (RH drive illustrated - LH drive on opposite side)
- **2.** Engine oil filler cap
- **3.** Dynamic Response fluid reservoir
- **4.** Engine oil level indicator
- **5.** Windshield washer reservoir
- **6.** Coolant expansion tank
- **7.** Power steering fluid reservoir

Maintenance Operations

Seats and Safety Belts

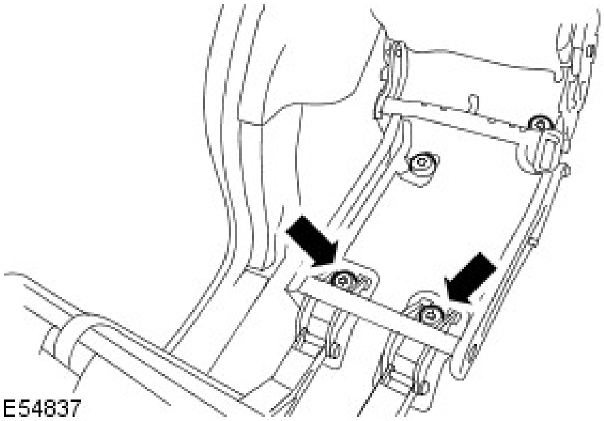


Front seat frame fixings - Every 2 years or 30,000 miles (48,000 km)

1. Carefully remove the trim panels covering the seat frame fixing Torx screws.

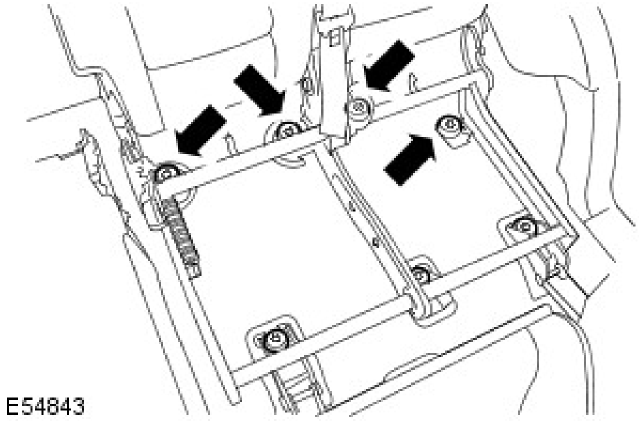
2. Check that the front seat frame fixing Torx screws are secure and that the seat frames show no signs of movement.

3. Reinstall the trim panels on completion.



Rear seat frame front fixings - Every 2 years or 30,000 miles (48,000 km)

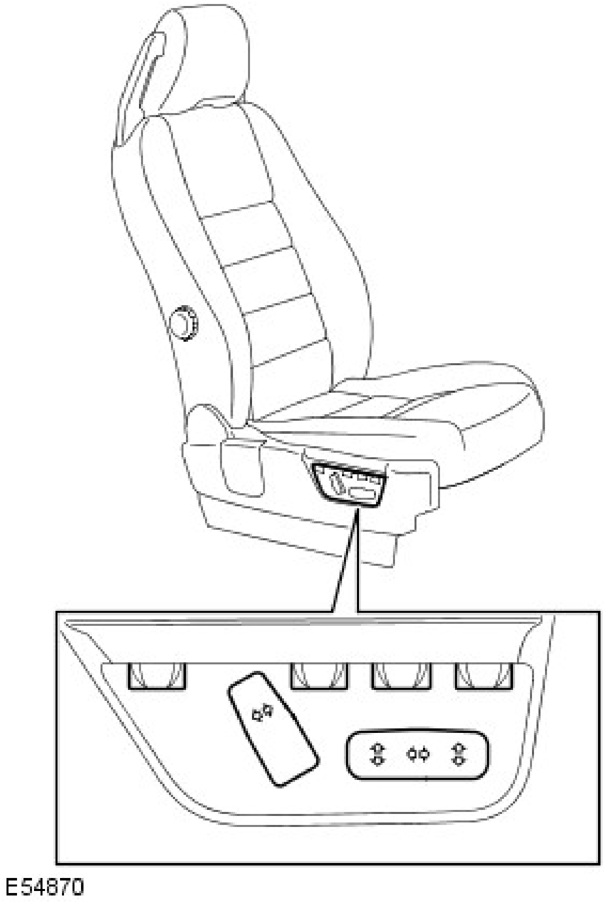
4. Check that the rear seat frame front fixings are secure and that the seat frames show no signs of movement.



Rear seat frame rear fixings - Every 2 years or 30,000 miles (48,000 km)

5. Fold the seat cushions forwards and check that the rear seat frame rear fixings are secure and that the seat frames show no signs of movement.

6. Fold the seat cushions back on completion.



Front seat controls

7. Check operation of all seat controls.

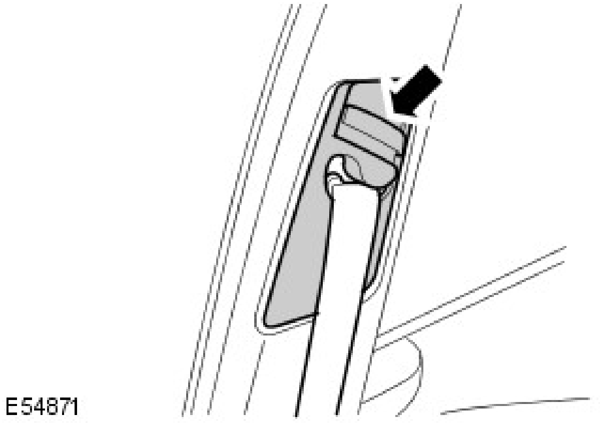
Safety belts - Every 2 years or 30,000 miles (48,000 km)

8. Fully extend each safety belt and check that it returns unassisted; repeat for all belts.

9. Check entire length of safety belt webbing for signs of fraying or damage; repeat for all belts.

10. Connect each safety belt to the correct buckle, check safety belt buckle and tongue are secure; check that buckle releases tongue correctly.

11. Check all safety belt and buckle mountings and fixings for security.



E54871

12. Check front safety belt height adjusters for correct operation.

Lamps, Horns and Warning Indicators

1. Check side, head, fog, reversing and tail lamps for correct operation.

2. Check operation of headlamp automatic levelling system - if installed.

3. Check turn signals and hazard warning lamps for correct operation.

4. Check brake (stop) lamps for correct operation.

5. Check all exterior lamp lenses for clarity and condition; pay particular attention to headlamp and fog lamp lenses for stone chips or damage.

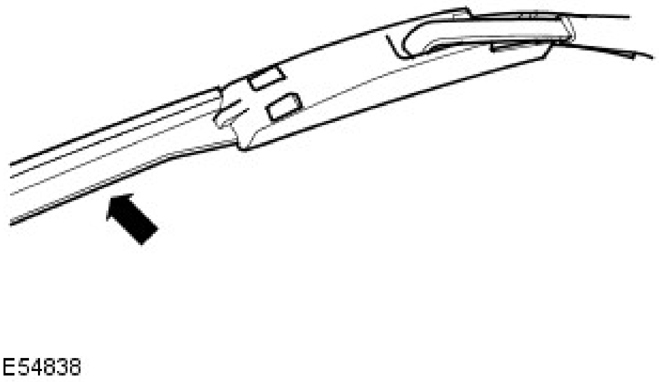
6. Check horn for loud, clear sound.

7. Switch on headlamps and check that side/headlamp reminder warning sounds when door is opened.

8. Check operation of interior courtesy lamps.

9. Check operation of all instrument pack warning and indicator lamps.

Washers and Wipers



E54838

1. Check all wiper blades for condition and signs of splits or damage.

2. Check security of wiper arms.

3. Operate front and rear screen washers, check that jets are clear and correctly aimed.

4. Operate front and rear wipers at all speeds and check for smooth, smear free operation.

Check High/Low Gear Engagement

1. Select LOW range gear, drive vehicle forwards 3 to 4 vehicle lengths, stop vehicle and select HIGH range gear - gears must engage smoothly.

Pollen Filter

1. Replace pollen filter.
For additional information, refer to: Pollen Filter (412-01 Air Distribution and Filtering, Removal and Installation).

Corrosion/Cosmetic Inspection

1. Carry out the annual corrosion/cosmetic inspection using the Annual Corrosion Inspection Sheet.

Wheels and Tires

1. Check that tires comply with manufacturer's specification.
For additional information, refer to: Wheels and Tires (204-04 Wheels and Tires, Description and Operation).

2. Check/adjust tire pressures including spare.
For additional information, refer to: Wheels and Tires (204-04 Wheels and Tires, Description and Operation).

3. Vehicles fitted with Uni-directional tires: Mark the wheel to stud relationship of each road wheel and note location of each road wheel to its respective hub.

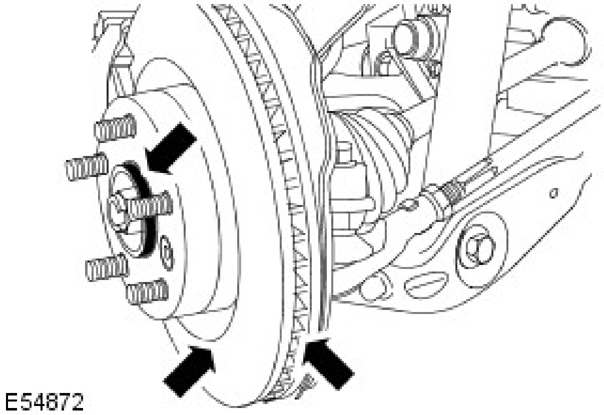
4. Loosen road wheel nuts. Raise vehicle to a wheel free condition.
For additional information, refer to: Lifting (100-02 Jacking and Lifting, Description and Operation).

5. Remove the road wheels.

6. Visually check tires for condition, lumps or bulges. Check tread depth across the width of the tire and around the circumference; make sure that remaining tread depth does not contravene local legislative requirements.

- NOTE: Do not install wheels at this stage.

Braking System



CAUTION: **When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km).**

1. Inspect front brake pads for wear.
For additional information, refer to: Specifications (206-03 Front Disc Brake, Specifications).

2. Inspect rear brake pads for wear.
For additional information, refer to: Specifications (206-04 Rear Disc Brake, Specifications).

3. Check brake calipers for signs of fluid leaks.

4. Check brake discs for condition.

5. Check all brake booster and brake system pipes and hoses for condition, chafing and leaks.

6. Clean road wheel hub spigots and apply grease, Land Rover Part Number RYL 105020 to the wheel mating surface of each spigot.

7. Vehicles fitted with Uni-directional tires: Install road wheels to their respective hubs ensuring that stud to wheel relationship is maintained.

8. Vehicles fitted with NON uni-directional tires: Install wheels on the opposite side of the vehicle but make sure that they are on the same axle as they were originally fitted.

9. Install road wheel nuts and tighten to 140 Nm (103 lb-ft).

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 2 years or 30,000 miles (48,000 km).**

10. Every 3 years or 45,000 miles (72,000 km): Replace brake fluid.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures) /
Brake System Pressure Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures).

11. Every 6 years or 90,000 miles (144,000 km): Replace all flexible brake hoses.

Electric Parking Brake

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service items must be carried out every 3 months or 3,750 miles (6,000 km)**

1. Check the adjustment of the electric parking brake.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

2. Vehicles operating under arduous conditions: Check the condition of the electric parking brake system.

Road Wheel Speed Sensors

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 3 months or 3,750 miles (6,000 km).**

1. Inspect the road wheel speed sensor harnesses for damage.

Fuel Filter Element

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 12 months or 15,000 miles (24,000 km).**

1. Every 2 years or 30,000 miles (48,000 km): Replace fuel filter element.
For additional information, refer to: Fuel Filter Element - VIN Range: SALLS900302->END OF 06MY (310-01C Fuel Tank and Lines - TDV6 2.7L Diesel, Removal and Installation).

Fuel Sedimentor

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 3 months or 3,750 miles (6,000 km).**

1. Drain the fuel sedimentor.

Radiator/intercooler and Cooling Fan

⚠CAUTION: **Vehicles operating under arduous conditions:**

1. Visually check the radiator/intercooler for external obstructions, check cooling fan blades for damage.

2. Remove any debris from the intercooler using a low pressure hose.

Air Suspension

1. Every 5 years or 75,000 miles (120,000 km) - Vehicles operating under arduous conditions: Replace the air suspension compressor filter.
For additional information, refer to: Air Suspension Air Filter (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Door Locks and Hinges

1. Check operation of all door locks, bonnet lock and fuel filler flap.

2. Lubricate all door check straps, bonnet catch and fuel filler flap catch.

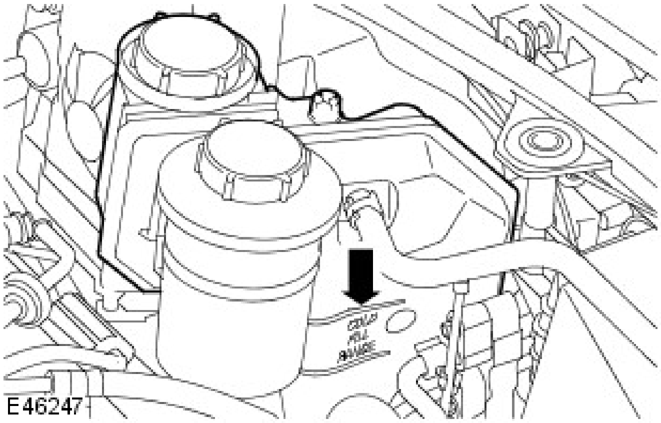
Cooling System

1. Check specific gravity of coolant using a hydrometer.

- NOTE: A suitable hydrometer is available from the Equipment Programme under Part Number 511 3302 001 00.

2. Top-up cooling system if necessary.
For additional information, refer to: Specifications (303-03C Engine Cooling - TDV6 2.7L Diesel, Specifications).

CAUTION: **Anti-freeze concentration must be maintained at 50%.**



Cooling system - Check/Top-up

WARNING: **Since injury such as scalding could be caused by escaping steam or coolant, do not remove the filler cap from the coolant expansion tank whilst the system is hot.**

CAUTION: **Engine coolant will damage the paint finished surfaces. If coolant is spilled, immediately remove the coolant and wash the area with water.**

1. Check the level of coolant in the expansion tank. With the engine cold, the coolant level must be to the**'UPPER LEVEL'** indicator mark above the **'COLD FILL RANGE'** text on the side of the expansion tank. Ignore any coolant which may be visible in the top section of the tank.

2. If topping-up is required, remove expansion tank filler cap and top-up coolant level to the **'UPPER LEVEL'** indicator mark.
For additional information, refer to: Specifications (303-03C Engine Cooling - TDV6 2.7L Diesel, Specifications).

CAUTION: **Always top-up with a 50% mixture of anti-freeze and water.**

3. Install expansion tank filler cap, tighten cap until ratchet is heard to 'click'.

Coolant - Replace

1. Every 10 years or 150,000 miles (240,000 km): Replace the coolant.
For additional information, refer to: Cooling System Draining, Filling and Bleeding (303-03C Engine Cooling - TDV6 2.7L Diesel, General Procedures).

Air Filtering

CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 12 months or 15,000 miles (24,000 km).**

1. Every 3 years or 45,000 miles (72,000 km): Replace the air cleaner element.
For additional information, refer to: Air Cleaner Element (303-12C Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

Ancillary Drive Belt

1. Check the condition of the ancillary drive belt.

2. Remove all traces of mud and dirt from the drive belt and pulleys.

3. Check the drive belt for signs of splitting and wear.

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 3 years or 45,000 miles (72,000 km).**

4. Every 7 years or 105,000 miles (168,000 km): Replace the ancillary drive belt.
For additional information, refer to: Accessory Drive Belt (303-05C Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

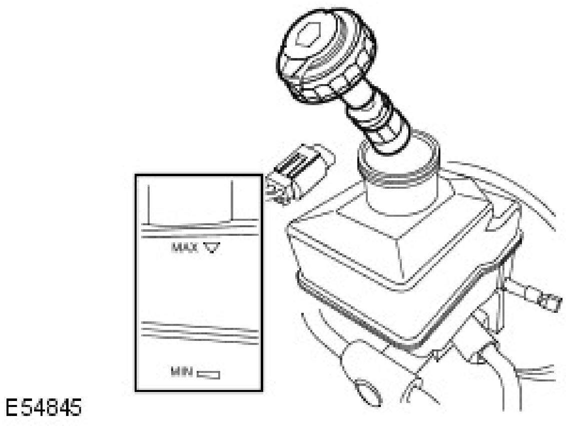
Camshaft Timing Belt and High Pressure Fuel Pump Drive Belt

⚠CAUTION: **When vehicles are operating under arduous conditions, the following service item must be carried out every 4 years or 60,000 miles (96,000 km).**

1. Every 7 years or 105,000 miles (168,000 km): Replace camshaft timing belt.
For additional information, refer to: Timing Belt (303-01C Engine - TDV6 2.7L Diesel, In-vehicle Repair).
Replace High pressure fuel pump drive belt.
For additional information, refer to: Fuel Injection Pump Belt (303-05C Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

Fluid Levels

Brake/clutch fluid reservoir



1. Remove the brake/clutch fluid reservoir cover.

2. Check the fluid level in the brake/clutch fluid reservoir, the level must be to the **'MAX'** mark on the reservoir; top-up if necessary.

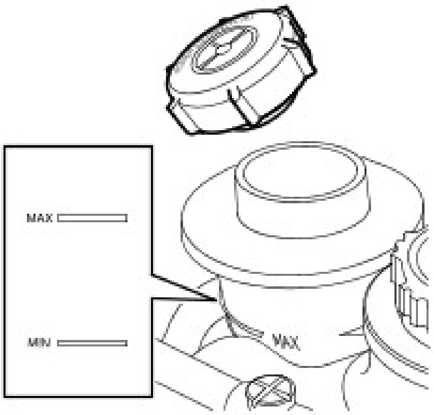
3. Clean the area around the reservoir filler cap, remove the cap.

4. If necessary, top-up using the recommended fluid to the **'MAX'** mark on the reservoir.
For additional information, refer to: Specifications (206-00 Brake System - General Information, Specifications).

5. Install the reservoir filler cap.

6. Install the brake/clutch fluid reservoir cover.

Power steering fluid reservoir



E54846

CAUTION: To prevent over filling, check/top-up the system with the engine switched off and the system cold. Make sure that the steering wheel is in the straight ahead position, do not turn the steering wheel prior to checking the fluid level.

1. Check that the fluid level is to the mid-way mark between the **'MAX'** and **'MIN'** marks on the fluid reservoir, top-up if necessary.

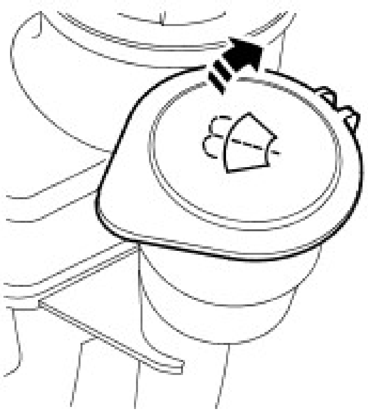
2. Clean the area around the reservoir filler cap, remove the cap.

3. If necessary, top-up using the recommended fluid to the mid-way mark on the reservoir.
For additional information, refer to: Specifications (211-02 Power Steering, Specifications).

CAUTION: **Do not fill reservoir above the 'MAX' mark.**

4. Refit the reservoir filler cap.

Windshield washer reservoir



E54847

1. Remove the windshield washer reservoir filler cap.

2. Top-up the reservoir using a mixture of an approved windshield washer fluid and water until the level is to the bottom of the gauze filter in the reservoir filler neck.

3. Install the reservoir filler cap.

Dynamic Response reservoir

1. Check that the fluid level is to the mid-way mark between the **'MAX'**and **'MIN'**marks on the fluid reservoir, top up if necessary.

2. Clean the area around the reservoir filler cap, remove the cap.

3. If necessary, top-up using the recommended fluid.

Engine Oil and Filter

- CAUTIONS:

⚠ **When vehicles are operating under arduous conditions, the following service item must be carried out every 3 months or 3,750 miles (6,000 km).**

⚠ **Vehicles operating on high sulphur content fuel - above 0.7%, the oil and filter change period MUST NOT exceed 3 months or 3,750 miles (6,000 km).**

⚠ **Vehicles operating on moderate sulphur content fuel - 0.3 to 0.7%, the oil and filter change period MUST NOT exceed 6 months or 7,500 miles (12,000 km).**

1. Renew engine oil and filter.
For additional information, refer to: Engine Oil Draining and Filling (303-01C Engine - TDV6 2.7L Diesel, General Procedures) /
Oil Filter Housing (303-01C Engine - TDV6 2.7L Diesel, In-vehicle Repair).

Automatic Transmission

1. Every 10 years or 150,000 miles (240,000 km): Renew automatic transmission fluid.
For additional information, refer to: Specifications (307-01C Automatic Transmission/Transaxle - TDV6 2.7L Diesel, Specifications) /
Transmission Fluid Drain and Refill (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Transfer Case

1. Every 5 years or 75,000 miles (120,000 km): Renew transfer case oil.
For additional information, refer to: Specifications (308-07B Transfer Case, Specifications) /
Transfer Case Draining and Filling (308-07B Transfer Case, General Procedures).

Differential Assemblies

1. Every 10 years or 150,000 miles (240,000 km): Renew front differential oil.
For additional information, refer to: Specifications (205-03 Front Drive Axle/Differential, Specifications) /
Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

2. Every 5 years or 75,000 miles (120,000 km): Renew rear 'Electronic Torque Managed (ETM)' differential oil.
For additional information, refer to: Specifications (205-02 Rear Drive Axle/Differential, Specifications) /
Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

3. Every 10 years or 150,000 miles (240,000 km): Renew rear 'OPEN' differential oil.
For additional information, refer to: Specifications (205-02 Rear Drive Axle/Differential, Specifications) /
Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

Suspension and Body Mountings

1. Check for free play in all suspension and body mounting rubbers.

2. Check condition of suspension rubber boots and gaiters.

3.Lift the vehicle so that front wheels are clear of ground/ramp to enable insertion of a suitable lever (e.g. a 1200mm long steel tube). Check the lower ball joints for free play by placing the lever between the ground/ramp and the tire, and lifting the wheel assembly with the lever. A second person will be required to check simultaneously for any ball joint lift. If free play (knock) is noted in the ball joint, replacement is required.

Fuel System

1. Check fuel system pipes, hoses and unions for chafing, leaks and corrosion.

Electrical Harnesses

1. Check all electrical harnesses for chafing.

Oil/Fluid Leaks

1. Check for oil/fluid leaks.

Exhaust System

1. Check exhaust system for leaks, security and damage.

Power Steering

1. Check power steering rod ball joint fixings, gaiters and condition of ball joints and dust covers.

2. Check power steering pipes, hoses and unions for chafing, leaks and corrosion.

- NOTE: M14 tie rod end nuts **do not** require checking.

3. Check torque of the tie rod end nuts - M12 nuts tighten to 76 Nm (56 lb.ft).

Clutch

1. Check clutch pipes and unions for chafing, leaks and corrosion.

Fault Lamp(s)

1. If fault lamp(s) are illuminated, test the associated system using approved Land Rover diagnositc equipment and report findings.

Road Test

1. Carry out road test of vehicle.
For additional information, refer to: Road/Roller Testing (100-00 General Information, Description and Operation).

General

1. Endorse Service Record.

2. Report any unusual features of vehicle condition and any additional work required.

Additional Items That May Require Attention

It is recommended that:

1. Every 6 years: All brake fluid hydraulic seals are replaced.

- NOTE: This is in addition to the maintenance requirement that flexible brake hoses MUST be replaced at this service interval.

2. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The electric parking brake should be cleaned and inspected.

3. After 50 miles (80 km) continuous use in severe off-road conditions i.e. wading, deep mud and abrasive grit/slurry: The ancillary drive belt should be cleaned and inspected.

4. Vehicles fitted with air suspension: Vehicles used extensively in arduous or off road conditions will require the compressor air inlet filter to be renewed more frequently.

5. Vehicles used in dusty or field conditions or deep wading: More frequent attention to the air cleaner will be required.

6. Vehicles used in areas where fuel quality is poor: Where vehicles are used in these areas, the fuel sedimentor may require draining at more frequent intervals.

Suspension System - General Information -

Air Spring Suspension

Item	Specification
Type	Independent with standard/Dynamic Response stabilizer bars, and air springs with multiple, driver selectable ride heights - Standard, off-road and access.

Steering Geometry - Front

⚠CAUTION: When checking or adjusting front or rear steering geometry, the vehicle must either have a full fuel tank or have sufficient weight placed in the vehicle's load space to give the equivalent weight of a full fuel tank. The weight must be evenly distributed at the front and the right hand side of the load space. The fuel tank capacity is 86.3 litres (18.9 Imperial gallons) (22.7 US gallons). Depending on the amount of fuel in the tank, calculate the amount of weight which must be added:

- 1 litre of fuel weighs 0.8 kg (1.7 pounds)
- 1 Imperial gallon of fuel weighs 3.6 kg (8.0 pounds)
- 1 US gallon of fuel weighs 3.0 kg (6.7 pounds)

Front Suspension at Standard Ride Height	Dynamic (Air) Suspension
Castor	4º 01' ± 45'
	(4.02º ± 0.75º)
Cross Castor	0º ± 45' - Maximum
	(0º ± 0.75º - Maximum)
Camber	-30' ± 45'
	(-0.50º ± 0.75º)
Cross Camber	0º ± 45' - Maximum
	(0º ± 0.75º - Maximum)
King Pin Inclination (KPI)	13º 54'
	(13.9º)
Total Toe - all models except TdV8	- 0º 10' ± 12'
	(- 0.16º ± 0.20º)
Total Toe - TdV8 models only	- 0º 05' ± 12'
	(- 0.08º ± 0.20º)

Steering Geometry - Rear

Rear Suspension at Standard Ride Height	Dynamic (Air) Suspension
Camber	-1° ± 45'
	(-1° ± 0.75º)
Cross Camber	0° ± 51' - Maximum
	(0° ± 0.85º - Maximum)
Total Toe - all models except TdV8	0º 14' ± 0.08'
	(0.24º ± 0.14º)
Total Toe - TdV8 models only	0º 24' ± 0.12'

Suspension System - General Information - Suspension System

Diagnosis and Testing

Inspection and Verification

WARNING: Before carrying out a road test, make sure the vehicle is safe to do so. Failure to follow this instruction may result in personal injury.

1. **1.** Gather as much information from the driver as possible and verify the customer concern by carrying out a road test, as closely as possible reproducing the conditions under which the fault occurs.
2. **2.** Visually inspect for obvious signs of mechanical damage.

Visual inspection

Mechanical
• Tire pressures • Damaged wheels or tires • Wheel bearing(s) • Loose or damaged front or rear suspension components • Loose, damaged or missing suspension fastener(s) • Damaged or leaking air suspension components • Worn or damaged suspension bushing(s) • Loose, worn or damaged steering system components • Damaged axle components

3. **3.** If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the symptom chart.

Symptom chart

Symptom	Possible causes	Action
Crabbing	• Incorrect rear thrust angle • Front or rear suspension components	Check the rear alignment. REFER to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures). Check the front and rear suspension for signs of damage or wear.
Drift/Pull/Wander	• Tire pressures • Uneven tire wear • Damaged steering components • Wheel alignment • Brake drag • Unevenly loaded or overloaded vehicle	Check and adjust the tire pressures (see visual inspection). Check for uneven tire wear, investigate the cause and rectify as necessary. Check the steering for wear/damage. Check and adjust the wheel alignment as necessary. Check for binding brakes, rectify as necessary. Advise the driver of the load issues.
Front bottoming or riding low	• Damaged suspension components • Air spring fault	Check the suspension components for damage. Check the dynamic suspension. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).
Uneven tire wear	• Incorrect tire pressure (rapid center rib or inner and outer edge	Check and adjust the tire pressures (see visual inspection). Check and adjust the wheel alignment as necessary. REFER to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures). Balance the wheels and tires as necessary.

	wear) - Incorrect front or rear toe (rapid inner or outer edge wear) - Incorrect camber (rapid inner or outer edge wear) - Tires out of balance (tires cupped or dished)	
Harsh ride	- Damaged suspension components - Air spring fault	Check the suspension components for damage. Check the dynamic suspension. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).
Shimmy or wheel tramp	- Wheels/tires - Loose wheel nut(s) - Loose front suspension fasteners - Front wheel bearing(s) fault - Worn or damaged suspension component bushing - Loose, worn or damaged ball joint(s) - Loose, worn or damaged steering components - Front wheel alignment	Check the wheels and tires for condition and balance. Check and tighten the wheel nuts and suspension fasteners to specification. Check the front wheel bearings, suspension bushings, ball joints and steering components for wear or damage. Check and adjust the wheel alignment as necessary. REFER to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures).
Poor returnability of the steering (self-centering)	- Steering column - Ball joints - Steering components	Check the steering column universal joints, etc. Check the ball joints and other steering components.
Sway or roll	- Loose front or rear stabilizer bar - Worn lower suspension arm stabilizer bar insulators - Air spring fault	Check the stabilizer bar security and condition. Rectify as necessary. Check the function of the active stabilization system (where fitted). REFER to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Diagnosis and Testing). Check the air springs. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).
Vehicle leans to one side	- Front or rear suspension	Check the front and rear suspension. Check the air springs. REFER to: Vehicle Dynamic Suspension (204-05 Vehicle Dynamic Suspension, Diagnosis and Testing).

	components - Air spring fault	

Published: 11-May-2011

Suspension System - General Information - Four-Wheel Alignment

General Procedures

• CAUTIONS:

⚠ Make sure the vehicle is on a flat level surface.

⚠ Make sure the tire pressures are within specification.

⚠ Make sure that only the manufacturers' recommended four wheel alignment equipment is used.

⚠ Make sure there are no heavy objects in the vehicle.

⚠ Make sure the air suspension is set to NORMAL ride height.

⚠ Make sure the steering is in the straight ahead position.

⚠ Make sure the slip plates (turntables) are free to move before adjusting the geometry.

1. Check the tie rod ends, suspension joints, wheel bearings and wheels and tires for damage, wear and free play.

- Adjust or repair any worn, damaged or incorrectly adjusted components.

2. Check and adjust tire pressures.

3. Position the vehicle on a calibrated, level, vehicle lift.

4. Release the vehicle parking brake.

5. Using the approved diagnostic tool, check the air suspension control module for fault codes and clear as required.

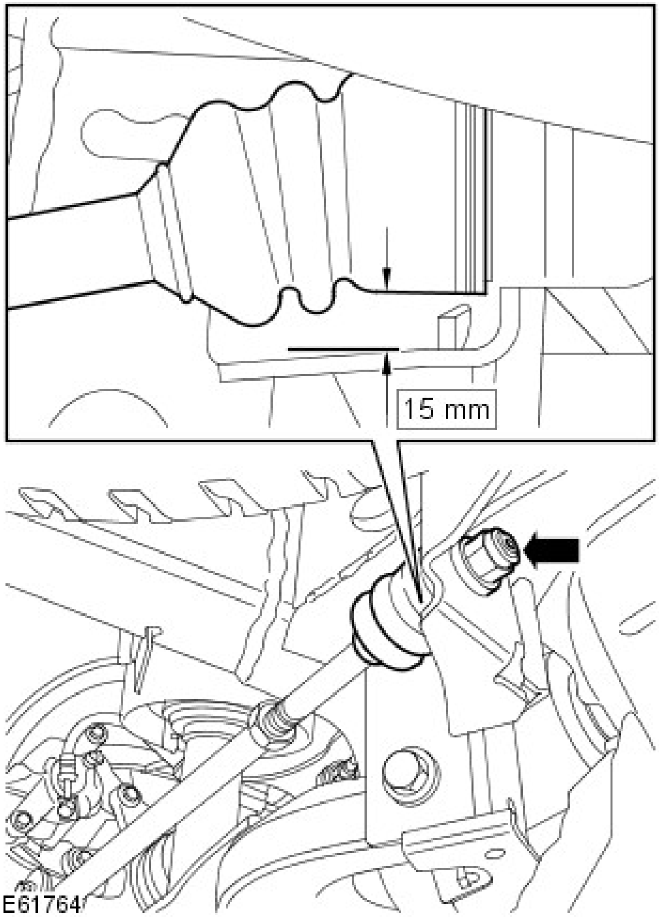
6. Using the diagnostic tool, set vehicle to 'Geometry Set Mode', using the instructions below. Putting the vehicle into this mode will make sure that the ride heights are controlled more accurately.

1. Select the 'Configuration' tab
2. Select 'Set up and Configure'.
3. Select 'Air Suspension'.
4. Select 'Suspension Geometry Set Up'.
5. Select 'Tight Tolerance Mode'.
6. Follow the on-screen instructions until the set up process has finished.

7. NOTE: If rear camber adjustment is required, loosen the rear camber adjustment bolts enough to allow adjustment before starting any other wheel alignment adjustments. Do not fully loosen the rear camber adjustment bolts.

Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

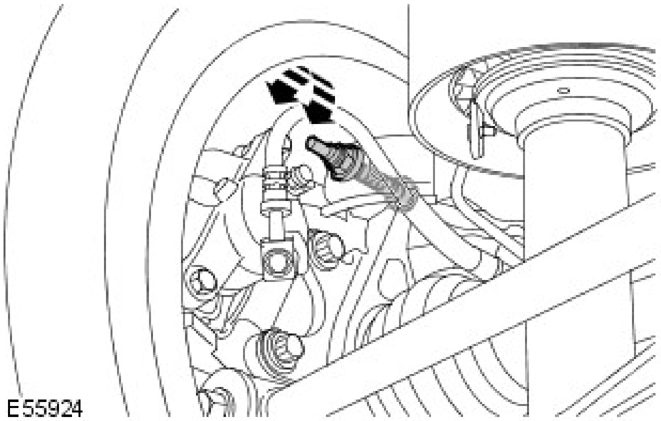
8. ⚠ CAUTION: Make sure the toe link anti-rotation tang is fully seated in the integrated body frame before tightening the toe link retaining nut. Failure to follow this instruction will result in damage to the toe link or integrated body frame.



• NOTE: This step is only required if the toe links have been removed or replaced.

Adjust the rear bump steer.

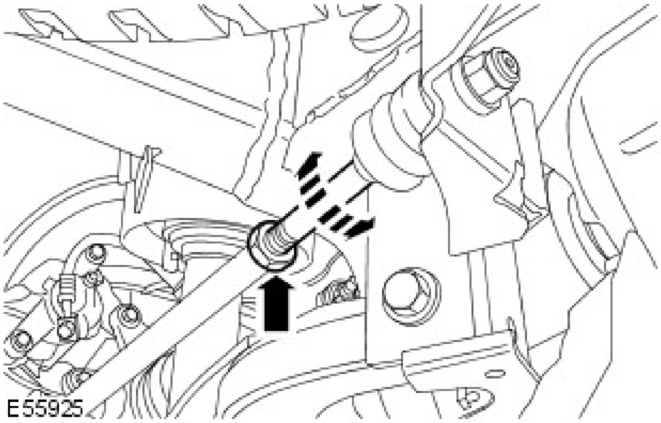
- Loosen the toe link inner ball joint retaining nut.
- Set the gap, between the underside of the toe link rubber boot and the integrated body frame bracket, to 15 mm (0.473 in).
- Tighten the toe link inner ball joint retaining nut to 133 Nm (98 lb.ft)
- Repeat the above procedure for the other side.



9. NOTE: The rear camber adjustment bolts cannot be fully tightened with the rear wheels installed. Do not remove the rear wheels to tighten the rear camber adjustment bolts until all other wheel alignment adjustments have been completed.

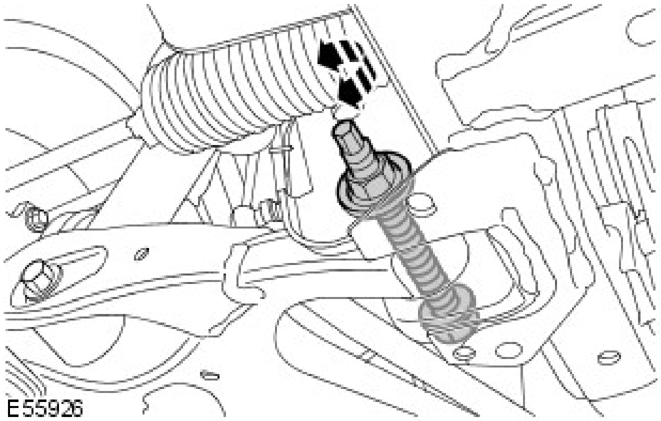
Adjust the rear camber.

- Loosen the rear camber adjusting bolts.
- Rotate the rear camber adjusting bolt until the correct value is obtained.
- Repeat the above procedure for the other side.
- Tighten the rear camber adjusting bolts.



10. Adjust the rear toe.

- Loosen the toe link adjustment locking nut.
- Rotate the toe link inner ball joint until the correct rear toe value is obtained.
- Tighten the toe link adjustment locking nut to 130 Nm (96 lb.ft).
- Repeat the above procedure for the other side.
- Repeat the rear toe measurement.

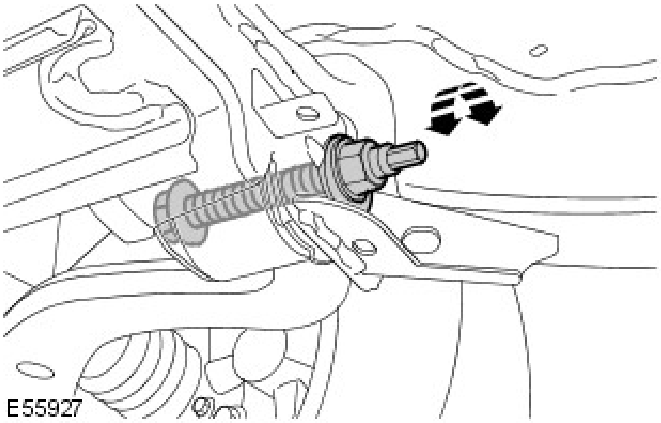


E55926

11. ⚠CAUTION: Make sure the slip plates (turntables) are free to move before adjusting the geometry.

Adjust the front camber.

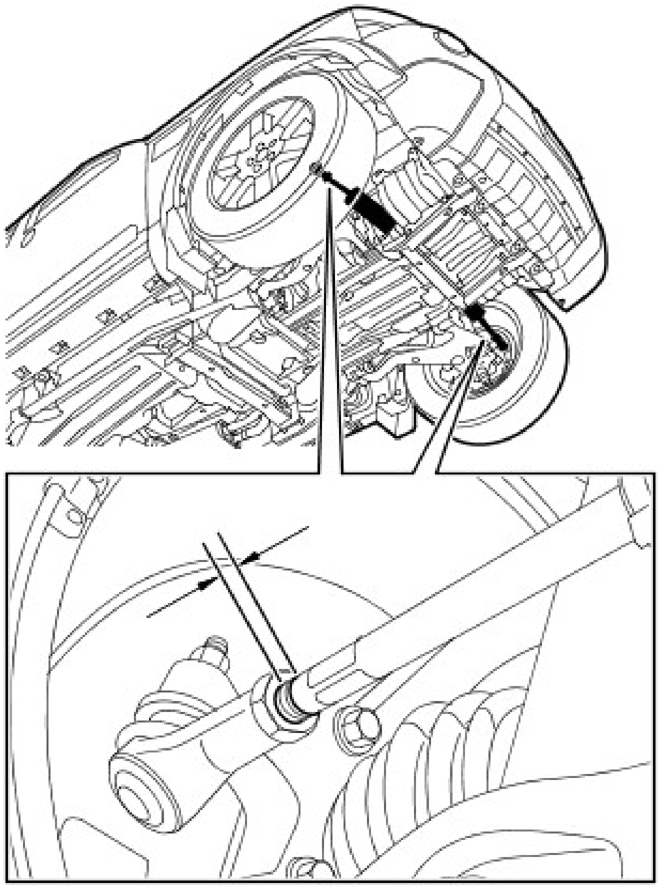
- Loosen the lower arm front camber adjusting bolt.
- Rotate the front camber adjusting bolt until the correct value is obtained.
- Tighten the lower arm front camber adjusting bolt to 275 Nm (203 lb.ft).
- Repeat the above procedure for the other side.



E55927

12. Adjust the front castor.

- Loosen the lower arm rear castor adjusting bolt.
- Rotate the castor adjusting bolt until the correct value is obtained.
- Tighten the lower arm rear castor adjusting bolt.
- Repeat the above procedure for the other side.
- Repeat the castor measurement.
- Repeat the above procedure until both castors achieve the correct value.
- Tighten the lower arm rear castor adjusting bolts to 275 Nm (203 lb.ft).



E55928

13. Align the steering to straight ahead.

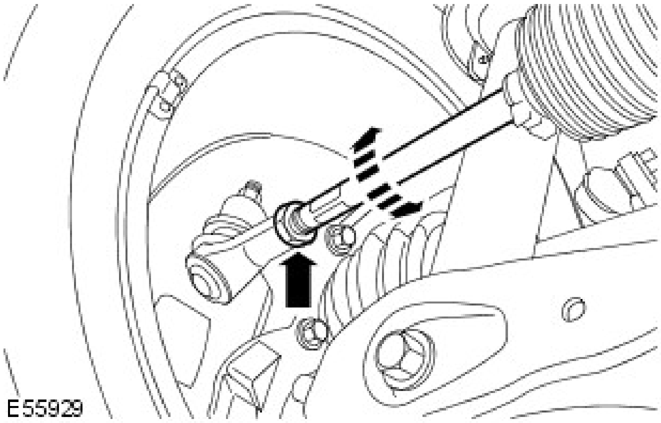
- Measure the length of the exposed thread on each track rod.
- If the exposed thread lengths differ by more than two millimeters:
- Stage one: Loosen one track rod end locking nut.
- Stage two: Rotate the track rod until the lengths of the exposed threads on both track rods are equal.
- Stage three: Tighten the track rod end locking nut.
- Stage four: Rotate the steering wheel until both front toe measurements are equal.

14. If the steering wheel is more than three degrees from the

straight ahead position, remove the steering wheel and reposition on the nearest spline to the straight ahead position.
For additional information, refer to: Steering Wheel (211-04 Steering Column, Removal and Installation).

- Align the steering wheel to straight ahead.

15. Adjust the front toe.



- Loosen the track rod end locking nuts.
- Rotate the track rods to adjust each individual front toe to the correct value.
- Tighten the track rod end locking nuts to 53 Nm (39 lb.ft).

16. Using the diagnostic tool, return the vehicle to 'Normal Mode'.

1. Select the 'Configuration' tab
2. Select 'Set up and Configure'.
3. Select 'Air Suspension'.
4. Select 'Suspension Geometry Set Up'.
5. Select 'Normal Mode'.
6. Follow the on-screen instructions until the normal mode process has finished.

17. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

18. Remove the rear wheels and tires.

19. Tighten the rear camber adjusting bolts to 133 Nm (98 lb.ft).

20. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

21. Calibrate the steering angle sensor using the diagnostic tool.

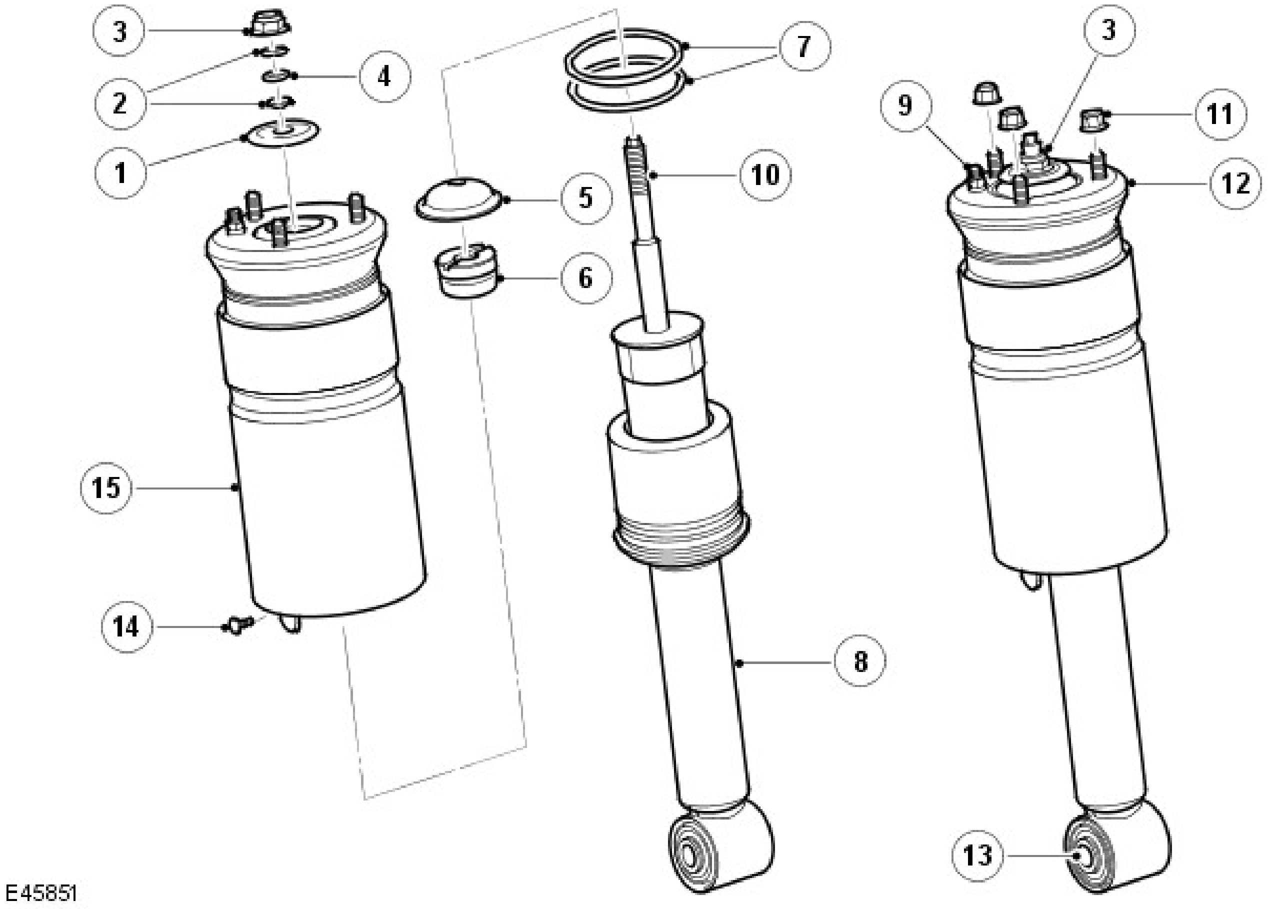
GENERAL

The front suspension is a fully independent design which offers a reduction in unsprung weight over the beam axle design. The front suspension comprises an upper arm, a lower arm, a wheel knuckle and hub, a stabilizer bar and links assembly and an air damper assembly. A conventional stabilizer bar is fitted to some models, with a Dynamic Response stabilizer bar system available as a standard or optional fitment.
For additional information, refer to: Active Stabilization System (204-06 Ride and Handling Optimization, Description and Operation).

The suspension lower arms have been designed for maximum ground clearance and also allow for adjustment of the camber and castor using cam adjusters.

AIR SUSPENSION DAMPER MODULE



Item	Part Number	Description
1	-	Rebound washer*
2	-	O-ring - damper rod (2 off)*
3	-	Self-locking nut*
4	-	Spacer - damper rod*
5	-	Bump washer
6	-	Spring aid*
7	-	O-ring - air spring sleeve support (2 off)*
8	-	Damper assembly*
9	-	Voss air fitting
10	-	Damper rod
11	-	Self-locking nut (3 off)
12	-	Top mount
13	-	Bush
14	-	Retaining pin - air spring assembly*
15	-	Air spring assembly*

- NOTE: * shows service items

The damper module comprises an air spring assembly, top mount and a damper assembly. The damper and air spring are only serviceable as complete assemblies.

Damper

The damper assembly is a mono tube design with an air spring. The lower end of the damper is fitted with a bush and is attached to the lower arm with a bolt and nut.

The damper functions by restricting the flow of hydraulic fluid through internal galleries within the damper. The damper rod moves axially within the damper, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The damper rod is sealed at its exit point from the damper body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

Air Spring

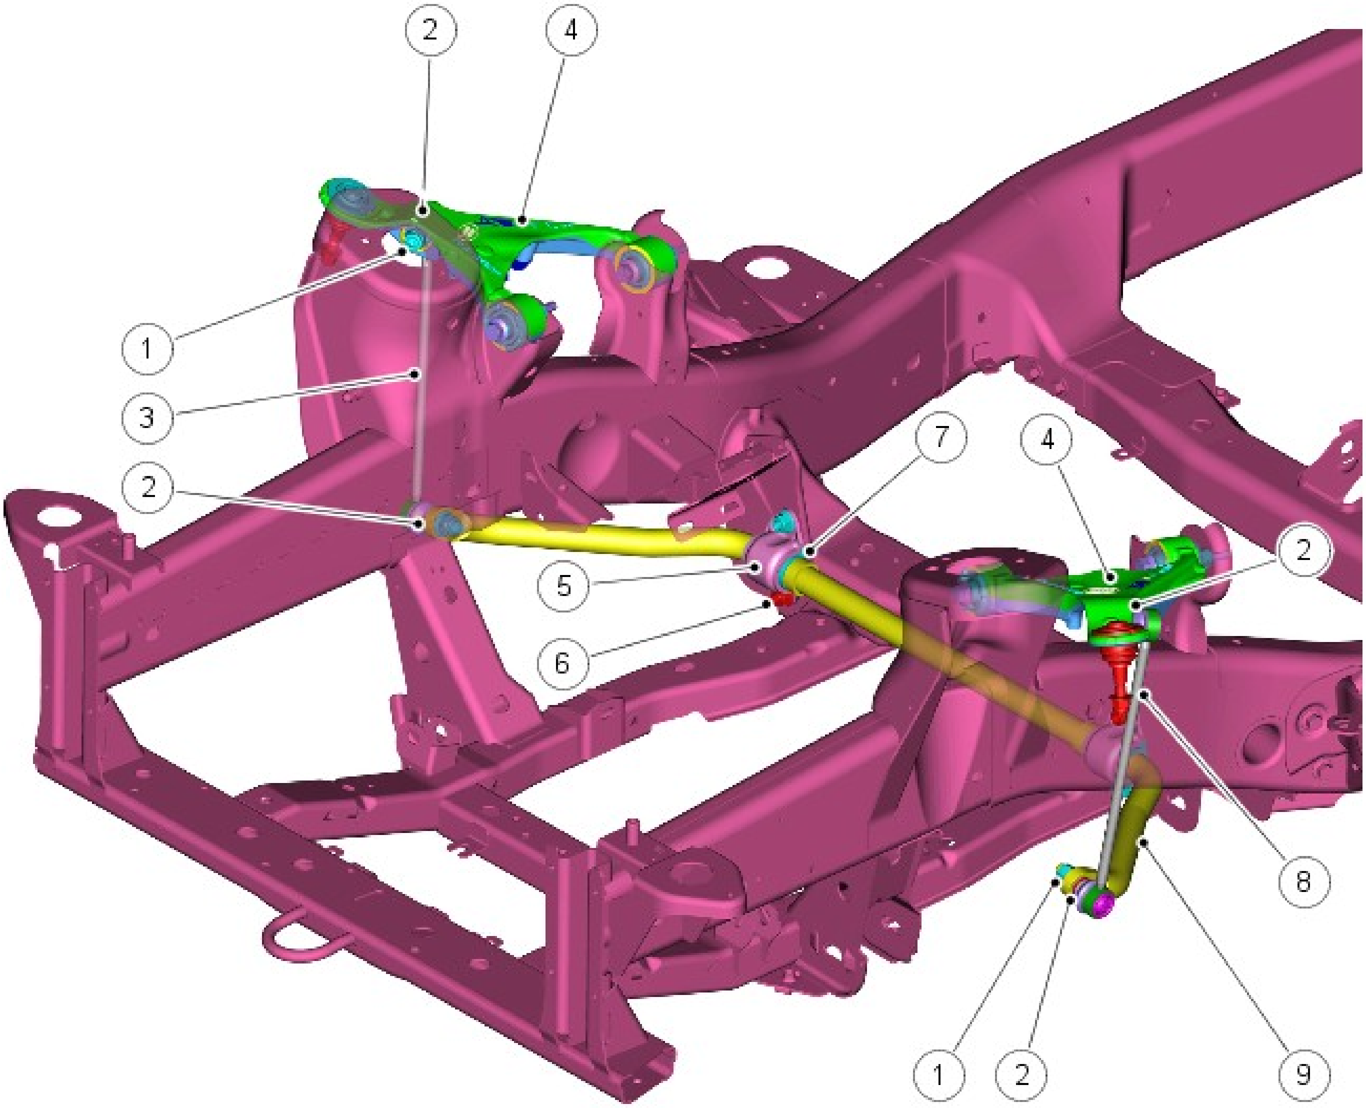
The air spring comprises an aluminium restraining cylinder, top mount, spring aid, air sleeve and an inner support sleeve.

The air sleeve is made from a flexible rubber material which allows the sleeve to roll up and down the air spring piston as the vehicle changes height. The air sleeve is attached to the restraining cylinder and support sleeve by crimp rings which provide an air tight seal. The support sleeve contains a seal carrier which has two O-rings sealing the support sleeve and two O-rings sealing to the damper body. The top of the air sleeve is crimped to the top mount which attaches to the chassis frame with three integral studs and self-locking nuts.

A spring aid is fitted to the damper rod and prevents the top mount contacting the top of the damper during full suspension compression and assists the suspension tune. The lower end of the air spring is located over the damper body and seats on a fabricated seat on the damper body. The air sleeve is positively attached to the seat with a retaining pin. The damper rod is located through a central hole in the top mount. The rod is threaded at its outer end. A self-locking nut secures the air spring to the damper rod.

The top mount is an integral part of the air spring and is fitted with a bush and a rebound washer. A bump washer is located between the top mount plate and the damper rod. The top mount is secured to the damper rod with a self-locking nut. The top mount attaches to a housing on the chassis with three integral studs and self-locking nuts. The top mount also incorporates a 6 mm Voss air fitting which allows for the attachment of the air harness.

STABILIZER BAR



E56035

Item	Part Number	Description
1	-	Nut - link to stabilizer bar/upper arm (4 off)
2	-	Hardened washer (4 off)
3	-	Right hand Link
4	-	Upper arm
5	-	Bracket (2 off)
6	-	Locknut (4 off)
7	-	Bush (2 off)
8	-	Left hand link
9	-	Stabilizer bar

Vehicles with the Dynamic Response system use an active stabilizer bar.
For additional information, refer to: Active Stabilization System (204-06 Ride and Handling Optimization, Description and Operation).

The stabilizer bar is fabricated from induction hardened, 31 mm diameter solid spring steel bar. The stabilizer bar operates, via a pair of links, from their attachment to the upper arm.

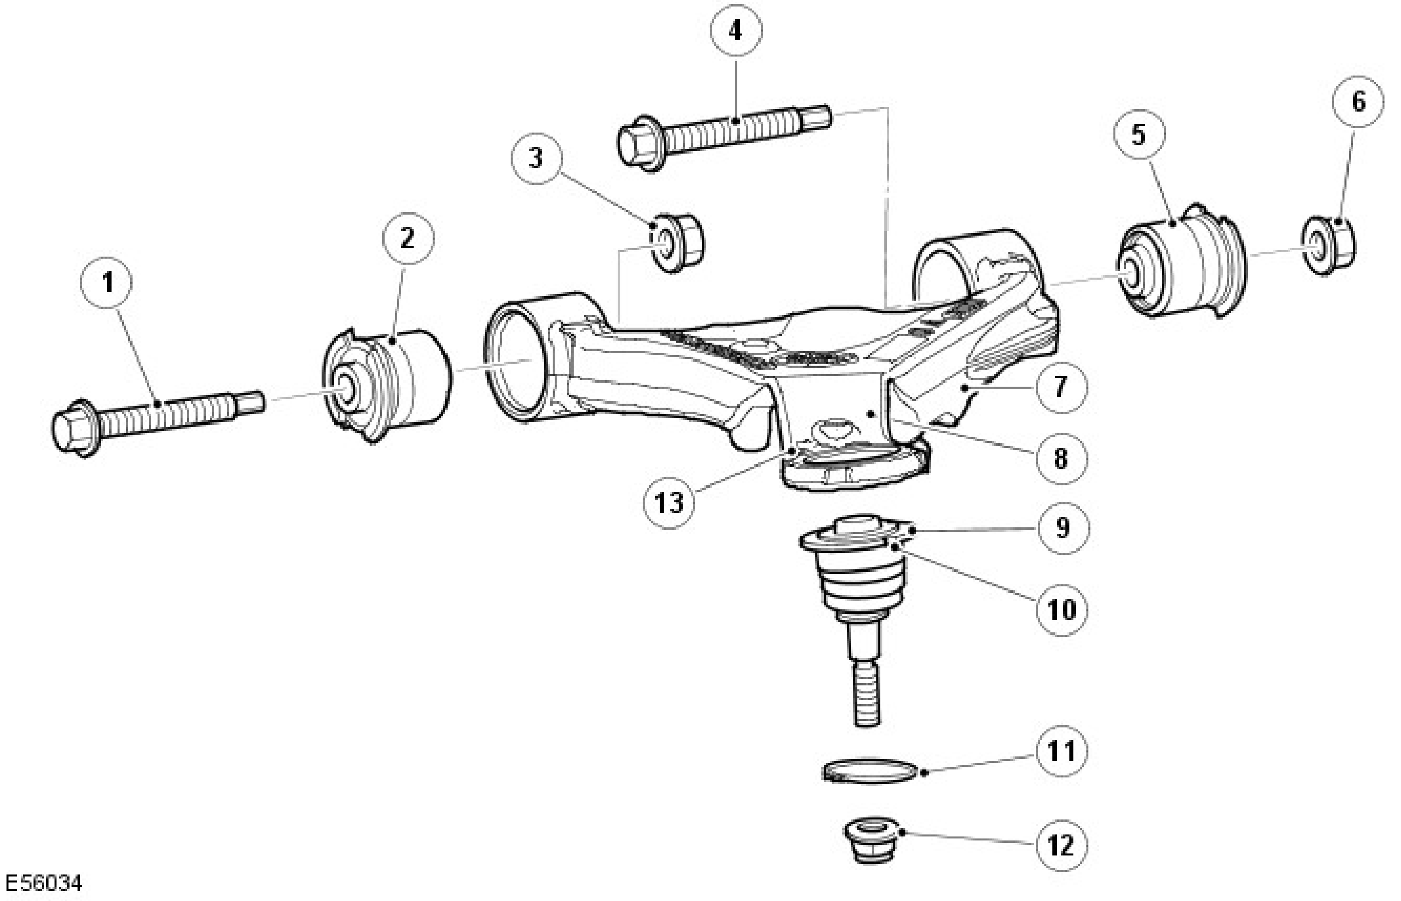
The stabilizer bar is mounted on the forward face of the chassis front cross member and is attached to the cross member with two, Teflon lined bushes. Brackets, which are pressed onto the bushes, are attached to the cross member with nuts, screwed onto studs in the cross member. The stabilizer bar has crimped, 'anti-shuffle' collars pressed in position on the inside edges of the bushes. The collars prevent sideways movement of the stabilizer bar.

The links, which are handed and have a ball joint at each end, are fitted with hardened steel washers at both ends. The top ball joint is attached to the link at 90 degrees to the link axis. The ball joint is located in a hole in the side of the upper arm and secured with the hardened steel washer on one side of the interface and a slef-locking nut on the other. The bottom ball joint is attached to the link at 90 degrees to the link axis. The ball joint is located in a hole in the end of the stabilizer bar and secured with the hardened steel washer on one side of the interface and the self-locking nut on other.

It is important that hardened steel washer is in the correct position between the stabilizer bar and the link ball joint and the upper arm and the link ball joint and the correct, hardened washer is fitted.

⚠ CAUTION: Failure to fit the washer or using an incorrect washer will result in relaxation of the torque on the self-locking nut and damage will be caused to the stabilizer bar, link and suspension upper arm.

UPPER ARM



Item	Part Number	Description
1	-	Flanged bolt
2	-	Bush
3	-	Self locking nut
4	-	Flanged bolt
5	-	Bush
6	-	Self locking nut
7	-	Upper arm
8	-	Stabilizer bar link attachment hole (hidden)
9	-	Ball joint
10	-	Timing mark
11	-	Circlip
12	-	Self locking nut
13	-	Timing mark

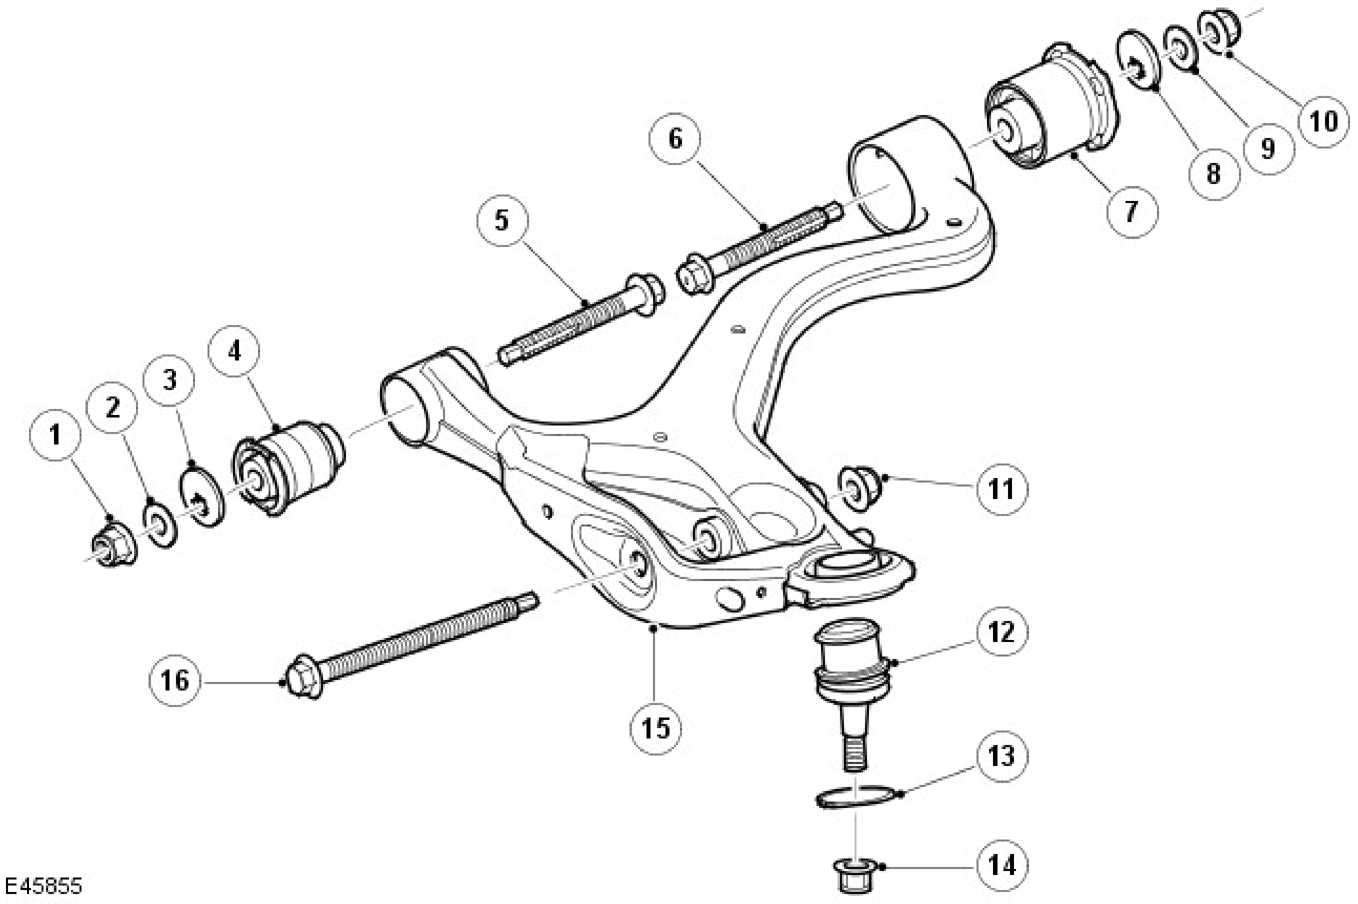
The upper arm assembly comprises, the upper arm, two bushes and a ball joint. The upper arm is made from cast and machined iron. Its outer end has a hole to accept the ball joint. A small indentation is located adjacent to the ball joint hole and is used to obtain the correct orientation of the ball joint. A hole on the rear side of the arm provides for the attachment of the stabilizer bar link.

The inner end of the arm has two bush housings which are machined in the arm casting. A bush is pressed into each housing. The bushes are located between lugs on the chassis and are secured with bolts and self-locking nuts through metal inserts in the centre of the bushes.

The ball joint is pressed into the upper arm. The ball joint is an interference fit in the hole which prevents the ball joint from moving. A circlip is fitted to the ball joint to retain it in the hole. The top face of the ball joint has two semi-circular cut-outs. One of these cut-outs must be aligned with the small indentation in the upper arm to ensure the correct operation of the ball joint.

A bracket, located on on the underside of the upper arm, provides for the attachment of the air suspension height sensor drop link.

LOWER ARM



Item	Part Number	Description
1	-	Self locking nut
2	-	Washer
3	-	Cam washer
4	-	Bush
5	-	Bolt
6	-	Bolt
7	-	Hydrobush
8	-	Cam washer
9	-	Washer
10	-	Self locking nut
11	-	Self locking nut - damper lower attachment
12	-	Ball joint
13	-	Circlip
14	-	Self locking nut
15	-	Lower arm
16	-	Bolt - damper lower attachment

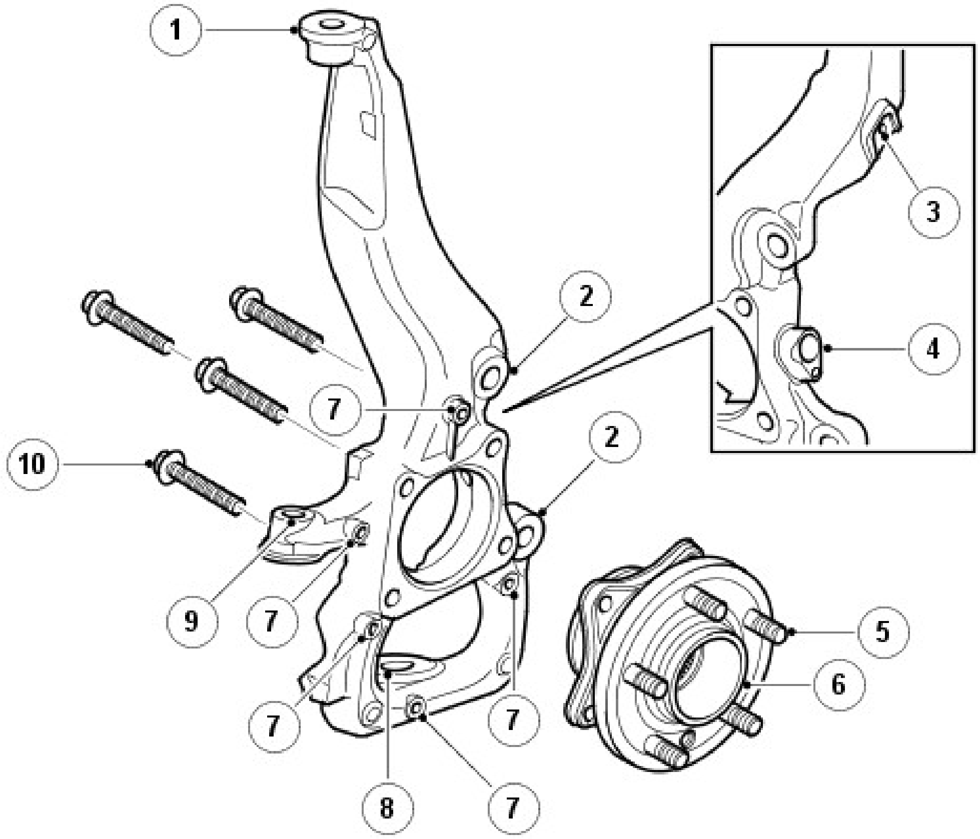
The lower arm assembly comprises, the lower arm, two bushes and a ball joint. The lower arm is a pressed steel fabrication with a hole at its outer end to accept the ball joint.

The inner end of the arm has two fabricated bush housings which are welded to the arm pressing. A bush is pressed into each housing. The rear bush is a hydrobush which provides a progressive increase in the hardness of the bush as the deflection of the wheel increases. The bushes are located between lugs on the chassis and are secured with bolts and self-locking nuts through metal inserts in the centre of the bushes. The forward bush, self-locking nut, has a cam washer located beneath it. The cam washer is located between lugs on the chassis bracket and its orientation can be adjusted to set the front camber. The rear bush, self-locking nut, also has a cam washer located beneath it. The cam washer is located between lugs on the chassis bracket and its orientation can be adjusted to set the front castor.

A central aperture in the arm provides for the attachment of the damper module lower bush. The damper is secured with a long bolt which is positioned through holes in the lower arm and secured with a self-locking nut.

The ball joint is pressed into the lower arm. The ball joint is an interference fit in the hole which prevents the ball joint from moving. A circlip is fitted to the ball joint to retain it in the hole.

WHEEL KNUCKLE, HUB AND BEARING ASSEMBLY



E45856

Item	Part Number	Description
1	-	Upper arm attachment
2	-	Brake caliper attachment holes
3	-	Brake hose bracket attachment point
4	-	Wheel speed sensor location
5	-	Wheel studs
6	-	Wheel hub
7	-	Brake disc dust shield attachment holes
8	-	Lower arm ball joint attachment
9	-	Steering gear ball joint attachment
10	-	Wheel hub bolts (4 off)

The wheel knuckle is a machined casting which is located between the ball joints of the upper and lower arms. The knuckle has four clearance holes which allow for the fitment of four bolts which secure the wheel hub housing. A cast boss on the forward edge of the knuckle provides for attachment of the steering gear, tie rod ball joint.

The wheel hub and bearing assembly comprises the wheel hub housing, wheel hub and taper roller bearing. The wheel hub and bearing assembly is a non-serviceable component. Five M14 studs are pressed into the wheel hub and provide for the attachment of the road wheel with wheel nuts.

The wheel hub housing is a machined forging which houses a taper roller bearing. The housing has four threaded holes which provide for the attachment to the wheel knuckle with four bolts.

The wheel hub has a splined centre bore which mates with corresponding splines on the half shaft. Rotation of the half shaft is passed, via the splines, to the wheel hub which rotates on the taper roller bearing.

Front Suspension - Front Stabilizer Bar

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the wheels and tires.

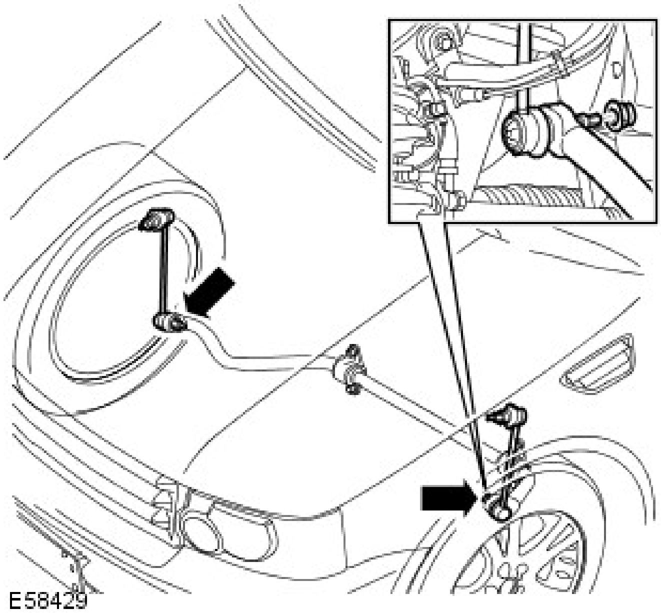
3. CAUTIONS:

   ⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

   ⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

   Disconnect both the stabilizer bar links from the stabilizer bar.

   - Remove and discard the 2 nuts.

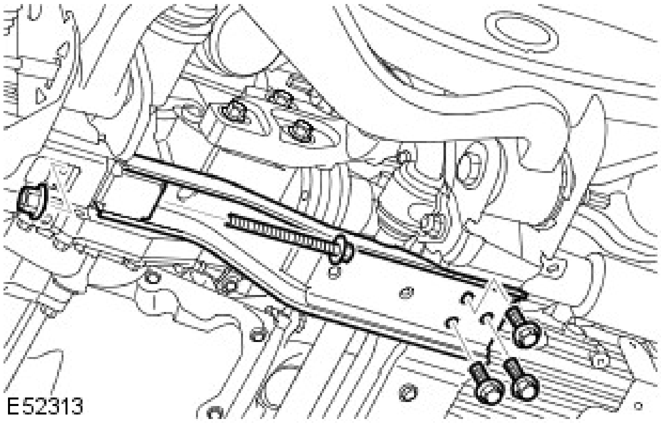


E58429

4. Remove the engine undershield.
   For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

5. Remove the front axle crossmember.

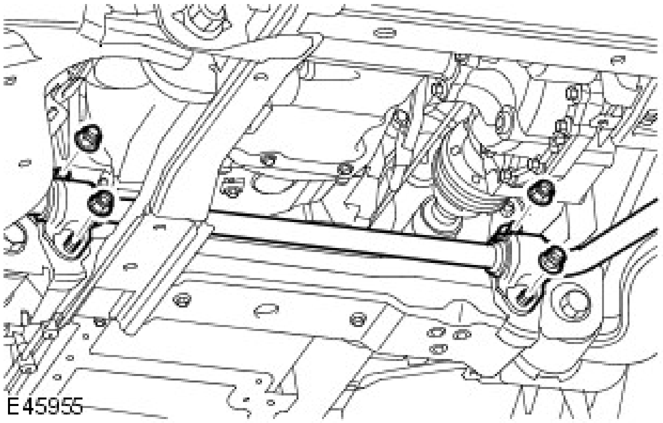
   - Remove the 4 bolts.



E52313

6. Remove the stabilizer bar bushing.

   - Remove the 4 nuts.
   - Remove the stabilizer bar clamps.



7. Remove the stabilizer bar.

- Remove the stabilizer bar out through the LH side wheel arch.

Installation

1. Install the stabilizer bar.

- Install the stabilizer bar through the LH side wheel arch.

2. Install the stabilizer bar bushing.

- Install the stabilizer bar clamps.
- Tighten the nuts to 115 Nm (85 lb.ft).

3. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

4. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

5. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Connect both stabilizer bar links to the stabilizer bar.

- Install new nuts and tighten to 175 Nm (129 lb.ft).

6. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Front Suspension - Front Stabilizer Bar Link

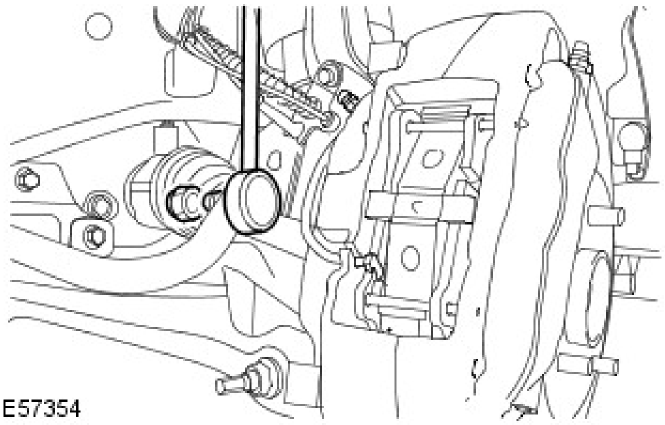
Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the wheel and tire.



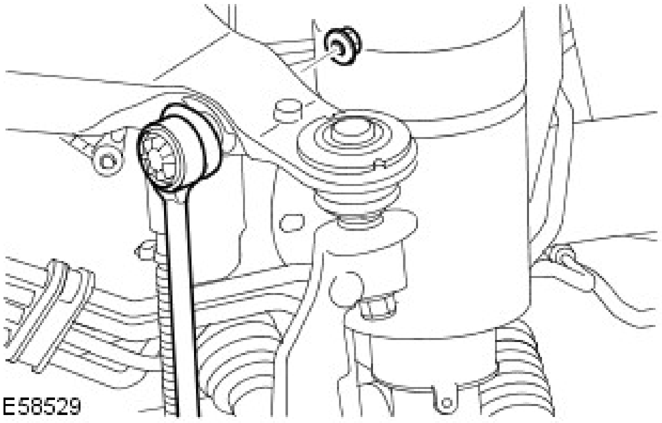
3. CAUTIONS:

   ⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

   ⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

   Release the stabilizer bar link.

   - Remove and discard the nut.



4. CAUTIONS:

   ⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

   ⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

   Remove the stabilizer bar link.

   - Remove and discard the nut.

Installation

Vehicles without Active Stabilization

1. CAUTIONS:

   ⚠ Make sure the hardened steel washers are installed between the stabilizer bar link and the stabilizer bar, and between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

   ⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

   Install the stabilizer bar link.

   - Install new nuts and tighten to 175 Nm (129 lb.ft).

Vehicles with Active Stabilization

2. CAUTIONS:

⚠ Make sure the hardened steel washers are installed between the stabilizer bar link and the stabilizer bar, and between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Install the stabilizer bar link.

- Install new nuts and tighten to 175 Nm (129 lb.ft).

All vehicles

3. Install the wheel and tire.

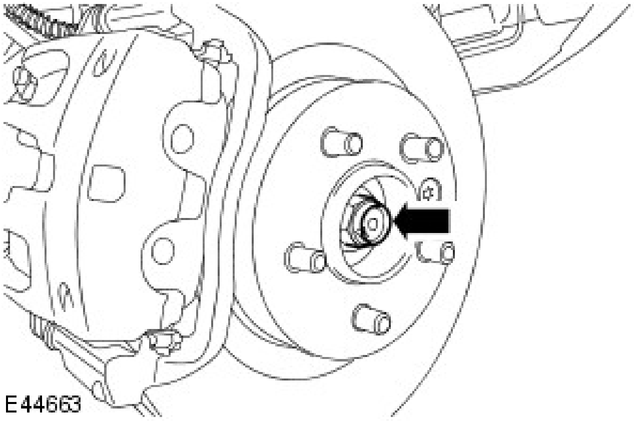
3. Loosen the halfshaft retaining nut.



Vehicles with standard brakes

4. Remove the brake disc.
For additional information, refer to: Brake Disc - Vehicles Without: Brembo Brakes (206-03 Front Disc Brake, Removal and Installation).

Vehicles with high performance brakes

5. Remove the brake disc.
For additional information, refer to: Brake Disc - Vehicles With: Brembo Brakes (206-03 Front Disc Brake, Removal and Installation).

All vehicles

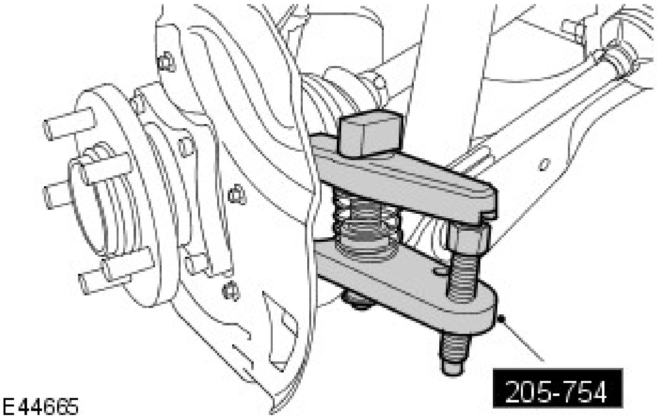
6. Remove the halfshaft retaining nut.

- Discard the nut.

7. Loosen the tie-rod end ball joint retaining nut.

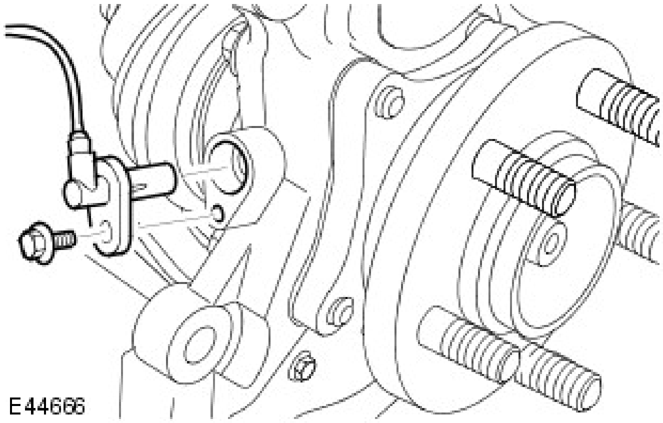
8. Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

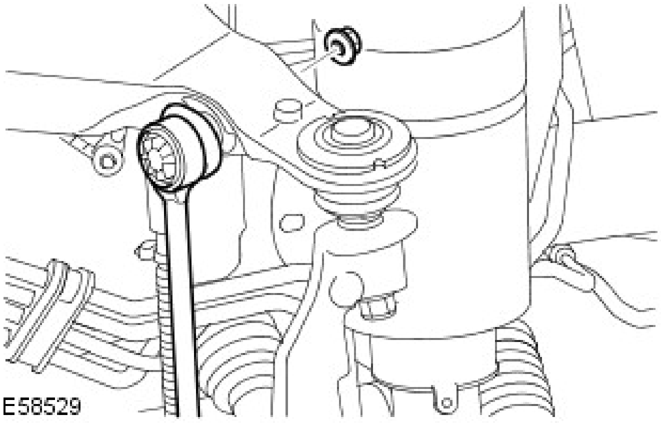
- Discard the nut.



9. Release the wheel speed sensor from the wheel knuckle.

- Remove the bolt.





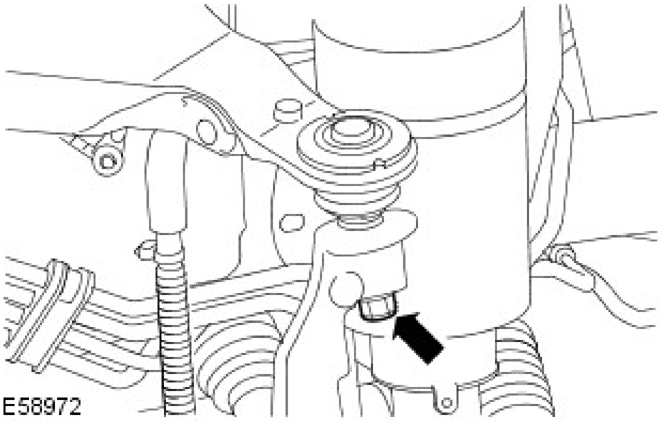
10. CAUTIONS:

⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

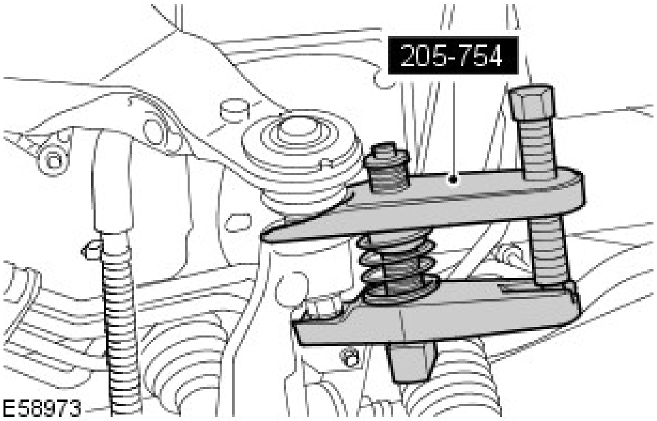
⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

Release the stabilizer bar link.

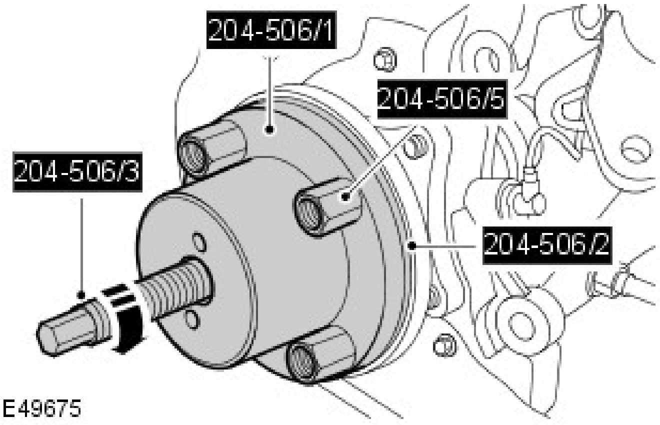
- Discard the nut.



11. Loosen the upper arm retaining nut.



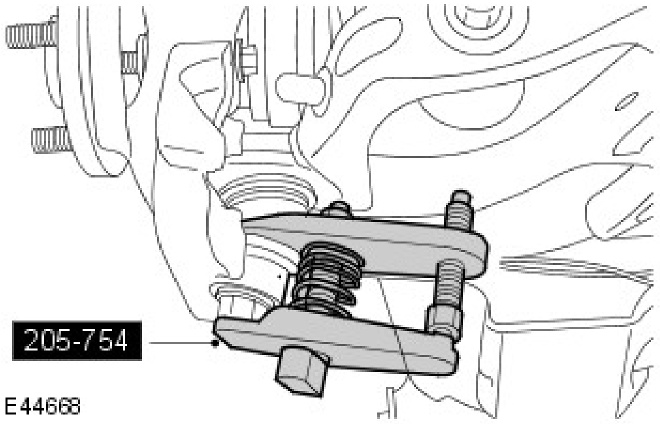
12. Using the special tool, release the upper arm ball joint.



13. ⚠ CAUTION: Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the drive flange.

14. Remove the lower ball joint retaining nut.



15. Using the special tool, release the lower ball joint from the steering knuckle.

16. Remove the upper arm retaining nut.

- Discard the nut.

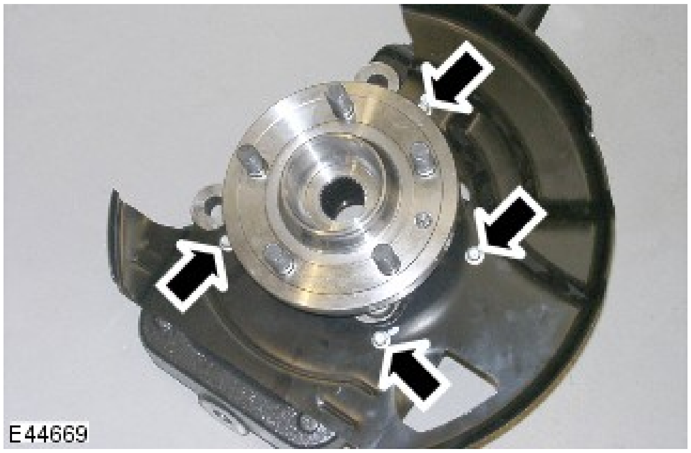
17. ⚠ CAUTION: The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

• NOTE: Do not disassemble further if the component is removed for access only.

Remove the wheel knuckle.

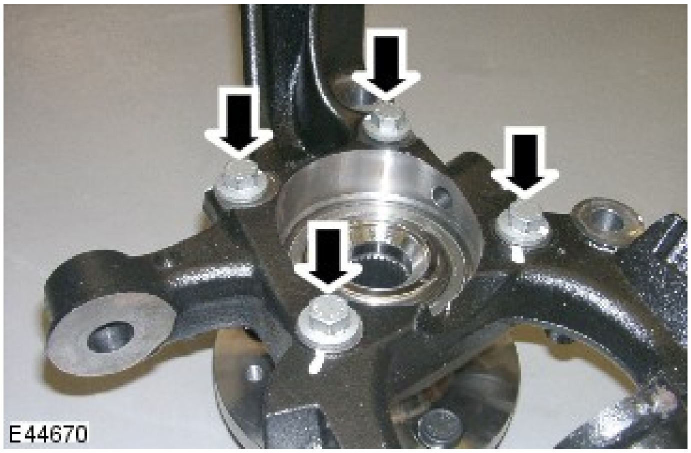
18. Remove the brake disc dust shield.

- Remove the five retaining bolts.



19. Remove the wheel hub.

- Remove the 4 bolts.

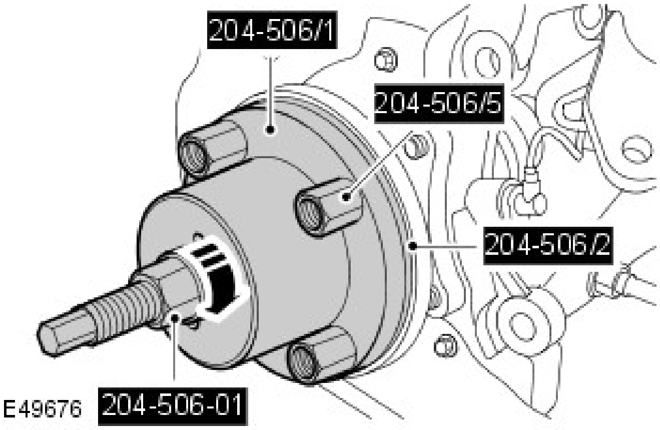


Installation

All vehicles

1. Clean the components.
2. Install the wheel hub.
   - Tighten the 4 bolts to 115 Nm (85 lb.ft).
3. Install the brake disc dust shield.
   - Tighten the 5 bolts to 10 Nm (7 lb.ft).
4. ⚠ CAUTION: The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

   With assistance, install the wheel knuckle.
5. Using the special tools, install the halfshaft in the wheel hub.



6. Connect the upper arm and wheel knuckle.
   - Install a new nut and tighten to 70 Nm (52 lb.ft).

Vehicles without Active Stabilization

7. CAUTIONS:

   ⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Secure the stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

Vehicles with Active Stabilization

8. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Secure the stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

9. Tighten the lower arm ball joint retaining nut to 115 Nm (85 lb.ft).

10. Connect the tie-rod end ball joint.

- Install a new nut and tighten to 76 Nm (56 lb.ft).

11. Install a new halfshaft retaining nut and lightly tighten.

12. Install the wheel speed sensor.

- Tighten the bolt to 10 Nm (7 lb.ft).

Vehicles with standard brakes

13. Install the brake disc.
For additional information, refer to: Brake Disc - Vehicles Without: Brembo Brakes (206-03 Front Disc Brake, Removal and Installation).

Vehicles with high performance brakes

14. Install the brake disc.
For additional information, refer to: Brake Disc - Vehicles With: Brembo Brakes (206-03 Front Disc Brake, Removal and Installation).

All vehicles

15. Tighten the new halfshaft retaining nut to 230Nm (170 lb.ft).

15. ⚠ CAUTION: Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

- Stake the nut to the halfshaft.

16. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

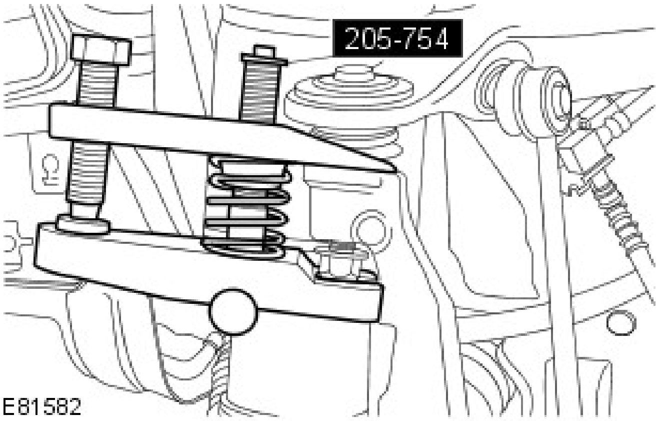
E81581

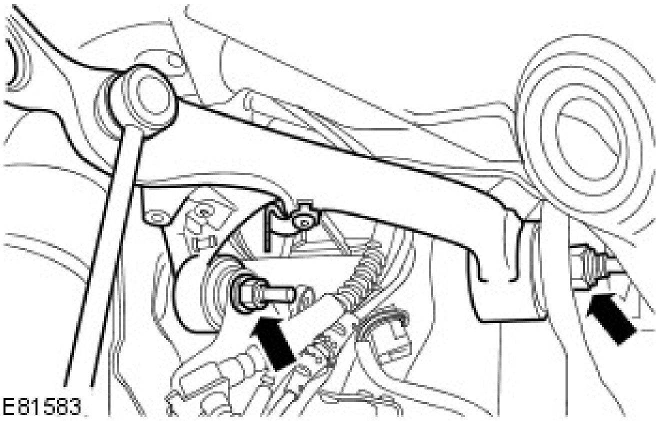
8. ⚠ CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

9. Using the special tool, release the upper arm ball joint.

- Remove and discard the nut.





10. Remove the upper arm.

- Remove and discard the 2 nuts.

Installation

1. Install the upper arm.

- Fit the bolts but do not fully tighten at this stage.
- Install new nuts.

2. Connect the upper arm and wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

3. Secure the stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

4. Connect the height sensor link.

5. Secure the brake hose to the upper arm.

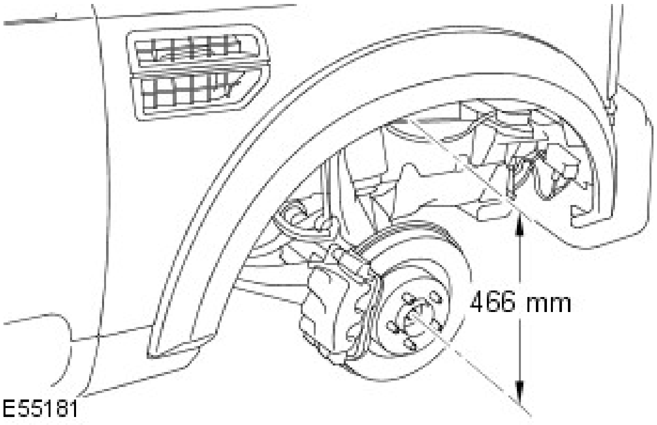
- Tighten the bolt to 23 Nm (17 lb.ft).

6. Secure the wheel speed sensor leads to the upper arm.

7. Install the upper arm and brake line heat shields.

- Install the 3 bolts.
- Install the 3 nuts.

8. Set the height distance between the centre of the halfshaft end and the edge of the fender trim to 466 mm (18.34'').



9. Tighten the 2 upper arm nuts and bolts to 175 Nm (129 lb.ft).

10. Install the wheel and tire.

    - Tighten the wheel nuts to 140 Nm (103 lb.ft).

11. Using the Land Rover approved diagnostic system, calibrate the suspension ride height.
    For additional information, refer to: Ride Height Adjustments (204-05, General Procedures).

Front Suspension - Lower Arm

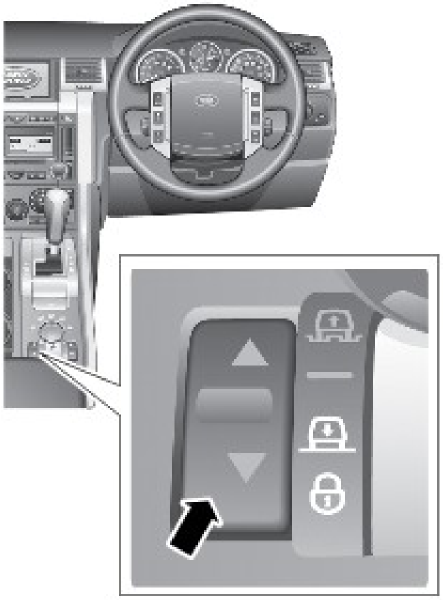
Removal and Installation

Special Tool(s)	
	Ball joint separator 205-754(LRT-54-027)

Removal

All vehicles

1. Place vehicle into access mode.



E99855

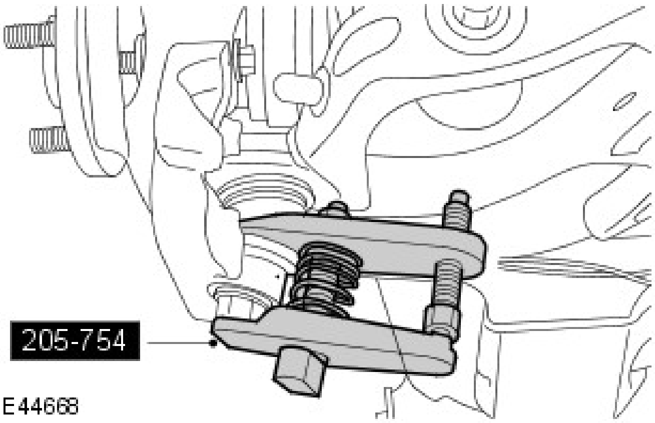
2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

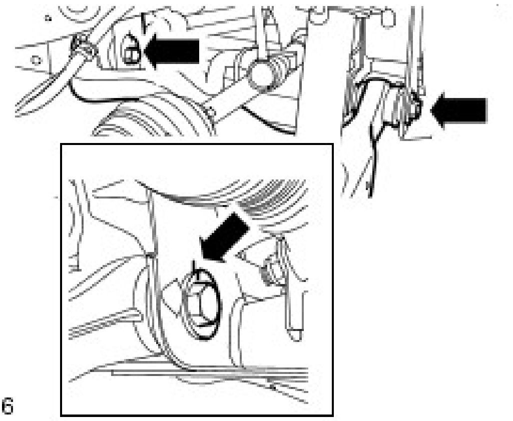
Raise and support the vehicle.

3. Remove the wheel and tire.

4. Remove the lower ball joint retaining nut.

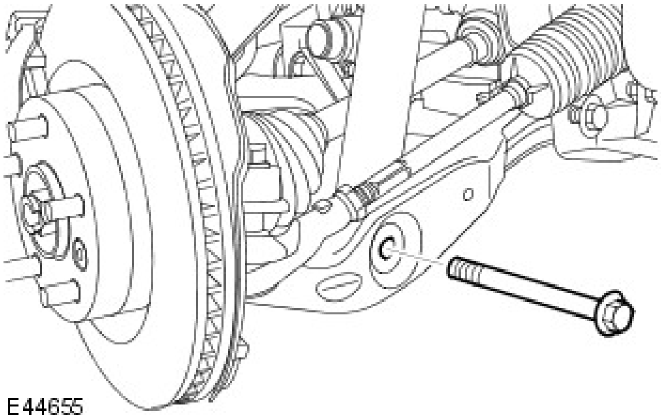
5. Using the special tool, release the lower ball joint from the steering knuckle.





6. Mark the position of the bolts in relation to the chassis brackets.

- Remove the 2 bolts.



7. Disconnect the shock absorber and spring assembly from the lower arm.

- Remove the nut and bolt.

8. ⚠CAUTION: Only displace the wheel knuckle sufficiently outboard to release the lower arm past the undertray. This will prevent the inboard driveshaft joint from separating. Failure to follow this instruction may result in damage to the vehicle.

- NOTE: Make sure the steering is in the straight ahead position.

Remove the lower arm.

- Release the lower arm from the subframe and reposition downwards.
- Rotate the lower arm and position forward to release from the wheel knuckle.

Vehicles with Active Stabilization

9. Position a transmission jack to support the hub assembly.

Installation

Vehicles with Active Stabilization

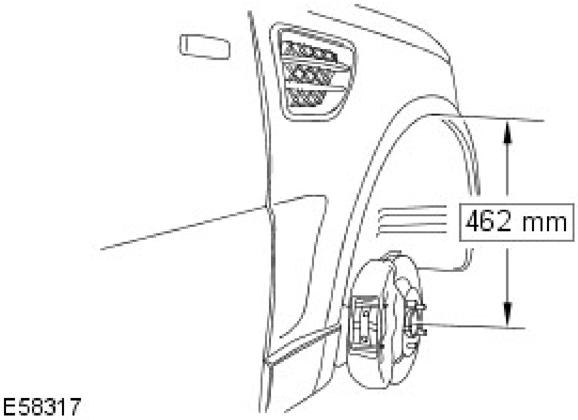
1. Remove the transmission jack.

All vehicles

2. Install the lower arm.
   - Fit the bolts but do not fully tighten at this stage.

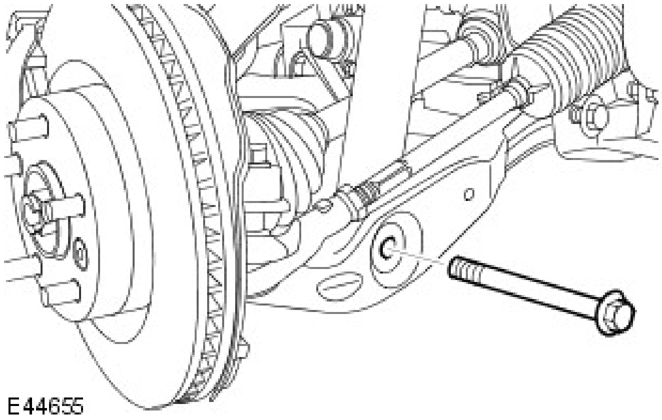
3. ⚠ CAUTION: The lower arm ball joint can be damaged by excessive articulation. Do not over articulate the ball joint. Failure to follow this instruction will result in damage to vehicle.

   Connect the lower arm to the wheel knuckle.
   - Tighten the lower arm ball joint retaining nut to 115 Nm (85 lb.ft).



4. Set the height distance, between the center of the halfshaft end, and the edge of the fender to 462 mm (18.19'').

5. Tighten the lower arm bolts to 275 Nm (203 lb.ft).
   - Align the bolts to the marks made previously.



6. Connect the shock absorber and spring assembly to the lower arm.
   - Tighten the nut and bolt to 300 Nm (221 lb.ft).

7. Install the wheel and tire.
   - Tighten the wheel nuts to 140 Nm (103 lb.ft).

8. Carry out the wheel alignment procedure.

Front Suspension - Upper Arm Bushing

Removal and Installation

Special Tool(s)	
 205-754A E45276	Ball joint separator 205-754 (LRT-54-027)
 204-532/1 E55136	Receiver cup upper arm bushes 204-532/1
 204-532/2 E55137	Remover upper arm bushes 204-532/2
 204-532/3 E55138	Installer upper arm front bush 204-532/3
 204-532/4 E55139	Installer upper arm rear bush 204-532/4

Removal

- NOTE: The bushings must be replaced in pairs, LH and RH sides.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

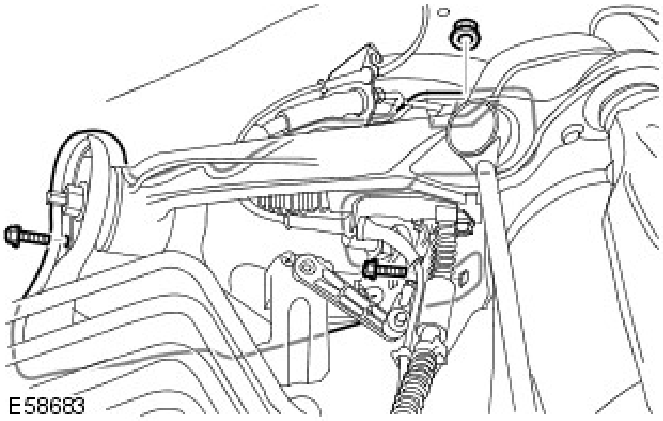
2. Remove the front wheels and tires.

3. Remove the LH upper arm.

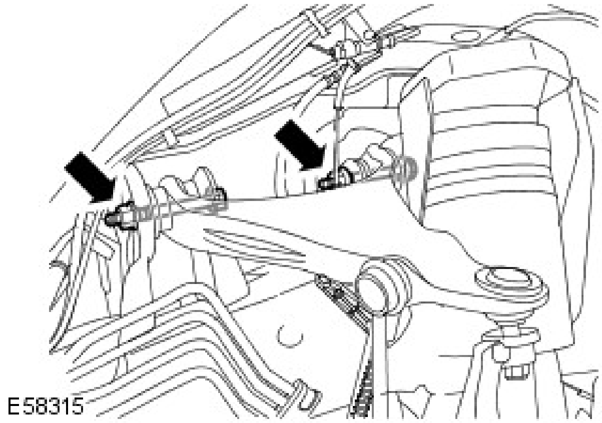
For additional information, refer to: Upper Arm (204-01 Front Suspension, Removal and Installation).

4. Release the heat shield for access to the upper arm bolts.

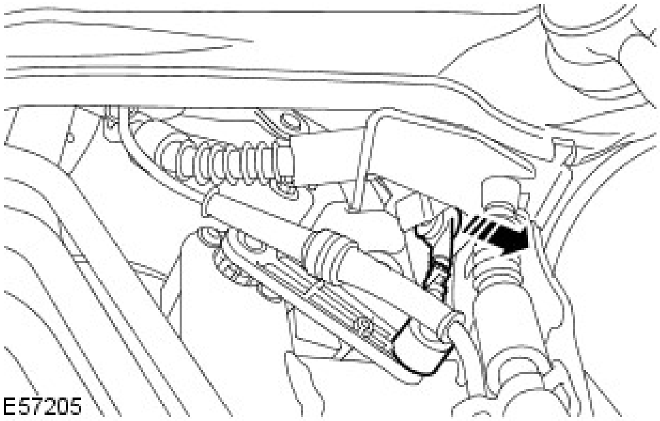
- Remove the retaining nut and two bolts.



5. Loosen the upper arm bolts.



6. Disconnect the height sensor link.



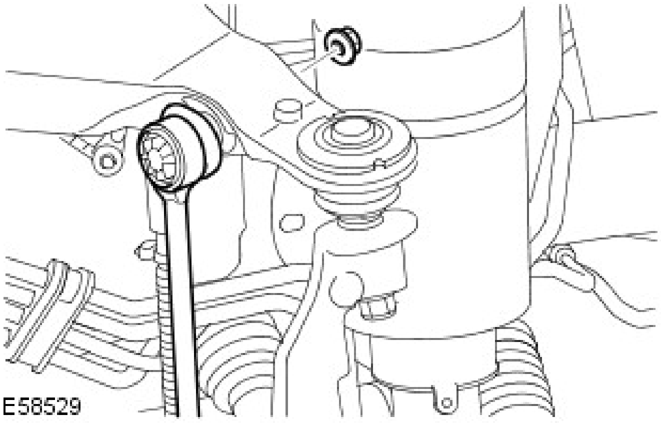
7. CAUTIONS:

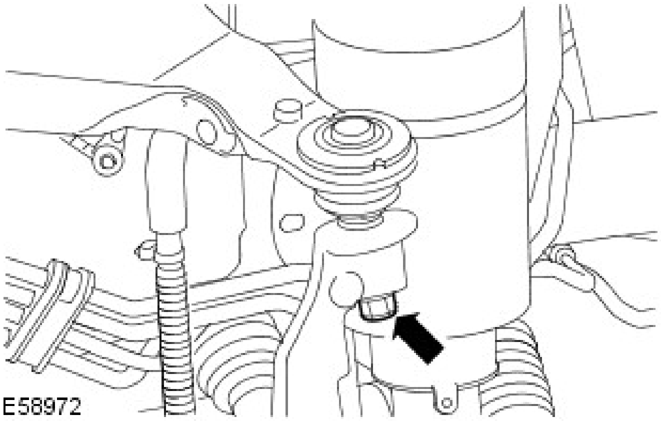
⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

Remove the stabilizer bar link nut.

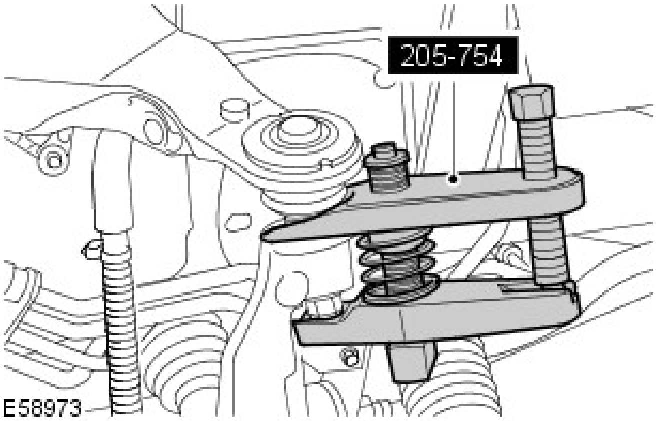
- Discard the nut.





8. ⚠ CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.



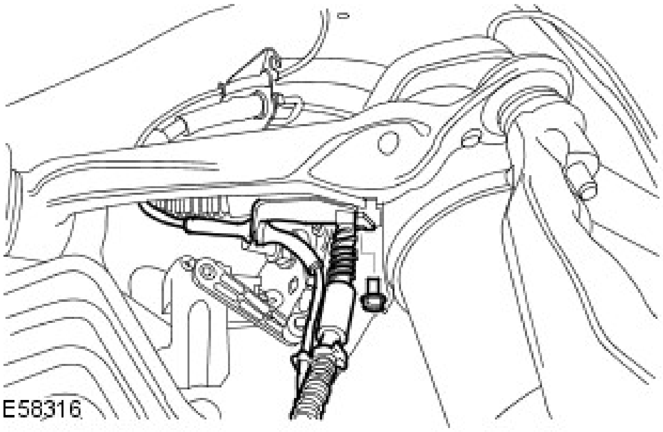
9. Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.

10. Release the brake hose from the upper arm.

11. Release the wheel speed sensor lead from the upper arm.

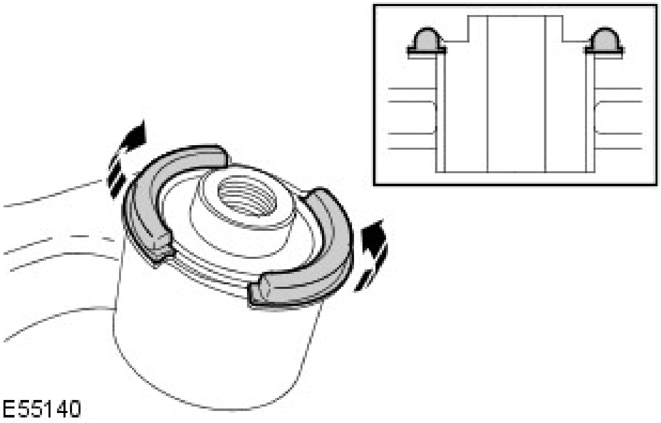
12. Remove the RH upper arm.



13. Note the position of the bushing in relation to the upper arm.

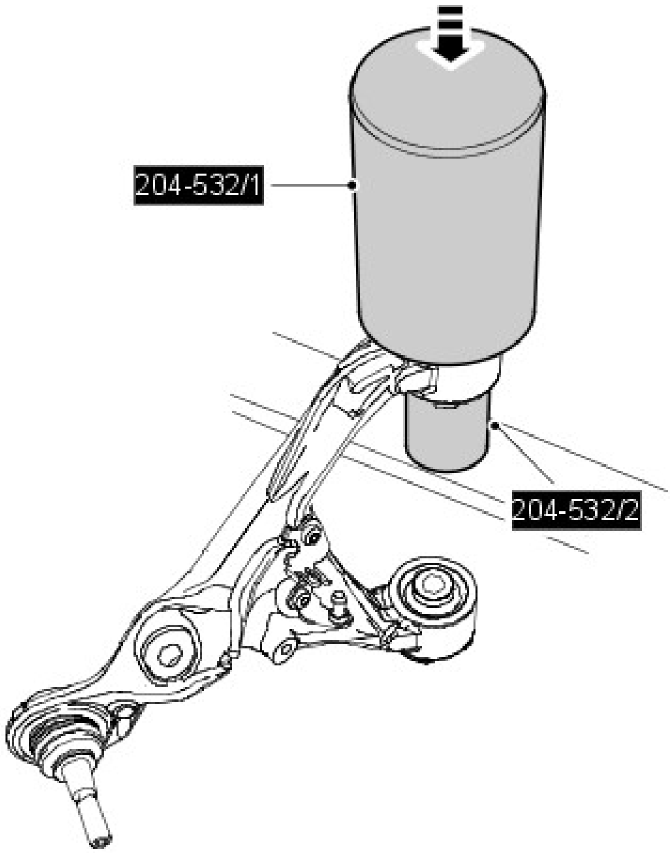
14. CAUTION: The bush flanges need to be removed to allow bush removal.

Using a suitable tool, bend over the bush flanges.



15. Using a hacksaw, remove the flange from the bushing, making sure the upper arm is not damaged.

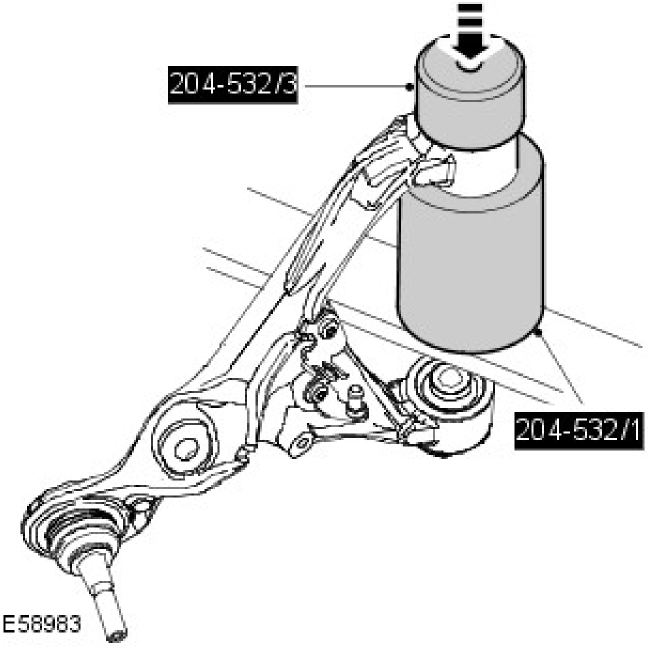
16. Using the special tools, remove and discard the upper arm bushings.



E58982

Installation

All vehicles



E58983

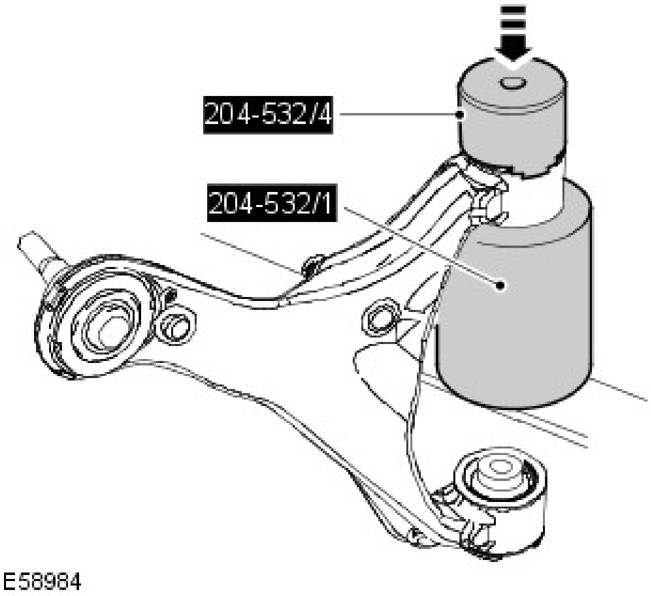
1. ⚠CAUTION: Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the upper arm rear bushings.

- Align the arrow on the bush with the mark, previously made on the upper arm.

2. Using the special tools, install the upper arm front bushings.

- Align the arrow on the bush with the mark, previously made on the upper arm.



3. Install the RH upper arm.

- Fit the bolts but do not fully tighten at this stage.

4. Secure the brake hose to the upper arm.

- Tighten the bolt to 23 Nm (17 lb.ft).

5. Secure the wheel speed sensor lead to the upper arm.

6. Connect the upper arm and wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

Vehicles without Active Stabilization

7. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Secure the stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

Vehicles with Active Stabilization

8. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

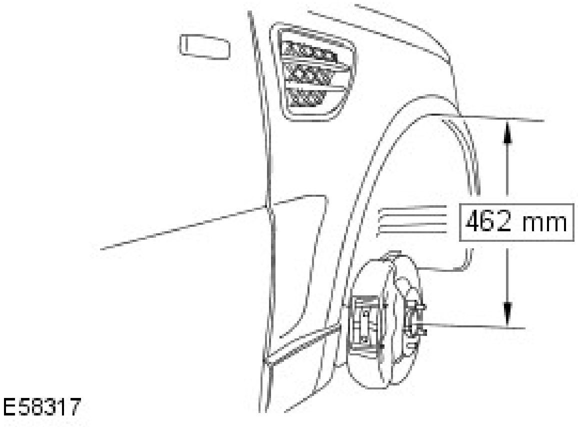
Secure the stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

All vehicles

9. Connect the height sensor link.

10. Set the height distance, between the center of the halfshaft end, and the edge of the fender to 462 mm (18.19'').



11. Tighten the 2 upper arm nuts and bolts to 175 Nm (129 lb.ft).

12. Secure the heat shield.

- Tighten to 10 Nm (7 lb.ft).

13. Install the LH upper arm.
For additional information, refer to: Upper Arm (204-01 Front Suspension, Removal and Installation).

14. Install the front wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

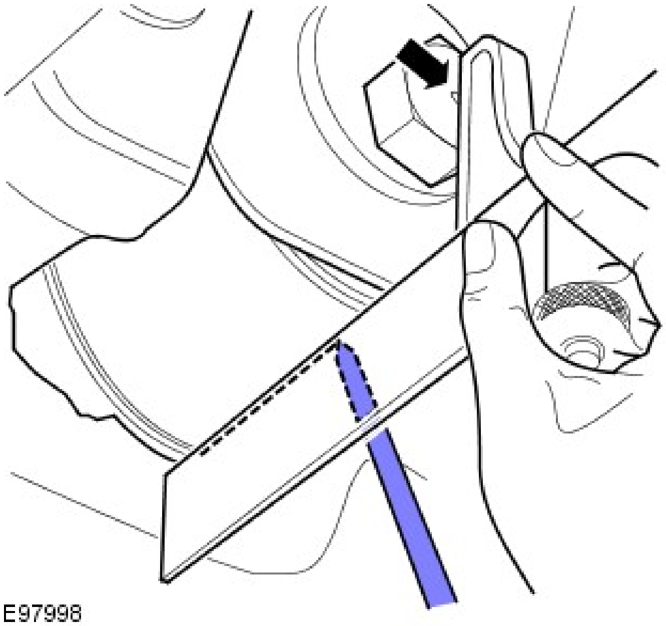
Removal

- NOTE: If installing the front bushes, both front bushes must be replaced.
- NOTE: If installing the rear bushes, both rear bushes must be replaced.
- NOTE: Take note of the fitted position of the bush.

All vehicles

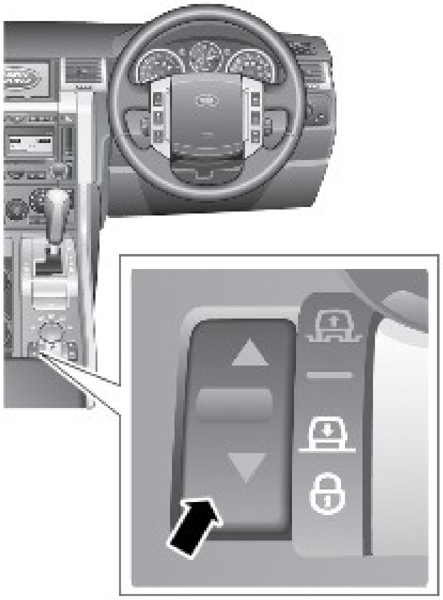
1. Make sure that the tire pressures are correct and that the vehicle is at the correct ride height.



2. Mark the position of the bushing in relation to the lower arm.

1. Using a spirit level type engineers square, align through the center of the bolt head retaining the lower arm rear bush with a perpendicular drop.
2. Align the rule of the engineers square along the lowest point on the circumference of the lower arm rear bush boss.
3. Apply a piece of tape to the arm and mark a horizontal line along the underside of the lower arm rear bush boss (parallel with the bush axis).
4. Make sure that the process is carried out on both right-hand side and left-hand side.

3. Place vehicle into access mode.



E99855

4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

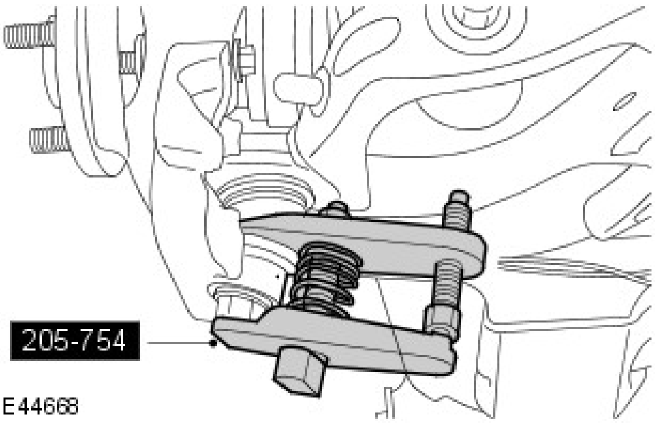
Raise and support the vehicle.

5. Remove the RH lower arm.
For additional information, refer to: Lower Arm (204-01 Front Suspension, Removal and Installation).

6. Remove the wheel and tire.

7. Remove the lower ball joint retaining nut.

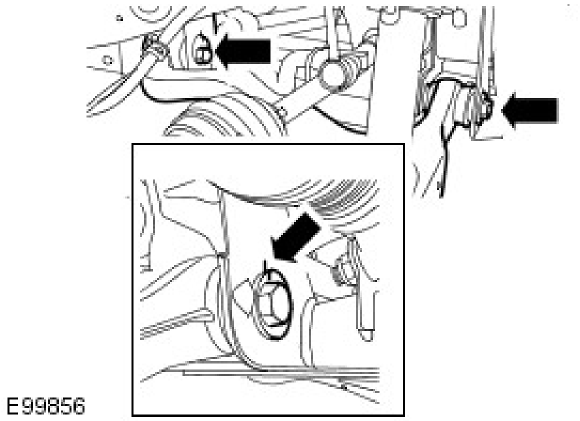
8. Using the special tool, release the lower ball joint from the steering knuckle.



E44668

9. Mark the position of the bolts in relation to the chassis brackets.

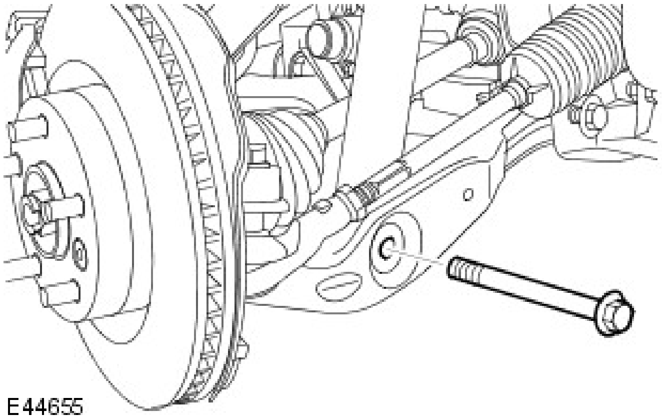
- Remove the 2 bolts.



E99856

10. Disconnect the shock absorber and spring assembly from the lower arm.

- Remove the nut and bolt.



E44655

11. Remove the lower arm.

- Release the lower arm from the subframe and reposition downwards.
- Rotate the lower arm and position forward to release from the wheel knuckle.

Vehicles with Active Stabilization

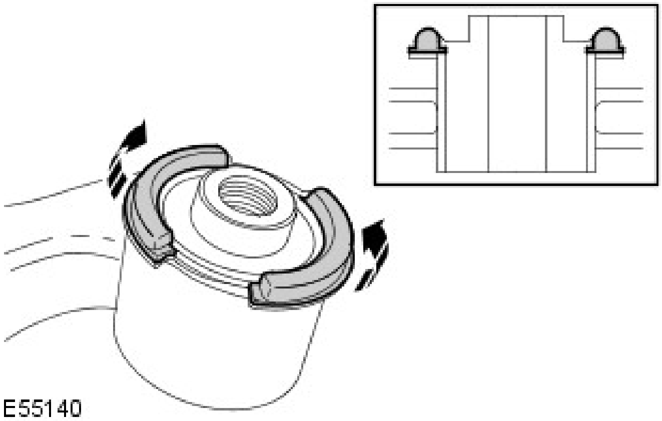
12. Position a transmission jack to support the hub assembly.

All vehicles

13. Note the position of the bushing in relation to the lower arm.

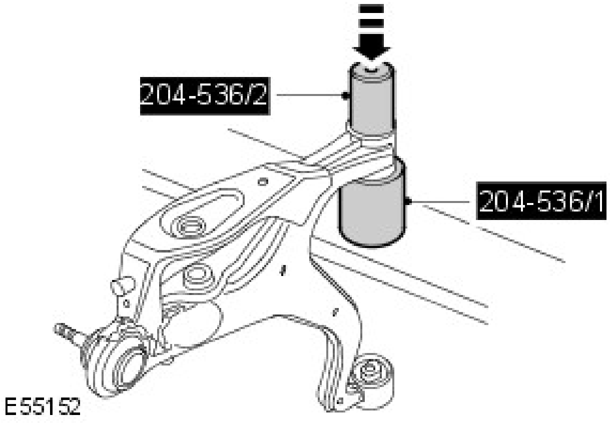
14. ⚠CAUTION: The bush flanges need to be removed to allow bush removal.

Remove the lower arm front bushing flanges.



E55140

15. Using the special tools, remove and discard the lower arm front bushings.



204-536/2
204-536/1
E55152

16. Apply alignment guide lines to installer tool (204-535/3).

    1. Mark center line on installer tool.
    2. Mark line across top surface 3 degrees to the left of center line.
    3. Mark 'LH' on top surface.
    4. Mark line across bottom surface 3 degrees to the left of the center line.
    5. Mark 'RH' on bottom surface.

Using the special tools, install the lower arm front bushings

Vehicles with Active Stabilization

4. Remove the transmission jack.

All vehicles

5. Install the lower arm.

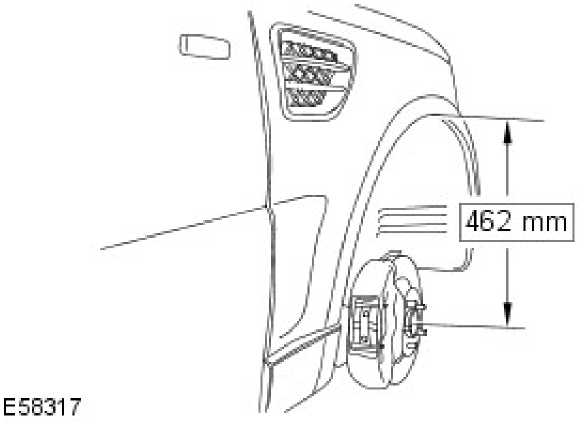
- Fit the bolts but do not fully tighten at this stage.

6. NOTE: The lower arm ball joint can be damaged by excessive articulation. Failure to follow this instruction will result in damage to vehicle.

Connect the lower arm to the wheel knuckle.

- Tighten the lower arm ball joint retaining nut to 115 Nm (85 lb.ft).

7. Set the height distance, between the center of the halfshaft end, and the edge of the fender to 462 mm (18.19'').

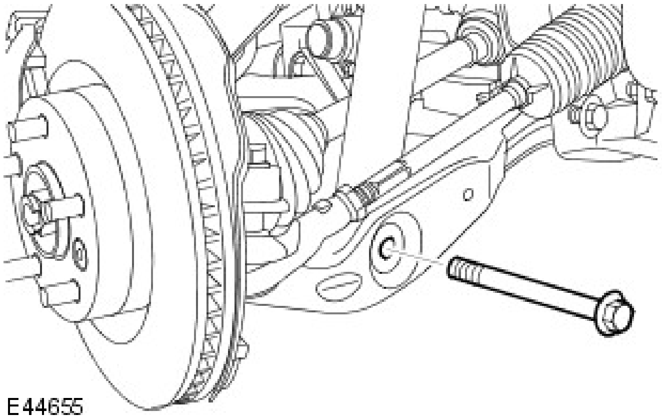


8. Tighten the lower arm bolts to 275 Nm (203 lb.ft).

- Align the bolts to the marks made previously.

9. Connect the shock absorber and spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).



10. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

11. Install the RH lower arm.
For additional information, refer to: Lower Arm (204-01 Front Suspension, Removal and Installation).

12. Carry out the wheel alignment procedure.

GENERAL

The independent rear suspension offers a reduction in unsprung weight over the beam axle design. The rear suspension comprises an upper arm, a lower arm, a wheel knuckle and wheel hub, two air spring damper modules and a stabilizer bar and links assembly.

The rear suspension arms have been designed to give maximum ground clearance. The suspension geometery can be adjusted for camber using a cam bolt and toe and bump steer adjustment can be corrected via an adjustable transverse link.

AIR SUSPENSION DAMPER MODULE

18	-	Top mount assembly
19	-	Bush
20	-	Voss connector

- NOTE: * Shows service items

The damper module comprises an air spring assembly, top mount and a damper assembly. The damper and air spring are only serviceable as complete assemblies.

Damper

The damper assembly is a mono tube design with an air spring. The lower end of the damper is fitted with a bush and is attached to the lower arm with a bolt and nut.

The damper functions by restricting the flow of hydraulic fluid through internal galleries within the damper. The damper rod moves axially within the damper, its movement limited by the flow of fluid through the galleries, providing damping of undulations in the terrain. The damper rod is sealed at its exit point from the damper body to maintain the fluid within the unit and to prevent the ingress of dirt and moisture. The seal also incorporates a wiper to keep the rod clean.

Air Spring

The air spring is similar in design to the air spring used on the front suspension.

The air spring comprises an aluminium restraining cylinder, top mount, spring aid, air sleeve and an inner support sleeve.

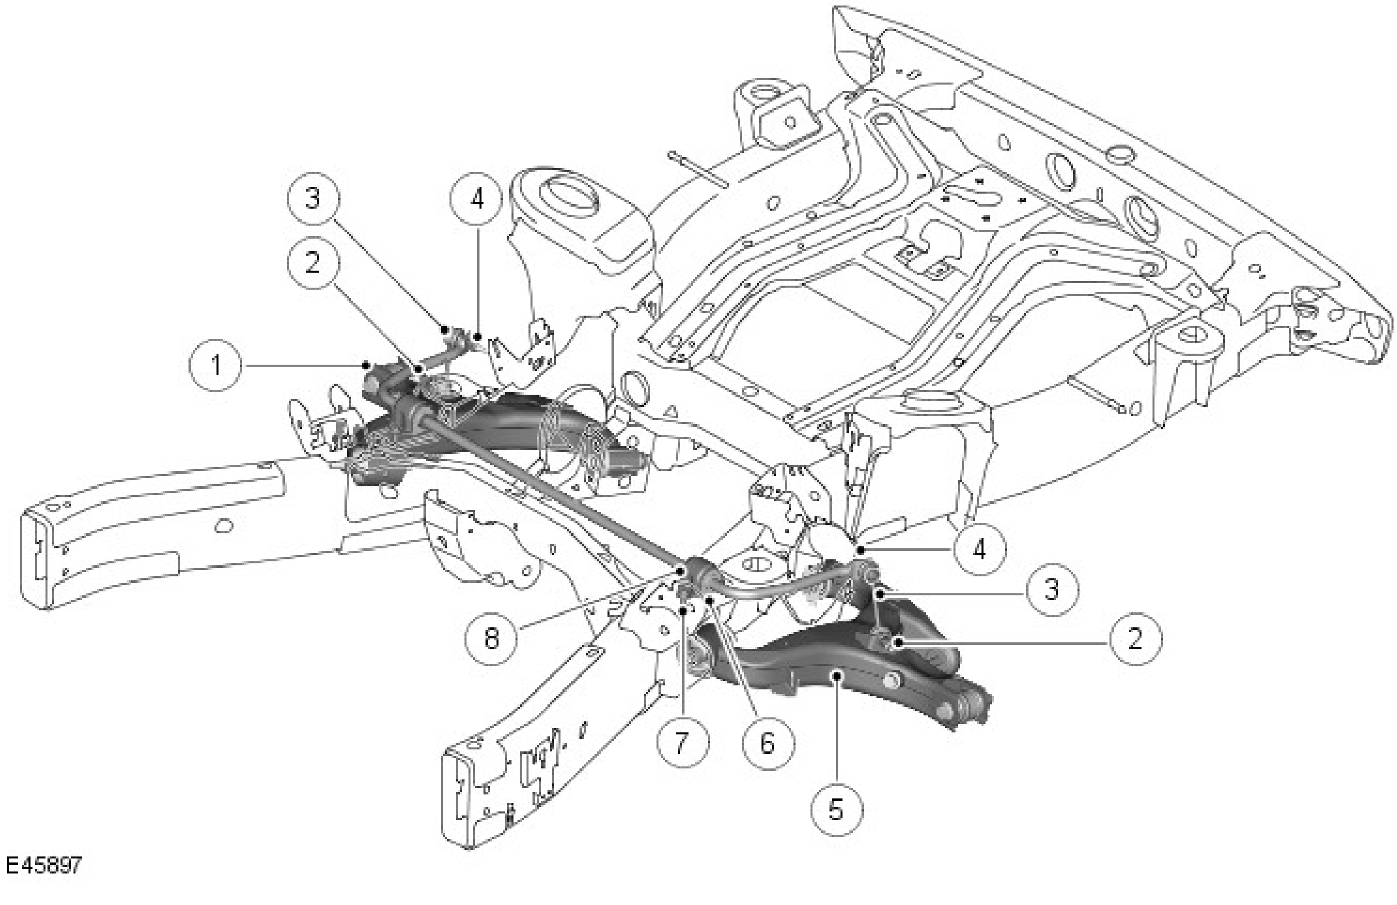
The air sleeve is made from a flexible rubber material which allows the sleeve to roll up and down the air spring piston as the vehicle changes height. The air sleeve is attached to the restraining cylinder and the support sleeve with crimp rings which provide an air tight seal. The support sleeve contains a seal carrier which has two O-rings sealing the support sleeve and two O-rings sealing to the damper body. The top of the air sleeve is crimped to the top mount which attaches to a mounting on the chassis with 3 integral studs and self-locking nuts.

A spring aid is fitted to the damper rod and prevents the top mount contacting the top of the damper during full suspension compression and assists the suspension tune. The lower end of the air spring is located over the damper body and seats on a fabricated seat on the damper body. The air sleeve is positively attached to the seat with a retaining pin. The damper rod is located through a central hole in the top mount. The rod is threaded at its outer end and accepts a self-locking nut which secures the air spring to the damper rod.

The top mount is an integral part of the air spring. A bump washer is located between the top mount plate and the damper rod. A self locking nut secures the damper rod to the top mount. The top mount attaches to a housing on the chassis with 3 integral studs and self-locking nuts. The top mount also incorporates a 6 mm Voss air fitting which allows for the attachment of the air harness.

The air spring is fitted with two gaitors. The upper gaitor is fitted between the top mount and the air spring restraining cylinder. The lower gaitor is secured to the lower end of the restraining cylinder and the damper body with metal straps. The gaitors prevent dirt and debris becoming trapped between the air sleeve and the restraining cylinder.

STABILIZER BAR



Item	Part Number	Description
1	-	RH lower arm

2	-	Nut - link to lower arm (2 off)
3	-	Link (2 off)
4	-	Nut - link to stabilizer bar (2 off)
5	-	LH lower arm
6	-	Bush (2 off)
7	-	Bolt (4 off)
8	-	Bracket (2 off)

Vehicles without the Dynamic Response stabilizer bar system use a conventional stabilizer bar. The Dynamic Response system is detailed in a separate section.
For additional information, refer to: Active Stabilization System (204-06 Ride and Handling Optimization, Description and Operation).

The stabilizer bar is fabricated from heat treated, 23 mm diameter solid, spring steel bar. The stabilizer bar operates, via a pair of links, from their attachment to the lower arm.

The stabilizer bar is located on the upper face of a combined body mount and stabilizer bar bracket which is welded to each chassis side member. The stabilizer bar is attached to the brackets with two, Teflon lined bushes. The bushes are fitted with brackets, which are pressed onto the bushes and secured to the chassis brackets with bolts.

The stabilizer bar has crimped, 'anti-shuffle' collars pressed into position on the inside edges of the bushes. The collars prevent sideways movement of the stabilizer bar.

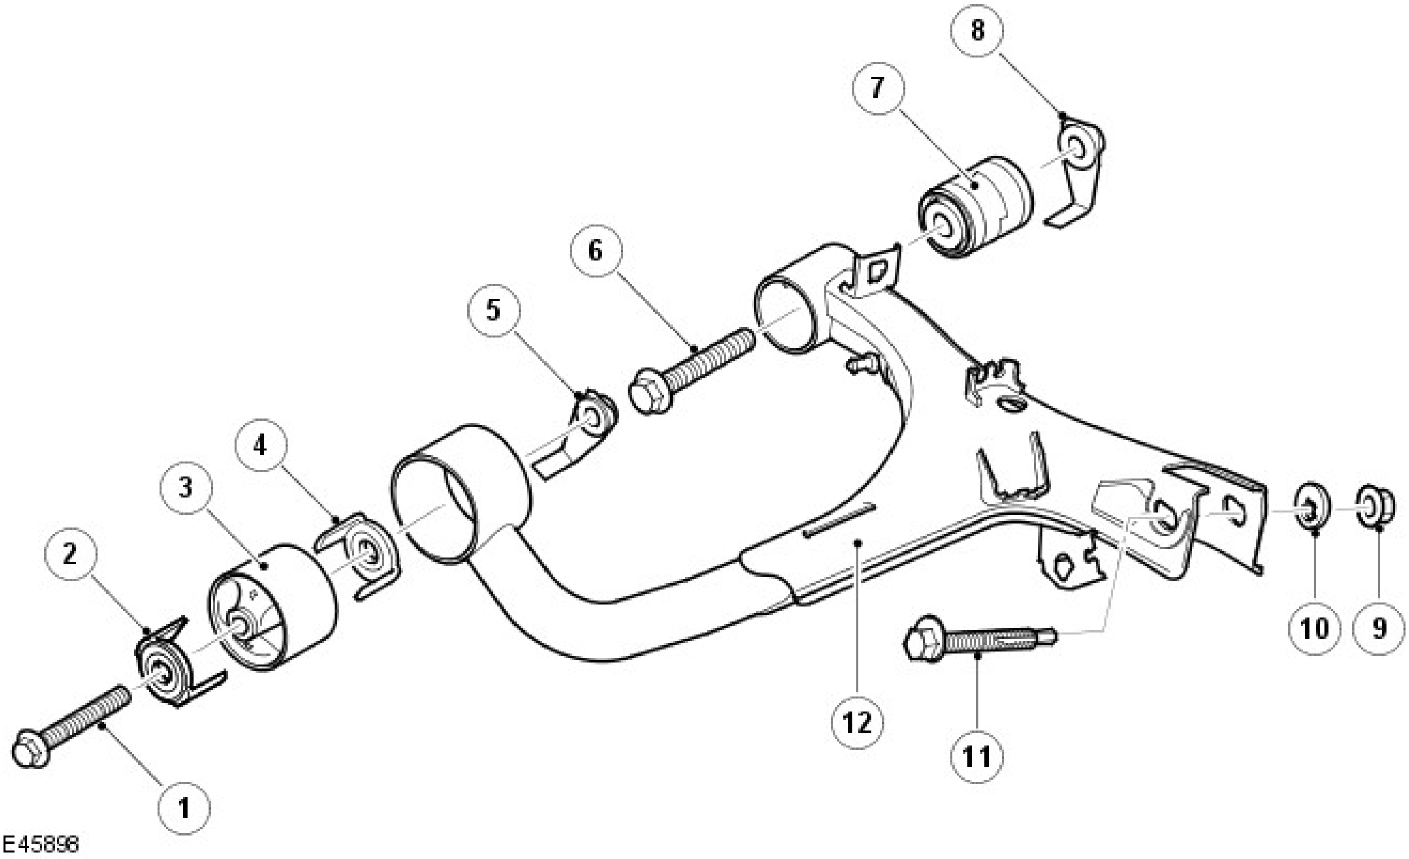
The ends of the stabilizer bar are attached to the lower arms via links. These allow the stabilizer bar to move with the wheel travel providing maximum effectiveness.

The rear stabilizer links are unique to vehicles with a passive (non-Dynamic Response) stabilizer bar. The passive (non-Dynamic Response) links can be identified by a white colored plastic bearing moulding. The Dynamic Response rear links are identified by a grey color plastic bearing moulding.

Each link has a ball joint at each end. The top ball joint is attached to the link at 90 degrees to the link axis. The ball joint is located in a hole in the end of the stabilizer bar and secured with a self locking nut.

The bottom ball joint is also attached to the link at 90 degrees to the link axis. The ball joint is located a hole in a bracket on the lower arm and secured with a self-locking nut. The links are not handed and therefore can be fitted to either side of the stabilizer bar.

UPPER ARM

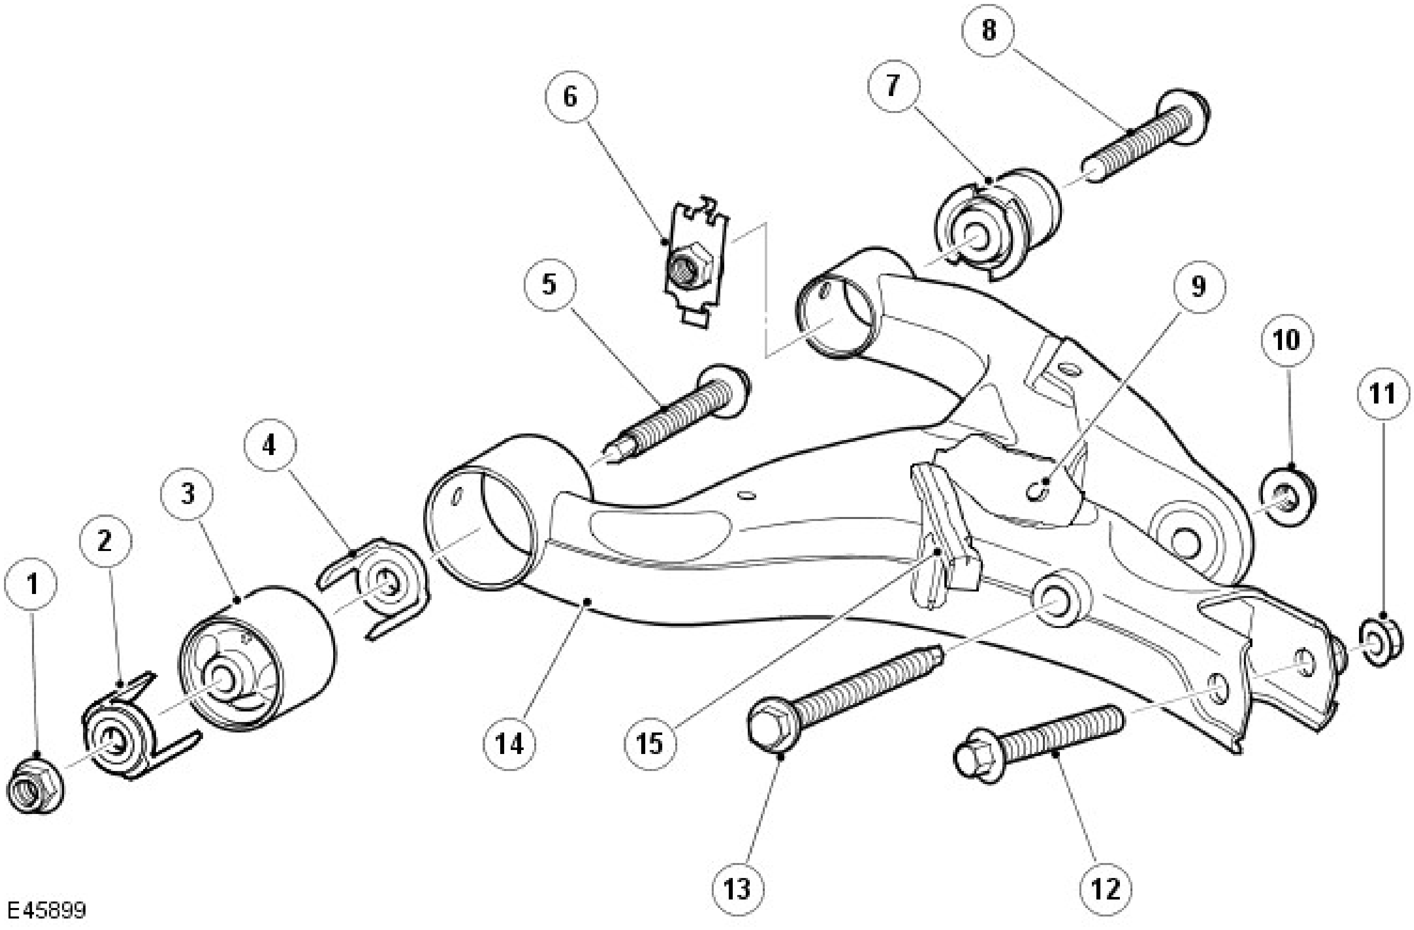


Item	Part Number	Description
1	-	Bolt
2	-	Bumpstop clip
3	-	Forward bush
4	-	Bumpstop clip
5	-	Caged nut
6	-	Bolt
7	-	Rearward bush
8	-	Caged nut
9	-	Self-locking nut - upper knuckle ball joint
10	-	Eccentric washer - upper knuckle ball joint
11	-	Cam bolt - upper knuckle ball joint
12	-	Upper arm

The upper arm locates in brackets on the upper surface of each chassis side member. The upper arm assembly comprises the upper arm and two bushes. The upper arm is a pressed steel fabrication. Its outer end has two brackets with slotted holes which locate the upper ball joint of the knuckle. The ball joint is secured in the upper arm with a cam bolt, eccentric washer and a self-locking nut. The cam bolt and the eccentric washer allow for the adjustment of the wheel camber.

Two fabricated tubular housings provide the location for the forward and rearward bushes. The bushes, which are pressed into the housings, locate between brackets on the chassis side members and are secured with bolts and caged nuts through metal inserts in the centre of the bushes.

LOWER ARM



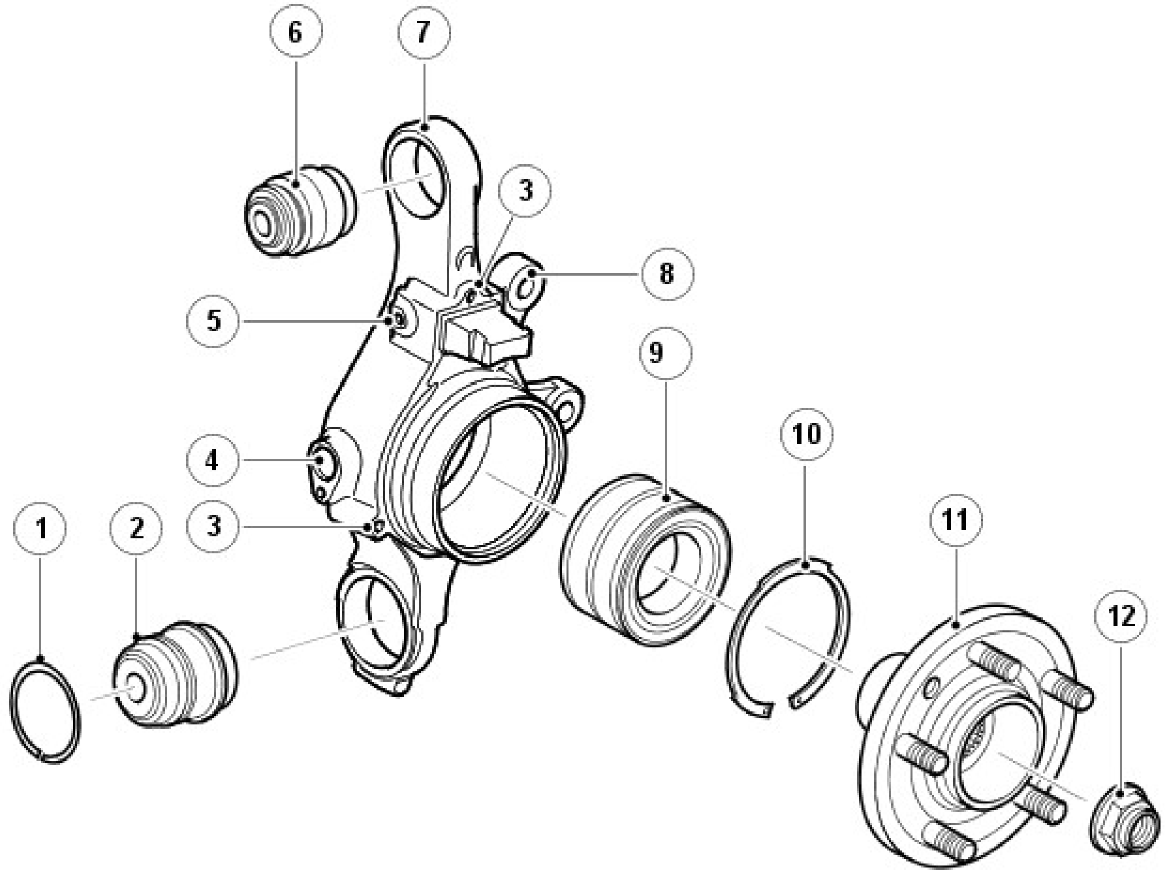
Item	Part Number	Description
1	-	Self-locking nut
2	-	Bumpstop clip
3	-	Forward bush
4	-	Bumpstop clip
5	-	Bolt
6	-	Nut and retainer
7	-	Rearward bush
8	-	Bolt
9	-	Stabilizer bar link bracket
10	-	Self-locking nut - damper lower attachment
11	-	Self-locking nut - knuckle lower ball joint attachment
12	-	Bolt - knuckle lower ball joint attachment
13	-	Bolt - damper lower attachment
14	-	Lower arm

The lower arm locates in brackets on the lower surface of each chassis side member. The lower arm assembly comprises the lower arm and two bushes. The lower arm is a pressed steel fabrication. Its outer end has two brackets which locate the lower ball joint of the knuckle. The ball joint is secured with a bolt and self-locking nut. The lower control arm also provides for the attachment of the damper bush which is secured with a bolt and a self-locking nut.

A bracket, welded to the upper surface of the lower arm, allows for the attachment of the bottom ball joint of the stabilizer bar link. The ball joint is secured to the bracket with a self-locking nut.

Two fabricated tubular housings provide the location for the forward and rearward bushes. The bushes, which are pressed into the housings, locate between brackets on the chassis side members. The forward bush is secured to the chassis bracket with a bolt and self-locking nut. The rearward bush is secured to the chassis bracket with a bolt and a nut with retainer. The nut and retainer allows for easy installation or removal of the bolt by removing the requirement to hold the self-locking nut when installing or removing the bolt.

WHEEL KNUCKLE, WHEEL HUB AND BEARING ASSEMBLY



E45900

Item	Part Number	Description
1	-	Circlip - lower ball joint
2	-	Ball joint - lower
3	-	Park brake assembly attachment holes
4	-	Wheel speed sensor location
5	-	Wheel speed sensor cable bracket attachment
6	-	Ball joint - upper
7	-	Knuckle
8	-	Brake caliper attachment holes
9	-	Wheel bearing
10	-	Circlip - wheel bearing retention
11	-	Wheel hub
12	-	Nut - halfshaft

The wheel knuckle is a machined forging which is located between the upper and lower arms. The knuckle is fitted with two ball joints which are pressed into the knuckle, with the lower ball joint being secured with a circlip. The ball joints are positioned between brackets on the upper and lower arms and secured to the arms with a bolt and self-locking nut.

The wheel knuckle provides the location for the rear wheel taper roller bearing, which is pressed into a machined bore and retained with a circlip. The wheel bearing is a serviceable item. The knuckle has a machined bore which provides the location for the wheel speed sensor. Four threaded holes allow for the attachment of the park brake assembly. A cast boss on the knuckle provides positive location for the park brake assembly. Two bosses on the knuckle casting provide the attachment points for the rear brake caliper.

The wheel hub is a machined casting which is pressed into the wheel bearing in the knuckle. The hub has a splined centre bore which mates with corresponding splines on the halfshaft. Five M14 studs are pressed into the wheel hub and provide for the attachment of the road wheel with wheel nuts. Rotation of the halfshaft is passed, via the splines, to the wheel hub which rotates on the taper roller bearing.

Removal and Installation

Special Tool(s)	
 204-509/10 E49584	Rear wheel bearing remover/installer 204-509/10 (LRT-60-033/10)
 205-802/1 E49579	Rear wheel bearing remover/installer 205-802/1
 205-802/2 E49580	Rear wheel bearing remover/installer 205-802/2
 205-802/3 E49581	Rear wheel bearing remover/installer 205-802/3
 205-802/4 E49582	Rear wheel bearing remover/installer 205-802/4
 205-802/5 E49583	Rear wheel bearing remover/installer 205-802/5

Removal

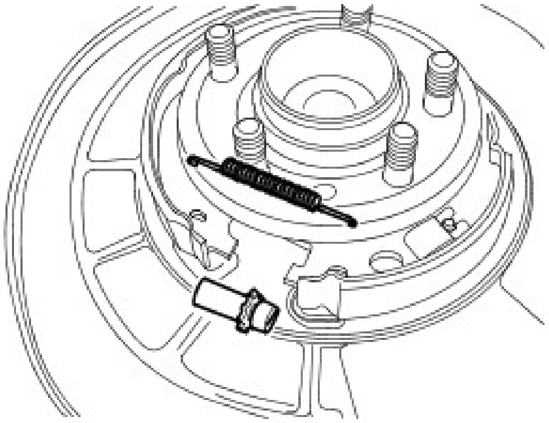
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. Remove the wheel knuckle.
For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).

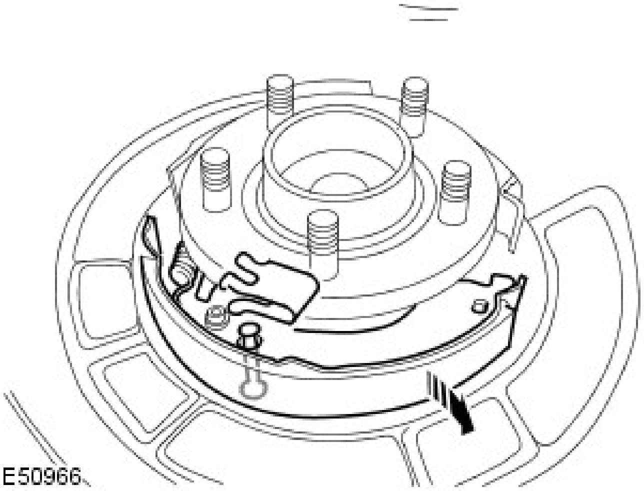
4. Remove the adjuster and return spring.



E50965

5. Remove the primary brake shoe.

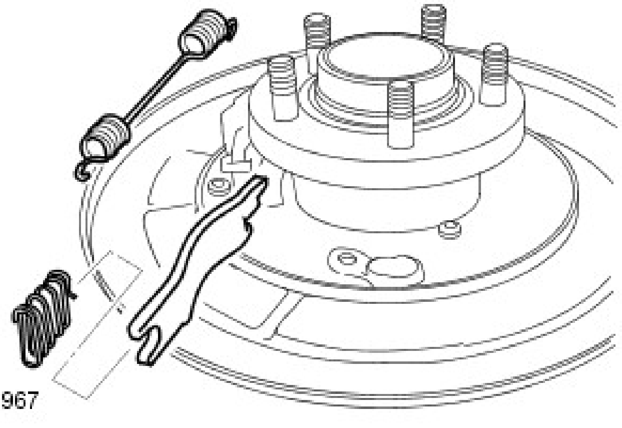
- Remove the hold-down spring and retaining pin.
- Pivot the shoe to release it from the spreader plate and return spring.



E50966

6. Remove the spreader plate and spring.

7. Remove the return spring.

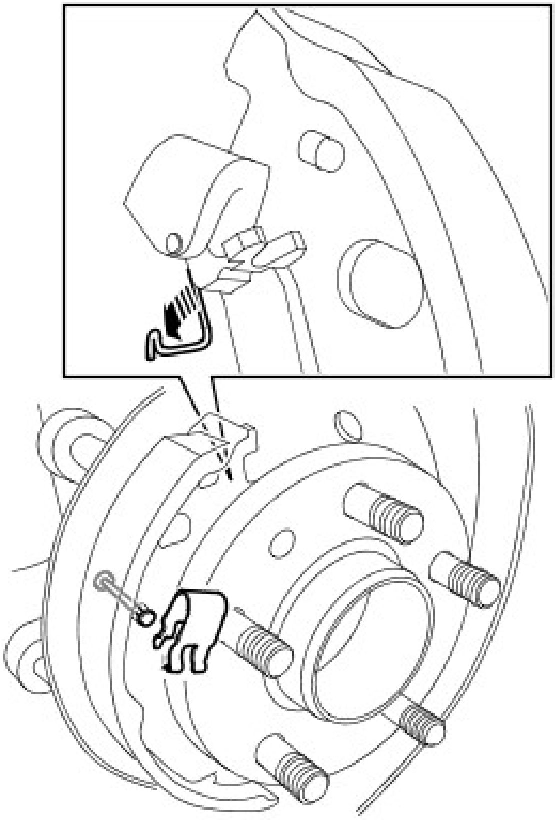


E50967

8. Remove the secondary brake shoe.

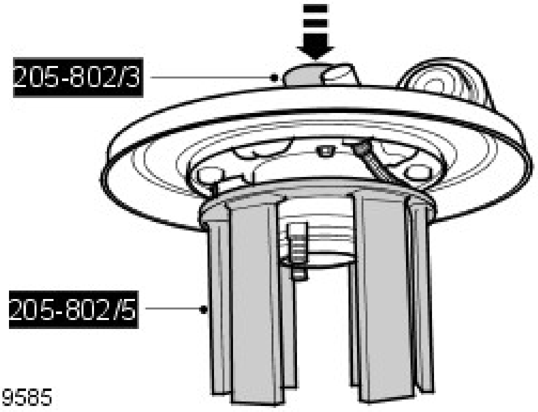
- Remove the hold-down spring and retaining pin.

- Disconnect the parking brake cable retaining spring from the brake shoe lever.



E50181

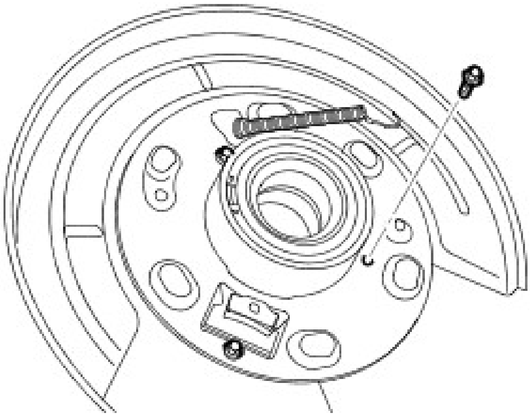
9. Using the special tools, remove the drive flange.



E49585

10. Remove the brake disc dust shield.

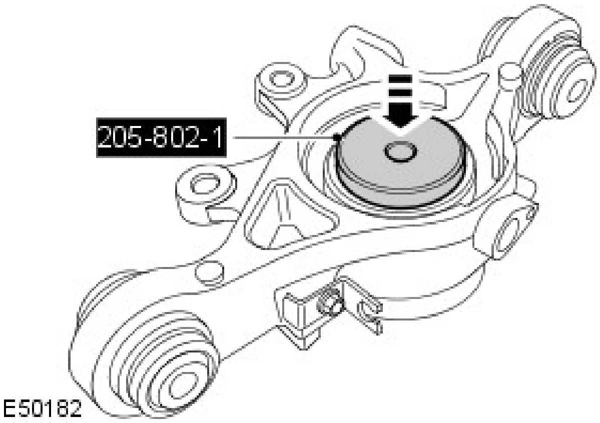
- Remove the 3 screws.



E49586

11. Using the special tools, remove the wheel bearing.

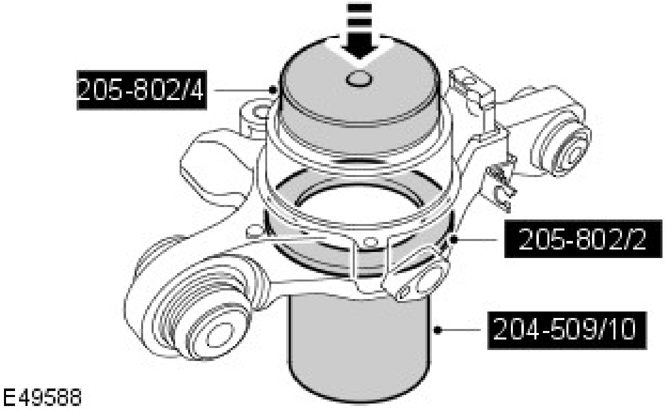
- Remove the circlip.



205-802-1
E50182

Installation

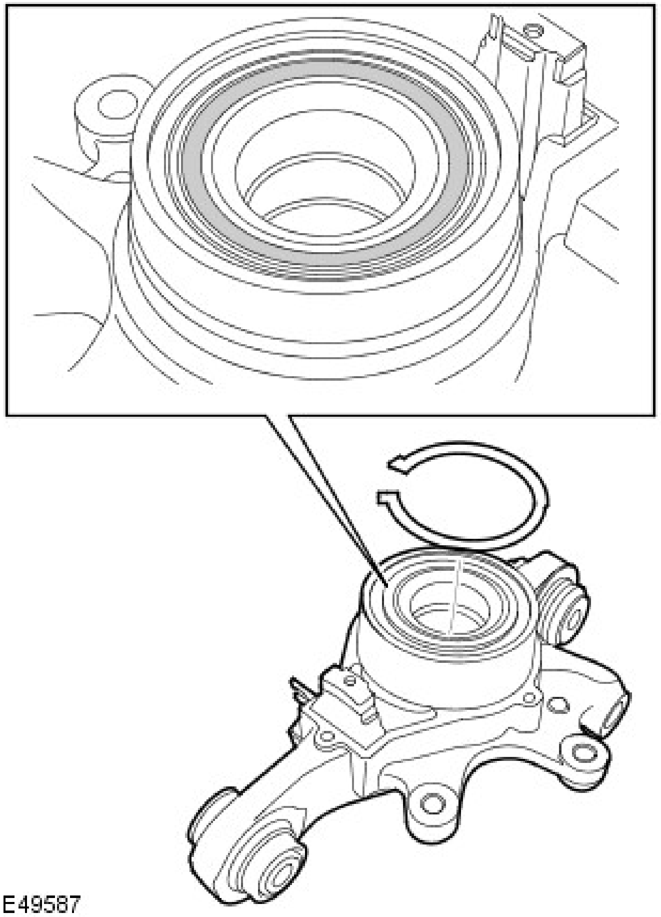
1. Clean the components.
2. Using the special tools, install the wheel bearing.



205-802/4
205-802/2
204-509/10
E49588

3. ⚠ CAUTION: Make sure that the bearing seal is not damaged when installing the circlip.

Install the circlip.



4. Install the brake disc dust shield.

- Tighten the bolts to 9 Nm (7 lb.ft).

5. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the backing plate and apply grease to the brake shoe contacts.

6. Clean the adjuster and set it to its minimum extension.

7. Install the secondary brake shoe.

- Connect the parking brake cable retaining spring to the brake shoe lever, making sure the spring is not twisted.
- Install the hold-down spring and retaining pin.

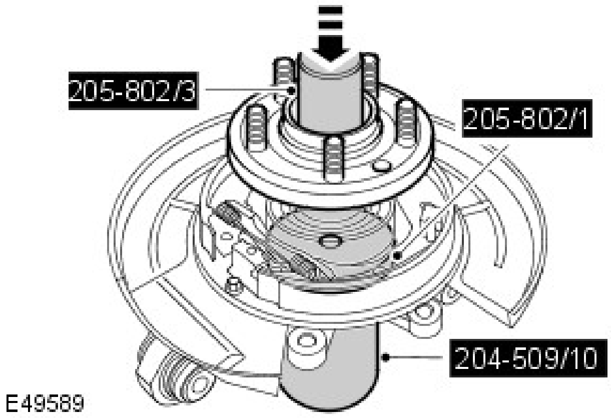
8. Install the primary brake shoe.

- Install the spreader plate and the spring.
- Install the return spring.
- Install the hold-down spring and retaining pin.

9. Install the return spring.

10. Install the brake shoe adjuster.

11. Using the special tools, install the drive flange.



205-802/3
205-802/1
204-509/10
E49589

12. Install the wheel knuckle.
For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).

Rear Suspension - Upper Arm

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

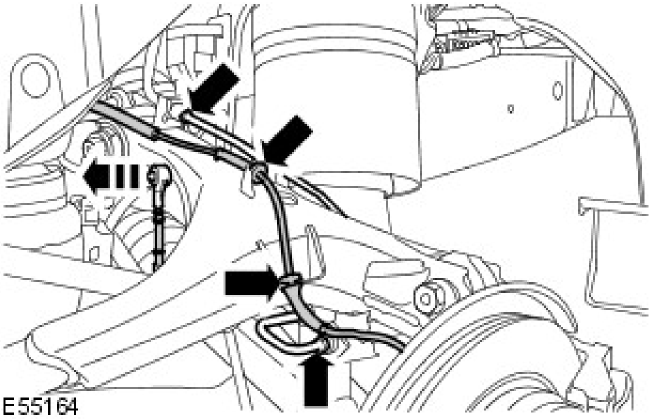
2. Remove the wheel and tire.

3. ⚠ CAUTION: Always plug any open connections to prevent contamination.

   Remove the brake tube.

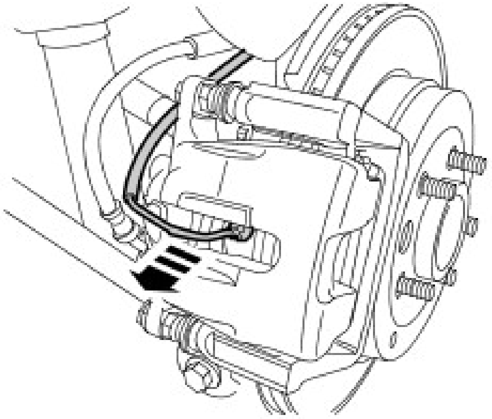
   - Disconnect the 2 brake tube unions.
   - Remove the brake hose clips and release the hoses.
   - Release the brake tube from the clip.

4. Disconnect the height sensor link.



E55164

5. Release the wheel speed sensor lead.

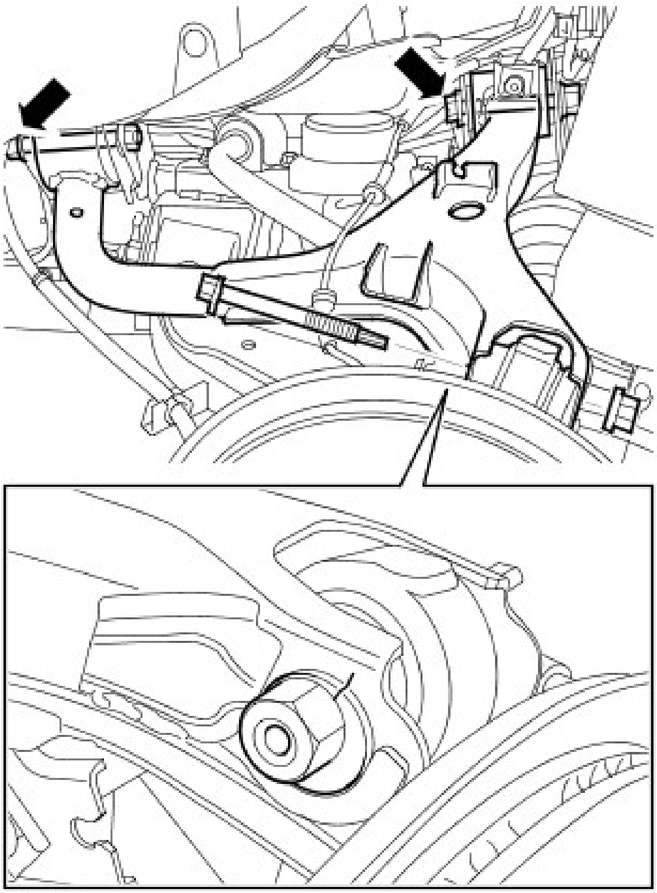


E55165

6. RH side only: Release the brake pad wear indicator sensor lead.

7. Remove the upper arm.

   - Loosen the upper arm bolts.
   - Mark the position of the bolt in relation to the upper arm.
   - Remove the nut and bolt, then release the upper arm from the wheel knuckle.

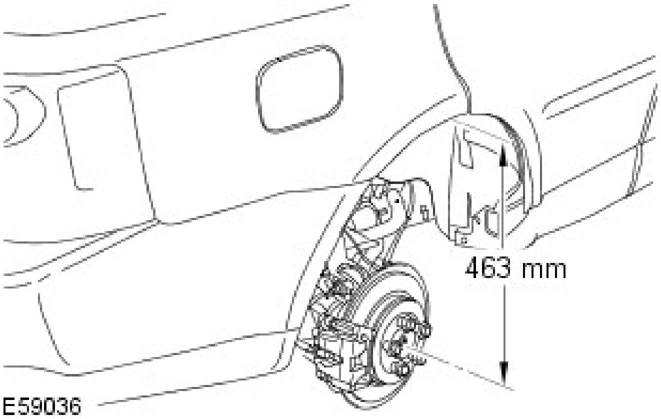


- Remove the upper arm bolts.

Installation

1. Install the upper arm.

- Fit the bolts but do not fully tighten at this stage.



2. Set the height, between the center of the halfshaft end and the edge of the fender trim, to 463 mm (18.23'').

- Support with an axle stand.

3. CAUTION: Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Tighten the bolt to 133 Nm (98 lb.ft).

4. Tighten the upper arm front bolt to 175 Nm (129 lb.ft).

5. Tighten the upper arm rear bolt to 275 Nm (203 lb.ft).

6. Secure the wheel speed sensor lead.

7. Secure the brake pad wear indicator sensor lead.

8. Connect the height sensor link.

9. Install the brake tube.

- Tighten the brake tube unions to 18 Nm (13 lb.ft).

10. Bleed the brake system.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures).

11. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

12. Carry out the wheel alignment procedure.

Published: 11-May-2011

Rear Suspension - Lower Arm

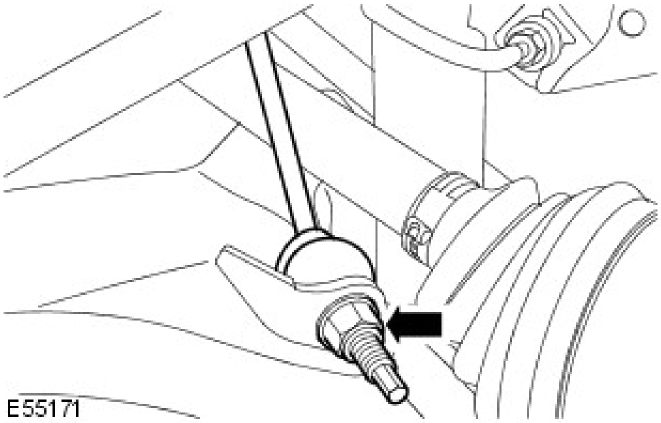
Removal and Installation

Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.



3. CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Release the stabilizer bar link.

- Remove and discard the retaining nut.

4. Loosen the 2 lower arm bolts.

5. Disconnect the shock absorber and spring assembly from the lower arm.

- Remove the nut and bolt.

6. Release the parking brake cable.

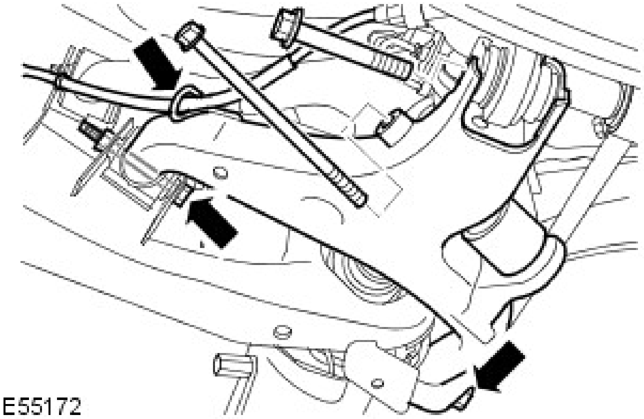
7. Remove the 2 lower arm bolts.

8. CAUTION: Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

- Remove the bolt.

9. Remove the lower arm.



Installation

1. Install the lower arm.

- Fit the bolts but do not fully tighten at this stage.

2. ⚠ CAUTION: Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

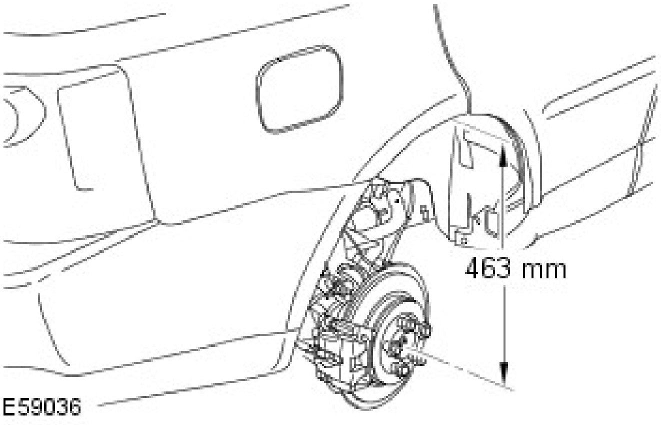
Connect the lower arm to the wheel knuckle.

- Tighten the bolt to 175 Nm (129 lb.ft).

3. Connect the shock absorber and spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

4. Set the height, between the center of the halfshaft end and the edge of the fender trim, to 463 mm (18.23'').



5. Tighten the lower arm bolts to 275 Nm (203 lb.ft).

6. Secure the parking brake cable.

7. Connect the stabilizer link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

8. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

9. Carry out the wheel alignment procedure.

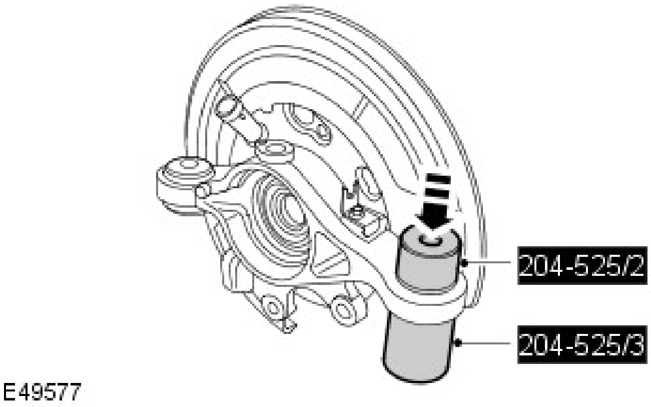
Rear Suspension - Upper Arm Ball Joint

Removal and Installation

Special Tool(s)	
204-525-1 E49576	Remover/installer rear upper arm ball joint 204-525/3
204-525-2 E49575	Remover/installer rear upper arm ball joint 204-525/2
204-525-1 E49574	Remover/installer rear upper arm ball joint 204-525/1

Removal

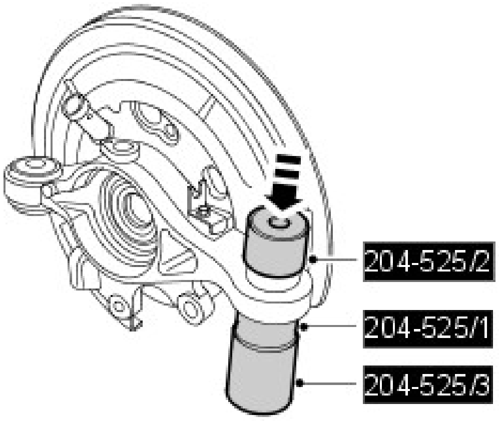
1. Remove the wheel knuckle.
   For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).
2. Using the special tools, remove the ball joint.
   - Position machined face against the special tool.



Installation

1. Clean the components.
2. CAUTIONS:

⚠ Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.



E49578

⚠ If the push in force is less than 10 kN the wheel knuckle must be replaced.

Using the special tools, install the ball joint.

- Position machined face against the special tool.

3. Install the wheel knuckle.
For additional information, refer to: Wheel Knuckle (204-02 Rear Suspension, Removal and Installation).

Published: 11-May-2011

Rear Suspension - Rear Stabilizer Bar

Removal and Installation

Removal

⚠ CAUTION: It is possible to install the stabilizer bar incorrectly. Note the position of the stabilizer bar before removal.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

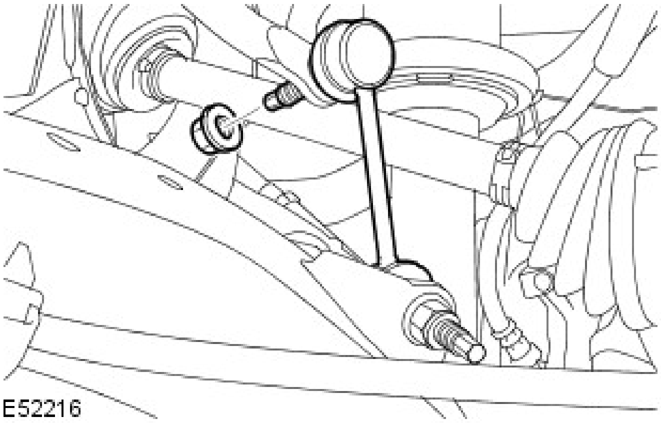
Raise and support the vehicle.

2. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

3. Remove the spare wheel and tire.

4. Raise the vehicle.

5. Remove the rear wheels and tires.

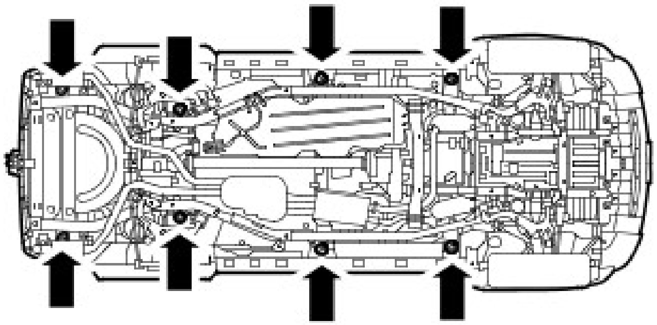


E52216

6. ⚠ CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Release both stabilizer bar links.

- Remove and discard the 2 nuts.



E52217

7. Remove the body mount retaining bolts.

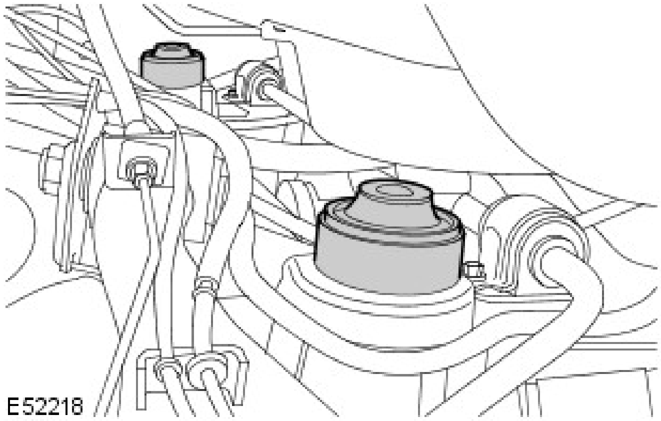
- Remove the 8 bolts.

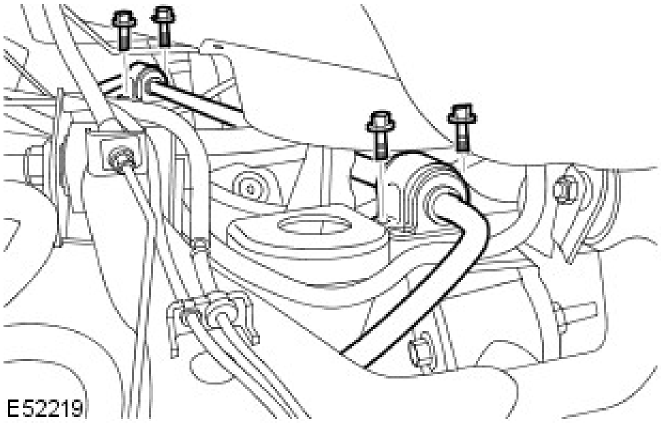
8. ⚠ CAUTION: Only raise the body sufficiently to remove the body mount.

Carefully raise the body.

- Using suitable stands, raise the body to release the body mounts.

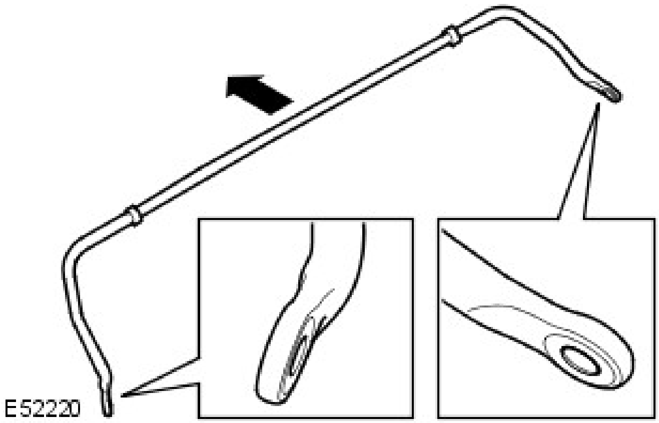
9. Remove the 2 rear body mounts.





10. Remove the stabilizer bar bushing.

- Remove the stabilizer bar clamps.
- Remove the 4 bolts.



11. ⚠CAUTION: Mark the position of the stabilizer bar.

Remove the stabilizer bar.

Installation

1. ⚠CAUTION: Make sure the stabilizer bar is correctly installed.

Install the stabilizer bar.

2. Install the stabilizer bar bushing.

3. Install the stabilizer bar clamps.

- Tighten the 4 retaining bolts to 62 Nm (46 lb.ft).

4. Install the body mounts.

5. Lower the body.

- Remove the stands.

6. Install the body mount retaining bolts.

- Tighten the 8 retaining bolts to 133 Nm (98 lb.ft).

7. Attach both stabilizer bar links.

- Tighten the nuts to 115 Nm (85 lb.ft).

8. Install the wheels and tires.

9. Lower the vehicle.

10. Install the spare wheel and tire.

11. Install the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

Published: 11-May-2011

Rear Suspension - Rear Stabilizer Bar Link

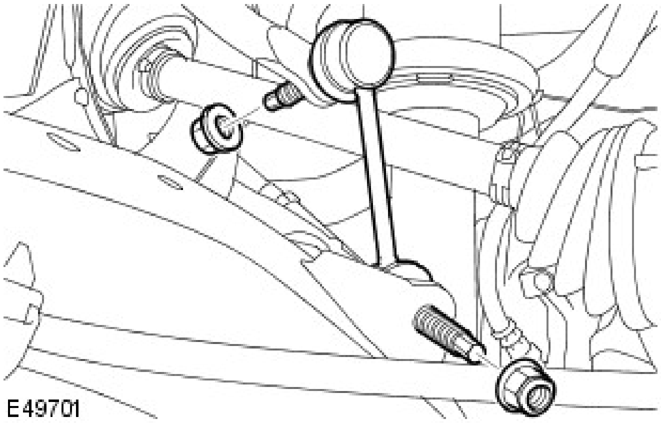
Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the wheel and tire.



3. ⚠ CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

   Remove the stabilizer bar link.

   - Remove and discard the 2 nuts.

Installation

1. Install the stabilizer bar link.
   - Tighten the nuts to 115 Nm (85 lb.ft).
2. Install the wheel and tire.
   - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Suspension - Lower Arm Bushing

Removal and Installation

Special Tool(s)	
 204-526/1 E55175	Receiver rear lower arm front bush 204-526/1
 204-526/2 E55176	Remover rear lower arm front bush 204-526/2
 204-526/3 E55177	Installer rear lower arm front bush 204-526/3
 204-532/1 E55178	Receiver rear lower arm rear bush 204-540/1
 204-540/2 E55179	Remover rear lower arm rear bush 204-540/2
 204-540/3 E55180	Installer rear lower arm rear bush 204-540/3

Removal

- NOTE: The bushings must be replaced in pairs, LH and RH sides.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

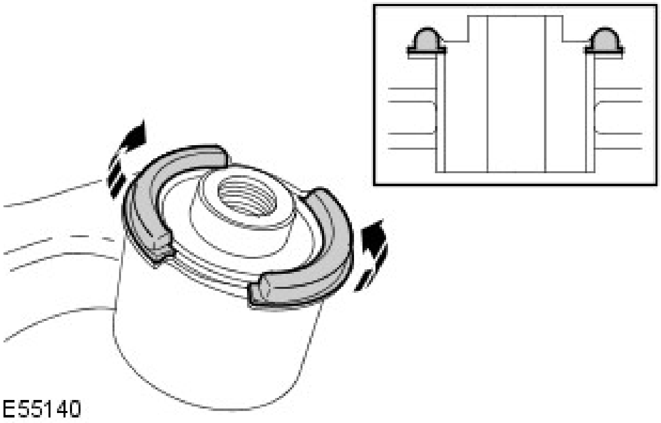
   Raise and support the vehicle.

2. Remove the wheels and tires.
3. Remove the LH lower arm.
   For additional information, refer to: Lower Arm (204-02, Removal and Installation).
4. Remove the RH lower arm.
5. Note the position of the bushing in relation to the lower arm.
6. CAUTION: The bush flanges need to be removed to allow bush removal.

- NOTE: Take note of the fitted position of the bush.

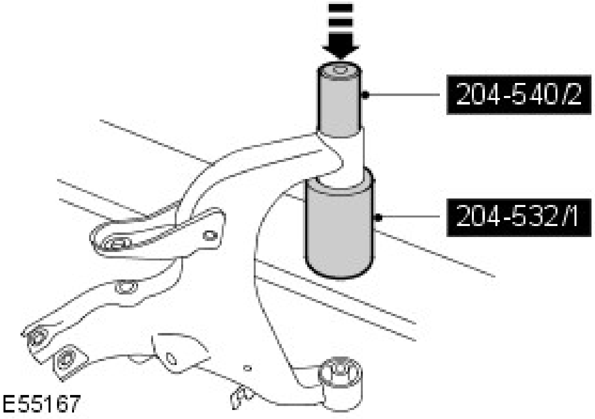
   Using a suitable tool, bend over the bush flanges.

7. Using a hacksaw, remove the flange from the bushing, making sure the upper arm is not damaged.



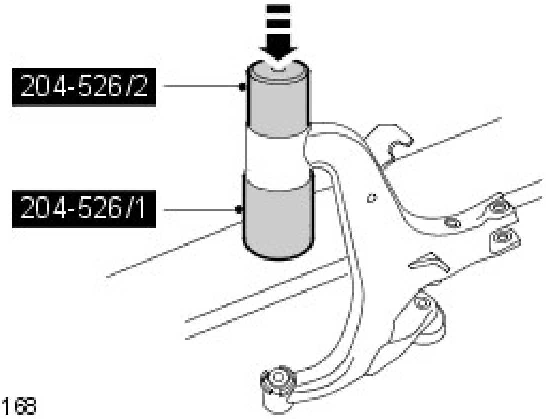
E55140

8. Using the special tools, remove and discard the lower arm rear bushings.



E55167

9. Using the special tools, remove and discard the lower arm front bushings.



E55168

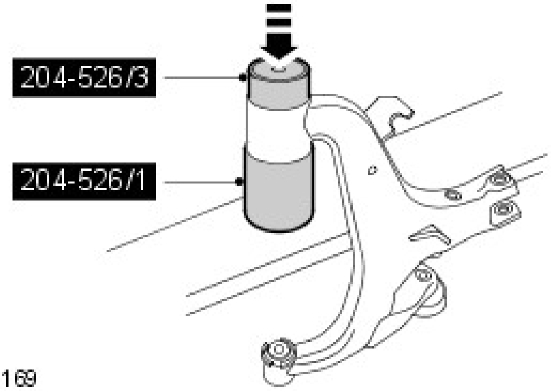
Installation

1. CAUTIONS:

⚠ Make sure the bush is correctly aligned.

⚠ Make sure the correct special tool is used to install the bushings to the correct depth.

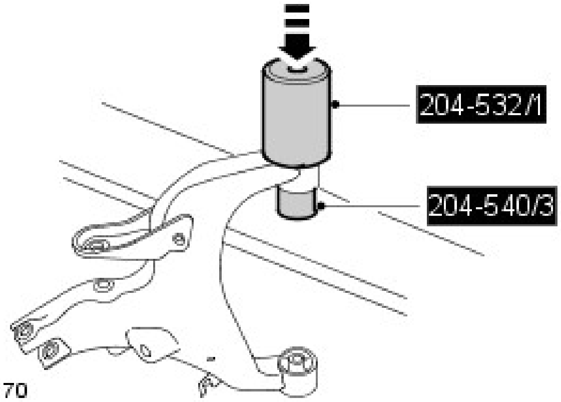
Using the special tools, install the lower arm front bushings



E55169

2. ⚠ CAUTION: Make sure the bush is correctly aligned.

Using the special tools, install the lower arm rear bushings.



E55170

3. Install the LH lower arm.
For additional information, refer to: Lower Arm (204-02, Removal and Installation).

4. Install the RH lower arm.

5. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

6. Check the wheel alignment.
For additional information, refer to: Four-Wheel Alignment (204-00 Suspension System - General Information, General Procedures).

Rear Suspension - Upper Arm Bushing

Removal and Installation

Special Tool(s)	
 204-528-1 E50585	Remover/installer - rear suspension upper arm front bushing 204-528/1
 204-528-2 E50586	Remover/installer - rear suspension upper arm front bushing 204-528/2
 204-528-3 E50587	Remover/installer - rear suspension upper arm front bushing 204-528/3
 204-558-1 E59154	Remover/installer rear suspension upper arm rear bushing 204-558/1
 204-558-2 E59152	Remover/installer rear suspension upper arm rear bushing 204-558/2
 204-558-3 E59153	Remover/installer rear suspension upper arm rear bushing 204-558/3

Removal

- NOTE: The bushings must be replaced in pairs, LH and RH sides.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheels and tires.

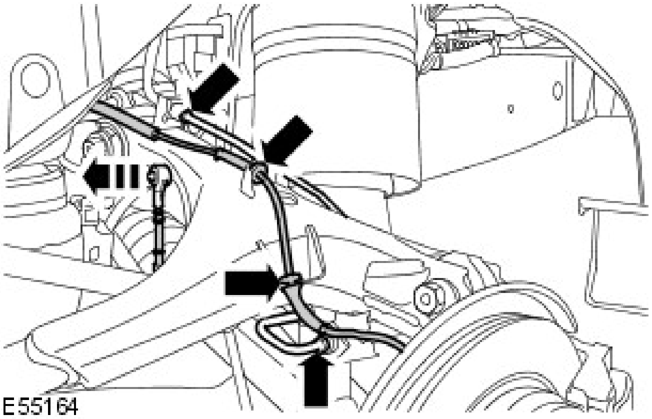
3. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Remove the brake tube.

- Disconnect the 2 brake tube unions.
- Remove the brake hose clips and release the hoses.
- Release the brake tube from the clip.

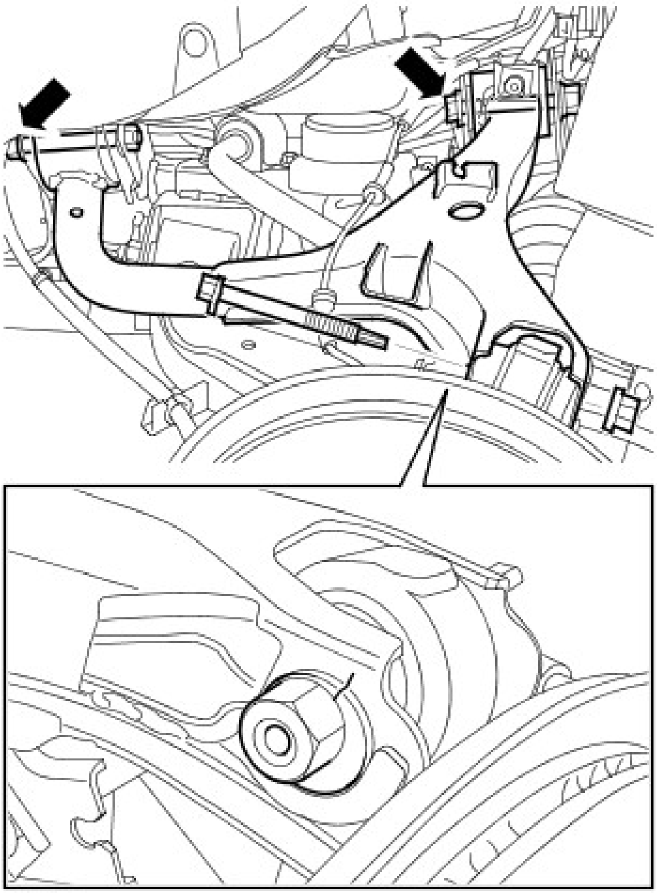
4. Disconnect the height sensor link.

5. Release the wheel speed sensor lead.

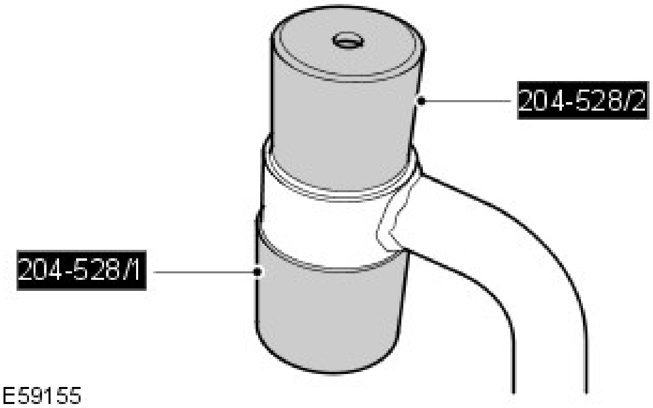


6. Remove the LH upper arm.

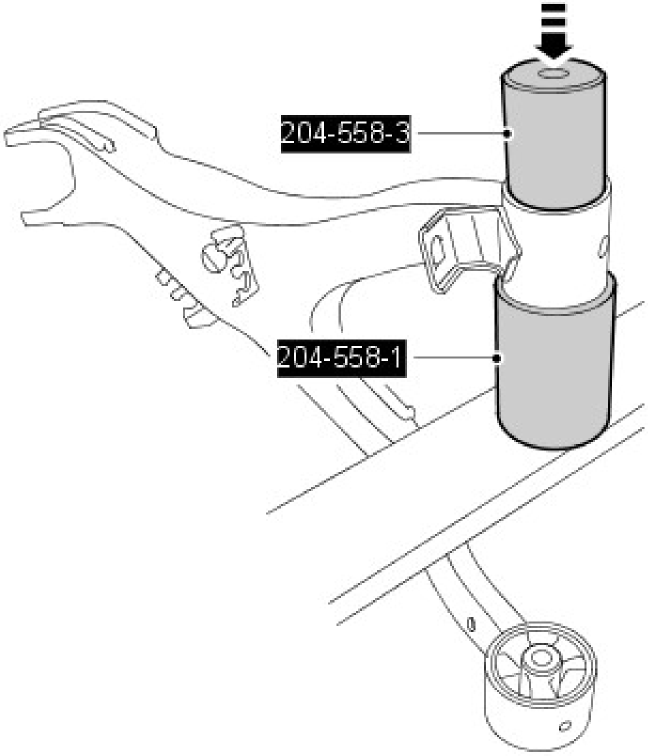
- Loosen the upper arm bolts.
- Mark the position of the bolt in relation to the upper arm.
- Disconnect the upper arm from the wheel knuckle.
- Remove the upper arm bolts.



7. Remove the RH upper arm.
   For additional information, refer to: Upper Arm (204-02 Rear Suspension, Removal and Installation).
8. Mark the position of the front bushing in relation to the upper arm.
9. Using the special tools, remove and discard the rear upper arm front bushing.



10. Using the special tools, remove and discard the rear upper arm rear bushing.



E59156

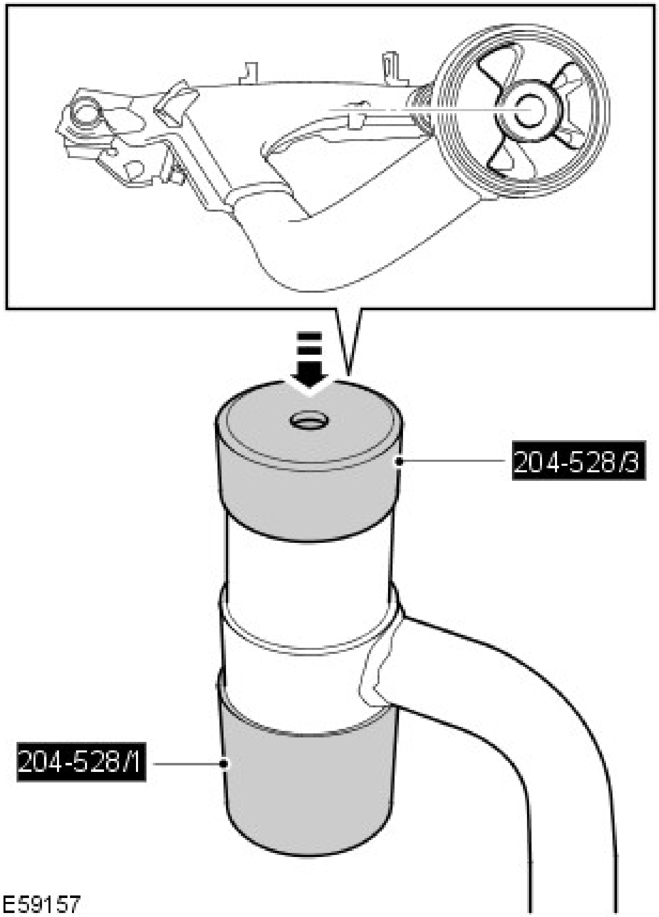
Installation

1. CAUTIONS:

⚠ Make sure the bush is correctly aligned.

⚠ Make sure the correct special tool is used to install the bushings to the correct depth.

Using the special tools, install the rear upper arm front bushing.

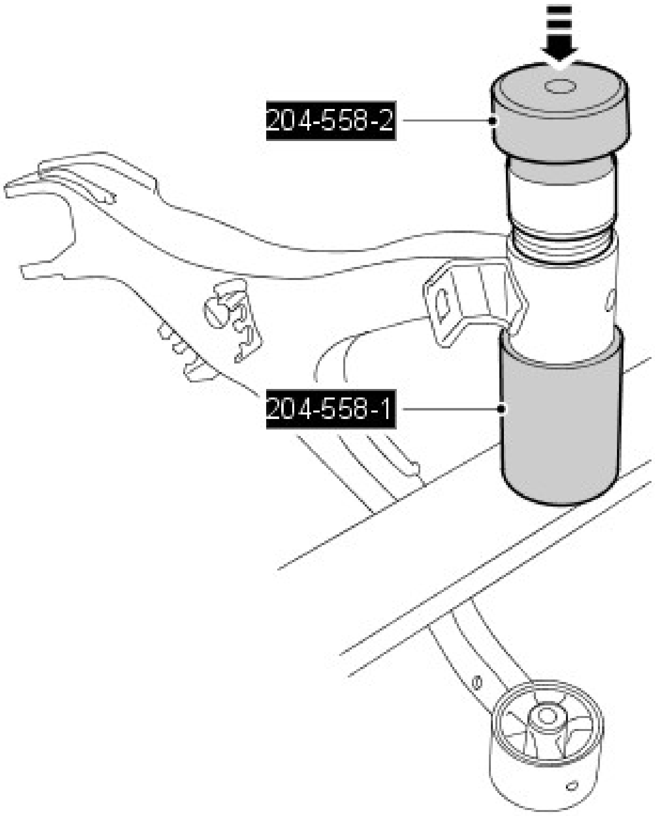


204-528/3
204-528/1

E59157

2. ⚠ CAUTION: Make sure the chamfered side of the ball joint is installed to the chamfered side of the rear upper arm.

Using the special tools, install the rear upper arm rear bushing.

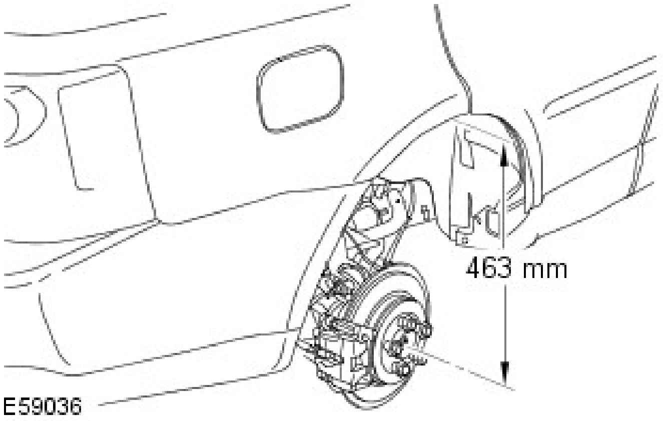


204-558-2
204-558-1

E59158

3. Install the LH upper arm.

- Fit the bolts but do not fully tighten at this stage.



4. Set the height, between the center of the halfshaft end and the edge of the fender trim, to 463 mm (18.23'').

- Support with an axle stand.

5. ⚠ CAUTION: Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Tighten the bolt to 133 Nm (98 lb.ft).

6. Tighten the upper arm front bolt to 175 Nm (129 lb.ft).

7. Tighten the upper arm rear bolt to 275 Nm (203 lb.ft).

8. Secure the wheel speed sensor lead.

9. Secure the brake pad wear indicator sensor lead.

10. Connect the height sensor link.

11. Install the brake tube.

- Tighten the brake tube unions to 18 Nm (13 lb.ft).

12. Install the RH upper arm.
For additional information, refer to: Upper Arm (204-02 Rear Suspension, Removal and Installation).

13. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Suspension - Wheel Knuckle

Removal and Installation

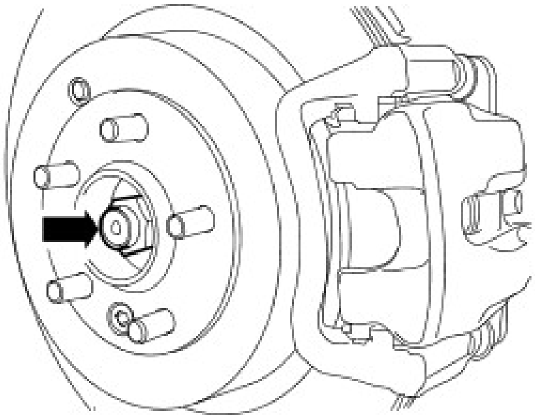
Special Tool(s)	
 204-506/1 E49618	Halfshaft remover/replacer 204-506/1(LRT-60-030/1)
 204-506/2 E49619	Halfshaft remover/replacer 204-506/2(LRT-60-030/2)
 204-506/3 E49620	Halfshaft remover/replacer 204-506/3(LRT-60-030/3)
 204-506/5 E49621	Retainers - halfshaft remover/replacer 204-506/5(LRT-60-030/5)
 204-506-01 E49622	Halfshaft installer adapter 204-506-01(LRT-60-030/4)

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

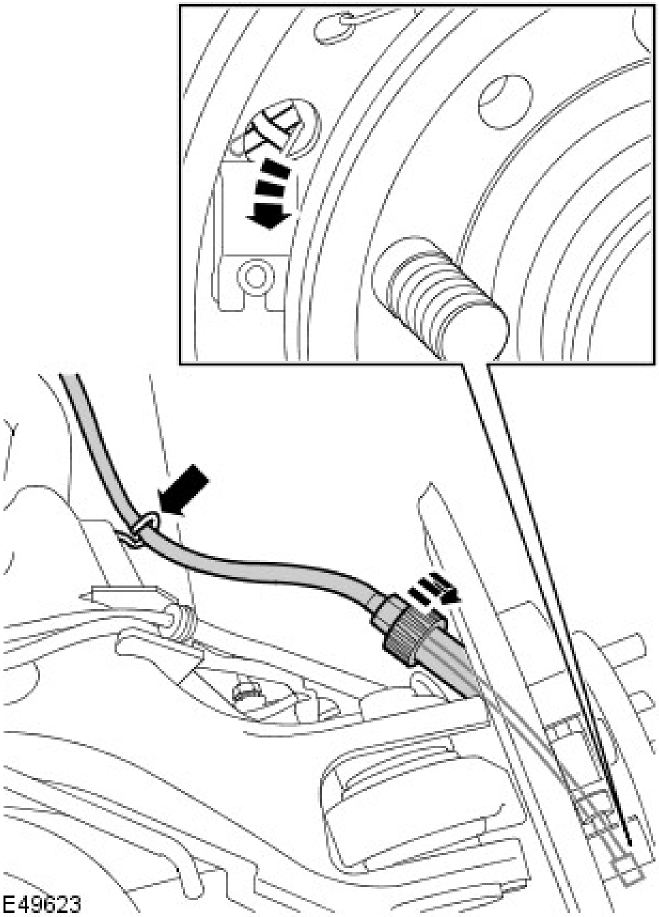
2. Remove the wheel and tire.
3. Loosen the halfshaft retaining nut.



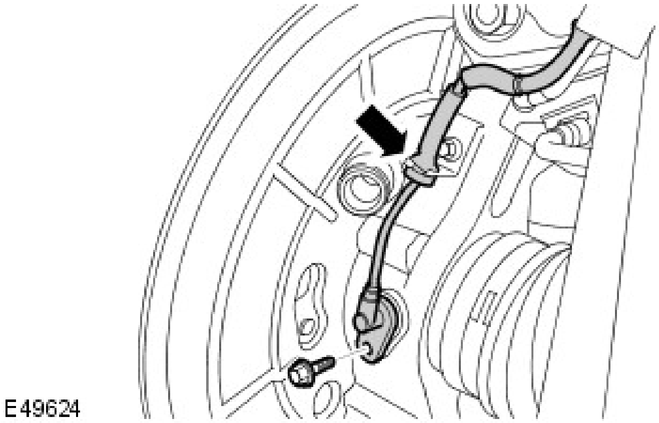
4. Remove the brake disc.
For additional information, refer to: Brake Disc (206-04 Rear Disc Brake, Removal and Installation).

5. Release the parking brake cable.

- Disconnect the parking brake cable from the brake shoe lever.
- Disconnect the parking brake cable from the backplate.
- Release the cable from the lower arm.



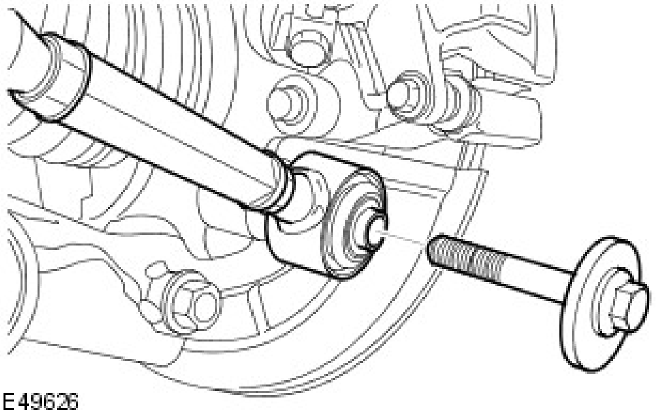
6. Release the wheel speed sensor from the wheel knuckle.



E49624

7. Disconnect the toe link.

- Remove and discard the bolt.



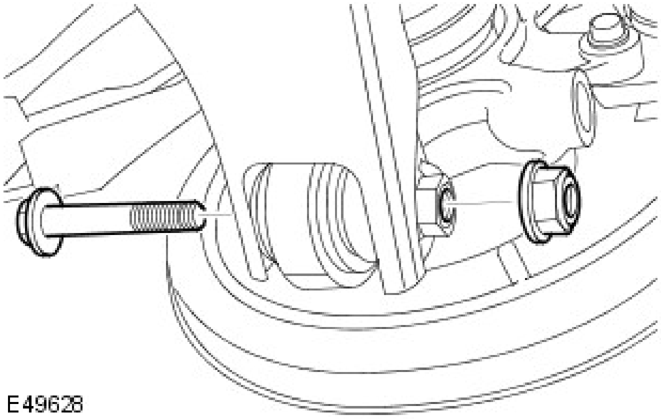
E49626

8. Remove the halfshaft retaining nut.

9. ⚠ CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the knuckle from the lower arm.

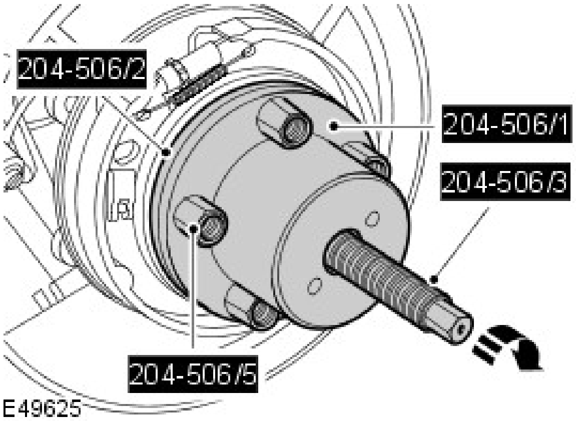
- Remove the bolt.



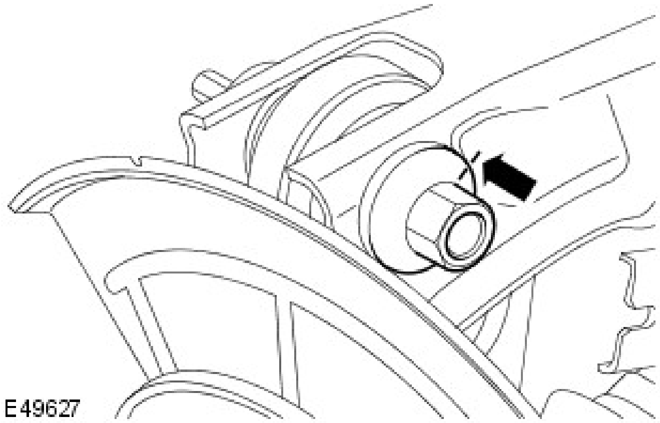
E49628

10. ⚠ CAUTION: Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.



E49625



11. ⚠CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Disconnect the upper arm from the wheel knuckle.

- Mark the position of the bolt in relation to the upper arm.
- Remove the nut and bolt.
- Discard the nut.

12. ⚠CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Remove the wheel knuckle.

Installation

1. Clean the components.

2. ⚠CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

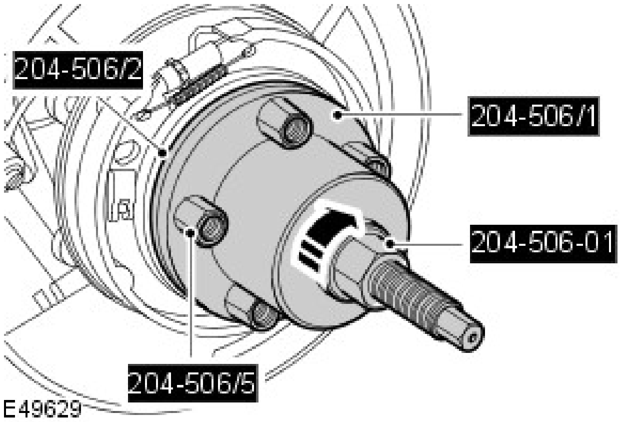
Install the wheel knuckle.

- Locate the halfshaft.

3. Connect the upper arm and wheel knuckle.

- Align the bolt to the marks made previously.
- Install a new nut and tighten to 133 Nm (98 lb.ft).

4. Using the special tools, install the halfshaft in the wheel hub.



5. ⚠CAUTION: Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

6. ⚠CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the nut and bolt to 175 Nm (129 lb.ft).

7. Connect the toe link.

- Tighten the new bolt to 175 Nm (129 lb.ft).

8. Install the wheel speed sensor.

- Tighten the bolt to 9 Nm (7 lb.ft).

9. Locate the parking brake cable to the backplate.

- Connect the cable to the brake shoe lever.
- Tighten the coupling to 8 Nm (6 lb.ft).
- Secure the parking brake cable to the lower arm.

10. Install the brake disc.
For additional information, refer to: Brake Disc (206-04 Rear Disc Brake, Removal and Installation).

11. ⚠ CAUTION: Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the halfshaft retaining nut to 350 Nm (258 lb.ft).

- Stake the nut to the halfshaft.

12. Install the wheel and tire.

13. Carry out the wheel alignment procedure.

 204-506/1 E49618	Halfshaft remover/replacer 204-506/1 (LRT-60-030/1)
 204-506/3 E49620	Halfshaft remover/replacer 204-506/3 (LRT-60-030/3)
	Halfshaft installer adapter 204-506-01

 E49622	
 E49621	Retainers - halfshaft remover/replacer 204-506/5 (LRT-60-030/5)

Removal

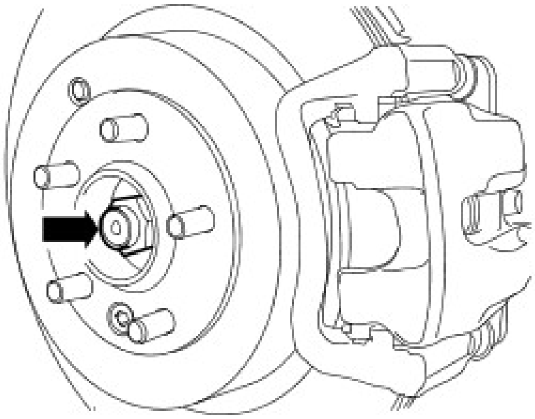
CAUTION: The bolt securing the toe link to the wheel knuckle must not be used more than 5 times. Mark the bolt head with a suitable centre punch.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

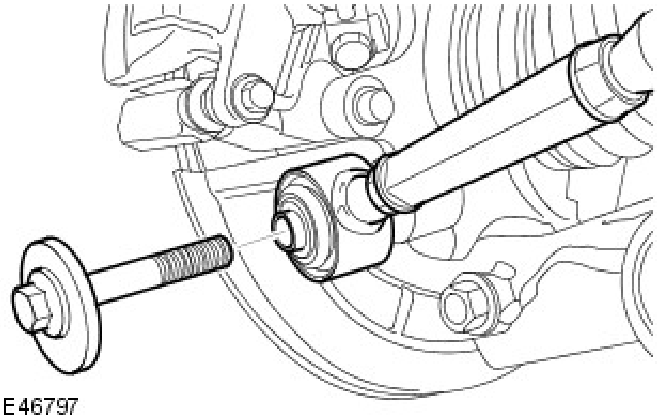
3. Loosen the halfshaft retaining nut.



E46796

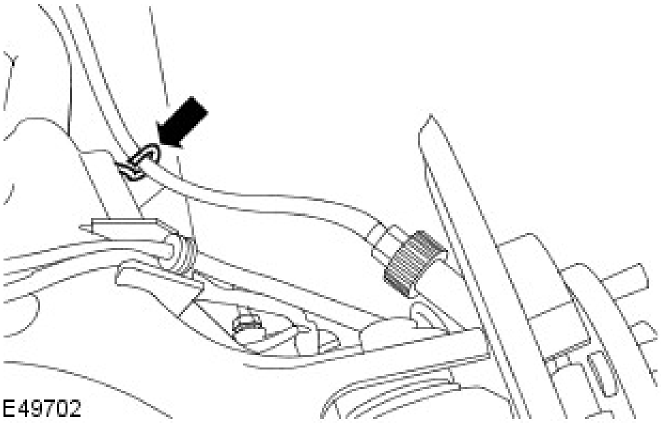
4. Disconnect the toe link.

- Remove the bolt.



E46797

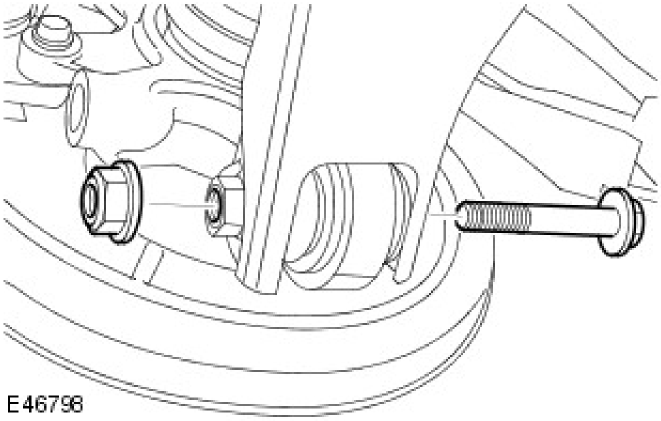
5. Release the parking brake cable from the lower arm.



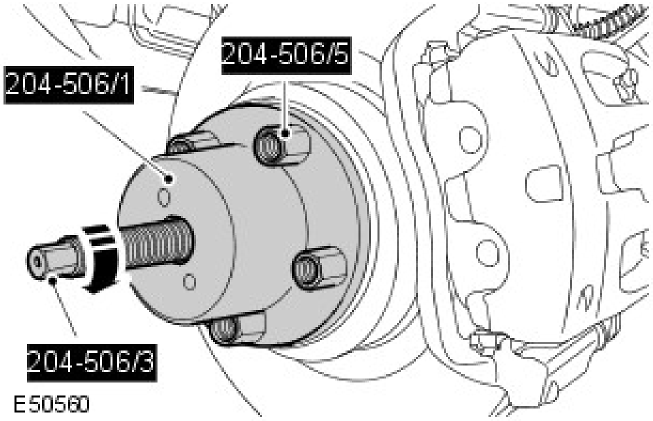
6. Remove the halfshaft retaining nut.

7. Release the knuckle from the lower arm.

- Remove the bolt.



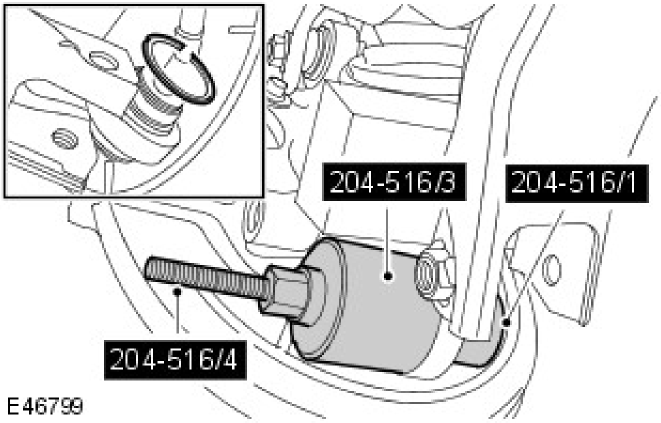
8. Using the special tools, release the halfshaft from the wheel hub.



204-506/5
204-506/1
204-506/3
E50560

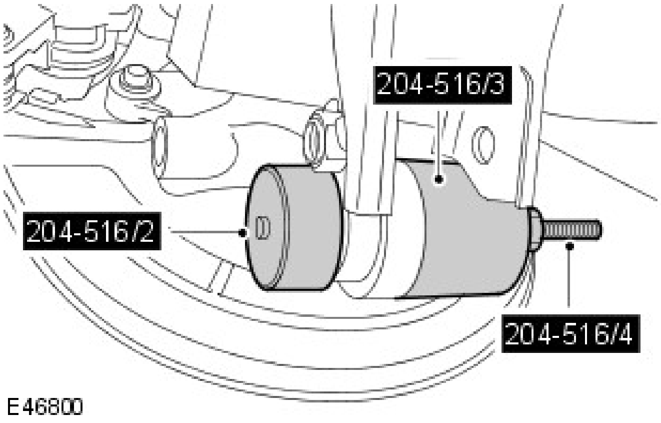
9. Using the special tool, remove the lower arm ball joint.

- Support the wheel knuckle to give access to the lower ball joint.
- Remove and discard the snap ring.



204-516/3
204-516/1
204-516/4
E46799

Installation



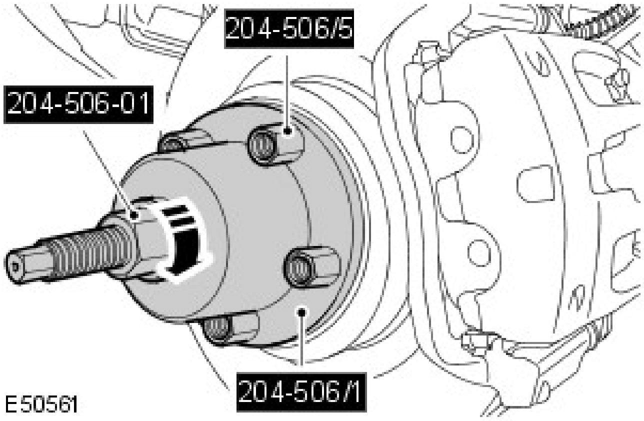
1. CAUTIONS:

⚠ If the push in force is less than 17 kN the wheel knuckle must be replaced.

⚠ Make sure the ball joint in installed from the chamfered side of the wheel knuckle.

Using the special tool, install the lower arm ball joint.

- Install the snap ring.



2. Using the special tools, install the halfshaft in the wheel hub.

3. ⚠ CAUTION: Ensure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the lower arm to the wheel knuckle.

- Tighten the bolt to 175 Nm (129 lb.ft).

4. Install a new halfshaft retaining nut and lightly tighten.

5. Secure the parking brake cable.

6. ⚠ CAUTION: Do not use a bolt that has been installed more than 5 times. Check the bolt head for centre punch marks. A bolt head with 4 centre punch marks indicates the bolt has been installed 5 times and must be replaced.

Connect the toe link.

- Tighten the bolt to 175 Nm (129 lb.ft).
- Mark the bolt head with a centre punch, to indicate the number of times it has been used.

7. Tighten the halfshaft retaining nut to 350 Nm (258 lb.ft).

- Stake the nut to the halfshaft.

8. Install the wheel and tire.

9. Carry out the wheel alignment procedure.

Rear Suspension - Toe Link

Removal and Installation

Removal

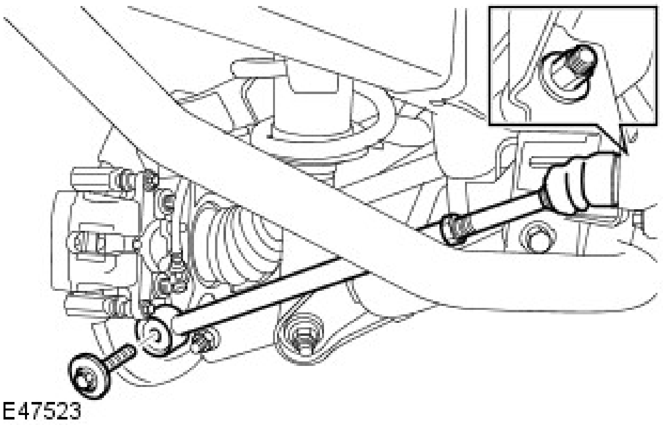
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. Disconnect the toe link.

- Remove and discard the bolt.



4. Remove the toe link.

- Remove and discard the nut.

Installation

1. ⚠ CAUTION: Make sure the toe link anti-rotation tang is fully seated in the integrated body frame before tightening the toe link retaining nut. Failure to follow this instruction will result in damage to the toe link or integrated body frame.

Install the toe link.

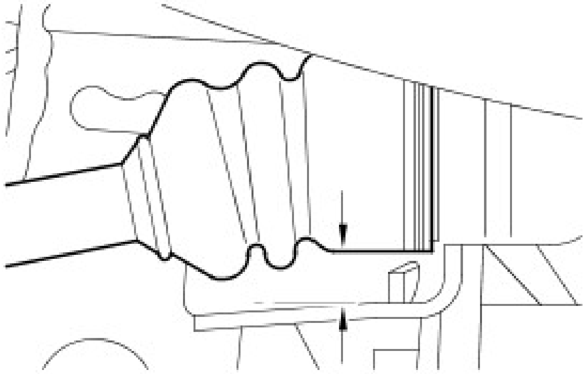
- Install a new nut and lightly tighten.

2. Connect the toe link.

- Using a M14 x 2 tap, clean the threads of the knuckle fixing hole. Blow out debris with an air-line.
- Tighten the new bolt to 175 Nm (129 lb.ft).

3. Set the gap, between the underside of the toe link rubber boot and the integrated body frame bracket, to 15 mm (0.590 in).

- Tighten the toe link inner ball joint retaining nut to 133 Nm (98 lb.ft)



E47524

4. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

5. Carry out the wheel alignment procedure.

Published: 02-Dec-2011

Wheels and Tires - Wheels and Tires

Diagnosis and Testing

Principle of Operation

For a detailed description of the wheels and tires, refer to the relevant Description and Operation section in the workshop manual. REFER to: Wheels and Tires (204-04 Wheels and Tires, Description and Operation) / Safety Precautions (204-04 Wheels and Tires, Description and Operation).

Inspection and Verification

⚠CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. **1.** Verify the customer complaint. As much information as possible should be gathered from the driver to assist in diagnosing the cause(s). Confirm which of the following two warning types (A or B) exist for the Tire Pressure Monitoring System when the ignition status is switched from 'OFF' to 'ON'.
   - **(A) Check Tire Pressure Warnings.** A low tire pressure warning will **continuously** illuminate the low tire pressure warning lamp. This warning may be accompanied by a text message such as CHECK TIRE PRESSURE (refer to owner literature). The manufacturer approved diagnostic system does NOT need to be used. Diagnostic Trouble Codes (DTCs) are not generated with this type of warning. To extinguish this warning it is essential that, with the ignition 'ON', all vehicle tires (including the spare) are to be set to the correct pressure as stated in the vehicle handbook or as indicated on the placard label in the passenger/driver door aperture. **It is not necessary to drive the vehicle to clear 'check tire pressure' warnings - just changing the tire pressure causes the tire low pressure sensor to transmit new data.**
     • NOTE: The tire pressures should be set by:
     - Using a calibrated tire pressure gauge
     - With 'cold' tires (vehicle parked in the ambient temperature for at least one hour, not in a garage with an artificial ambient temperature)

     • NOTE: If the tire pressure warning does not clear within two minutes, it is likely that the gauge is not correctly calibrated or the tires are 'warm'. Carry out the following steps until the warning has cleared:
     - Increase the tire pressures by 3psi
     - Wait a further two minutes
     - When the tires are at ambient temperature and a **calibrated** gauge is available, reset the tire pressures to the correct pressure

     • NOTE: Tire pressure adjustments are part of routine owner maintenance. Tire pressure adjustments that are required due to a lack of owner maintenance are not to be claimed under vehicle warranty.
   - **(B) System Fault Warnings.** When a system fault is detected, the low tire pressure warning lamp will flash for approximately 75 seconds prior to being continuously illuminated. Visually inspect for obvious signs of damage and system integrity. Check for the presence of tire low pressure sensors on all four wheels (note: a tire low pressure sensor has a metal valve stem rather than a rubber one).
2. **2.** Check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

• NOTE: If the tester fails to communicate with the Tire Pressure Monitoring System module, the following actions are recommended:

- Remove the Tire Pressure Monitoring System power supply fuse, inspect and re-install (if intact). Test to see if communications have been re-established.
- Remove the Tire Pressure Monitoring System ignition fuse (if applicable), inspect and re-install (if intact). Test to see if communications have been re-established.
- With ignition status set to 'ON', refer to the electrical circuit diagrams and check Tire Pressure Monitoring System module for power, ignition and ground supplies.
- Carry out CAN network integrity test using the manufacturer approved diagnostic system.

DTC Index

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only five digit codes. If this is the case, match the five digits from the scan tool to the first five digits of the seven digit code listed to identify the fault (the last two digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places, and with an up-to-date calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

• NOTE: If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.

DTC	Description	Possible Cause	Action
C1A0111	LED-circuit short to ground	● Center facia switch pack - tire pressure monitoring switch status indicator LED circuit, short to ground	Refer to the electrical wiring diagrams and check Center facia switch pack - tire pressure monitoring switch status indicator LED circuit for short to ground. Repair as required. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
C1A0112	LED-circuit short to battery	● Center facia switch pack - tire pressure monitoring switch status indicator LED circuit, short to power	Refer to the electrical wiring diagrams and check Center facia switch pack - tire pressure monitoring switch status indicator LED circuit for short to power. Repair as required. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
C1A0113	LED-circuit open	● Center facia switch pack - tire pressure monitoring switch status indicator LED circuit, open circuit	Refer to the electrical wiring diagrams and check Center facia switch pack - tire pressure monitoring switch status indicator LED circuit for open circuit. Repair as required. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
C1A2992	Switch Activation Too Long-performance or incorrect operation	● Center facia switch pack - tire pressure monitoring switch contact closed for excessive duration	Check the switch for correct operation, the switch status indicator LED will toggle state after each ignition on, if the switch is constantly closed. Replace Center facia switch pack as necessary. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
C1A5512	Ignition Switch Input Circuit-circuit short to battery	● Ignition switch input circuit short circuit to power	Refer to the electrical wiring diagrams and check the ignition switch and circuits for short to power. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
C1A5514	Ignition Switch Input Circuit-circuit short to ground or open	● Ignition switch input circuit short circuit to ground ● Ignition switch input circuit high resistance, open circuit	Refer to the electrical wiring diagrams and check the ignition switch and circuits for short to ground, high resistance, open circuit. Carry out On Demand Self Test (ODST) using manufacturer approved diagnostic system to confirm rectification.
C1A5631	Left Front Tire Pressure Sensor and Transmitter Assembly-no signal	● Missing, incompatible or defective tire low pressure sensor or radio frequency receiver	GO to Pinpoint Test E.
C1A5668	Left Front Tire Pressure Sensor and Transmitter Assembly-event information	● Information only - vehicle exposed to extreme temperature environment and/or tire low pressure sensor low battery voltage event	No action required
C1A5691	Left Front Tire Pressure Sensor and Transmitter Assembly-parametric	● Tire low pressure sensor has reported out of range information for pressure, temperature or acceleration	Replace defective tire low pressure sensor. Refer to the relevant section of the workshop manual
C1A5693	Left Front Tire Pressure Sensor and Transmitter Assembly-no operation	● No tire low pressure sensor can be localized at this position due to an initiator or tire low pressure sensor malfunction	GO to Pinpoint Test F.

DTC	Description	Possible Cause	Action
C1A5711	Left Front Initiator-circuit short to ground	- Left front initiator circuit is short to ground	GO to Pinpoint Test A. Refer to Pinpoint test A1
C1A5712	Left Front Initiator-circuit short to battery	- Left front initiator circuit is short to power	GO to Pinpoint Test A. Refer to Pinpoint test A2
C1A5713	Left Front Initiator-circuit open	- Left front initiator circuit open	GO to Pinpoint Test A. Refer to Pinpoint test A9
C1A5831	Right Front Tire Pressure Sensor and Transmitter Assembly-no signal	- Missing, incompatible or defective tire low pressure sensor or radio frequency receiver	GO to Pinpoint Test E.
C1A5868	Right Front Tire Pressure Sensor and Transmitter Assembly-event information	- Information only - vehicle exposed to extreme temperature environment and/or tire low pressure sensor low battery voltage event	No action required
C1A5891	Right Front Tire Pressure Sensor and Transmitter Assembly-parametric	- Tire low pressure sensor has reported out of range information for pressure, temperature or acceleration	Replace defective tire low pressure sensor. Refer to the relevant section of the workshop manual.
C1A5893	Right Front Tire Pressure Sensor and Transmitter Assembly-no operation	- No tire low pressure sensor can be localized at this position due to an initiator or tire low pressure sensor malfunction	GO to Pinpoint Test F.
C1A5911	Right Front Initiator-circuit short to ground	- Right front initiator circuit is short to ground	GO to Pinpoint Test B. Refer to Pinpoint test B1
C1A5912	Right Front Initiator-circuit short to battery	- Right front initiator circuit is short to power	GO to Pinpoint Test B. Refer to Pinpoint test B2
C1A5913	Right Front Initiator-circuit open	- Right front initiator circuit open	GO to Pinpoint Test B. Refer to Pinpoint test B9
C1A6031	Left Rear Tire Pressure Sensor and Transmitter Assembly-no signal	- Missing, incompatible or defective tire low pressure sensor or radio frequency receiver	GO to Pinpoint Test E.
C1A6068	Left Rear Tire Pressure Sensor and Transmitter Assembly-event information	- Information only - vehicle exposed to extreme temperature environment and/or tire low pressure sensor low battery voltage event	No action required
C1A6091	Left Rear Tire Pressure Sensor and Transmitter Assembly-parametric	- Tire low pressure sensor has reported out of range information for pressure, temperature or acceleration	Replace defective tire low pressure sensor. Refer to the relevant section of the workshop manual.
C1A6093	Left Rear Tire Pressure Sensor and Transmitter Assembly-no operation	- No tire low pressure sensor can be localized at this position due to an initiator or tire low pressure sensor malfunction	GO to Pinpoint Test F.
C1A6111	Left Rear Initiator-circuit short to ground	- Left rear initiator circuit short to ground	GO to Pinpoint Test C. Refer to Pinpoint test C1

DTC	Description	Possible Cause	Action
C1A6112	Left Rear Initiator-circuit short to battery	- Left rear initiator circuit short to power	GO to Pinpoint Test C. Refer to Pinpoint test C2
C1A6113	Left Rear Initiator-circuit open	- Left rear initiator circuit open	GO to Pinpoint Test C. Refer to Pinpoint test C9
C1A6231	Right Rear Tire Pressure Sensor and Transmitter Assembly-no signal	- Missing, incompatible or defective tire low pressure sensor or radio frequency receiver	GO to Pinpoint Test E.
C1A6268	Right Rear Tire Pressure Sensor and Transmitter Assembly-event information	- Information only - vehicle exposed to extreme temperature environment and/or tire low pressure sensor low battery voltage event	No action required
C1A6291	Right Rear Tire Pressure Sensor and Transmitter Assembly-parametric	- Tire low pressure sensor has reported out of range information for pressure, temperature or acceleration	Replace defective tire low pressure sensor. Refer to the relevant section of the workshop manual.
C1A6293	Right Rear Tire Pressure Sensor and Transmitter Assembly-no operation	- No tire low pressure sensor can be localized at this position due to an initiator or tire low pressure sensor malfunction	GO to Pinpoint Test F.
C1A6311	Right Rear Initiator-circuit short to ground	- Right rear initiator circuit short to ground	GO to Pinpoint Test D. Refer to Pinpoint test D1
C1A6312	Right Rear Initiator-circuit short to battery	- Right rear initiator circuit short to power	GO to Pinpoint Test D. Refer to Pinpoint test D2
C1A6313	Right Rear Initiator-circuit open	- Right rear initiator circuit open	GO to Pinpoint Test D. Refer to Pinpoint test D9
C1A6468	Spare Wheel Tire Pressure Sensor and Transmitter Assembly-event information	- Information only - vehicle exposed to extreme temperature environment and/or tire low pressure sensor low battery voltage event	No action required
C1A6491	Spare Wheel Tire Pressure Sensor and Transmitter Assembly-parametric	- Tire low pressure sensor has reported out of range information for pressure, temperature or acceleration	Replace defective tire low pressure sensor. Refer to the relevant section of the workshop manual.
C1A6493	Spare Wheel Tire Pressure Sensor and Transmitter Assembly-no operation	- Missing, incompatible or defective tire low pressure sensor or radio frequency receiver	GO to Pinpoint Test G.
U001088	Medium Speed CAN Communication Bus-bus off	- CAN bus fault	Carry out CAN network integrity tests. Refer to the electrical wiring diagrams and check CAN network for short, open circuit
U014000	Lost communication with body control module-no sub type information	- CAN bus fault - Central Junction Box fault	Refer to the electrical wiring diagrams and check Central Junction Box power and ground supplies for short, open circuit. Carry out CAN network integrity tests.
U015500	Lost Communications With Instrument Panel Cluster (IPC) Control Module-no sub type information	- CAN bus fault - Instrument cluster fault	Refer to the electrical wiring diagrams and check instrument cluster power and ground supplies for short, open circuit. Carry out CAN network integrity tests.

DTC	Description	Possible Cause	Action
U016400	Lost Communication With HVAC Control Module-no sub type information	- CAN bus fault - Climate control module fault	Refer to the electrical wiring diagrams and check climate control module power and ground supplies for short, open circuit. Carry out CAN network integrity tests.
U030000	Internal Control Module Software Incompatibility-no sub type information	- Incompatible tire pressure monitoring system module for vehicle CAN network	Check correct tire pressure monitoring system module is installed to vehicle specification, otherwise suspect the instrument cluster.
U041600	Invalid Data Received From Vehicle Dynamics Control Module-no subtype information	- Invalid data received from Anti lock Braking System module - CAN Bus fault - Anti lock Braking System fault	Check Anti lock Braking System module and instrument cluster for related DTCs and refer to the relevant DTC Index. Carry out CAN network integrity test using manufacturer approved diagnostic system.
U1A1449	CAN Initialisation Failure-internal electronic failure	- Tire pressure monitoring system module fault	Install a new tire pressure monitoring module. Refer to the new module/component installation note at the top of the DTC Index
U300055	Control Module-not configured	- Tire pressure monitoring system configuration data is invalid	Check and amend the car configuration file.
U300087	Control Module-missing message	- Tire pressure monitoring system configuration data not received	Check the instrument cluster for related DTCs and refer to the relevant DTC Index. Carry out CAN network integrity test.
U300281	Vehicle Identification Number - invalid serial data received	- Tire pressure monitoring system module and vehicle VIN mis-match	• NOTE: This DTC indicates that the tire pressure monitoring system module is not the original part installed to the vehicle at the factory/dealer and could have been substituted. Refer to the note above the DTC index about replacing components which may remain under manufacturer warranty. Re-install the original or a new tire pressure monitoring system control module

Component Tests

Wheels and Tires

For wheel and tire specification information (pressures, torques, etc).
REFER to: Specifications (204-04 Wheels and Tires, Specifications).

When replacing wheels or tires, local legislation regarding health and safety must be complied with.

If the vehicle has a Tire Pressure Monitoring System installed, only Land Rover approved wheels and tires should be used. If the wheel and tire size is changed (for example from R18 to R20) the Tire Pressure Monitoring System module should be updated with the correct pressure information appropriate to the new wheel and tire set. Update the Tire Pressure Monitoring System module using the Land Rover approved diagnostic system.

As a general guideline, only replace tires in pairs or as a set, and only with tires of equivalent size and specification.

Confirm the symptoms of the customer complaint.

As much information as possible should be gathered from the driver to assist in diagnosing the cause(s).

1. **1.** Before a road test, carry out a basic inspection to make sure the vehicle is safe and legal to drive.

   Basic inspection

- Correct tire inflation.
  REFER to: Specifications (204-04 Wheels and Tires, Specifications).
- Legal tire tread depth
- Cuts/Bulges in tire sidewall(s)
- Tire ply separation
- Embedded objects
- Wheel rim damage
- Correct tire installation (specification, direction of rotation, etc)
- Any obvious distortion of the tire (flat/high spots)
- Worn/Damaged steering or suspension components

Road test

If the results of the basic inspection are acceptable, carry out a road test to confirm the symptoms.

To reproduce the symptoms, test the vehicle on similar roads to those on which the fault occurs and at similar speeds (provided it is legal to do so).

If the vibration or noise can be reproduced, note the speed at which it occurs and see if it is possible to drive through the symptom, meaning, is it possible to alter the fault by driving faster or slower than the speed at which it occurs?

If it **is** possible, it is likely that the fault is caused by an imbalance in the wheel or tire.

If the vibration or noise gets worse as the vehicle speed increases, it is likely that the fault is caused by distortion in the wheel or tire, or worn or damaged components.

Distortion checks

Check for distortion by raising the vehicle so that the wheels are free and placing an axle stand or similar fixed object next to each wheel in turn.

If the stand is placed at the tread of the tire, the tire can be checked for ovality by turning the wheel by hand and checking for high or low spots where the gap between the tread and the stand increases or reduces.

If the stand is placed next to the wheel rim or tire sidewall, the wheel and tire can be checked for run-out in a similar way.

Road test

If the results of the basic inspection are acceptable, carry out a road test to confirm the symptoms.

To reproduce the symptoms, test the vehicle on similar roads to those on which the fault occurs and at similar speeds (provided it is legal to do so).

If the vibration or noise can be reproduced, note the speed at which it occurs and see if it is possible to drive through the symptom, meaning, is it possible to alter the fault by driving faster or slower than the speed at which it occurs?

If it **is** possible, it is likely that the fault is caused by an imbalance in the wheel or tire.

If the vibration or noise gets worse as the vehicle speed increases, it is likely that the fault is caused by distortion in the wheel or tire, or worn or damaged components.

Distortion checks

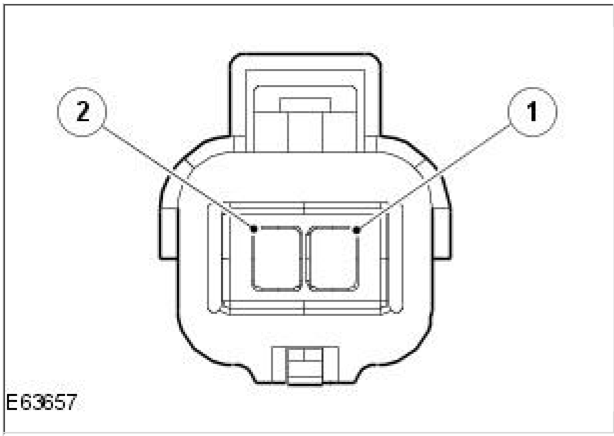
Check for distortion by raising the vehicle so that the wheels are free and placing an axle stand or similar fixed object next to each wheel in turn.

If the stand is placed at the tread of the tire, the tire can be checked for ovality by turning the wheel by hand and checking for high or low spots where the gap between the tread and the stand increases or reduces.

If the stand is placed next to the wheel rim or tire sidewall, the wheel and tire can be checked for run-out in a similar way.

Pinpoint Tests

PINPOINT TEST A : LEFT FRONT LOW-FREQUENCY INITIATOR CIRCUIT	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
A1: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND	
	1 Key off.
	2 Disconnect the left hand front low-frequency initiator electrical connector, C2198.



3 Measure the resistance between:

C2198, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to A5.

No

GO to A3.

A2: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2198, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

GO to A6.

No

GO to A4.

A3: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:

C2198, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to A7.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

A4: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2198, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

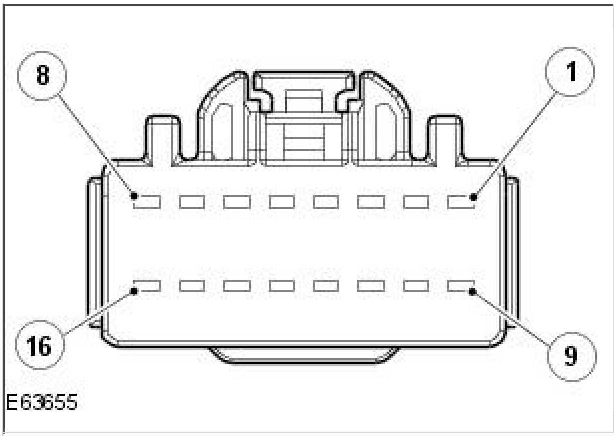
GO to A8.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

A5: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2198, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

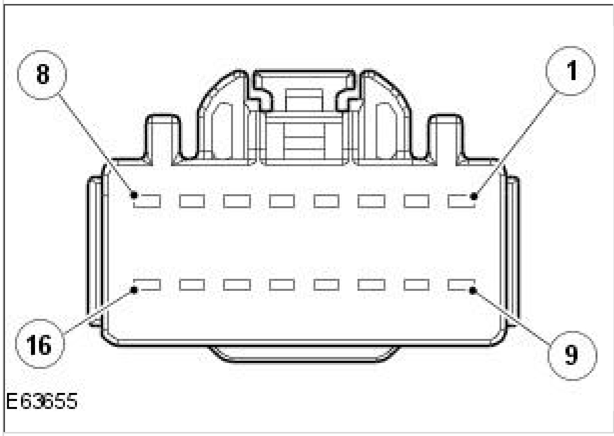
REPAIR the short circuit. This circuit contains intermediate connectors, C2243 and C2245. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

A6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2198, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

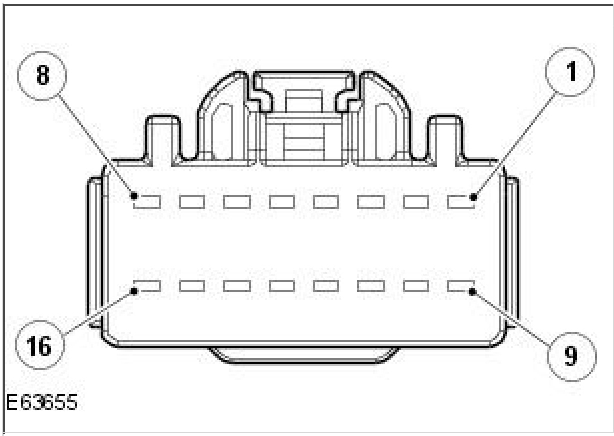
REPAIR the short circuit. This circuit contains intermediate connectors, C2243 and C2245. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

A7: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2198, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

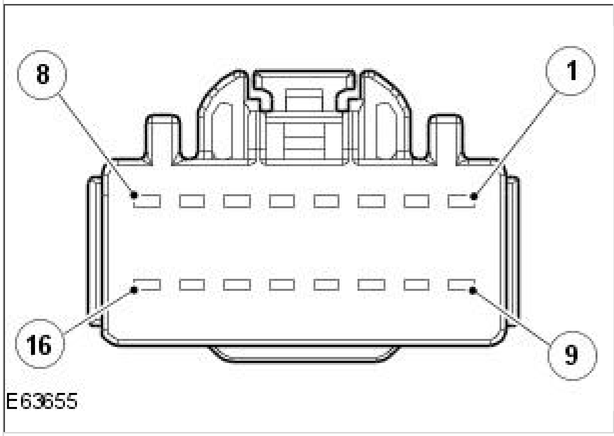
REPAIR the short circuit. This circuit contains intermediate connectors, C2243 and C2245. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

A8: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2198, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. This circuit contains intermediate connectors, C2243 and C2245. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

A9: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

C2447, harness side	C2198, harness side
Pin 14	Pin 2

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. This circuit contains intermediate connectors, C2243 and C2245. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

GO to A10.

A10: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

C2447, harness side	C2198, harness side
Pin 13	Pin 1

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. This circuit contains intermediate connectors, C2243 and C2245. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new left hand front low-frequency initiator.

REFER to: Tire Pressure Monitoring System (TPMS) Front Antenna (204-04 Wheels and Tires, Removal and Installation).

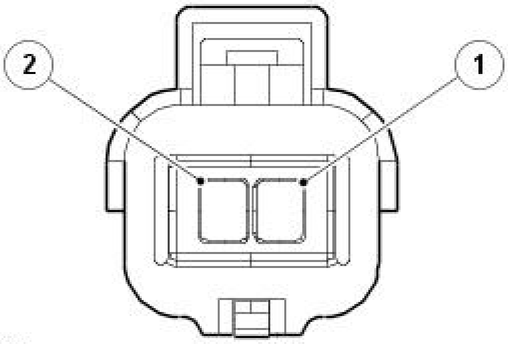
PINPOINT TEST B : RIGHT FRONT LOW FREQUENCY INITIATOR CIRCUIT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

B1: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Key off.

2 Disconnect the right hand front low-frequency initiator electrical connector, C2199.



E63657

3 Measure the resistance between:

C2199, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to B5.

No

GO to B3.

B2: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2199, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

GO to B6.

No

GO to B4.

B3: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:

C2199, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to B7.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

B4: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2199, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

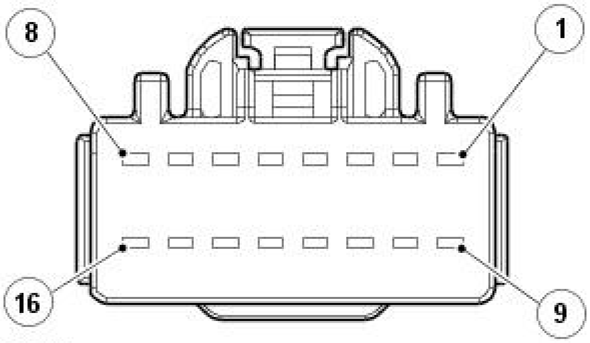
GO to B8.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

B5: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



E63655

2 Measure the resistance between:

C2199, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

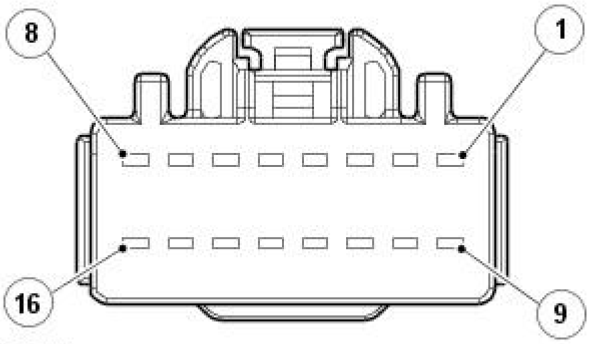
REPAIR the short circuit. This circuit contains intermediate connectors, C2242 and C2244. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

B6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



E63655

2 Measure the resistance between:

C2199, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

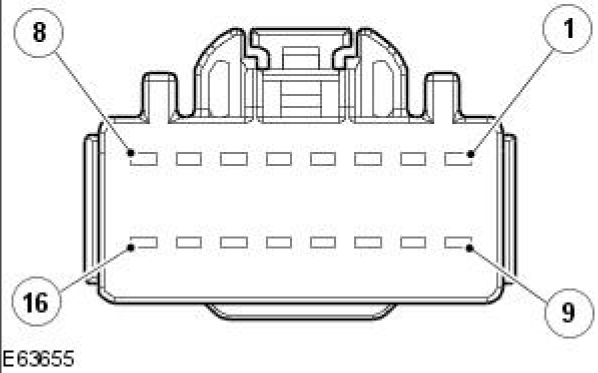
REPAIR the short circuit. This circuit contains intermediate connectors, C2242 and C2244. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

B7: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2199, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

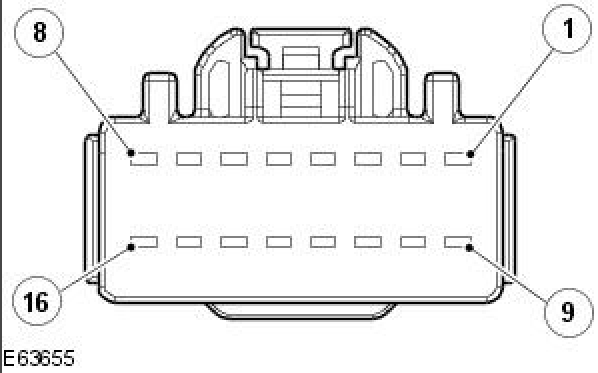
REPAIR the short circuit. This circuit contains intermediate connectors, C2242 and C2244. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

B8: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2199, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. This circuit contains intermediate connectors, C2242 and C2244. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.

REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

B9: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

C2447, harness side	C2199, harness side
Pin 16	Pin 2

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. This circuit contains intermediate connectors, C2242 and C2244. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

GO to B10.

B10: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

C2447, harness side	C2199, harness side
Pin 15	Pin 1

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. This circuit contains intermediate connectors, C2242 and C2244. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new right hand front low-frequency initiator.
REFER to: Tire Pressure Monitoring System (TPMS) Front Antenna (204-04 Wheels and Tires, Removal and Installation).

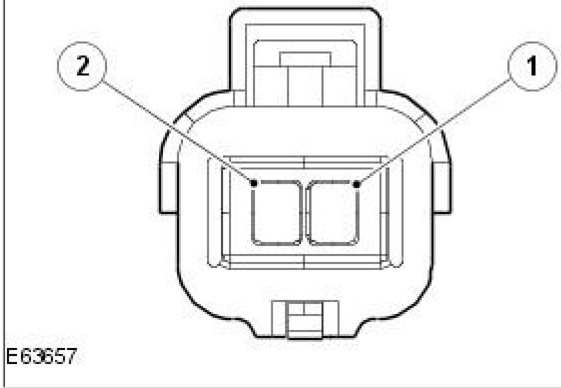
PINPOINT TEST C : LEFT REAR LOW-FREQUENCY INITIATOR CIRCUIT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

C1: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Key off.

2 Disconnect the left hand rear low-frequency initiator electrical connector, C2200.



3 Measure the resistance between:

C2200, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to C5.

No

GO to C3.

C2: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2200, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

GO to C6.

No

GO to C4.

C3: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:

C2200, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to C7.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

C4: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2200, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

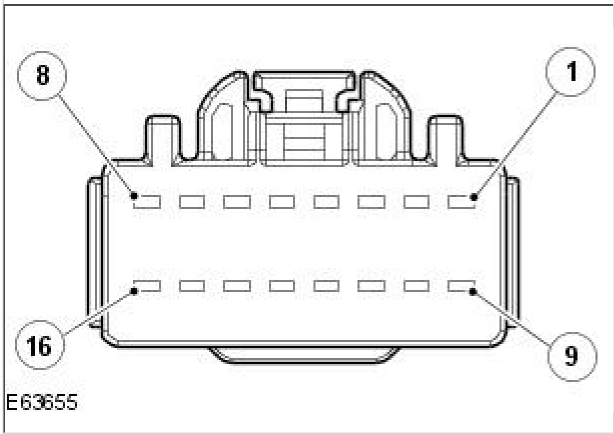
GO to C8.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

C5: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2200, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

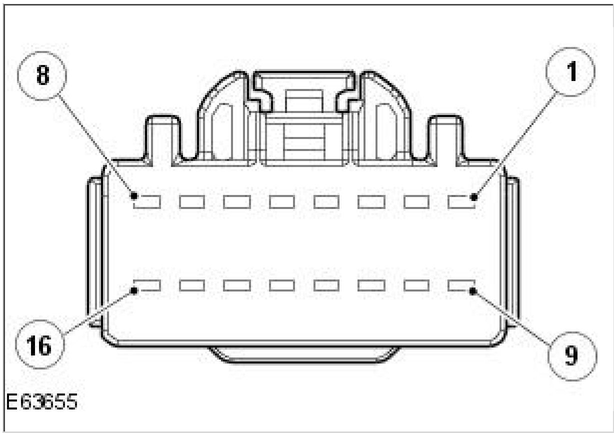
REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

C6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2200, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

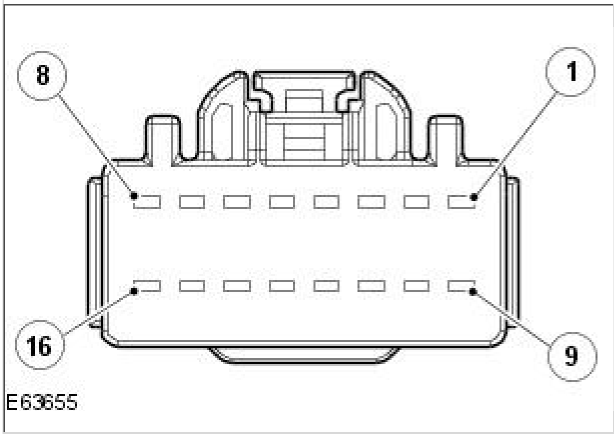
REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

C7: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2200, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

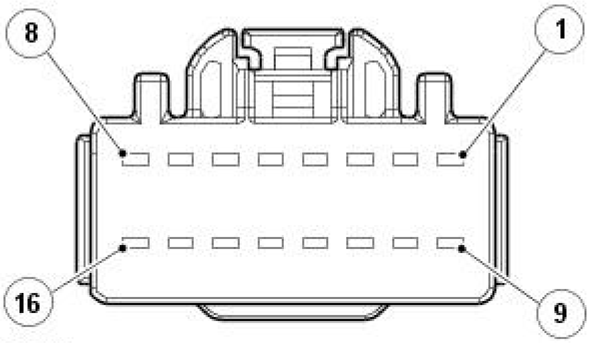
REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

C8: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2200, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

C9: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

C2447, harness side	C2200, harness side
Pin 6	Pin 2

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

GO to C10.

C10: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

C2447, harness side	C2200, harness side
Pin 5	Pin 1

Is the resistance greater than 5 ohms?

Yes

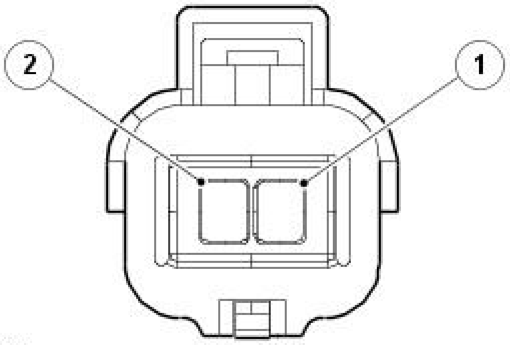
REPAIR the high resistance circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new left hand rear low-frequency initiator.
REFER to: Tire Pressure Monitoring System (TPMS) Rear Antenna (204-04 Wheels and Tires, Removal and Installation).

PINPOINT TEST D : RIGHT REAR LOW-FREQUENCY INITIATOR CIRCUIT

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
D1: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND	
	1 Key off.
	2 Disconnect the right hand rear low-frequency initiator electrical connector, C2201.



E63657

3 Measure the resistance between:

C2201, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to D5.

No

GO to D3.

D2: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2201, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

GO to D6.

No

GO to D4.

D3: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO GROUND

1 Measure the resistance between:

C2201, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

GO to D7.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

D4: CHECK THE INITIATOR CIRCUIT FOR SHORT CIRCUIT TO POWER

1 Measure the resistance between:

C2201, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

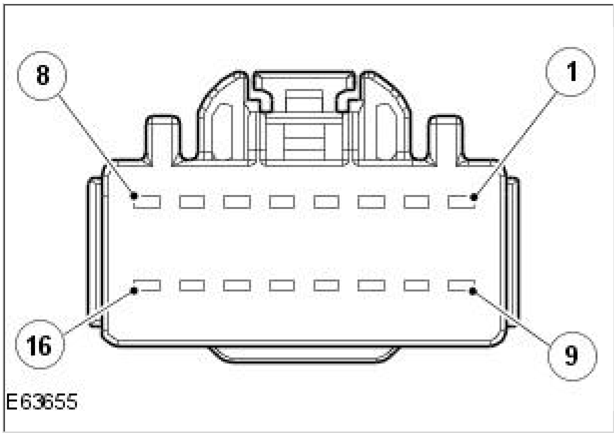
GO to D8.

No

Fault not present run On Demand Self Test (ODST) to confirm. Investigate cause of possible intermittent fault.

D5: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2201, harness side	Battery
Pin 2	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

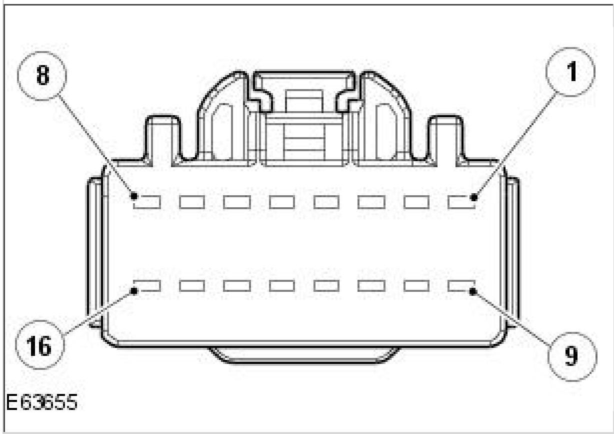
REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

D6: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2201, harness side	Battery
Pin 2	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

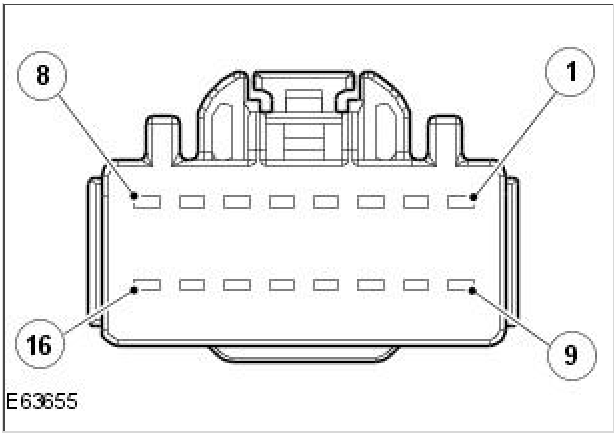
REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

D7: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2201, harness side	Battery
Pin 1	Negative terminal

Is the resistance less than 10,000 ohms?

Yes

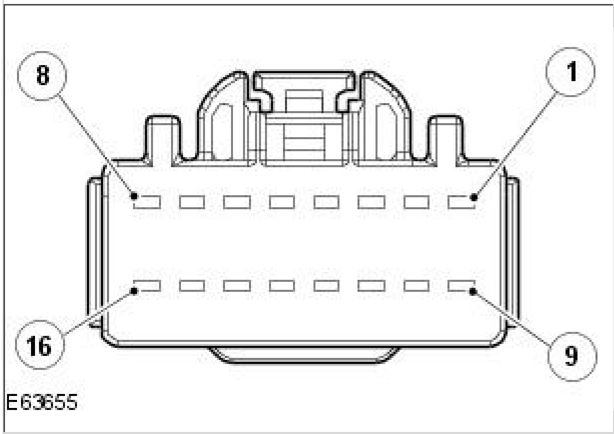
REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

D8: CHECK WHETHER THE SHORT CIRCUIT IS IN THE HARNESS OR THE MODULE

1 Disconnect the Tire Pressure Monitoring System module connector, C2447.



2 Measure the resistance between:

C2201, harness side	Battery
Pin 1	Positive terminal

Is the resistance less than 10,000 ohms?

Yes

REPAIR the short circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

INSTALL a new Tire Pressure Monitoring System module.
REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation).

D9: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

1 Measure the resistance between:

C2447, harness side	C2201, harness side
Pin 8	Pin 2

Is the resistance greater than 5 ohms?

Yes

REPAIR the high resistance circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification.

No

GO to D10.

D10: CHECK THE INITIATOR CIRCUIT FOR HIGH RESISTANCE

	1 Measure the resistance between:

C2447, harness side	C2201, harness side
Pin 7	Pin 1

	Is the resistance greater than 5 ohms? **Yes** REPAIR the high resistance circuit. For additional information, refer to the wiring diagram. Clear the DTC and run an On Demand Self Test (ODST) using the manufacturer approved diagnostic system to confirm rectification. **No** INSTALL a new right hand rear low-frequency initiator. REFER to: Tire Pressure Monitoring System (TPMS) Rear Antenna (204-04 Wheels and Tires, Removal and Installation).

PINPOINT TEST E : MISSING, INCOMPATIBLE OR DEFECTIVE RUNNING TIRE LOW PRESSURE SENSOR OR RECEIVER	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
E1: CHECK FOR CORRECT WHEEL AND TIRE ASSEMBLY AND TIRE LOW PRESSURE SENSOR	
	1 Establish that a full size running wheel and tire assembly has a tire low pressure sensor installed. As a visual confirmation, a tire low pressure sensor has a metal valve stem rather than a rubber one and cannot be installed to a mini/space saver spare wheel.
	Is a full size wheel and tire assembly with tire low pressure sensor installed? **Yes** GO to E2. **No** Install the correct wheel and tire assembly or tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application.
E2: CHECK FOR ADDITIONAL DTCS	
	1 Remove the Tire Pressure Monitoring System power supply fuse and re-install it. Clear DTCs and leave the vehicle stationary for 15 minutes, then drive it at a speed greater than 15.5 mph (25 kph) continuously for at least 10 minutes. (Note: If the vehicle speed drops below this value, the drive time to complete the test will need to be increased.) The use of the manufacturer approved diagnostic system, and the datalogger signal 'Tire pressure monitor system status – learn mode status' will verify the completion of the test when the value returns to 'Inactive'.
	2 Check for additional DTCs C1A5631, C1A5831, C1A6031, C1A6231, with identical time stamps.
	Have all four DTCs logged with identical time stamps in the tire pressure monitoring system module? **Yes** Replace the tire pressure monitoring system module. REFER to: Tire Pressure Monitoring System (TPMS) Module (204-04 Wheels and Tires, Removal and Installation). **No** GO to E3.
E3: VERIFY THE POSITION OF THE DEFECTIVE TIRE LOW PRESSURE SENSOR	
	1 Check tire pressure monitoring system DTCs.
	Are any C1AXX31 DTCs logged? **Yes** Install the correct tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application, to the position identified by the logged DTC. REFER to: Tire Low Pressure Sensor (204-04 Wheels and Tires, Removal and Installation). **No** No further action is required. (Note: The use of the manufacturer approved diagnostic system, and the datalogger signal 'Tire pressure monitor system status – learn completed successfully' will verify the successful completion of the test.)

PINPOINT TEST F : LOCALIZATION FAILURE	
TEST CONDITIONS	**DETAILS/RESULTS/ACTIONS**
F1: CHECK FOR ADDITIONAL DTCS	
	1 Check for additional DTCs: C1A5711, C1A5712, C1A5713. C1A5911, C1A5912, C1A5913, C1A6111, C1A6112, C1A6113, C1A6311, C1A6312, C1A6313.

	Are any of the DTCs listed above also logged? **Yes** Refer to the DTC Index and remedial actions. **No** GO to F2.
F2: CHECK FOR ADDITIONAL DTCS	
	1 Check for additional DTCs: C1A5631, C1A5831, C1A6031 or C1A6231
	Is a C1A5631, C1A5831, C1A6031 or C1A6231 DTC also logged? **Yes** Refer to the DTC Index and remedial actions. **No** GO to F3.
F3: CHECK INITIATOR INSTALLATION	
	1 Check for correct installation of Initiator. REFER to: (204-04 Wheels and Tires) Tire Pressure Monitoring System (TPMS) Front Antenna (Removal and Installation), Tire Pressure Monitoring System (TPMS) Rear Antenna (Removal and Installation).
	Is the Initiator correctly installed? **Yes** GO to F4. **No** Rectify as required. REFER to: (204-04 Wheels and Tires) Tire Pressure Monitoring System (TPMS) Front Antenna (Removal and Installation), Tire Pressure Monitoring System (TPMS) Rear Antenna (Removal and Installation).
F4: CHECK FOR SHORT CIRCUIT IN INITIATOR HARNESS	
	1 Locate and remove module blue connector L.
	2 Measure the resistance across the relevant initiator circuits within the blue connector.
	Is the resistance less than 1 Ohm? **Yes** A value of less than 1 Ohm indicates a short circuit, rectify the short circuit as required. **No** Install the correct tire low pressure sensor, of correct frequency, in accordance with that defined in the manufacturer approved diagnostic system new tire low pressure sensor application, to the position identified by the logged DTC. REFER to: Tire Low Pressure Sensor (204-04 Wheels and Tires, Removal and Installation).

PINPOINT TEST G : SPARE TIRE LOW PRESSURE SENSOR NO OPERATION

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS
G1: ESTABLISH THE TYPE OF SPARE WHEEL AND TIRE ASSEMBLY INSTALLED	
	1 Establish the type of spare wheel and tire assembly installed.
	Is the spare wheel a mini/space saver type? **Yes** Tire low pressure sensors are not installed to mini/space-saver spare wheels. Tire low pressure sensors are installed to full size spare wheels only. The DTC is to be ignored and no repair action is required. **No** GO to G2.
G2: ESTABLISH THAT THE SPARE WHEEL HAS A TIRE LOW PRESSURE SENSOR INSTALLED	
	1 Establish that the spare wheel has a tire low pressure sensor installed, considering the following additional information: ● a) As a visual confirmation, the tire low pressure sensor has a metal valve stem rather than a rubber one.
	Is a tire low pressure sensor installed? **Yes** GO to G3. **No** A new spare tire low pressure sensor should be installed. Note: Refer to the note above the DTC index about replacing components which may remain under manufacturer warranty. Refer to the relevant section of the workshop manual.
G3: CONFIRM OPERATION OF THE SPARE WHEEL PRESSURE SENSOR	
	1 Deflate the spare tire, in close proximity to the vehicle, until it is completely deflated.
	2 Complete an ignition cycle to ignition on and verify that the instrument cluster reports a spare tire pressure warning for approximately 20 seconds.
	3 Re-inflate the spare tire, in close proximity to the vehicle, to the recommended spare tire pressure. Refer to the Inspection and Verification, Check Tire Pressure Warnings notes.

	4 Complete an ignition cycle to ignition on and verify that the instrument cluster no longer reports a spare tire pressure warning.
	Does the instrument cluster continue to report a spare tire pressure warning? **Yes** GO to G4. **No** No repair action is required. It is possible that the customer may have placed items in the vehicle's luggage compartment that prevented correct RF reception.
G4: VERIFY THAT THE SPARE TIRE LOW PRESSURE SENSOR ID HAS BEEN CORRECTLY PROGRAMMED TO THE MODULE	
	1 Remove tire low pressure sensor. Record the 8 character hexadecimal ID written on the casing.
	2 Use the approved diagnostic system to read the spare tire sensor ID from the module. Refer to the relevant procedure in the workshop manual.
	3 Compare the IDs from steps 1 & 2.
	Do the IDs match? **Yes** Replace the spare tire low pressure sensor. Refer to the relevant installation section in the workshop manual. The identification for the sensor must be programmed into the tire pressure monitoring system module using the manufacturer approved diagnostic system. The identification code is provided on a label with the complete assembly and is also printed on the casing of each sensor. **No** Program the spare tire sensor ID, recorded in step 1, to the module using the approved diagnostic system. The identification code is provided on a label with the complete assembly and is also printed on the casing of each sensor. Repeat test to ensure correct operation. GO to G3.

Wheels and Tires - Tire Low Pressure Sensor

Removal and Installation

Removal

• NOTE: It is strongly recommended that the valve seal and steel washer is replaced each time a tire is changed to avoid a seal failure. The seal and washer must be replaced if the sensor is removed. Removal of the sensor retaining nut must be regarded as sensor removal. The valve cap must always be in place except when inflating, releasing pressure or checking pressure.

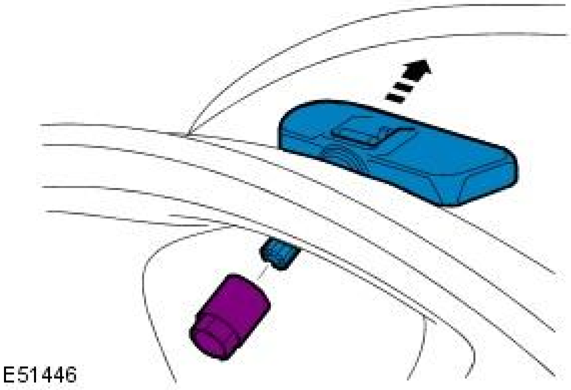
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

3. ⚠ CAUTION: To avoid damage to the tire low pressure sensor, release the tire bead from the rim, 180 degrees from the valve.

Remove the tire from the wheel.



E51446

4. CAUTIONS:

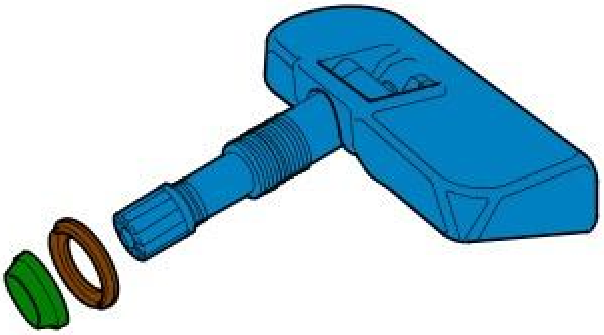
⚠ Do not push on the valve.

⚠ If the tire low pressure sensor is to be re-installed, a new washer, seal and nut must be installed.

⚠ If the tire low pressure sensor is to be re-installed, a new washer, seal, nut and silver coloured nickel valve core must be installed.

Remove the tire low pressure sensor.

- Remove the nut.
- Release and withdraw the sensor along the valve axis.



E51447

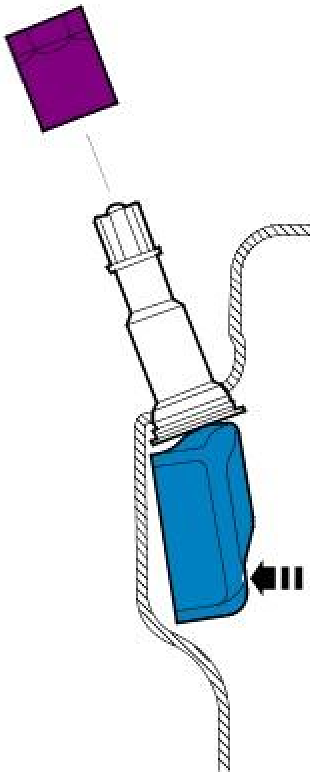
5. If necessary, install a new seal and washer.

- Remove and discard the seal and washer.
- Install a new washer and seal, making sure the valve remains pressed fully onto its seat.

Installation

1. ⚠ CAUTION: Do not use compressed air to clean the sensor. Do not clean the sensor with solvents or cleaning agents of any type, use a clean dry cloth.

Clean the component mating faces.



E51449

2. ⚠ CAUTION: Do not apply any lubricant to the new valve.

• NOTE: If the sensor is replaced on a 'running' wheel, the new sensor identification will be learnt when the vehicle is first driven. If a new sensor is fitted to the spare wheel the identification for that sensor must be programmed into the Tire Pressure Monitoring System (TPMS) module using T4. The identifcation code is provided on a label with the complete assembly and is also printed on the casing of each sensor.

Install the tire low pressure sensor.

- Install and hand tighten the nut whilst keeping the sensor in place.
- Tighten the nut to 6.5 Nm (4.8 lb.ft).

3. Install the tire and balance the wheel.
4. Install the wheel and tire.
   - Tighten the wheel nuts to 140 Nm (103 lb.ft).

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Rear Antenna

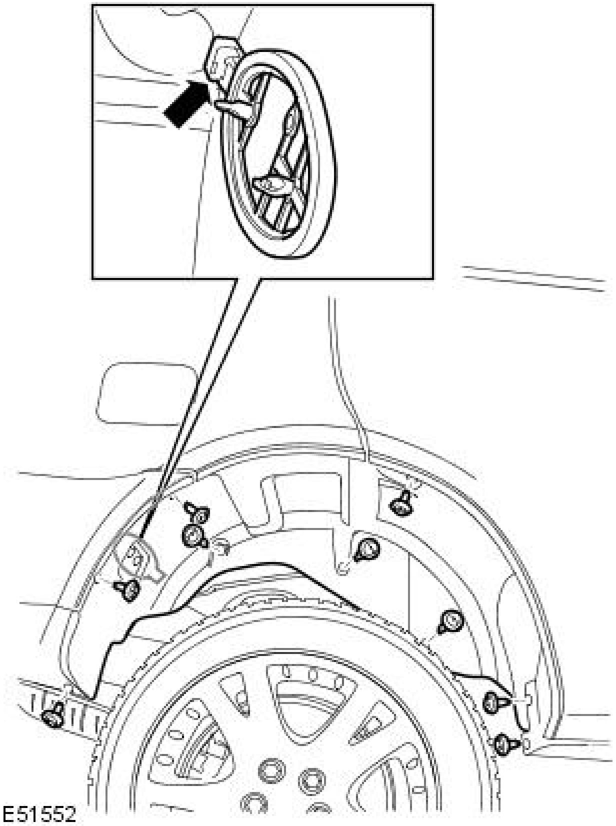
Removal and Installation

Removal

1. Raise and support the vehicle.

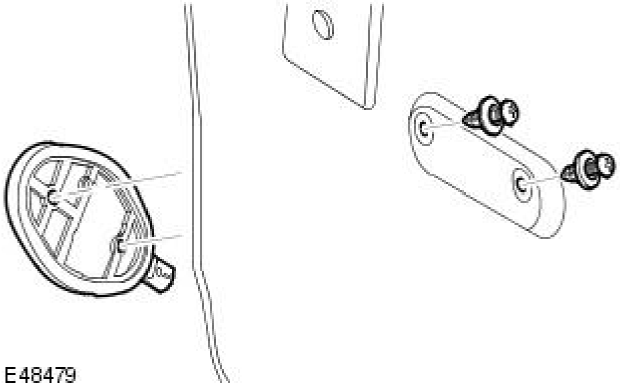
2. Remove the fender splash shield.

- Remove the 9 screws.
- Disconnect the electrical connector.



3. Remove the tire pressure antenna.

- Remove the 2 retainers.



Installation

1. To install, reverse the removal procedure.

2. Initiate a new tire pressure antenna using T4.

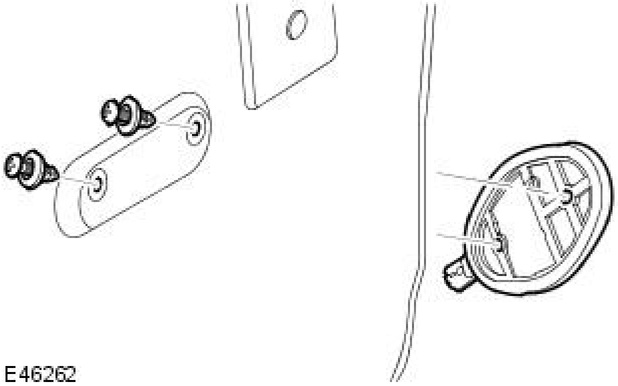
Published: 11-May-2011

Wheels and Tires - Tire Pressure Monitoring System (TPMS) Front Antenna

Removal and Installation

Removal

1. Raise and support the vehicle.
2. Remove the fender splash shield.
   For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).
3. Remove the tire pressure antenna.
   - Remove the 2 retainers.



Installation

1. To install, reverse the removal procedure.
2. Initiate a new tire pressure antenna using T4.

Wheels and Tires -

Wheels

Wheel type	Wheel size
Alloy wheel	7J x 17
Alloy wheel	8J x 18
Alloy wheel	8J x 19
Alloy wheel	9J x 19
Alloy wheel	9.5J x 20
Reduced size spare wheel - Steel	5.5J x 19

- CAUTIONS:

⚠ With reduced size spare wheel installed, do not exceed 50 mph (80 kph) and replace with standard size wheel at earliest opportunity.

⚠ Do not use power tools when operating the spare wheel winch, raise and lower winch manually using hand tools only.

Tire Sizes - Standard Fit

Wheel size	Tire size	Tire load index
7J x 17 - Alloy	235/65 R17H - All terrain	108
8J x 18 - Alloy	255/55 R18V - All terrain	109
8J x 19 - Alloy	255/50 R19Y - All terrain	107
9J x 19 - Alloy	255/50 R19Y - All terrain	107
9.5J x 20 - Alloy	275/40 R20M - All terrain	106

⚠ CAUTION: Inner tubes must not be installed with any of these tires.

Tire Pressures - Not NAS Vehicles

Loading condition	bar	lb/in^2	kPa
Normal operating conditions - Up to 4 people:			
Front	2.3	34	230
Rear	2.5	36	250
Vehicle loaded to maximum gross vehicle weight:			
Front	2.6	38	260
Rear	2.9	42	290
Reduced size spare wheel	4.2	60	420
*** Standard size spare wheel**	2.9	42	290

⚠ CAUTION: * The standard size spare wheel tire should be inflated to the maximum gross vehicle weight pressure and the pressure for the front or rear wheel locations must be adjusted accordingly if the wheel is to be used under conditions other than with the vehicle loaded to maximum gross vehicle weight.

Tire Pressures - NAS Vehicles

Loading condition	bar	lb/in^2	kPa
All conditions:			
Front	2.6	38	260
Rear	2.9	42	290
Reduced size spare wheel	4.2	60	420
*** Standard size spare wheel**	2.9	42	290

⚠ CAUTION: * The standard size spare wheel tire should always be inflated to the highest loading condition pressure which must be adjusted accordingly if the wheel is to be installed to the front wheel locations.

General Specification

Item	Make	Location
Tire low pressure sensor	Siemens	On inside of wheel rim
Tire pressure sensor initiator:		
Front	Siemens	Attached to the fender splash shield adjacent to the front bumper
Rear	Siemens	Attached to the fender splash shield adjacent to the rear bumper
Module	Siemens	Attached to the roof behind the roof opening panel.

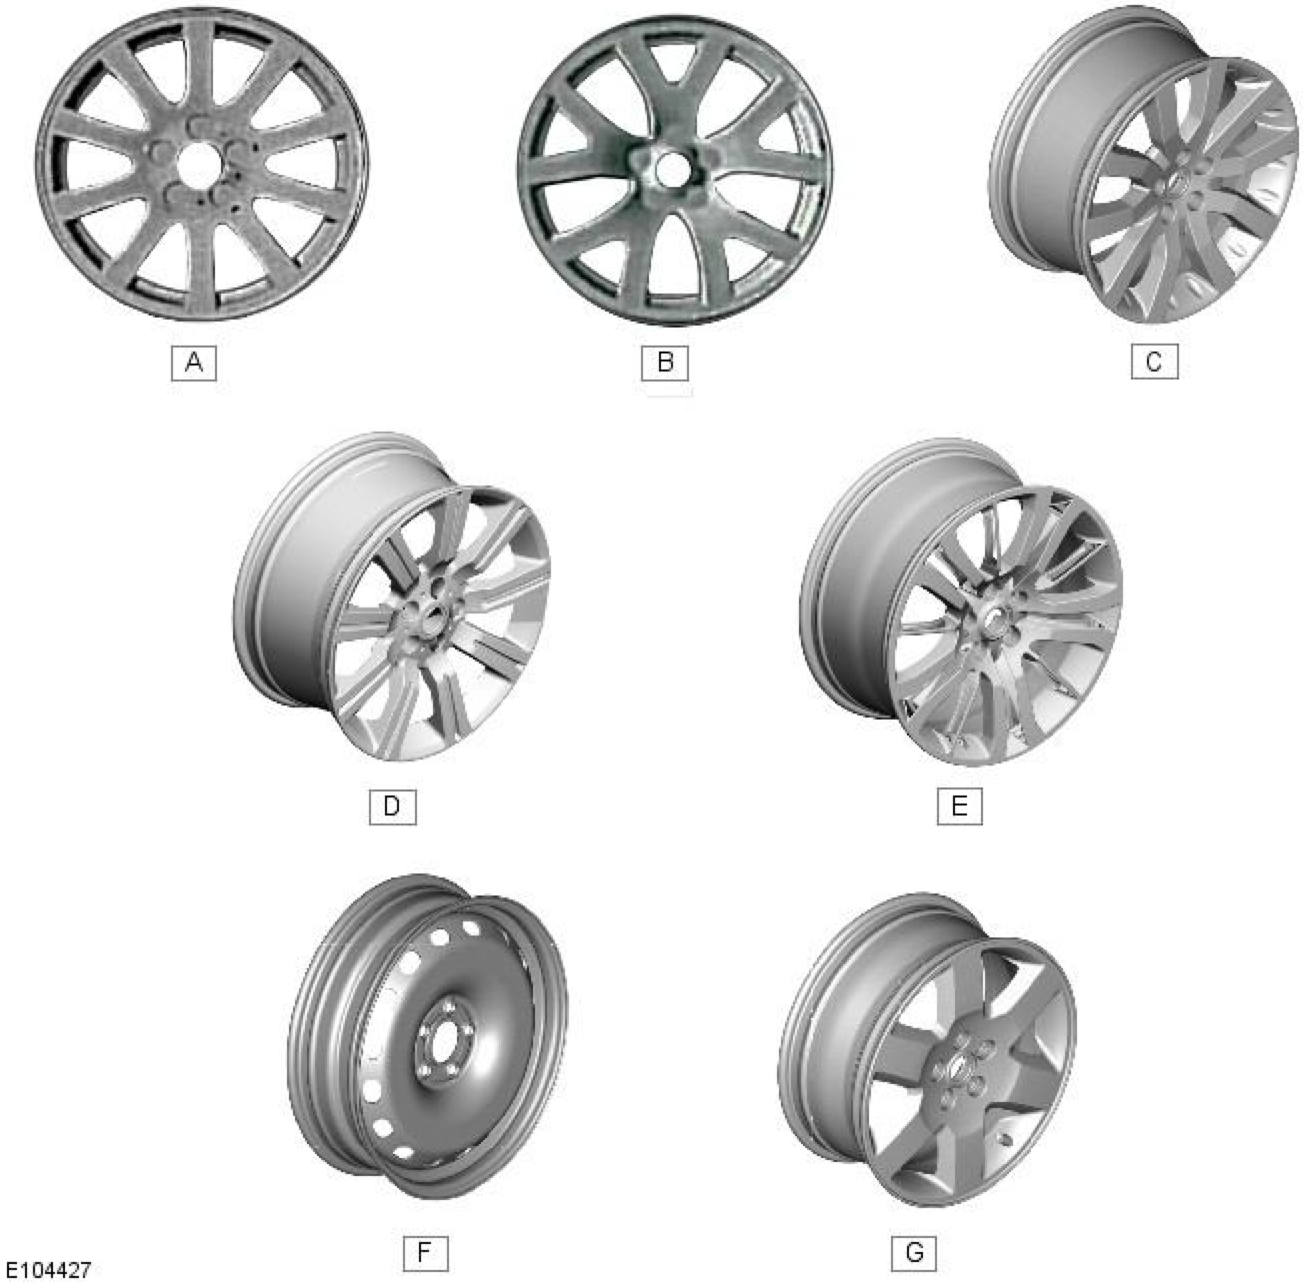
Wheels and Tires - Wheels and Tires

Description and Operation

OVERVIEW

A number of alloy wheel and tire size combinations are available. A Tire Pressure Monitoring System (TPMS) is also available. This system monitors the pressure in each tire and informs the driver if the pressure is outside predetermined thresholds.

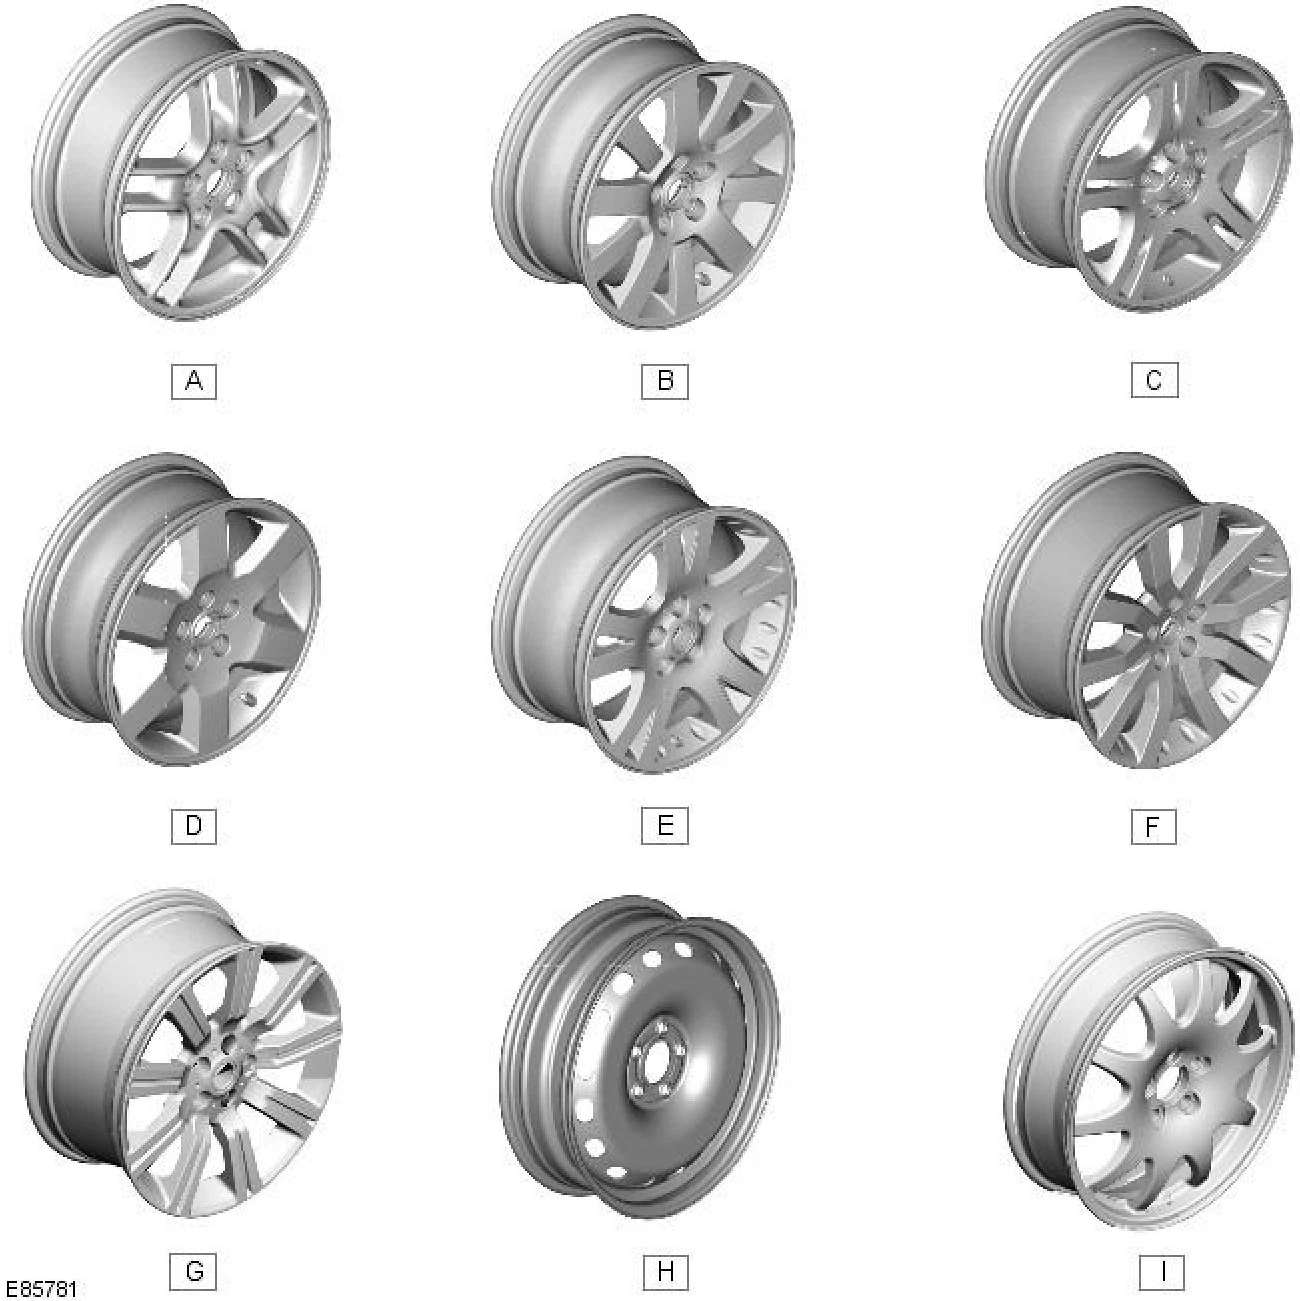
WHEELS (2009 MY onwards)



Item	Part Number	Description
A	-	8JX18 (10 Spoke)
B	-	9JX19 (5x2 Spoke)
C	-	9½JX20 (10 Spoke Supercharge + 10 Spoke Supercharge Chrome Shadow)
D	-	9½JX20 (Stormer)
E	-	9½JX20 (5 Star + 5 Star Diamond Turned)

F	-	5½JX19 (Stiff Space Saver)
G	-	8X19 (6 Spoke Spare)

WHEELS (up to 2009 MY)



Item	Part Number	Description
A	-	7JX17
B	-	8JX18 - Style 2
C	-	8JX18 - Style 3 (up to 2007MY)
D	-	8JX19
E	-	9JX19
F	-	9½JX20
G	-	9.5JX20 Stormer (from 2007)
H	-	5½JX19 - Space saver (up to 2007MY)
I	-	5.5X19 Space Saver Alloy (from 2007)

There are a number of different alloy wheel sizes and styles as shown in the above illustration.

The spare wheel fitted to most vehicles is a steel space saver wheel. The wheel size is 5½J X 19 and uses a T175/80R19 tire. The space saver wheel is a standard fitment for all markets except Gulf states. An 8J X 19 alloy, black painted spare is offered as an optional fitment. The steel space saver and the alloy spare wheel are subject to a maximum 50 mph (80 km/h) speed limit.

TIRES

Tires are available in a number of sizes and tread patterns dependent on the vehicle usage. Tire sizes are as follows:

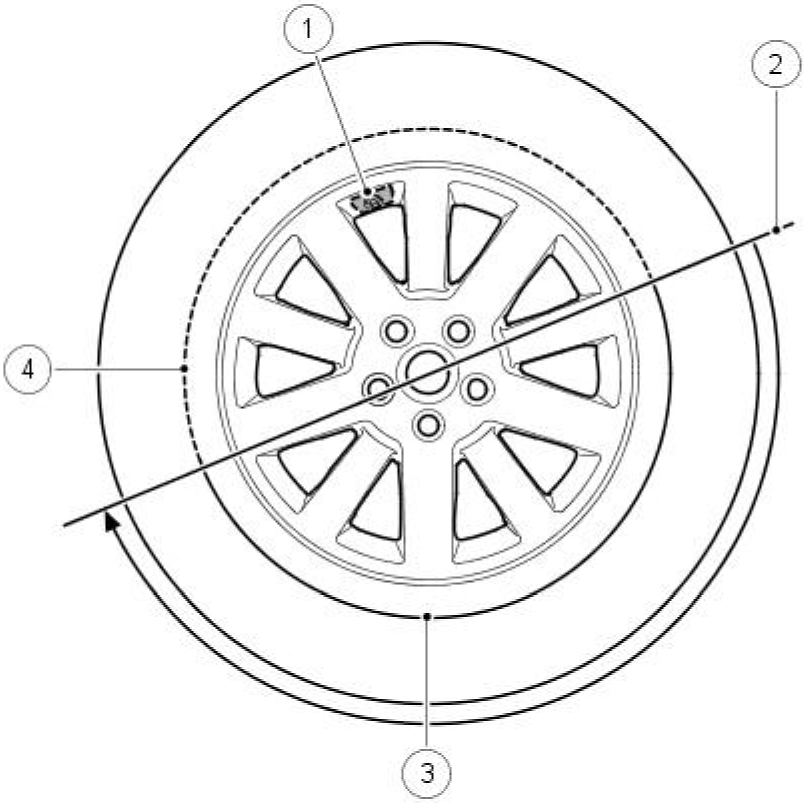
- 235/65R17
- 255/55R18
- 255/50R19
- 275/40R20.

The following tires are available; All Season (AS), All Terrain (AT) and All Terrain - Sport (AT-S).

• NOTE: Tires should be inflated to the recommended pressures (as given in the owners handbook) only when the tires are cold (ambient temperature). If the tires have been subjected to use or exposed to direct sunlight, move the vehicle into a shaded position and allow the tires to cool before checking and/or adjusting the pressures.

Tire Changing

Care must be taken when removing and refitting tires to ensure that the tire pressure sensor is not damaged.



E45549

Item	Part Number	Description
1	-	Tire valve and pressure sensor
2	-	Tire fitting/removal tool initial start position
3	-	High tire and bead tension area
4	-	Low tire and bead tension area

When removing the tire, the bead breaker must not be used within 90 degrees of the tire valve in each direction.

When using the tire removal machine, the fitting arm start position must be positioned as shown in the tire changing illustration. The wheel can then be rotated through 180 degrees in a counterclockwise direction. This will relieve the high tension from the tire bead allowing the remaining 180 degrees of the tire to be manually pulled from the rim.

When refitting the tire, position the fitting arm as shown. Rotate the tire and take care that the bead on the low tension side of the tire does not damage the sensor.

Tread Act - NAS Only

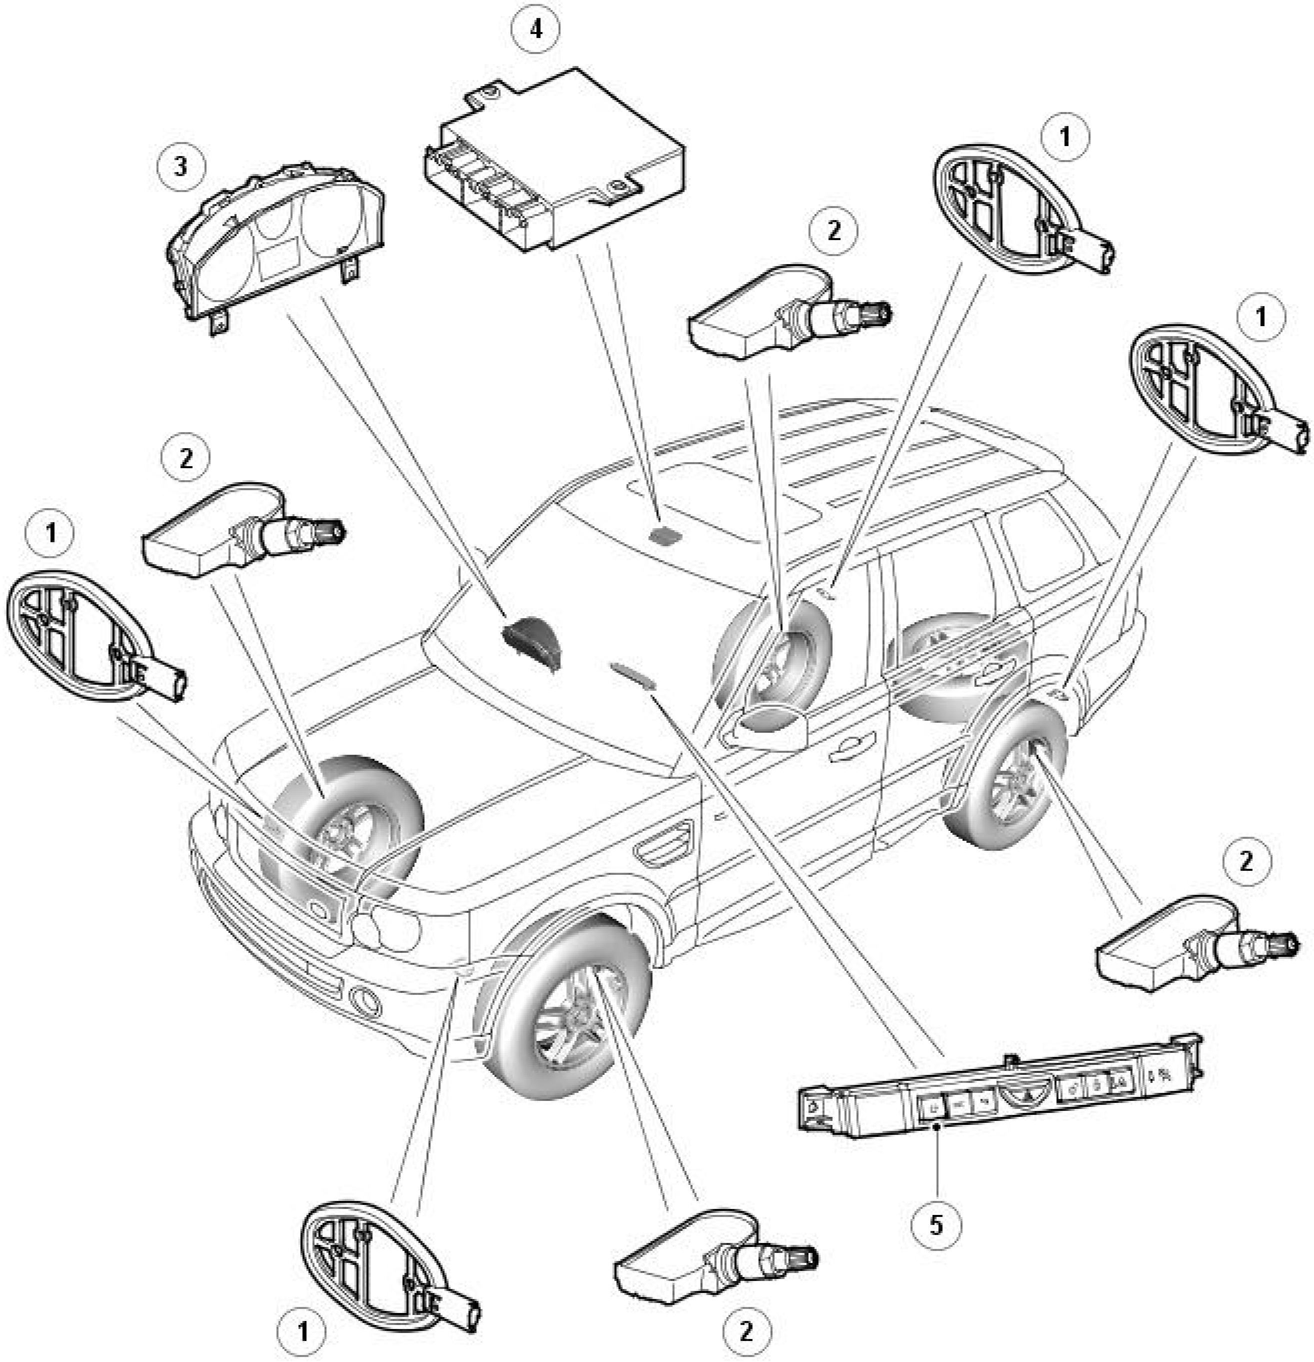
Vehicles supplied to the North American markets must comply with the legislation of the Transport Recall Enhancement, Accountability and Documentation (TREAD) act. Part of the requirement of the TREAD act is for the vehicle to display a label, positioned on the driver's side B-pillar, which defines the recommended tire inflation pressure, load limits and maximum load of passengers and luggage the vehicle can safely carry. This label is specific to each individual vehicle and is installed on the production line.

This label must not be removed from the vehicle. The label information will only define the specification of the vehicle as it came off the production line. It will not include dealer or owner fitted accessory wheels and tires of differing size from the original fitment.

If the label is damaged or removed for body repair, it must be replaced with a new label specific to that vehicle. A new label is requested from Land Rover parts and will be printed specifically for the supplied VIN of the vehicle.

TIRE PRESSURE MONITORING SYSTEM (TPMS)

Tire Pressure Monitoring System - Component Location



E52480

Item	Part Number	Description
1	-	Initiator
2	-	Tire pressure sensor
3	-	Instrument cluster
4	-	TPMS module
5	-	TPMS switch (Not available on NAS vehicles)

The purpose of the Tire Pressure Monitoring System (TPMS) is to assist the driver in maintaining the vehicle's tire pressures at the optimum level in order to:

- improve fuel consumption
- maintain ride and handling characteristics
- reduce the risk of rapid tire deflation – which may be caused by under inflated tires
- comply with legislation in relevant markets.

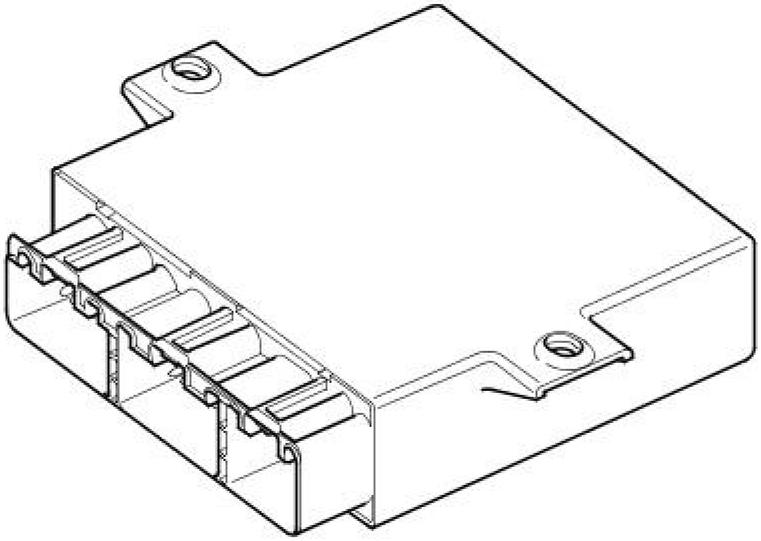
The TPMS measures the pressure in each of the tires on the vehicle (including the spare, if required) and issues warnings to the driver if any of the pressures deviate from defined tolerances.

• NOTE: During a 'blow out' a very rapid reduction in pressure is experienced. The system is not intended to warn the driver of a 'blow out', since it is not possible to give the driver sufficient warning that such an event is occurring, due to its short duration. The design of the TPMS is to assist the driver in keeping the tires at the correct pressure, which will tend to reduce the likelihood of a tire 'blow out' occurring.

A single TPMS hardware configuration is used. TPMS status information is relayed to the driver with a message displayed in the instrument cluster message centre and one warning indicator LED.

The message centre provides the driver with more detailed information and identifies of location of a specific tire on the vehicle.

TPMS Module



E45551

The TPMS module is located above the head liner of the vehicle, mounted in a central position above the windscreen. The module is retained in position with two plastic locknuts. The three connectors of the module point towards the left hand side of the vehicle.

The TPMS module's main function is to detect the following:

- the tire pressure is below the recommended low tolerance value – under inflated tire
- the location of the tire on the vehicle.

The TPMS module also communicates with the vehicle instrument cluster to provide the driver with appropriate warnings that show the importance of the condition detected and indicate the status/failure of TPMS components.

Tire Location

Because of the requirement for different pressure targets and thresholds for the front and rear tires, the TPMS module can identify the location of the tires on the vehicle, and assign a received tire pressure sensor identification to a specific position on the vehicle (i.e. FL (front left), FR (front right), RL (rear left) or RR (rear right)).

Tire location is performed automatically by the module using an auto-location function. This function requires no manual intervention by the driver. The TPMS module can automatically learn the position of tires on the vehicle if the tire pressure sensors or their positions are changed on the vehicle.

The tire learn and location process is ready to commence when the vehicle has been stationary or travelling at less than 12 mph (20 km/h) for 15 minutes. This is known as 'parking mode'. The learn/locate process requires the vehicle to driven at speeds of more than 12 mph (20 km/h) for 15 minutes. If the vehicle speed reduces to below 12 mph (20 km/h), the learn process timer is suspended until the vehicle speed increases to more than 12 mph (20 km/h), after which time the timer is resumed. If the vehicle speed remains below 12 mph (20 km/h) for more than 15 minutes, the timer is set to zero and the process starts again.

The TPMS module can automatically detect, under all operating conditions, the following:

- one or more tire pressure sensors have been replaced
- one or more tire pressure sensor identifications are missing
- one or more ‘alien’ identifications are being received, i.e. the module can reject identifications from tire pressure sensors that do not belong to the vehicle
- the spare tire and one of the tires in use on the vehicle have exchanged position on the vehicle.

If the tire pressure sensors fitted to the running wheels (not the spare) are changed, the module can learn the new sensor identifications automatically. The learn function requires no manual intervention by the driver.

If a new sensor is fitted to the spare tire, it must have its identification code programmed into the TPMS module diagnostically using a Land Rover approved diagnostic system or used on the vehicle as a 'running' wheel and the vehicle driven for 15 minutes at more than 12.5 mph (20 km/h).

Spare Tire Identification

Depending on the vehicle specification, the spare tire may or may not be fitted with a tire pressure sensor.

• NOTE: Tire pressure sensors cannot be fitted to space saver spare wheels.

If the spare tire is fitted with a tire pressure sensor, the TPMS module can detect it, determine that it is the spare tire and monitor its pressure and issue warnings to the driver accordingly. If the TPMS module expects the spare tire to be fitted with a tire pressure sensor and it does not, the module will not show a fault to the driver, however a fault code will be stored in the TPMS module.

If the spare tire is being monitored and the driver replaces a flat ‘running’ tire with the spare tire, the module will not continually warn the driver that the original flat tire (now in the spare position) is flat. This prevents distraction of the driver by constant pressure warnings being issued. The driver is reminded by a message displayed for 20 seconds at each ignition on cycle that the spare tire is flat.

System Operation

Each time the vehicle is driven, the TPMS module transmits a Low Frequency (LF) (125 KHz) signal to each initiator in turn. This is received by the tire pressure sensor which transmits a Radio Frequency (RF) (315 or 433 MHz depending on market) signal to the module. This signal contains coded data which corresponds to sensor identification, air pressure, air temperature and acceleration data.

The system enters 'parking mode' after the vehicle speed has been less than 12.5 mph (20 km/h) for 12 minutes. In parking mode the tire pressure sensors transmit a coded signal to the module once every 13 hours. If the tire pressure decreases by more than 1 lbf/in^2 (0.6 bar) the sensor will transmit more often if pressure is being lost.

The spare tire sensor transmits a signal every 13 hours in the same manner as the road wheels when in parking mode. If the tire pressure decreases by more than 1 lbf/in^2 (0.6 bar) the sensor will transmit more often if pressure is being lost.

As each wheel responds to the LF signal from the TPMS module, it is assigned a position on the vehicle and is monitored for the remainder of that drive cycle in that position.

When the vehicle has been parked for more than 15 minutes and then driven at a speed of more than 12.5 mph (20 km/h), the initiators fire in turn for 6 seconds on vehicles fitted with 433 MHz systems or for 18 seconds on vehicles fitted with 315 MHz systems in the following order:

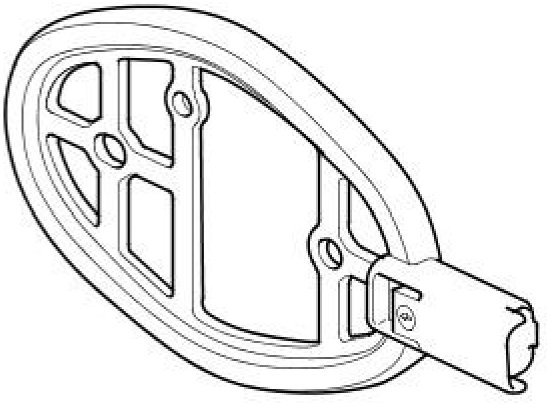
- Front left
- 6 second pause (for the TPMS module to detect a response from the tire pressure sensor)
- Front right
- 6 second pause
- Rear right
- 6 second pause
- Rear left
- 6 second pause.

Each tire pressure sensor responds in turn so the module can establish the sensor positions at the start of the drive cycle. This process is repeated up to three times but less if the sensor positions are already known in the module. The process is known as 'Auto Location' and takes 3 to 4 minutes on vehicles fitted with 433 MHz systems and 7 to 8 minutes on vehicles fitted with 315 MHz systems to complete. During this period the tire sensors transmit at regular intervals, once every 5 seconds on vehicles fitted with 433 MHz systems and once every 15 seconds on vehicles fitted with 315 MHz systems. For the remainder of the drive cycle the tire sensors transmit once every 60 seconds or if a change in tire pressure is sensed until the vehicle stops and the system returns to parking mode.

Once the wheel position is established, the initiators stop firing a signal and do not fire again until the vehicle has been parked for more than 15 minutes. The signal transmissions from each wheel sensor continue at 1 minute intervals whilst the vehicle is being driven. This transmission is to monitor the tire pressure.

At 25% deflation the amber warning indicator in the instrument cluster is illuminated and an appropriate message displayed in the message centre.

Initiator



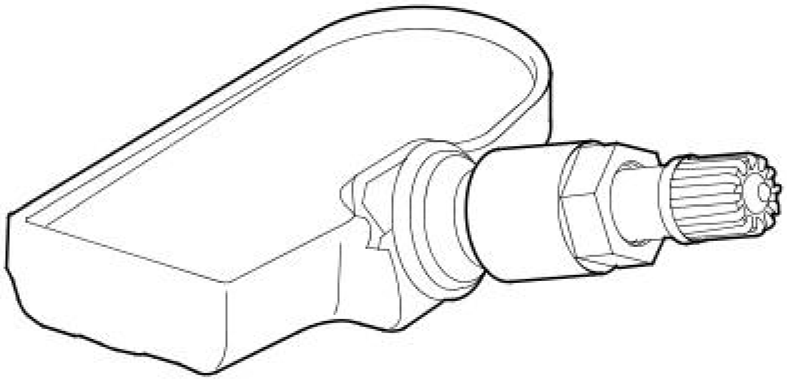
E45552

The initiators are located near the front of the front wheel arches and near the rear of the rear wheel arches and are secured with two scrivets. The TPMS has four initiators. Each initiator has a connector which connects with the body harness.

The initiator is a passive, Low Frequency (LF) transmitter. Each initiator provides an auto-location feature to identify tire positions on the vehicle and transmit that data to the TPMS module.

The TPMS module energises each initiator in turn using LF drivers. The corresponding tire pressure sensor detects the resulting LF transmission and responds by initiating an RF transmission of its data. This data is received by the TPMS module internal RF antenna. The module can then determine which sensor is transmitting and its location on the vehicle.

Tire Pressure Sensor



E45553

The TPMS system uses ‘active’ tire pressure sensors which are mounted on each wheel, inside the tire cavity. The sensor is retained in position by the valve attachment to the wheel structure. The sensors transmit their RF signals at either 315 MHz or 433 MHz dependent on market requirements.

The sensors periodically measure the pressure and temperature of the air inside the tire. Pressure and temperature measurements are transmitted periodically to the RF receiver in the vehicle.

The tire pressure sensors are self-contained units which have no electrical connections into or out of the sensor.

The care points detailed in 'Tire Changing' in this chapter must be followed to avoid damage to the sensor. If the sensor is replaced, the nut, seal and washer must also be replaced and the sensor tightened to the correct torque value as given in the Service Repair manual.

The RF transmission from the sensor contains a unique identification code in its transmission data, so that the TPMS module can identify the tire on the vehicle. If the sensor is replaced on a 'running' wheel, the new sensor identification will be learnt when the vehicle is first driven at a speed of more than 12.5 mph (20 km/h) for 15 minutes. If a new sensor is fitted to the spare wheel, the identification for that sensor must be programmed into the TPMS module using a Land Rover approved diagnostic system or that wheel will not be monitored. The code is provided on a label with the complete wheel and tire assembly when new and is also printed on the casing of each sensor.

The replacement spare wheel may also be programmed to the vehicle by using it as a 'running' wheel for 15 minutes at more than 12.5 mph (20 km/h), then replacing it to the spare wheel position.

In order to conserve battery power, the tire sensor module uses different transmission rates when the wheel is stationary or moving. The wheel speed required to change between the stationary and moving transmission rates is very low to allow for the requirement for slow off-road driving.

TPMS Switch

- NOTE: The TPMS switch is not fitted to NAS vehicles. NAS vehicles do not have the option to select target pressure modes.

The TPMS switch is a non-latching push button switch which is located in the centre console switch pack, adjacent to the DSC switch.

The TPMS switch is used by the driver to set the required target pressures for the vehicle, i.e. ‘light load’ or ‘heavy load’. The switch is used to toggle between the two modes.

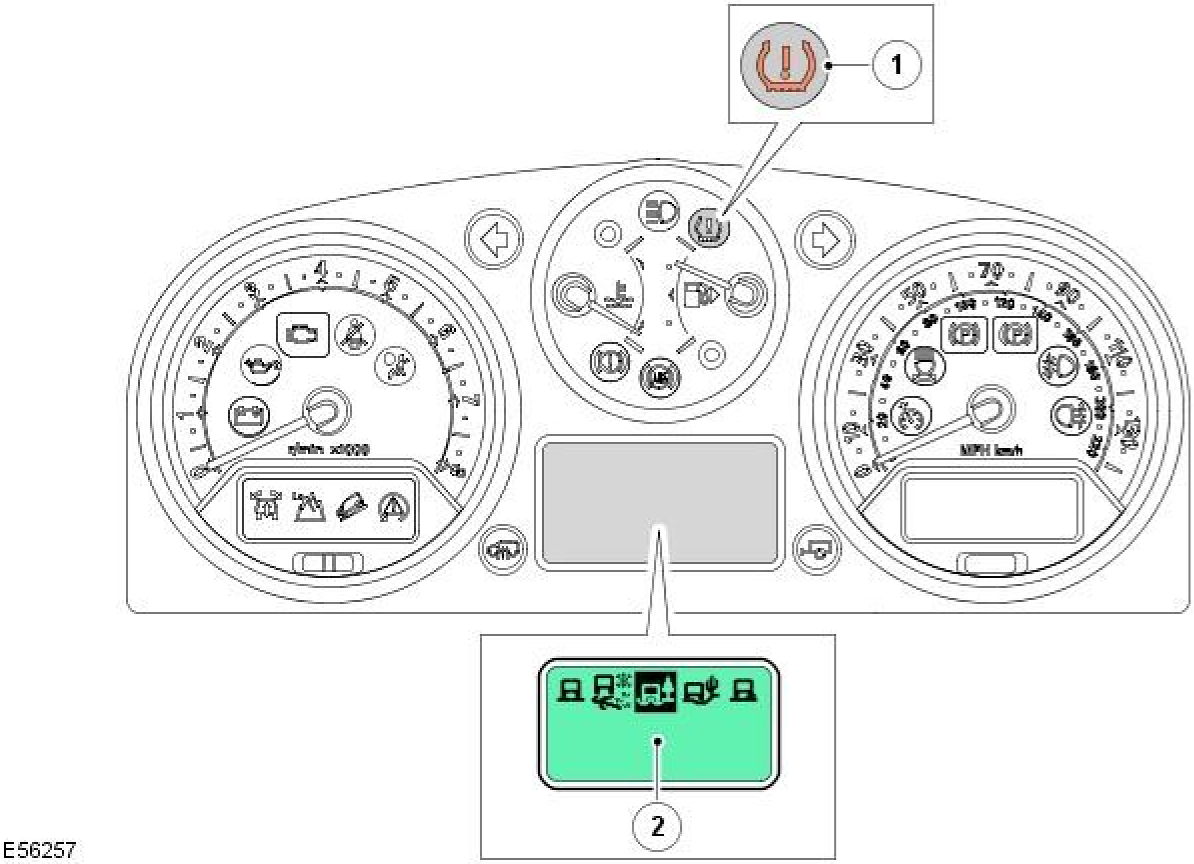
The TPMS switch has a status LED, located in the face of the switch, which informs the driver when the ‘light load’ or ‘heavy load’ pressures are set. When 'light load' mode is set, the LED is illuminated. When 'heavy load' mode is set, the LED is extinguished.

The status LED has two-stage illumination, providing day or night time illumination levels. The illumination level is determined by the TPMS module, based on data received via the vehicle CAN interface.

The switch is used to change between the modes as required. The ignition switch must be in position II. If the TPMS is in the 'light load' mode, pressing and holding the switch for 4 seconds will change the target pressures to 'heavy load' mode. The LED will be extinguished, the message centre in the instrument cluster will flash 'TYRE PRESSURE MONITORING SET FOR HEAVY LOAD' for 3 seconds. This setting will remain until deselected by the driver.

To change from 'heavy load' mode to 'light load' mode, the ignition switch must be in position II and the switch must be pressed and held for 4 seconds. This will change the target pressures from 'heavy load' mode to 'light load' mode. The switch LED will illuminate and the instrument cluster message centre will display 'TYRE PRESSURE MONITORING SET FOR LIGHT LOAD' for 3 seconds. The 'light load' message will also be displayed at every ignition cycle.

Instrument Cluster Indications



Item	Part Number	Description
1	-	Amber warning indicator
2	-	Message centre

The warning indications to the driver are common on all vehicles fitted with TPMS. Warnings are conveyed by an amber LED warning indicator and a text message displayed in the message centre.

The warning indicator and message centre are driven by CAN messages from the TPMS module. The warning indicator is illuminated by the cluster software for 3 seconds when the ignition is switched to position II for a bulb check.

• NOTE: If the vehicle is not fitted with the TPMS, the warning indicator will not illuminate at any time.

When the TPMS module transmits a warning indicator on signal, this may also be accompanied by a chime from the instrument cluster sounder.

The following table shows the warning indicator functionality for given events.

Event	Instrument Cluster Indications
Minor warning threshold reached in any 'running' tire	Amber LED illuminated. 'CHECK ALL TYRE PRESSURES' message displayed.
Any 'running' or 'spare' tire pressure sensor battery low	No indication (Fault code stored on TPMS module)
TPMS Fault	Amber LED illuminated. Amber LED illuminated at next and subsequent ignition on cycle. Sounder activated on initial LED illumination. 'TYRE PRESSURE MONITORING SYSTEM FAULT' message displayed.
One TPMS wheel sensor fault	Amber LED illuminated. Amber LED illuminated at next and subsequent ignition on cycle. Sounder activated on initial LED illumination. 'XX TYRE PRESSURE NOT MONITORED' message displayed.
More than one TPMS wheel sensor fault	Amber LED illuminated. Amber LED illuminated at next and subsequent ignition on cycle. Sounder activated on detection of each additional

Event	Instrument Cluster Indications
	wheel sensor fault event. 'TYRE PRESSURE MONITORING SYSTEM FAULT' message displayed.
TPMS switch pressed for 4 seconds to set 'Light Load' operation when engine is not running and the ignition switch is in position II	TPMS switch status LED illuminated. 'TYRE PRESSURE MONITORING SET FOR LIGHT LOAD' message displayed for 3 seconds.
TPMS switch pressed for 4 seconds to set 'Heavy Load' operation when engine is not running and the ignition switch is in position II	TPMS switch status LED is extinguished. 'TYRE PRESSURE MONITORING SET FOR HEAVY LOAD' message is displayed for 3 seconds.

- NOTE: 'XX' is the tire position on the vehicle, e.g. FL (front left), FR (front right), RL (rear left) or RR (rear right).

Controller Area Network (CAN)

The TPMS module sends and receives a number of digital messages via the medium speed CAN. The received messages are used for the operation of the TPMS. The transmitted messages comprise of TPMS status and requests to the instrument cluster to illuminate warnings indicators and/or display messages in the message centre.

Received Messages

The TPMS module receives the messages shown in the following table.

Message	Transmitted By
Vehicle speed	ABS module
External ambient temperature - corrected	ATC module
Side lamp status	CJB
Ignition switch status	CJB
Odometer value	Instrument cluster
Minute counter	Instrument cluster
Vehicle voltage level	Instrument cluster
Engine crank relay status	ECM
Diagnostic physical request	Land Rover approved diagnostic system
Diagnostic functional request	Land Rover approved diagnostic system
Engine running status	ECM
Master car configuration identification	Instrument cluster
Car configuration parameters	Instrument cluster

Transmitted Messages

The TPMS module transmits the messages shown in the following table.

Message	Received By
TPMS diagnostic response	Land Rover approved diagnostic system
TPMS yellow warning indicator request at 25% tire deflation	Instrument cluster
TPMS audible alert	Instrument cluster
TPMS message display request	Instrument cluster

Diagnostics

The TPMS module has a diagnostic connection via the medium speed CAN to enable system status and faults to be retrieved using a Land Rover approved diagnostic system.

Additionally, an on-board diagnostic routine within the TPMS module constantly monitors the system and alerts the driver to system faults by illuminating the amber warning indicator, emitting a tone from the instrument cluster sounder and/or displaying a message in the instrument cluster message centre.

Fault Detection

If a sensor fails, the amber warning indicator in the instrument cluster will be illuminated. A message 'XX Tyre Pressure Not Monitored' will be displayed in the message centre in addition to the amber warning indicator.

If more than one sensor fails or the TPMS module develops a fault, the amber warning indicator will be illuminated. A message 'Tyre Pressure Monitoring System Fault' will be displayed in the message centre in addition to the amber warning indicator. This fault could also be caused if RF interference near the vehicle affects the system signal reception. When the interference has ceased, the fault will be automatically cancelled and the TPMS will operate normally.

If a tire pressure sensor battery voltage becomes low, the sensor transmits a message to the TPMS module. The module stores the low battery condition as a fault flag in its memory with no other visual warnings displayed. If the battery fails, the sensor will stop transmitting and the TPMS module will transmit a message to display 'FL Tyre Not Being Monitored' for example in the message centre.

The dealer should interrogate the TPMS module using a Land Rover approved diagnostic system for the fault flag to determine the cause of the message. If the battery has failed, the sensor must be replaced and the stored fault flags removed using a Land Rover approved diagnostic system.

The TPMS module will learn the identification of the new sensor when the vehicle is driven. If the replaced sensor is fitted to the spare wheel (if fitted), its identification must be manually programmed into the module using a Land Rover approved diagnostic system or by using it as a 'running' wheel for 15 minutes at more than 12.5 mph (20 km/h), then replacing it to the spare wheel position.

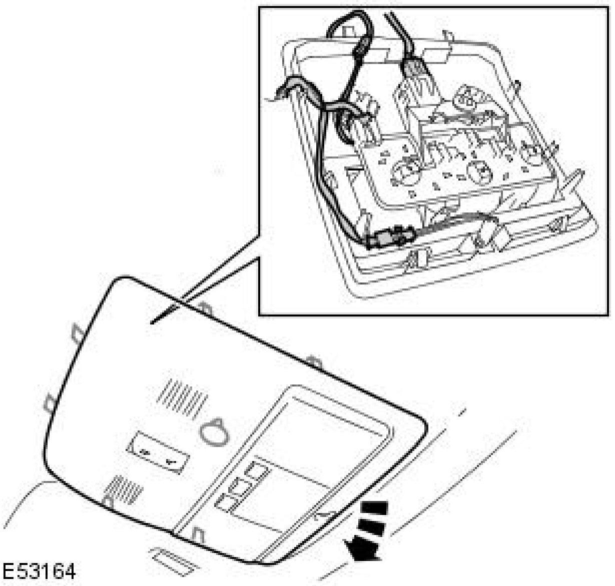
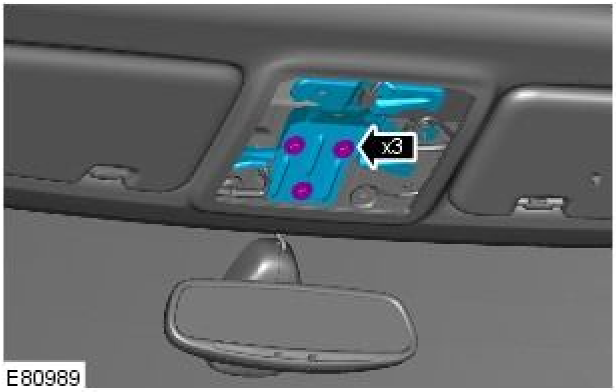
Wheels and Tires - Tire Pressure Monitoring System (TPMS) Module

Removal and Installation

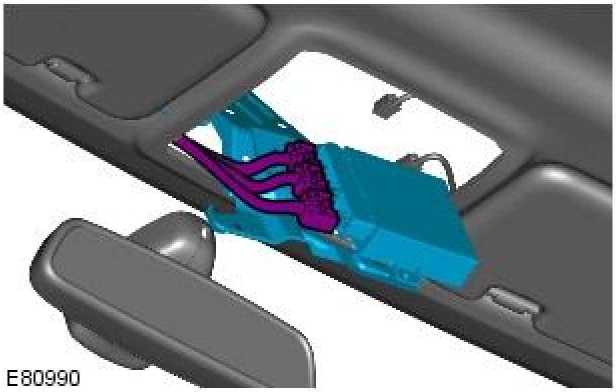
Removal



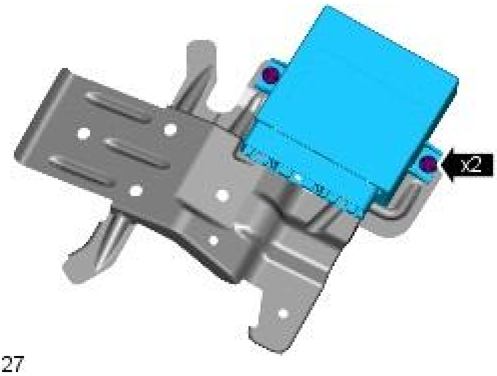
1. Remove the overhead console.



2. Remove the tire pressure monitoring module and bracket assembly.



3. Disconnect the electrical connectors.



E81027

4. NOTE: Do not disassemble further if the component is removed for access only.

Remove the tire pressure monitoring module.

Installation

1. Install the tire pressure monitoring module.

2. Install the tire pressure monitoring module and bracket assembly.

- Install and tighten the bolts to 25 Nm (18 lb.ft).

3. Install the overhead console.

Vehicle Dynamic Suspension - Ride Height Adjustments

General Procedures

Special Tool(s)	
	Gauge, Ride height 204-557B

- CAUTIONS:

⚠ Make sure the wheels and tires, tie rod ends, suspension joints and wheel bearings are free from damage, wear and free play.

⚠ Make sure there are no heavy objects in the vehicle.

⚠ The ride height must be measured with the vehicle weight supported by the suspension.

⚠ With the engine running and all vehicle doors closed, make sure the air suspension is functioning and the vehicle height can be raised and lowered using the air suspension switch.

⚠ Drive the vehicle on to a flat, level surface.

⚠ Make sure the steering is in the straight ahead position.

- NOTE: This procedure must be carried out after replacement of the air suspension control module or height sensor link arm, removal or replacement of the front or rear upper arms or the height sensor. The ride height does not need calibration after removal or replacement of the front or rear air springs or shock absorbers.

1. Using the Land Rover approved diagnostic system, carry out the ride height adjustments.

2. ⚠ CAUTION: Make sure the vehicle is not moved once it has been positioned to take measurements.

Position the vehicle on a flat level surface.

3. Connect IDS to the vehicle data link connector.

- Connect the vehicle data link cable into the vehicle communications module.
- Connect the IDS USB Lead into the vehicle communications module.
- Connect the data link cable to the data link connector.
- Connect the IDS USB lead to the IDS USB port.

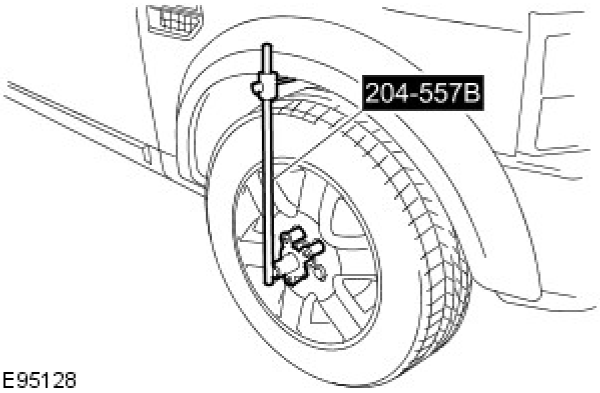
4. ⚠ CAUTION: Make sure the ignition switch is turned off, the park brake is on and the selector lever is in park.

- NOTE: IDS already loaded with the latest issue of software.

Switch IDS on and navigate to the vehicle identification number (VIN) input screen.

5. Enter the VIN and navigate to the vehicle configuration menu.

- Select setup and configuration.
- Select air suspension height calibration and read all warnings and cautions.



6. NOTE: Do not install the special tool over a locking wheel nut.

• NOTE: Make sure the special tool is square to the wheel face with the measuring rod in a vertical position.

• NOTE: Take the measurement from the top edge of the slider on the special tool.

• NOTE: Make sure the fender splash shields are correctly fitted.

Once in the suspension height measurement screen, use the special tool to measure and record the height setting from each wheel center to the wheel arch.

7. ⚠ CAUTION: IDS will now cause the vehicle height to change.

Input the ride height measurements taken from the vehicle into IDS.

8. Using the special tool, repeat the vehicle ride height measurements.

9. After successful calibration of the air suspension switch off IDS and return to its original position.

OVERVIEW

• NOTE: This section covers the air suspension control system.

Front suspension, rear suspension, Dynamic Response and Terrain Response™ are detailed in separate sections. For additional information, refer to:

Front Suspension (204-01 Front Suspension, Description and Operation),
Rear Suspension (204-02 Rear Suspension, Description and Operation),
Active Stabilization System (204-06 Ride and Handling Optimization, Description and Operation),
Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

The dynamic suspension system is a four corner air suspension system which is fitted as standard to all models.

The dynamic suspension system is electronically controlled by an air suspension control module which controls the air supply unit, reacts to inputs from four height sensors and distributes air around the system via valve blocks.

The main air suspension system components are:

- Air suspension control module
- Air supply unit
- Four height sensors
- Three valve block assemblies
- Reservoir
- Air harness
- Four suspension air spring damper modules.

The four corner air suspension system maintains the vehicle height under all operating conditions by controlling the mass of air in the air springs. The air suspension control module uses signals from the four height sensors to maintain the correct suspension height. This is achieved by operating pneumatic control valves to increase or decrease the mass of air in the air spring damper modules.

The air suspension system has three driver selectable, pre-determined ride heights. A driver interface indicates the selected ride height and direction of movement. Additional information is also relayed to the driver via the instrument cluster message centre and by audible warnings also transmitted by the instrument cluster.

Height changes can only be made when the engine is running and the driver's and passenger doors are closed.

Access height can be selected with the engine not running, within 40 seconds of moving the ignition switch to the off position provided the driver's door has not been opened in this time.

The air suspension can be controlled manually by the driver using a switch on the centre console to select the required height change.

OPERATING MODES

The driver can manually select, using the air suspension switch, one of four ride states:

- ON-ROAD - this height is the normal operating height of the vehicle
- OFF-ROAD - this height is higher than the on-road height and provides improved ground clearance, approach, departure and breakover angles
- ACCESS - this height is lower than the on-road height and makes entering and exiting the vehicle easier for the occupants
- CRAWL (Locked at access) - this height allows the vehicle to be driven at the access height at low speeds to provide increased roof clearance in low car parks etc.

HIGH SPEED - A non-selectable, automatic high speed mode is provided which lowers the vehicle height to improve vehicle handling.

• NOTE: Vehicle height changes are prevented if the air suspension control module receives a 'Door Open' signal from the Central Junction Box (CJB).

An additional 'TRANSPORTATION' mode is also available but is only selectable using a Land Rover approved diagnostic system.

An additional function allows the vehicle to be raised or lowered from outside of the vehicle when the vehicle is stationary. For example, this assists with the attachment of a trailer and is achieved using the buttons on the remote handset and the ignition switch in the off position. The remote handset can be programmed to perform a number of additional functions.
For additional information, refer to: Handles, Locks, Latches and Entry Systems (501-14 Handles, Locks, Latches and Entry Systems, Description and Operation).

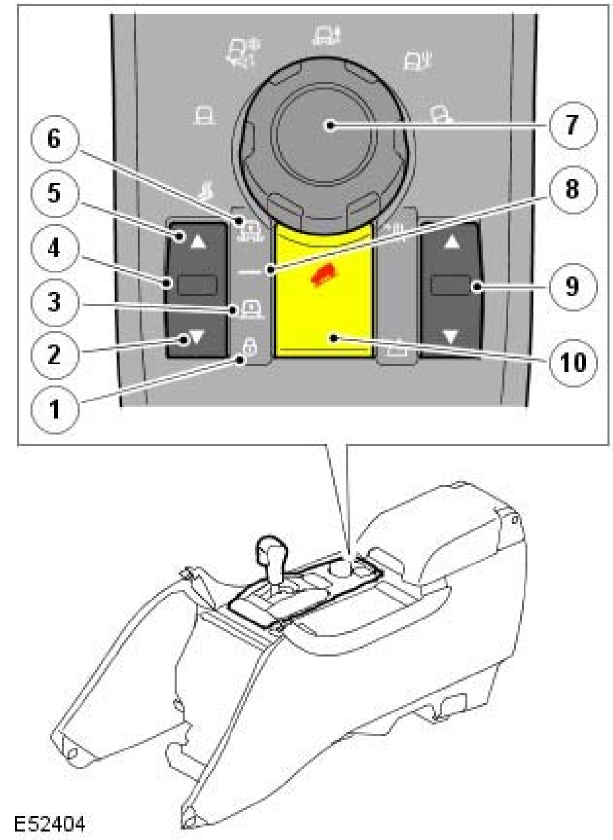
If the air suspension control module senses that the vehicle has grounded and lost traction, the control module can temporarily increase and/or redistribute the volume of air supplied to the affected air spring(s) to maximise the available traction. This is known as extended mode and will be indicated to the driver by the lamps on the air suspension switch flashing and a message in the instrument cluster message centre.

If the air suspension control module senses that the vehicle is prevented from moving upwards or downwards during a height change or levelling correction, the control module will adopt a safe state and further height changes will be suspended.

If a fault is detected by the air suspension control module, the control module will reduce the system functionality dependent on the type and severity of the fault. The control module will also store a fault code which can be retrieved using a Land Rover approved diagnostic system. If a severe fault occurs, the control module will attempt to put the vehicle in a safe condition. A fault is relayed to the driver by the illumination of the air suspension warning indicator, the instrument cluster message centre and an audible warning emitted from the instrument cluster.

If the detected fault is minor and does not affect vehicle safety, the air suspension warning indicator in the instrument cluster will illuminate in an amber color and the fault should be rectified at the earliest opportunity. If a more severe fault is detected, the warning indicator will illuminate in a red color at vehicle speeds above 31 mph (50 km/h) and the vehicle should be driven with care until the fault is rectified. An audible warning is emitted by the instrument cluster sounder when the warning indicator is illuminated. The indicator will change to an amber color and the audible warning will stop when the vehicle speed is reduced.

Air Suspension Switch Mode Lamps



Item	Part Number	Description
1	-	Crawl (locked at access) mode lamp
2	-	Lowering lamp
3	-	Access mode lamp
4	-	Air suspension switch
5	-	Raising lamp
6	-	Off-road mode lamp
7	-	Terrain Response™ rotary control
8	-	On-road (normal height) lamp
9	-	Transfer box range selection switch
10	-	Hill Descent Control (HDC) switch

On-Road Mode

This is the normal ride height for the vehicle.

Off-Road Mode

Off-road mode will only be activated if the vehicle speed is less than 25 mph (40 km/h). The vehicle will be raised 55 mm (2.2 in) higher than the on-road mode to provide additional body clearance and improved approach, departure and breakover angles. If the vehicle speed exceeds 31 mph (50 km/h), the air suspension control module will automatically lower the vehicle to the on-road mode height. At 25 to 28 mph (40 to 45 km/h) a message is displayed in the message centre to warn the driver to slow down or the vehicle will lower.

• NOTE: The suspension can be automatically set to off-road mode when some Terrain Response programs and low range are selected.

Access Mode

Access mode lowers the vehicle body height by 50 mm (2 in) and provides easier entry, exit and loading of the vehicle. Access mode can be pre-selected when the vehicle is moving. The vehicle will partly lower as the vehicle speed decreases, lowering to the full access mode height when the vehicle reaches 5 mph (8 km/h). If the required road speed is not reached within a predetermined time, the air suspension will return the vehicle to the previously selected height.

Access mode can be selected at any vehicle speed. When access mode is selected, the response of the air suspension system will depend on the vehicle speed:

- If the vehicle speed is more than 12.5 mph (20 km/h), the air suspension control module will wait for up to one minute for the vehicle speed to be reduced. The access mode lamp and the lowering lamp will flash while the air suspension control module waits for the vehicle speed to be reduced, the on-road mode lamp will remain illuminated. If the vehicle speed is not reduced sufficiently, the access mode request will be cancelled after 1 minute.

- If the vehicle speed is less than 12.5 mph (20 km/h), the air suspension control module will lower the suspension to a part lowered height and will remain at this height for up to one minute. The on-road mode lamp will extinguish as the air suspension control module lowers the suspension to the part lowered height. The access mode lamp and the lowering lamp will illuminate. When part lowered is reached, the lowering lamp will flash. If the vehicle speed is not reduced to less than 5 mph (8 km/h) in the one minute period, the access mode request will be cancelled.
- If the vehicle speed is less than 5 mph (8 km/h), the suspension will be lowered to access mode immediately. The access mode lamp and the lowering lamp will illuminate. When the access mode height is reached, the lowering lamp will be extinguished.

Access height may be selected up to 40 seconds after the ignition is turned off, provided that the driver's door has not been opened within this time.

The suspension will automatically rise from access mode when the vehicle speed exceeds 6.2 mph (10 km/h). If access mode was selected directly from off-road mode then the system will return to off-road mode when the vehicle speed exceeds 6.2 mph (10 km/h). Otherwise the system will lift the suspension to On-road height.

Selecting Access Mode Directly from Off-Road Mode

When the suspension is in off-road mode height, pressing the air suspension switch once and then a second time before the lowering lamp is extinguished, the control module will lower the suspension to access mode height. The control module will remember to return the suspension to off-road height automatically if the vehicle speed increases above 6.2 mph (10 km/h).

Crawl (Locked at Access) Mode

Crawl mode allows the vehicle to be driven at access height. The vehicle is locked in access height and can be selected at a speed of less than 21.7 mph (35 km/h) and can be driven at low speeds to improve clearance in areas with restricted headroom, i.e. car parks. If the vehicle exceeds 24.8 mph (40 km/h), crawl mode will be cancelled and the vehicle will return to on-road height.

Crawl mode allows the vehicle to be driven at low speeds with the suspension locked at the access mode height. This allows the vehicle to be driven in low car parks etc. with increased roof clearance.

Crawl mode can be selected from normal or access ride heights up to 21.7 mph (35 km/h) with a long press of the switch in the down direction. The access mode lamp and the crawl mode lamp will be illuminated. When the control module is in crawl mode, on-road mode height will be selected automatically if the vehicle speed exceeds 25 mph (40 km/h). At 18.6 to 21.7 mph (30 to 35 km/h) a message is displayed in the message centre to warn the driver to slow down or the vehicle will raise. Crawl mode can also be manually cancelled by moving the switch in the up direction for 1 second. The crawl mode lamp will be extinguished.

High Speed Mode

High speed mode is a non-selectable, automatic mode which lowers the vehicle height by 20mm to improve vehicle handling. This feature is fully automated and is 'invisible' to the driver.

If the vehicle speed exceeds 100 mph (160 km/h) for more than five seconds, the air suspension control module initiates the high speed mode. When the vehicle speed reduces to less than 80 mph (130 km/h) for more than 30 seconds, the vehicle returns to the On-Road height. This function is cancelled if a trailer is connected to the trailer socket.

Automatic Height Change Warnings

When the suspension is in off-road mode, access mode or crawl mode height, the air suspension control module will change the suspension height automatically when the vehicle speed exceeds predetermined thresholds.

When the suspension is at off-road mode or crawl mode height, the control module issues a warning to advise the driver that the vehicle is approaching the speed threshold. The instrument cluster sounder will emit a chime, a message will be displayed in the message centre and the on-road mode lamp and either the raising or lowering lamp will flash.

The off-road mode or crawl mode height speed warning is removed when the vehicle speed is reduced.

SPECIAL MODES

Door Open Functionality

If one or more of the vehicle doors are opened during a height change when the vehicle is stationary, the air suspension control module will restrict further height change. The door open signal is transmitted by the CJB on the high speed CAN bus and received by the air suspension control module. This keeps the vehicle level to the set height when a door opens to allow for changes in loading conditions.

A hardwired door status signal is also transmitted from the CJB to the air suspension control module. This signal provides door status information when the high speed CAN bus is off, i.e.; during periodic re-levelling.

The lamp on the air suspension switch for the target mode height will remain illuminated and the raising or lowering lamp will flash.

If all of the doors are closed within 90 seconds, the height change will resume. If the 90 second period is exceeded and all of the doors are not closed, the height change will be cancelled. The mode lamps showing the previously selected height and the target height will be illuminated. The mode height change can be reselected by operating the switch, however, if the vehicle is driven at speed of more than 5 mph (8 km/h) the control module will continue to raise or lower the vehicle to the target mode height.

Extended Mode

If the vehicle becomes grounded and the traction control becomes operational, the air suspension control module automatically increases the mass of air in the air springs to raise the vehicle clear of the obstruction. Extended mode is activated automatically and cannot be selected manually.

When the air suspension control module has activated the extended mode, the off-road mode lamp will flash if the suspension is above off-road mode height. The off-road mode and on-road mode lamps will flash if the suspension is between off-road mode and on-road mode heights. The on-road mode and access mode lamps will flash if the suspension is between on-road mode and access mode. A message will also be displayed in the message centre.

To exit the extended mode, press the air suspension switch briefly in the up or down position or alternatively drive the vehicle at a speed of more than 2 mph (3 km/h) for 45 seconds.

Additional Lift in Extended Mode

When extended mode has been invoked and the automatic lifting of the vehicle is complete, the driver can request an additional lift of the vehicle. This can be particularly useful when extended mode has been activated on soft surfaces.

The additional lift can be requested once the raising lamp has extinguished. Press and hold the air suspension switch in the up position for 3 seconds whilst simultaneously depressing the brake pedal. A chime from the instrument cluster will sound to confirm that the request has been accepted. The raising symbol will be illuminated while the vehicle is being lifted.

Suspension Prevented From Moving

If the air suspension control module is attempting to change the suspension height and it detects that the suspension is prevented from moving, the control module will stop all suspension movement. This can be caused by jacking the vehicle, attempting to lower the vehicle onto an object or raising the vehicle against an obstruction.

The air suspension switch lamps operate as described for extended mode and the same message is displayed in the message centre. To start the air suspension system operating, press the air suspension switch briefly in the up or down position or drive the vehicle at a speed of more than 12.5 mph (20 km/h).

Periodic Re-levelling

When the vehicle is parked, the air suspension control module 'wakes up' two hours after the ignition was last switched off and then once every six hours. The vehicle height is checked and if the vehicle is not level within a pre-set tolerance, small downwards height adjustments may be made automatically.

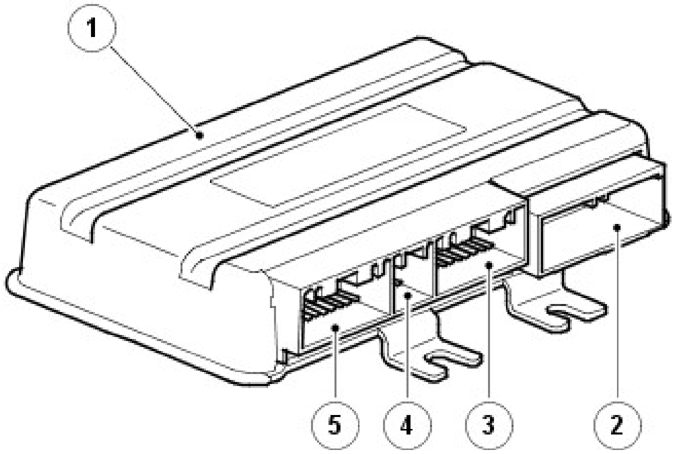
Transportation Mode

Transportation mode is a factory set mode which locks the suspension to enable the vehicle to be safely lashed to a transporter. Transportation mode can only be selected or deselected using a Land Rover approved diagnostic system.

When the ignition switch is switched off, the vehicle will be lowered onto the bump stops. This ensures that the securing straps do not become loose should air leak from the air springs.

When the engine is running, the air supply unit will operate to raise the vehicle height, allowing the vehicle to be loaded. When the ignition switch is subsequently switched off, the vehicle will again lower onto the bump stops. An audible warning will be emitted from the instrument cluster sounder until the vehicle has reached the higher transportation height.

AIR SUSPENSION CONTROL MODULE



E45176

Item	Part Number	Description
1	-	Air suspension control module
2	-	Connector C2321
3	-	Connector C2320
4	-	Connector C2030
5	-	Connector C0867

The air suspension control module is located behind the instrument panel, on the driver's side 'A' pillar. The control module is attached to the 'A' pillar with a single screw and two plastic clips.

The air suspension control module also contains the software for the variable steering.
For additional information, refer to: Power Steering (211-02 Power Steering, Description and Operation).

Calibration

A calibration routine is performed using a Land Rover approved diagnostic system to access the position of each corner of the vehicle and record the settings in the control module memory. Once set, the calibration is not required to be performed unless the air suspension control module is removed or replaced, a height sensor is removed or replaced or a suspension arm to which the sensor is connected is removed or replaced. If a removed height sensor is subsequently refitted, the calibration procedure will have to be performed to ensure the integrity of the system.

If the air supply unit, the reservoir, a valve block, a damper module or the air harness is removed or replaced, the system will not require recalibration.

Inputs and Outputs

The air suspension control module uses four harness connectors for all inputs and outputs.

The air suspension control module uses inputs received on the CAN bus from other vehicle systems. The system uses longitudinal acceleration, lateral acceleration, steering angle and wheel speed data to control the suspension operation in differing driving conditions.

The system will react differently if one or more of these data inputs is missing or incorrect, for example, if the steering angle sensor is missing or incorrect, the air suspension control module assumes a default value of zero which may result in some unnecessary levelling activity.

Steering - Servotronic Valve

The power steering Servotronic 2 system is controlled by software which is incorporated into the air suspension control module. The software responds to steering torque inputs and road speed signals and controls the assistance via a transducer valve located on the steering gear valve. The valve is connected by two wires to the control module on connector C2320. For details refer to the Power Steering section.
For additional information, refer to: Power Steering (211-02 Power Steering, Description and Operation).

Air Supply Unit Relay

The air supply unit relay is located in the Battery Junction Box (BJB) in the engine compartment. The relay is connected directly to the battery via fusible link 10E (60A). The relay coil is connected to and controlled by the air suspension control module. The relay is used by the air suspension control module to control the operation of the compressor.

When air supply unit operation is required, the air suspension control module supplies power and ground for the relay coil which energises, closing the relay contacts. This allows battery voltage via the fusible link to pass through the relay and operate the air supply unit electric motor and the compressor.

The battery voltage is also passed from the relay, via a splice joint in the harness, to the air suspension control module and is used as a signal that the relay is operating.

System Inhibits

A number of conditions exist where a change of ride height is undesirable. To counter this, the air suspension control module is programmed with a number of system inhibits. If any of the conditions detailed below exist, the air suspension control module will suspend height changes and height corrections.

Compressor

The temperature sensors located within the compressor protect the compressor from overheating. If the compressor temperature rises above set limits, the air suspension control module will inhibit the compressor operation. These limits are shown in the following table:

Compressor Head Temperature Sensor

	Lifting	Filling Reservoir
Stop	140°C (302°F)	130°C (284°F)
Start	120°C (266°F)	110°C (248°F)

Compressor Brush Temperature Sensor

	Lifting	Filling Reservoir
Stop	140°C (284°F)	130°C (266°F)
Start	120°C (248°F)	110°C (230°F)

Cornering

If the air suspension control module registers a cornering force greater than 0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the cornering force falls to less than 0.15g. The air suspension control module receives a message from the lateral acceleration sensor (which is an integral part of the ABS yaw rate sensor) on the high speed CAN bus for the cornering force.

Rapid Acceleration

If the air suspension control module registers a rapid acceleration greater than 0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the rapid acceleration falls to less than 0.15g. Acceleration is calculated by the air suspension control module from a vehicle speed signal received via the high speed CAN bus.

Rapid Deceleration

If the air suspension control module registers a rapid deceleration smaller than -0.2g it will inhibit all height changes and corrections. The system will remain inhibited until the rapid deceleration rises above -0.15g. Deceleration is calculated by the air suspension control module from a vehicle speed signal received via the high speed CAN bus.

Vehicle Jack

The air suspension control module will inhibit all height changes and corrections if it detects a corner lowering too slowly for more than 1.2 seconds. This is interpreted as the corner identified as moving too slowly being supported on a jack. In this situation, the corner height will not change when air is released from the air spring because the jack acts as a mechanical prop. The system will remain inhibited until any of the following conditions exist:

- The air suspension switch is moved to the up or down position
- Vehicle speed rises to more than 2 mph (3 km/h) for more than 45 seconds.

Door Open

The air suspension control module will stop all height change requests while any of the doors are open. Vehicle levelling continues with a door open by keeping the vehicle at the height when the door was opened if the vehicle load changes.

Battery Voltage

If the supply voltage measured by the control module is less than 10 volts for more than 0.25 seconds or more than 17.5 volts for more than 0.25 seconds, all valve and compressor operation is suspended. Operation is resumed when the battery voltage is more than 11 volts or less than 16.5 volts. A diagnostic code is stored if the battery voltage is out of range after the engine has been running for more than 10 seconds.

Diagnostics

The air suspension control module can store fault codes which can be retrieved using a Land Rover approved diagnostic system. The diagnostic information is obtained via the diagnostic socket which is located in the lower instrument panel closing panel, on the driver's side, below the steering column.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems and a Land Rover approved diagnostic system or a diagnostic tool. This allows the fast retrieval of diagnostic information and programming of certain functions using a Land Rover approved diagnostic system.

Fault Detection

The air suspension control module performs fault detection and plausibility checks. Fault detection is limited to faults that the control module can directly measure as follows:

- Sensor electrical hardware faults
- Valve electrical hardware faults
- Sensor and actuator supply faults
- Bus failures
- Control module hardware errors.

Plausibility checks are checks on signal behaviour, as follows:

- Average height does not change correctly
    - Height changes too slowly
- Gallery pressure
    - Does not increase fast enough when reservoir filling requested
    - Increases when system is inactive
    - Too low when lifting is requested
    - Increases too rapidly when filling reservoir
    - Does not decrease when gallery is vented
    - Pressure varies too much when inactive.
- Compressor temperature
    - Sensor voltage too large - head and brush sensors (short circuit to battery)
    - Takes too long to be readable after suitable compressor run time - head and brush sensors
    - Does not increase when compressor active - head sensor only
- Sensor activity
    - Signal floating
    - Constant articulation when moving

When a fault is detected, the air suspension control module will attempt to maintain a comfortable ride quality and where possible will retain as much functionality as possible.

The system functionality depends on the severity of the fault.

Faults

- Height sensor faults (hardware faults) and reservoir valve block failure
    - Retain full functionality with no 'refinements', e.g. cross-link valves inoperative, no compensation for uneven surfaces.
- Pressure sensor faults, compressor faults, corner valves stuck shut
    - Vehicle returns to on-road mode height when next requested
    - Levels at 'current' height.
- Reservoir valve stuck open, exhaust valve stuck shut if below on-road mode height, corner valves stuck open if above on-road mode height
    - Vehicle returns to on-road mode height when next requested
    - Does not level at 'current' height.
- Failure of multiple height sensors, cross-articulation when driving, calibration corrupted
    - Vehicle lowers to bump stops.
- ABS module failure, CAN bus failure
    - If the air suspension control module loses communications with the ABS module or the ABS module reports a fault, the air suspension control module immediately returns to the 'default' height, which is below the on-road ride height. Once at the default height, the control module will continue to level the vehicle at this height. It is unlikely that the fault will be in the air suspension control module. When the fault is repaired, the air suspension control module will resume full functionality but the error will remain in the control module memory.

For major faults the control module will not level the vehicle at the 'current' ride height. The control module freezes height changes until it receives a manual or automatic request for height change. The control module will return to standard height if possible and freezes once standard height is achieved.

If the suspension is above the on-road height and the air suspension control module cannot lower the suspension, all height changes will be frozen. The control module will issue a message on the high speed CAN bus which is received by the instrument cluster which displays a maximum advisable speed in the message centre. An immediate 'freeze' of the vehicle height is caused by the following:

- Failure of more than one height sensor - vehicle on bump stops
- Implausible articulation symptoms detected - vehicle on bump stops
- Valve or solenoid failure - corner valve stuck open below on-road mode height or exhaust valve stuck shut above on-road mode height
- Stuck corner or whole vehicle (diagnosed using plausibility of the sensor inputs).

If height change is not possible, e.g. exhaust valve failed closed at off-road height or compressor failed at access height, the control module will not level or change height.

If the air suspension control module has a hardware fault, the control module will disable all air suspension functions. Detectable hardware errors include memory error, control module failure and calibration errors.

Fault Messages

The air suspension has two methods which it can use to inform the driver of a fault in the air suspension system; the air suspension switch LED's and the instrument cluster message centre.

When minor faults occur and the air suspension control module is able to level the vehicle to the 'current' ride height, the air suspension switch LED's will display the current ride height.

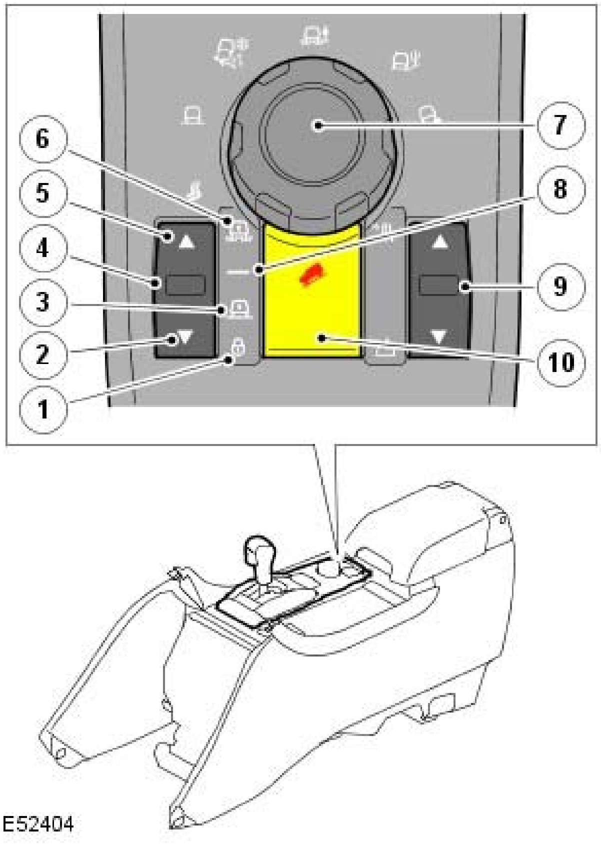
If the air suspension control module suffers a major failure and there is no air suspension control, all the control switch LED's will remain off.

If a fault occurs and the air suspension control module can determine the ride height and the vehicle is above on-road mode height, the driver will be notified via a 'AIR SUSPENSION FAULT MAX SPEED 30 MPH (50 KM/H)' message in the message centre.

If the control module cannot determine the height of the vehicle, or the vehicle is not above on-road mode height, cannot be lowered and the vehicle speed is too high, an air suspension fault message is displayed.

If the vehicle is restricted to on-road mode height an air suspension fault normal height only message is displayed.

AIR SUSPENSION SWITCH



Item	Part Number	Description
1	-	Crawl (locked at access) mode lamp
2	-	Lowering lamp
3	-	Access mode lamp
4	-	Air suspension switch
5	-	Raising lamp
6	-	Off-road mode lamp
7	-	Terrain Response™ rotary control
8	-	On-road (normal height) lamp
9	-	Transfer box range selection switch
10	-	Hill Descent Control (HDC) switch

The air suspension control switch is located in the centre console, behind the automatic transmission selector lever. The switch is a three position, non-latching rocker type switch which allows selection of the following driver selectable modes:

- Off-road mode
- On-road mode
- Access mode
- Crawl (locked at access) mode.

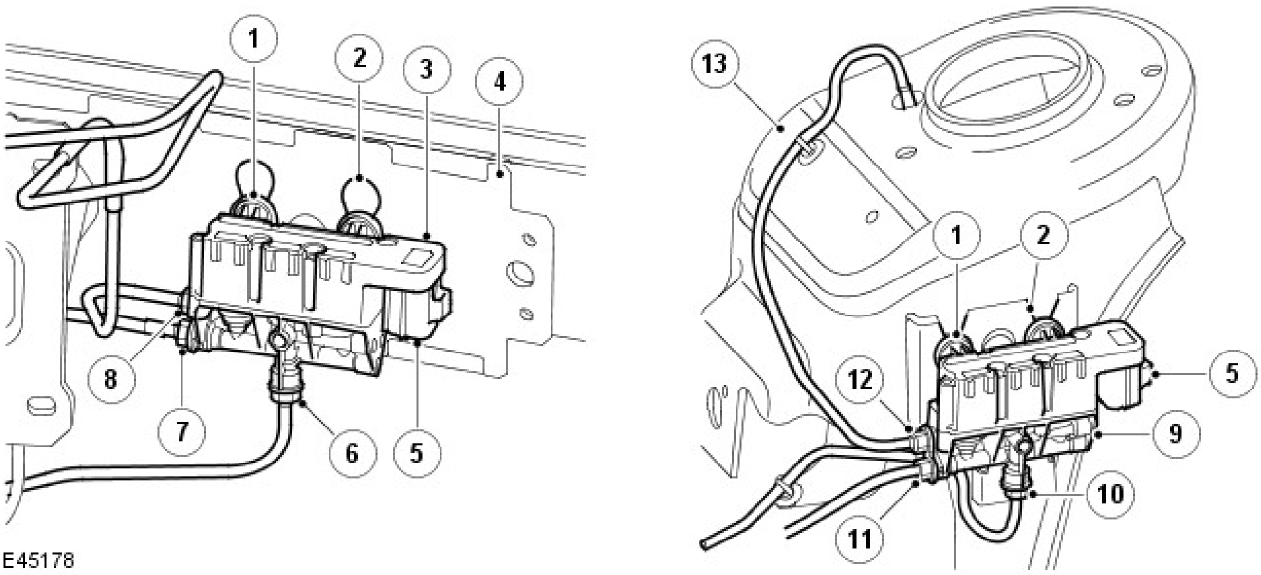
The air suspension rocker switch can be pressed downwards at either end to select the required mode. The switch is non-latching and returns to the central position when released. The switch completes a ground path to the air suspension control module when operated. This ground path is completed on separate wires for the raise and lower switch positions, allowing the control module to determine which selection the driver has made.

The switch has six symbols which illuminate to show the current selected height and the direction of movement. The raise and lower symbols will flash and a warning tone will be emitted from the instrument cluster sounder when a requested height change is not allowed, i.e. vehicle speed too fast.

A flashing symbol indicates that the air suspension system is in a waiting state or that the system will override the driver's selection because the speed threshold is too high.

The driver can also ignore the system's warning signals and allow the height to change automatically. For example, increasing the vehicle speed to more than 25 mph (40 km/h) will cause the control module to automatically change the ride height from off-road mode to on-road mode.

FRONT AND REAR AXLE VALVE BLOCKS



Item	Part Number	Description
1	-	Isolation rubber mounts (3 off)
2	-	Location slots
3	-	Front valve block, valves and solenoid assembly
4	-	Front bumper armature
5	-	Electrical connector
6	-	LH air spring damper module air harness connection
7	-	Air inlet/outlet connection
8	-	RH air spring damper module air harness connection
9	-	Rear valve block, valves and solenoid assembly
10	-	RH air spring damper module air harness connection
11	-	Air inlet/outlet connection
12	-	LH air spring damper module air harness connection
13	-	Rear suspension turret

The front and rear axle valve blocks are similar in their design and construction and control the air supply and distribution to the front or rear pairs of air spring damper modules respectively. The difference between the two valves is the connections from the valve block to the left and right hand air spring damper modules and the valve size. It is important that the correct valve block is fitted to the correct axle. Fitting the incorrect valve block will not stop the air suspension system from functioning but will result in slow raise and lower times and uneven raising and lowering between the front and rear axles.

The front valve block is attached to the right hand end of the front bumper armature assembly. The valve block has three attachment lugs which are fitted with isolation rubber mounts. The rubber mounts locate in slots in the armature. The valve lugs locate in the holes above the slots and are pushed downwards into positive location in the slots.

The rear valve block is located on the forward face of the left hand rear suspension turret. The valve block has three attachment lugs which are fitted with isolation rubber mounts which locate in a bracket with three slotted holes. The bracket is attached to the left hand side of the chassis. The isolation rubber mounts locate in the 'V' shaped slots and are pushed downwards into positive location in the slots.

The front and rear valve blocks each have three air pipe connections which use 'Voss' type air fittings. One connection is an air pressure inlet/outlet from the reservoir valve block. The remaining two connections provide the pressure connections to the left and right hand air springs.

Each valve block contains three solenoid operated valves; two corner valves and one cross-link valve. Each of the valve solenoids is individually controlled by the air suspension control module. The solenoids have a resistance value of 2 Ohms at a temperature of 20°C (68°F).

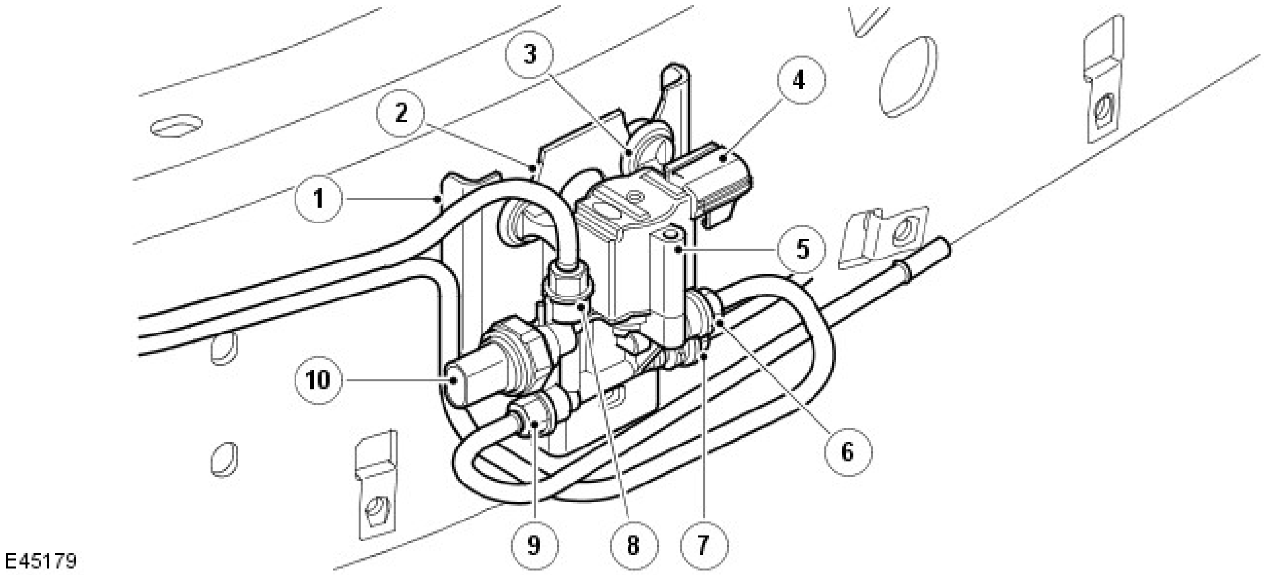
Corner Valves

The corner valves control the flow of air into and out of the individual air springs. When the solenoid is de-energised, the corner valves are held in a closed position by internal springs. When the solenoid is energised, the valve armature moves and allows air to flow into or out of the air spring.

Cross Link Valves

The cross-link valve provides a connection between the two air springs on the same axle. When de-energised, the cross-link valve prevents air passing from one air spring to another. When the solenoid is energised, the valve spool moves and allows air to pass from one air spring to the other. This increases wheel articulation and improves ride comfort at low vehicle speeds.

RESERVOIR VALVE BLOCK



Item	Part Number	Description
1	-	Chassis mounting bracket
2	-	Location slot
3	-	Isolation rubber mounts (3 off)
4	-	Electrical connector
5	-	Reservoir valve block, valves and solenoid assembly
6	-	Reservoir connection
7	-	Rear valve block connection
8	-	Front valve block connection
9	-	Air supply unit connection
10	-	Pressure sensor

The reservoir valve block controls the storage and distribution of air from the reservoir. The reservoir valve block also contains the system pressure sensor.

The reservoir valve block is attached to a bracket on the outside of the left hand chassis rail, between the reservoir and the air supply unit. The valve block is located within the air supply unit acoustic box to protect it from dirt ingress and damage from stones. The valve block has three attachment lugs which are fitted with isolation rubber mounts. The rubber mounts locate in the chassis bracket which has three corresponding 'V' shaped slots. the rubber mounts are pushed downwards into positive location in the slots.

The valve block has four air pipe connections which use 'Voss' type air fittings. The connections provide for air supply from the air supply unit, air supply to and from the reservoir and air supply to and from the front and rear valve blocks. The connections from the air supply unit and the front and rear control valves are all connected via a common gallery within the valve and therefore are all subject to the same air pressures.

The valve block contains a solenoid operated valve which is controlled by the air suspension control module. The solenoid valve controls the pressure supply to and from the reservoir. The solenoid has a resistance value of 2 Ohms at a temperature of 20°C (68°F). When energised, the valve spool moves allowing air to pass to or from the reservoir.

The valve block also contains a pressure sensor which can be used to measure the system air pressure in the air springs and the reservoir. The pressure sensor is connected via a harness connector to the air suspension control module. The control module provides a 5V reference voltage to the pressure sensor and monitors the return signal voltage from the sensor.

Using this sensor, the control module controls the air supply unit operation and therefore limits the nominal system operating pressure to 244 lbf/in^2 (16.8 bar gage).

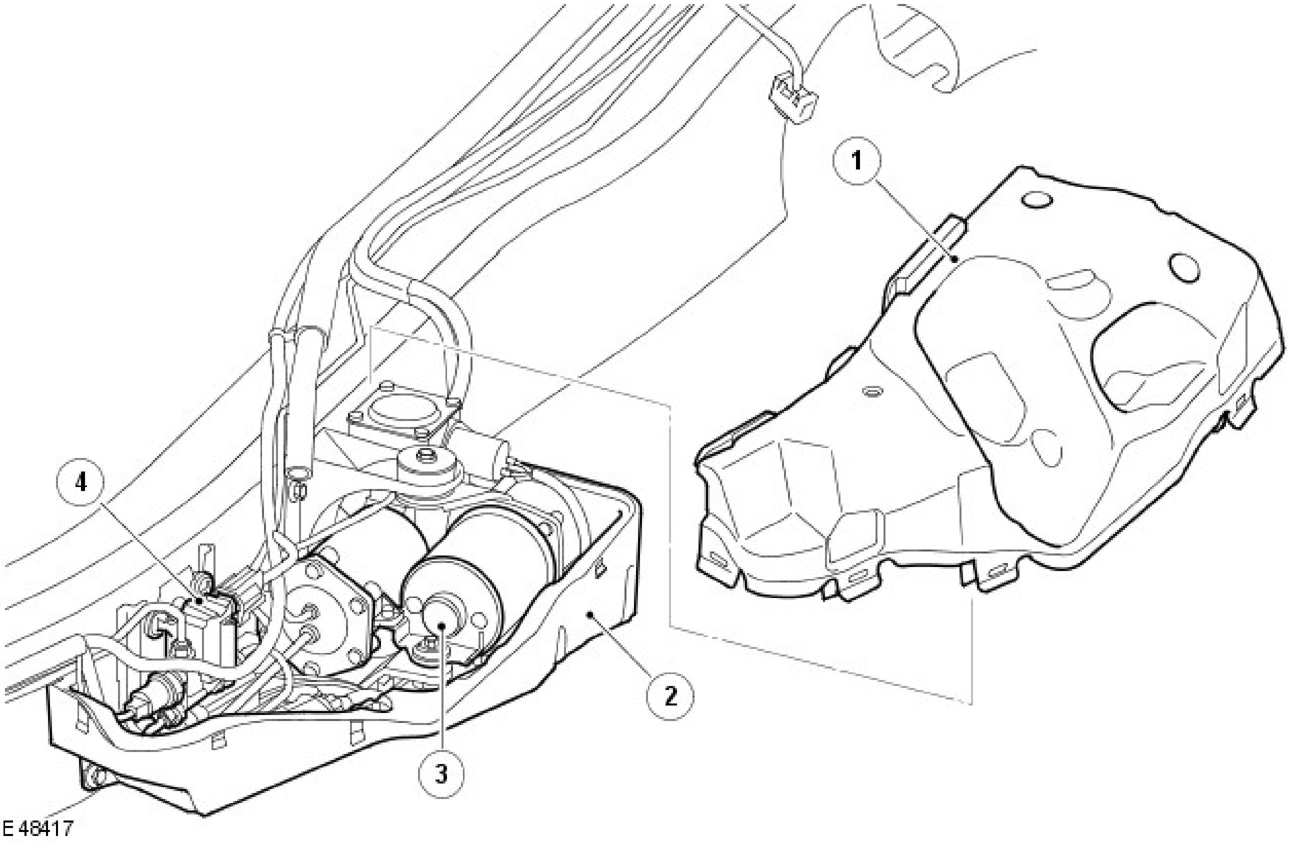
12	-	High pressure supply to the air suspension system
13	-	Compressor cylinder head temperature sensor
14	-	Compressor

The air supply unit is located on the outside of the left hand chassis rail, forward of the upper control arm. The unit is attached to the chassis rail with three bolts and is protected by an acoustic box.

Acoustic Box



Item	Part Number	Description
1	-	Upper cover
2	-	Lower cover
3	-	Air supply unit
4	-	Reservoir valve block

The acoustic box, which comprises of two parts; upper and lower, surrounds the air supply unit. The acoustic box is a plastic moulding which is lined with an insulating foam which controls the operating noise of the air supply unit. The reservoir valve block is also located in the acoustic box, forward of the air supply unit.

The air supply unit comprises the following major components:

- A piston compressor
- A 12V electric motor
- A solenoid operated pilot valve
- An exhaust valve
- An air dryer unit

The air supply unit supplies dry, compressed air into the air suspension system where it is directed into the air springs or the reservoir by solenoid operated valves. Air can be exhausted from the system when required by the opening of an air spring or reservoir valve in addition to an exhaust valve which is part of the air supply unit.

The compressor operates to pressurize either the reservoir or to inflate one or more of the air springs. Height changes of less than 20 mm are achieved using the compressor alone. Height changes of more than 20 mm are achieved using the reservoir and the compressor. The compressor cannot operate without the engine running, with the following exceptions:

- During remote operation to raise the vehicle to allow for thr attachment of a trailer

- When under control of a Land Rover approved diagnostic system.

The air supply unit can be serviced in the event of component failure, but is limited to the following components; air dryer, pilot exhaust pipe and the rubber mounts.

The air supply unit is attached to a bracket which is bolted to the chassis. The unit is mounted to the bracket with flexible isolation mounting rubbers which assist with preventing operating noise being transmitted to the chassis.

Removal of the air supply unit does not require the whole air suspension system to be depressurised. The front and rear valve blocks and the reservoir valve block are normally closed when de-energised, preventing air pressure in the air springs and the reservoir escaping when the unit is disconnected.

There are a number of conditions that will inhibit operation of the air supply unit. It is vitally important that these system inhibits are not confused with a system malfunction. A full list of air supply unit inhibits are given in the air suspension control module section in this chapter.

19	-	Spring - pressure relief

Pilot Exhaust Valve

A solenoid operated pilot exhaust valve is connected to the air delivery gallery, downstream of the air dryer. The pilot valve, when opened, operates the main compressor exhaust valve. This allows the air springs to be deflated when required.

When the solenoid is energised, pilot air moves the exhaust valve plunger, allowing pressurised air from the air springs and/or reservoir to pass via the reservoir control valve to the air supply unit.

The solenoid has a resistance value of 4 Ohms at a temperature of 20°C (68°F).

Exhaust Valve

The exhaust valve has three functions. It operates in conjunction with the pilot exhaust valve to allow air to be exhausted from the air springs and/or the reservoir as described previously.

The valve also protects the system from over-pressure. The valve is connected into the main pressure gallery which is always subject to the system pressure available in either the air springs or the reservoir. The valve is controlled by a spring which restricts the maximum operating pressure to between 319 to 391 lbf/in^2 (22.0 to 27 bar gage).

The minimum pressure in the system is also controlled by the exhaust valve to ensure that, even when deflated, the air springs contain a positive pressure of approximately 14.5 lbf/in^2 (1 bar gage) with respect to atmosphere. This protects the air spring by ensuring it can still 'roll' over the piston without creasing.

Electric Motor

The electric motor is a 12V dc motor with a nominal operating voltage of 13.5V. The motor drives a crank which has an eccentric pin to which the compressor connecting rod is attached.

The motor is fitted with a temperature sensor on the brush PCB assembly. The sensor is connected to the air suspension control module which monitors the temperature and can suspend motor operation if an overheat condition occurs.

Compressor

The compressor comprises a motor driven connecting rod and piston which operate in a cylinder with a cylinder head. The motor rotates the crank moving the piston up and down in the cylinder bore. The air in the cylinder is compressed with the up stroke and is passed via a delivery valve, through the air dryer into the system.

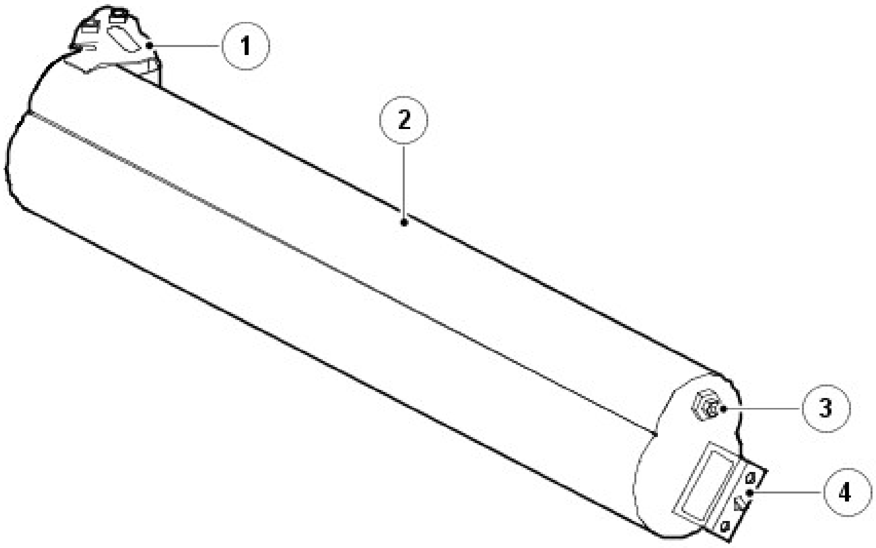
Air Dryer

The air dryer is an integral part of the air supply unit. The air dryer contains a desiccant which absorbs moisture. Pressurised air is passed through the air dryer which removes any moisture in the compressed air before it is passed to the reservoir and/or the system

When the air is exhausted from the system, the returning air is passed through the air dryer, regenerating the air dryer by removing moisture from the desiccant and expelling it to atmosphere via the exhaust.

The air dryer is an essential component in the system ensuring that only dry air is present in the system. If moist air is present in the system, freezing can occur, resulting in poor system operation or component malfunction/failure.

AIR RESERVOIR



E45182

Item	Part Number	Description
1	-	Front bracket
2	-	Reservoir
3	-	Air hose connection to reservoir valve block
4	-	Rear bracket

The reservoir is an air storage vessel which provides fast air suspension lift times by the immediate availability of pressurised air into the system.

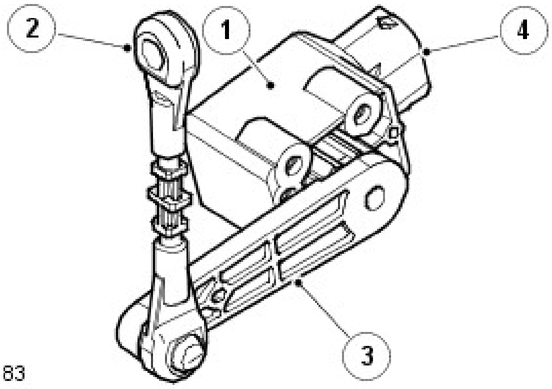
The reservoir is a steel fabrication and is located on the outside of the left hand chassis rail, in front of the air supply unit. The reservoir has a bracket at each end which attach to the body mounting brackets on the chassis.

The rearward end of the reservoir has a 'Voss' air fitting which provides for the connection of the air hose between the reservoir and the reservoir valve block.

The reservoir has a capacity of 550 in^3 (9 liters). The nominal working pressure of the reservoir is 243.6 lbf/in^2 (16.8 bar gage), with a maximum pressure of 507 lbf/in^2 (35 bar gage).

HEIGHT SENSORS

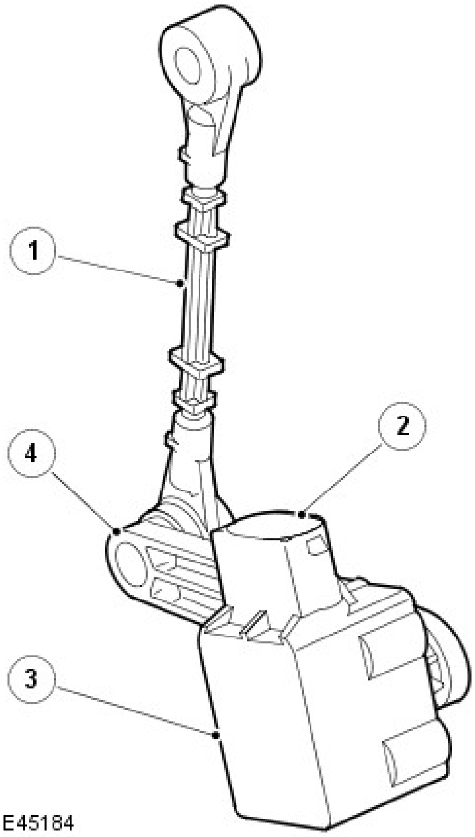
Front Height Sensor



E45183

Item	Part Number	Description
1	-	Sensor body
2	-	Drop link
3	-	Lever arm
4	-	Electrical connector

Rear Height Sensor



Item	Part Number	Description
1	-	Drop link
2	-	Electrical connector
3	-	Sensor body
4	-	Lever arm

A height sensor is fitted in each corner of the vehicle to monitor the ride height of the vehicle. The sensor bodies are attached with screws to brackets on the chassis rails.

Each sensor comprises a sensor body which contains a single track rotary potentiometer, a lever arm and a drop link.

The sensor lever arm has a drop link which provides the connection between the sensor and the suspension control arm. The drop link is a serviceable component and is a push fit to the lever arm and the suspension control arm.

The sensors are connected via their harness connector to the air suspension control module which receives the signal output from each sensor and, using preprogrammed information, converts the signal to a height for each sensor position.

The front left and right hand sensors are common parts. The left and right hand rear sensors are handed. All are color coded for identification as follows:

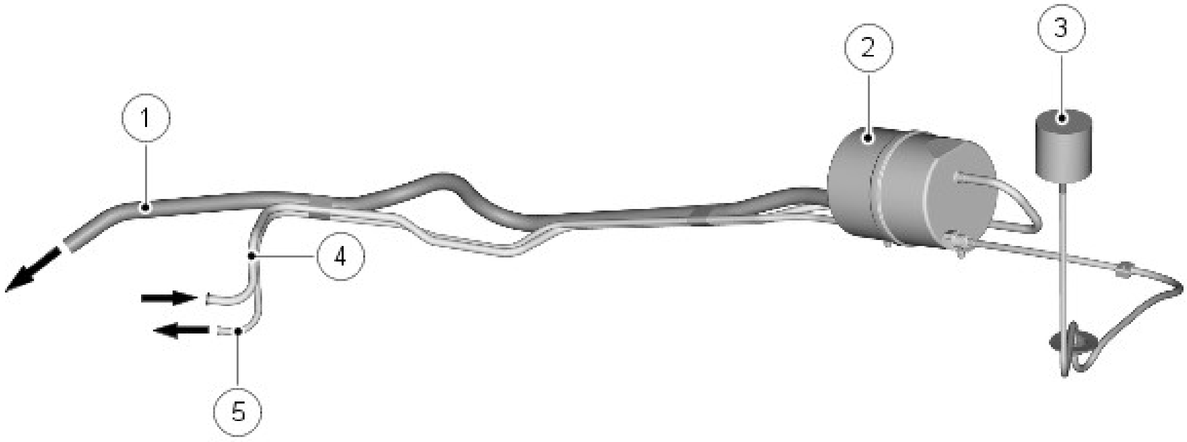
- Left and right hand front - gray lever arm
- Left hand rear - white colored lever arm, black plastic drop link
- Right hand rear - black colored lever arm, black plastic drop link.

Calibration

A calibration routine is performed using a Land Rover approved diagnostic system to read the position of each corner of the vehicle and record the settings in the control module memory. Once set, the calibration is not required to be performed unless the air suspension control module is removed or replaced, a height sensor is removed or replaced or a suspension arm to which the sensor is connected is removed or replaced. If the removed height sensor is subsequently refitted, the calibration procedure will have to be performed to ensure the integrity of the system.

If a replacement drop link is fitted, recalibration is not required providing the sensor body is not removed from its mounting bracket.

AIR SILENCER AND INLET AIR FILTER



E45185

Item	Part Number	Description
1	-	Exhaust (to atmosphere)
2	-	Inlet and exhaust silencer
3	-	Air inlet filter
4	-	Exhaust air from air supply unit
5	-	Air inlet supply to air supply unit

The air silencer is required to limit any noise produced from the air supply unit during inflation or deflation of the air springs.

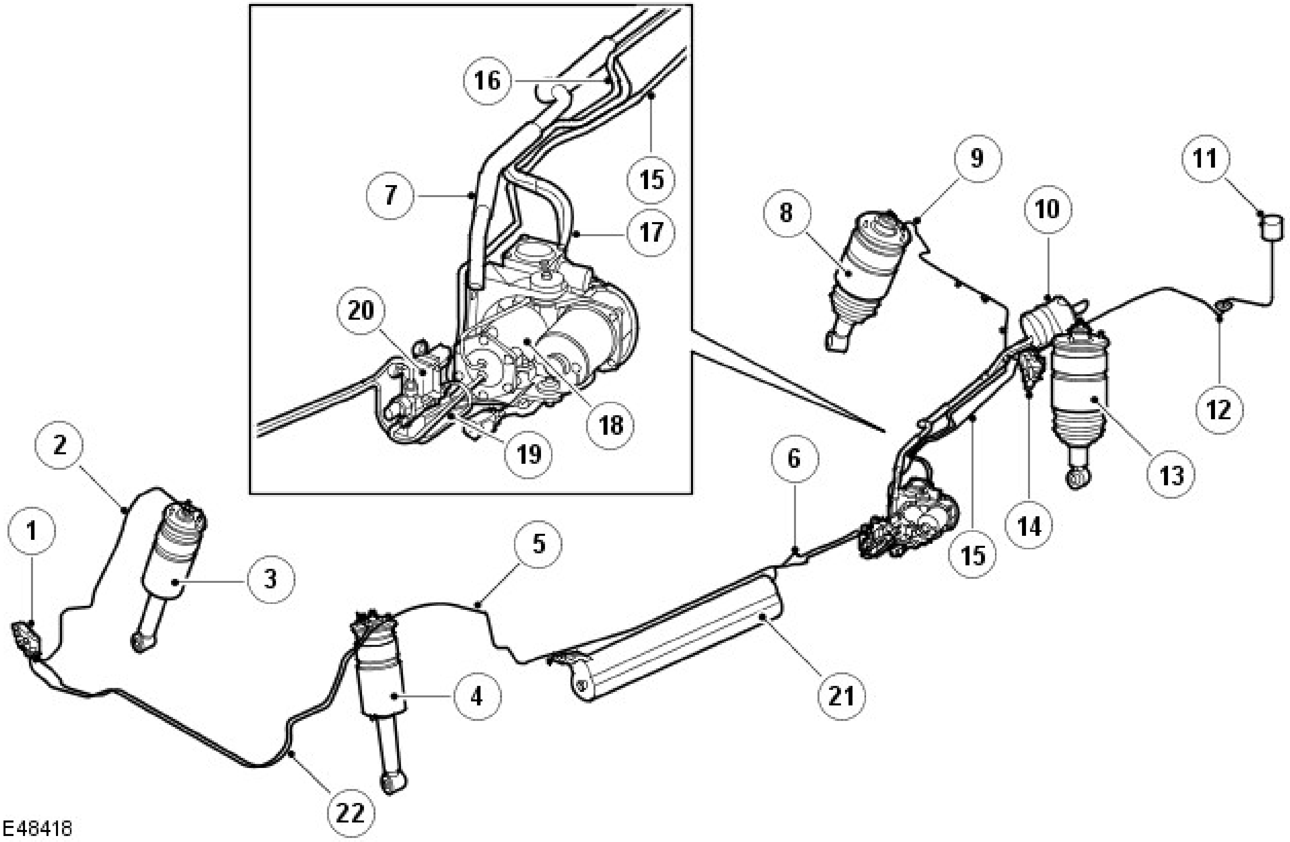
The silencer comprises two plastic moulded cans, which are bonded together. A silencing foam in the large internal chamber forms the exhaust silencer. A pipe connection is moulded onto each end of the silencer and provides for the attachment of the exhaust air to atmosphere pipe and the exhaust air pipe from the air supply unit.

A secondary chamber, located around the outside of the exhaust chamber forms the silencer for the inlet air. Pipe connections are moulded onto each end of the intake silencer and provide for the attachment of the air inlet pipe from the inlet air filter and the air inlet pipe to the air supply unit. The intake air silencer is a hollow chamber with no noise reduction foam filling.

The air intake filter is connected via a pipe to the intake silencer chamber of the air silencer unit. The filter is located in the rear left hand corner of the body, away from possible sources of dirt and moisture.

The filter contains a foam element which removes particulate matter from the inlet air before it reaches the silencer or the air supply unit.

AIR HARNESS



Item	Part Number	Description
1	-	Front axle valve block
2	-	Pipe - Front axle valve block to front RH air spring damper module
3	-	Front RH air spring damper module
4	-	Front LH air spring damper module
5	-	Pipe - Reservoir valve block to front axle valve block
6	-	Pipe - Reservoir valve block to reservoir
7	-	Pipe - Exhaust
8	-	Rear RH air spring damper module
9	-	Pipe - Rear axle valve block to rear RH air spring damper module
10	-	Air silencer assembly
11	-	Air inlet filter
12	-	Pipe - Main inlet
13	-	Rear LH air spring damper module
14	-	Rear axle valve block
15	-	Pipe - Reservoir valve block to rear axle valve block
16	-	Pipe - Compressor inlet
17	-	Pipe - Compressor exhaust
18	-	Air supply unit
19	-	Pipe - Air supply unit to reservoir valve block
20	-	Reservoir valve block
21	-	Reservoir
22	-	Pipe - Front axle valve block to front LH air spring damper module

The air harness comprises ten separate nylon pipes which are connected between the system components with Voss connectors. The pipes have the following diameters:

Pipe	Diameter
High pressure pipes	6 mm
Compressor inlet pipe	8 mm
Inlet filter to silencer	8 mm
Compressor exhaust pipe	10 mm
Silencer exhaust pipe	19 mm

If a pipe becomes damaged, an in-line connector is available for repair purposes. The pipes are secured to the body and the chassis with a number of plastic clips.

Vehicle Dynamic Suspension - Vehicle Dynamic Suspension

Diagnosis and Testing

Principle of Operation

For information on the operation of the system, refer to relevant section 204-05 - Vehicle Dynamic Suspension of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Confirm which, if any, warning lights and/or messages were displayed on the instrument cluster. For a list of messages, Refer to the relevant section of the workshop manual.
3. **3.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Air leakage ● Air springs ● Reservoir ● Compressor ● Compressor air filter ● Pipework and unions ● Sensor installation ● Valve block(s)	● Battery ● Fuse(s) ● Wiring harness physical damage or water ingress ● Loose or corroded electrical connectors ● Air suspension control switch ● Controller area network (CAN) circuits ● Sensors ● Valve block(s) ● Air suspension control module

4. **4.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. **5.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible message	Possible other warnings	Possible causes	Action
Vehicle on bump stops	● Suspension fault	● Two chimes repeated regularly Red indicator permanently illuminated	● Water ingress to wiring harness or connectors ● Air leak(s) ● Vehicle in transportation mode ● System not calibrated or calibration corrupt ● Implausible articulation symptoms detected ● Failure of multiple height sensors ● Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Visually inspect the system for air leakage. Check the system mode and calibration using the approved diagnostic system. Check for implausible articulation symptoms, i.e. height sensor or linkage fault, deflated air spring, under inflated tire etc. Note implausible articulation symptoms may be caused by an un-calibrated height sensor. Check for height sensor DTCs and refer to the DTC index. Refer to the warranty policy and procedures manual if a module is suspect.
Vehicle does not sit level	● Suspension fault	● Two chimes repeated regularly Red indicator permanently illuminated	● Water ingress to wiring harness or connectors ● Air leak(s) ● Calibration corrupt ● cross-link valve fault ● Height sensor fault	Visually inspect the wiring harness and connectors for water ingress. Visually inspect the system for air leakage and refer to the guided diagnostic routine on the approved diagnostic system. Check the system calibration using the approved diagnostic system. For front

Symptom	Possible message	Possible other warnings	Possible causes	Action
			- Reservoir valve stuck open - Exhaust valve stuck closed - Corner valves stuck open - Air suspension control module failure	and rear cross link valve tests refer to the guided diagnostic routine on the approved diagnostic system. Check for height sensor DTCs and refer to the DTC index. For reservoir and exhaust valve tests refer to the guided diagnostic routine on the approved diagnostic system. Check for corner valve DTCs and refer to the DTC index. Refer to the warranty policy and procedures manual if a module is suspect.
Vehicle sits too low	- Suspension fault - Hill descent control (HDC) fault, system not available - Dynamic stability control (DSC)	- Two chimes, amber indicator permanently illuminated - One chime - DSC amber indicator permanently illuminated - ABS indicator permanently illuminated	- Water ingress to wiring harness or connectors - Air leak(s) - Air suspension compressor temperature sensor fault - Inlet air filter blockage/restriction - Air suspension compressor fault - Exhaust valve stuck/sticking - Air suspension control module lost communication with ABS module - ABS fault. - Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Visually inspect the system for air leakage. For air compressor temperature sensor, inlet air filter, exhaust valve and air compressor tests refer to the guided diagnostic routine on the approved diagnostic system. For Air suspension control module lost communication with ABS module, refer to the lost communication codes statement at the end of this table. Check for ABS DTCs, Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Vehicle sits too high	- Suspension fault	- Two chimes, amber indicator permanently illuminated	- Reservoir valve stuck open - Exhaust valve stuck closed - Corner valves stuck open - Air suspension control module failure	For reservoir valve and exhaust valve tests refer to the guided diagnostic routine on the approved diagnostic system. Check for corner valve DTCs and refer to the DTC index. Refer to the warranty policy and procedures manual if a module is suspect.
System detects extended mode unnecessarily when lowering	- -	- -	- Crossed gallery and air spring pipes - Incorrect valve block installed to front or rear - Damage or blockage in air harness	Refer to the guided diagnostic routine on the approved diagnostic system.
Vehicle leans/tilts after being left over-night or for some days	- -	- -	- Leaking air spring(s) - Leak from corner valve to gallery - Exhaust valve stuck open	Refer to the guided diagnostic routine on the approved diagnostic system.
After vehicle left over-night or for some days system regularly indicates "Suspension vehicle raising	- Suspension vehicle raising slowly	- -	- Leaking air spring(s) - Leaking reservoir	Refer to the guided diagnostic routine on the approved diagnostic system.

Symptom	Possible message	Possible other warnings	Possible causes	Action
slowly" when first driving off				

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: Intermittent faults may cause DTCs to be logged, however some DTCs may be cleared during an ignition off, ignition on cycle. Carry out a road test (if safe to do so), check the functionality of the system and retrieve any DTCs **before** turning the ignition off.

DTC	Description	Possible causes	Action
B1A8455	Car Configuration Data	● Data does not match that expected for VIN range/Air suspension incorrectly configured	Configure the car configuration file (CCF) using the approved diagnostic system. Clear the DTC and test for normal operation.
C112201	Steering Isolation Valve	● Servotronic steering valve disconnected ● Servotronic steering valve circuit(s) high resistance or short circuit to ground ● Servotronic steering valve fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C11231C	Steering Isolation Valve Supply Circuit	● Servotronic steering valve supply circuit high resistance ● Servotronic steering valve supply circuit short circuit to ground ● Servotronic steering valve supply circuit short circuit to power ● Servotronic steering valve fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C112F72	Air Spring Valve	● Repeated or frequent level activity in the down direction ● Corner valve stuck open ● Corner valve leak to gallery	Refer to the approved diagnostic system for corner valve checks.
C113066	Air Spring Air Supply	● Repeated or frequent level activity in the up direction ● Air spring leak ● Air harness leak ● Exhaust valve stuck open ● Corner valve leak to gallery	Visually inspect the system for air leakage. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C11307A	Air Spring Sir Supply	● Unable to lift vehicle ● Detached air pipe ● Loose or burst air pipe ● Excessive air spring leak ● Height sensor stuck ● Height sensor failure ● Blockage in air harness	Visually inspect the system for an excessive air leak. Check the height sensor linkage(s) for damage/restrictions. Visually inspect the air harness for evidence of melting, crushing, kinking or collapsing. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C113192	Air Spring Air Supply	● Unable to pressurize gallery ● Insufficient pressure from compressor ● Detached air pipe	Visually inspect the system for air leakage. Check the reservoir valve block pipes for correct routing and installation.

DTC	Description	Possible causes	Action
		● Loose or burst air pipe ● Reservoir valve block pipes incorrectly installed (unions reversed) ● Pressure sensor fault	
C1A001C	Control Module	● A momentary low voltage event occurred ● Low battery voltage ● One or more control valve supplies intermittent short circuit to ground	Check the battery charge, condition and circuit. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C1A001D	Control Module	● Isolation switch current monitor ● One or more valve supplies short circuit to ground ● Rear valve block disconnected ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0049	Control Module	● Water ingress to valve wiring harness or connector(s) ● Valve supply circuit(s) short circuit to power ● Air suspension control module internal electrical failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0053	Control Module	● This is not a fault, the system has been deflated using the diagnostic routine	Carry out Air suspension deflation exit routine using the approved diagnostic system or the routine listed at the end of this section.
C1A0054	Control Module	● Air suspension control module not calibrated ● Air suspension control module has been set into manufacturing, calibration or tight tolerance mode	If the problem is found during pre-delivery inspection, check that the air suspension control module (RLM) is NOT in manufacturing mode, calibration mode or tight tolerance mode using the approved diagnostic system. Configure the RLM to customer mode if necessary (tight tolerance mode and manufacturing mode can be set/cleared by starting then ending the suspension geometry set process from IDS menu. Refer to the relevant Technical Service Bulletin). Clear the DTC and test for normal operation. Only if the DTC re-occurs, should the system be calibrated using the approved diagnostic system. Clear the DTC and test for normal operation.
C1A0119	LED	● Switch pack LED circuit, short circuit to power ● One or more LEDs short circuit to each other	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C1A031C	Left Front Height Sensor	● Left-hand front height sensor signal voltage out of range ● Water ingress to wiring harness or connectors ● Height sensor linkage disconnected ● Height sensor linkage damaged/bent ● Height sensor disconnected ● Height sensor linkage toggled (now operating in reverse direction) ● Height sensor bracket damaged/bent ● Height sensor incorrectly	Visually inspect the wiring harness and connectors for water ingress. For height sensor linkage, mounting and circuit tests refer to the guided diagnostic routine on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		installed ● Height sensor installed on wrong side of vehicle ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Incorrect height calibration ● Air suspension control module failure	
C1A0326	Left Front Height Sensor	● Left-hand front height sensor signal voltage stuck whilst vehicle is driven ● Water ingress to wiring harness or connectors ● Height sensor linkage disconnected ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0329	Left Front Height Sensor	● Left-hand front height sensor signal invalid ● Water ingress to wiring harness or connectors ● Height sensor linkage damaged/bent ● Height sensor bracket damaged/bent ● Height sensor incorrectly installed ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Incorrect height calibration process	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system.
C1A0392	Left Front Height Sensor	● Left-hand front height sensor height changing slower than expected ● Suspension prevented from moving ● Height sensor incorrectly installed ● Air spring leak ● Air harness leak ● Blocked/damaged air harness ● Blocked/damaged gallery pipe ● Corner valve stuck closed ● Front or rear valve block pipes incorrectly installed (unions reversed) ● Reservoir valve block pipes incorrectly installed (unions reversed) ● Reservoir valve stuck open ● Exhaust valve stuck closed	Check that the vehicle is free of obstructions. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check for an air spring leak. Check the air harness for evidence of melting, crushing, kinking or collapsing. Check the front and rear valve block pipes for correct routing and installation. Check the reservoir valve block pipes for correct routing and installation. Refer to the approved diagnostic system for corner, reservoir and exhaust valve checks. Check the corner valve for leaks.

DTC	Description	Possible causes	Action
		• Corner valve air leak • Pressure sensor fault • Height sensor failure	
C1A041C	Right Front Height Sensor	• Right-hand front height sensor signal voltage out of range • Water ingress to wiring harness or connectors • Height sensor linkage disconnected • Height sensor linkage damaged/bent • Height sensor disconnected • Height sensor linkage toggled (now operating in reverse direction) • Height sensor bracket damaged/bent • Height sensor incorrectly installed • Height sensor installed on wrong side of vehicle • Height sensor harness wiring short circuit to ground, short circuit to power or high resistance • Height sensor failure • Incorrect height calibration • Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0426	Right Front Height Sensor	• Right-hand front height sensor signal voltage stuck whilst vehicle is driven • Water ingress to wiring harness or connectors • Height sensor linkage disconnected • Height sensor harness wiring short circuit to ground, short circuit to power or high resistance • Height sensor failure • Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0429	Right Front Height Sensor	• Right-hand front height sensor signal invalid: • Water ingress to wiring harness or connectors • Height sensor linkage damaged/bent • Height sensor bracket damaged/bent • Height sensor incorrectly installed • Height sensor harness wiring short circuit to ground, short circuit to power or high resistance • Height sensor failure • Incorrect height calibration process	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system.

DTC	Description	Possible causes	Action
C1A0492	Right Front Height Sensor	• Right-hand front height sensor height changing slower than expected • Suspension prevented from moving • Height sensor incorrectly installed • Air spring leak • Air harness leak • Blocked/damaged air harness • Blocked/damaged gallery pipe • Corner valve stuck closed • Front or rear valve block pipes incorrectly installed (unions reversed) • Reservoir valve block pipes incorrectly installed (unions reversed) • Reservoir valve stuck open • Exhaust valve stuck closed • Corner valve air leak • Pressure sensor fault • Height sensor failure	Check that the vehicle is free of obstructions. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check for an air spring leak. Check the air harness for evidence of melting, crushing, kinking or collapsing. Check the front and rear valve block pipes for correct routing and installation. Check the reservoir valve block pipes for correct routing and installation. Refer to the approved diagnostic system for corner, reservoir and exhaust valve checks. Check the corner valve for leaks.
C1A051C	Left Rear Height Sensor	• Left-hand rear height sensor signal voltage out of range • Water ingress to wiring harness or connectors • Height sensor linkage disconnected • Height sensor linkage damaged/bent • Height sensor disconnected • Height sensor linkage toggled (now operating in reverse direction) • Height sensor bracket damaged/bent • Height sensor incorrectly installed • Height sensor installed on wrong side of vehicle • Height sensor harness wiring short circuit to ground, short circuit to power or high resistance • Height sensor failure • Incorrect height calibration • Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0526	Left Rear Height Sensor	• Left-hand rear height sensor signal voltage stuck whilst vehicle is driven • Water ingress to wiring harness or connectors • Height sensor linkage disconnected • Height sensor harness wiring short circuit to ground, short circuit to power or high resistance • Height sensor failure • Air suspension control	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		module failure	
C1A0529	Left Rear Height Sensor	- Left-hand rear height sensor signal invalid - Water ingress to wiring harness or connectors - Height sensor linkage damaged/bent - Height sensor bracket damaged/bent - Height sensor incorrectly installed - Height sensor harness wiring short circuit to ground, short circuit to power or high resistance - Height sensor failure - Incorrect height calibration process	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system.
C1A0592	Left Rear Height Sensor	- Left-hand rear height sensor height changing slower than expected - Suspension prevented from moving - Height sensor incorrectly installed - Air spring leak - Air harness leak - Blocked/damaged air harness - Blocked/damaged gallery pipe - Corner valve stuck closed - Front or rear valve block pipes incorrectly installed (unions reversed) - Reservoir valve block pipes incorrectly installed (unions reversed) - Reservoir valve stuck open - Exhaust valve stuck closed - Corner valve air leak - Pressure sensor fault - Height sensor failure	Check that the vehicle is free of obstructions. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check for an air spring leak. Check the air harness for evidence of melting, crushing, kinking or collapsing. Check the front and rear valve block pipes for correct routing and installation. Check the reservoir valve block pipes for correct routing and installation. Refer to the approved diagnostic system for corner, reservoir and exhaust valve checks. Check the corner valve for leaks.
C1A061C	Right Rear Height Sensor	- Right-hand rear height sensor signal voltage out of range - Water ingress to wiring harness or connectors - Height sensor linkage disconnected - Height sensor linkage damaged/bent - Height sensor disconnected - Height sensor linkage toggled (now operating in reverse direction) - Height sensor bracket damaged/bent - Height sensor incorrectly installed - Height sensor installed on wrong side of vehicle - Height sensor harness wiring short circuit to	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		ground, short circuit to power or high resistance ● Height sensor failure ● Incorrect height calibration ● Air suspension control module failure	
C1A0626	Right Rear Height Sensor	● Right-hand rear height sensor signal voltage stuck whilst vehicle is driven ● Water ingress to wiring harness or connectors ● Height sensor linkage disconnected ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0629	Right Rear Height Sensor	● Right-hand rear height sensor signal invalid ● Water ingress to wiring harness or connectors ● Height sensor linkage damaged/bent ● Height sensor bracket damaged/bent ● Height sensor incorrectly installed ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Incorrect height calibration process	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system.
C1A0692	Right Rear Height Sensor	● Right-hand rear height sensor height changing slower than expected ● Suspension prevented from moving ● Height sensor incorrectly installed ● Air spring leak ● Air harness leak ● Blocked/damaged air harness ● Blocked/damaged gallery pipe ● Corner valve stuck closed ● Front or rear valve block pipes incorrectly installed (unions reversed) ● Reservoir valve block pipes incorrectly installed (unions reversed) ● Reservoir valve stuck open ● Exhaust valve stuck closed ● Corner valve air leak ● Pressure sensor fault ● Height sensor failure	Check that the vehicle is free of obstructions. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check for an air spring leak. Check the air harness for evidence of melting, crushing, kinking or collapsing. Check the front and rear valve block pipes for correct routing and installation. Check the reservoir valve block pipes for correct routing and installation. Refer to the approved diagnostic system for corner, reservoir and exhaust valve checks. Check the corner valve for leaks.

DTC	Description	Possible causes	Action
C1A0762	Cross Articulation	- Cross articulation too large whilst vehicle is driven - Water ingress to wiring harness or connectors - Height sensor linkage damaged/bent - Height sensor linkage loose/disconnected - Height sensor bracket damaged/bent - Height sensor harness wiring short circuit to ground, short circuit to power or high resistance - Height sensor removed and reinstalled without being recalibrated - New height sensor installed without calibration - Incorrect height calibration - Height sensor failure	Follow the process detailed in the relevant special service message (SSM). Check the condition and security of the height sensor bracket(s). Check the height sensor for correct fitment and fixings torque. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system.
C1A081C	Pressure Sensor Supply	- Pressure sensor supply voltage out of range - Pressure sensor harness wiring short circuit to ground, short circuit to power or high resistance - Pressure sensor failure - Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A091C	Pressure Sensor Signal	- Pressure sensor signal voltage out of range - Pressure sensor disconnected - Pressure sensor harness wiring short circuit to ground, short circuit to power or high resistance - Pressure sensor failure - Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A1064	Pressure Fluctuates When System Inactive	- Reservoir and air spring pipes incorrectly installed to front or rear valve block (unions reversed) - Corner valve stuck open - Pressure sensor harness wiring short circuit to ground, short circuit to power or high resistance - Pressure sensor failure - Air suspension control module failure	Check the reservoir and air spring pipes for correct routing and installation. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A1164	Pressure Fluctuates When System Inactive	- Reservoir and air spring pipes incorrectly installed to front or rear valve block (unions reversed) - Corner valve internal leak - Reservoir valve internal leak - Pressure sensor harness wiring short circuit to ground, short circuit to	Check the reservoir and air spring pipes for correct routing and installation. For corner valve, reservoir valve, pressure sensor and circuit tests refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		power or high resistance - Pressure sensor failure	
C1A1364	Pressure Does Not Decrease When Venting Gallery	- Exhaust valve stuck closed - Exhaust valve does not hold minimum retention pressure - Gallery pipe blocked/damaged - Pressure sensor fault - Air suspension exhaust silencer blocked/restricted - Air suspension exhaust pipe blocked/damaged - Reservoir valve block pipes incorrectly installed (unions reversed)	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the Air suspension exhaust pipe and silencer for blockage/restriction. Check the reservoir valve block pipes for correct routing and installation.
C1A1864	Pressure Increase Too Rapid When Filling Reservoir	- Reservoir valve stuck closed - Reservoir pipe blocked/damaged - Reservoir port blocked/restricted - Pressure sensor fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C1A2064	Pressure Increase Too Slow When Filling Reservoir	- Compressor fault - Reservoir pipe air leak - Reservoir air leak - Gallery pipe air leak - Intake filter blocked/restricted - Intake pipe blocked/restricted - Air suspension intake silencer blocked/restricted - Corner valve stuck open - Pressure sensor fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the Air suspension intake pipe and silencer for blockage/restriction.
C1A2464	No Temperature Increase When Compressor Requested	- Air compressor cylinder head temperature sensor disconnected - Air compressor cylinder head temperature sensor detached from cylinder head - Air compressor cylinder head temperature sensor fault - Air compressor fault	Check the security of the compressor cylinder head temperature sensor and electrical connection. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C1A2467	No Temperature Increase When Compressor Requested	- Temperature takes too long to read after suitable compressor runtime - Air compressor cylinder head temperature sensor disconnected - Air compressor cylinder head temperature sensor fault - Air compressor disconnected - Air compressor ground circuit high resistance - Air compressor fault	Check the security of the compressor cylinder head temperature sensor and electrical connection. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
C1A2616	Temperature Sensor Circuit	● Temperature sensor voltage out of range ● Air compressor cylinder head temperature sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A2712	Compressor Circuit	● Compressor voltage present when compressor not requested ● Air compressor harness wiring short circuit to power ● Air compressor relay fault ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A2714	Compressor Circuit	● Compressor voltage present when compressor requested ● Air suspension control module supply (COMP_V) fuse in battery junction box (BJB) failed ● Air supply relay/air compresor supply fusible link in BJB failed/not installed ● Air compressor harness wiring short circuit to ground or high resistance ● Air compressor relay failure ● Air suspension control module failure	Check/renew fuses as necessary. Refer to the electircal guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A2729	Compressor Circuit	● Compressor relay control voltage signal invalid ● Air compressor harness wiring short circuit to power ● Air compressor relay fault ● Air suspension control module failure	DTC C1A2712 will be set first. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A2864	Wrong Number of LEDs Illuminated	● Wrong number of LEDs illuminated on switch pack ● Air suspension control module supply (BATTERY) fuse in battery junction box (BJB) failed ● Switch pack harness wiring short circuit to ground, short circuit to power or high resistance ● LED circuit short circuit to power ● One or more LEDs short circuit to each other ● Switch pack failure ● Air suspension control module failure	Check/renew fuse as necessary. Refer to the electircal guides. Refer to the electrical guides and check the switch pack and LED wiring ciruits. Renew/repir as necessary. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
C1A2992	Switch Activation Too Long	● Ride height change switch activation too long ● Switch pressed for more than 255 seconds ● Switch pack harness wiring short circuit to ground, short circuit to power or high resistance ● Switch pack failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3064	Both Switches Pressed At Same Time	● Raise and lower switches activated at same time ● Air suspension control module supply (BATTERY) fuse in battery junction box (BJB) failed ● Switch pack harness wiring short circuit to ground, short circuit to power or high resistance ● Switch pack failure ● Air suspension control module failure	Check/renew fuse as necessary. Refer to the electircal guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3101	Left Front Corner Valve	● Left-hand front corner valve, general electrical failure ● Front valve block disconnected ● Front valve block harness wiring short circuit to ground or high resistance ● Left-hand front corner valve failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3201	Right Front Corner Valve	● Right-hand front corner valve, general electrical failure ● Front valve block disconnected ● Front valve block harness wiring short circuit to ground or high resistance ● Right-hand front corner valve failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3301	Left Rear Corner Valve	● Left-hand rear corner valve, general electrical failure ● Rear valve block disconnected ● Rear valve block harness wiring short circuit to ground or high resistance ● Left-hand rear corner valve failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
C1A3401	Right Rear Corner Valve	● Right-hand rear corner valve, general electrical failure ● Rear valve block disconnected ● Rear valve block harness wiring short circuit to ground or high resistance ● Right-hand rear corner valve failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3501	Reservoir Valve	● Reservoir valve general electrical failure ● Reservoir valve block disconnected ● Reservoir valve block harness wiring short circuit to ground or high resistance ● Reservoir valve block failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3601	Exhaust Valve	● Exhaust valve, general electrical failure ● Exhaust valve disconnected ● Exhaust valve harness wiring short circuit to ground or high resistance ● Exhaust valve failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3701	Front Cross-Link Valve	● Front cross-link valve general electrical failure ● Front valve block disconnected ● Front valve block harness wiring short circuit to ground or high resistance ● Front cross-link valve failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A3801	Rear Cross-Link Valve	● Rear cross-link valve general electrical failure ● Rear valve block disconnected ● Rear valve block harness wiring short circuit to ground or high resistance ● Rear cross-link valve failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A5501	Ignition Switch Input Circuit	● Ignition switch input circuit; ignition on while wake-up off or ignition off while engine running ● Ignition switch input circuit short circuit to ground, short circuit to power or	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		high resistance	
C1A681C	Left Front Height Sensor Supply	● Left-hand front height sensor supply circuit voltage out of range ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A691C	Right Front Height Sensor Supply	● Right-hand front height sensor supply circuit voltage out of range ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A701C	Left Rear Height Sensor Supply	● Left-hand rear height sensor supply circuit voltage out of range ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A711C	Right Rear Height Sensor Supply	● Right-hand rear height sensor supply circuit voltage out of range ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A721C	Left Front Height Sensor Mechanism	● Left-hand front height sensor signal voltage out of range (mechanical) ● Water ingress to wiring harness or connectors ● Height sensor linkage disconnected ● Height sensor linkage damaged/bent ● Height sensor disconnected ● Height sensor linkage toggled (now operating in reverse direction) ● Height sensor bracket damaged/bent ● Height sensor incorrectly installed ● Incorrect height calibration ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		● Height sensor failure ● Air suspension control module failure	
C1A731C	Left Front Height Sensor Mechanism	● Right-hand front height sensor voltage out of range (mechanical) ● Water ingress to wiring harness or connectors ● Height sensor linkage disconnected ● Height sensor linkage damaged/bent ● Height sensor disconnected ● Height sensor linkage toggled (now operating in reverse direction) ● Height sensor bracket damaged/bent ● Height sensor incorrectly installed ● Incorrect height calibration ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A741C	Left Rear Height Sensor Mechanism	● Left-hand rear height sensor signal voltage out of range (mechanical) ● Water ingress to wiring harness or connectors ● Height sensor linkage disconnected ● Height sensor linkage damaged/bent ● Height sensor disconnected ● Height sensor linkage toggled (now operating in reverse direction) ● Height sensor bracket damaged/bent ● Height sensor incorrectly installed ● Incorrect height calibration ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
C1A751C	Right Rear Height Sensor Mechanism	● Right-hand rear height sensor signal voltage out of range (mechanical) ● Water ingress to wiring harness or connectors ● Height sensor linkage disconnected ● Height sensor linkage damaged/bent ● Height sensor disconnected ● Height sensor linkage	Visually inspect the wiring harness and connectors for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the height sensor bracket condition and security. Check the height sensor for correct installation and torque of fixings. If any height sensor fixings are slackened or found to be loose, or a height sensor has been changed, the vehicle ride height must be re-calibrated. Calibrate the system using the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		toggled (now operating in reverse direction) ● Height sensor bracket damaged/bent ● Height sensor incorrectly installed ● Incorrect height calibration ● Height sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Height sensor failure ● Air suspension control module failure	
C1B1862	Supply Voltage X-Ref Check	● Inconsistent battery voltages received by Air suspension control module ● Air suspension control module supply circuit(s) short circuit to ground ● Air suspension control module supply circuit(s) high resistance ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C1B1903	Door Status Signal	● Door status signal, pulse width modulated failures ● Incorrect software loaded to Air suspension control module ● Central junction box to Air suspension module harness wiring short circuit to ground, short circuit to power or high resistance ● Central junction box fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
C1B211C	Compressor Brush Card Temperature Sensor Circuit	● Compressor brush card temperature sensor circuit, voltage out of range ● Compressor brush card temperature sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Compressor brush card temperature sensor failure ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.
U007388	Control Module Communication Bus 'A' Off	● CAN bus connections short circuit to each other	Refer to the Network Communications section of the workshop manual.
U010087	Lost Communication With ECM/PCM "A"	● CAN bus fault ● ECM disconnected ● ECM not configured ● ECM failure	Refer to the Network Communications section of the workshop manual.
U010187	Lost Communication With Transmission Control Module	● CAN bus fault ● Transmission control module (TCM) disconnected ● TCM not configured ● TCM failure	Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Action
U010287	Lost Communication With Transfer Box Control Module	● CAN bus fault ● Transfer box control module disconnected ● Transfer box control module not configured ● Transfer box control module failure	Refer to the Network Communications section of the workshop manual.
U012287	Lost Communication With Vehicle Dynamics Control Module	● CAN bus fault ● ABS module disconnected ● ABS module not configured ● ABS module failure	Refer to the Network Communications section of the workshop manual.
U012687	Lost Communication With Steering Angle Sensor Module	● CAN bus fault ● SASM disconnected ● SASM not configured/calibrated ● SASM failure	Refer to the Network Communications section of the workshop manual.
U012887	Lost Communication With Park Brake Control Module	● CAN bus fault ● Park brake module disconnected ● Park brake module not configured ● Park brake module failure	Refer to the Network Communications section of the workshop manual.
U013387	Lost Communication With Active Roll Control Module	● CAN bus fault ● Vehicle dynamic suspension system module disconnected ● Vehicle dynamic suspension system module not configured ● ABS module failure	Refer to the Network Communications section of the workshop manual.
U013687	Lost Communication With Differential Control Module - Rear	● CAN bus fault ● Electronic rear differential control module disconnected ● Electronic rear differential control module not configured ● Electronic rear differential control module failure	Refer to the Network Communications section of the workshop manual.
U015587	Lost Communication With Instrument Panel Cluster (IPC) Control Module	● CAN bus fault ● Instrument cluster disconnected ● Instrument cluster not configured ● Instrument cluster failure	Refer to the Network Communications section of the workshop manual.
U030055	Internal Control Module Software Incompatibility	● Incorrect software loaded ● CAN wiring to instrument cluster high resistance ● Incorrect instrument cluster CAN configuration	Configure the Air suspension control module and instrument cluster as necessary using the approved diagnostic system.
U040186	Invalid Data Received From ECM/PCM A	● Engine management system fault	Refer to the Network Communications section of the workshop manual.
U041686	Invalid Data Received From Vehicle Dynamics Control Module	● Warnings and Messages: - Warning - Two Chimes - Displayed message - SLOW DOWN OR VEHICLE WILL LOWER ● Subsequent Warning &	Refer to the Network Communications section of the workshop manual. Check for ABS system DTCs and repair as necessary.

DTC	Description	Possible causes	Action
		Message - Warning - One Chime. - Message - SUSPENSION LOWERED - Meaning - Vehicle has lowered to Access height because of failure of another vehicle system ● ABS fault	
U041786	Invalid Data Received From Park Brake Control Module	● Park brake fault	Refer to the Network Communications section of the workshop manual.
U042886	Invalid Data Received From Steering Angle Sensor Module (SASM)	● SASM not configured/calibrated ● SAS fault	Check the security of the electrical connection. Configure/calibrate the SAS using the approved diagnostic system. Refer to the Network Communications section of the workshop manual.
U043486	Invalid Data Received From Active Roll Control Module	● Vehicle dynamic suspension system fault	Refer to the Network Communications section of the workshop manual.
U1A1387	Lost Communication With All Terrain Control Module	● Lost communication with all terrain optimization switch ● CAN bus fault ● Terrain optimization switch disconnected ● Terrain response module not configured ● Terrain response module failure	Refer to the Network Communications section of the workshop manual.
U1A1449	CAN Initialization Failure	● Internal electronic failure	Refer to the Network Communications section of the workshop manual.
U1A3562	VIN Data	● VIN from instrument cluster does not match VIN at time of calibration ● Air suspension control module has been swapped with another vehicle ● Instrument cluster not configured	Configure the instrument cluster using the approved diagnostic system.
U200067	Motor Temperature	● Temperature sensor voltage takes too long to read after suitable compressor runtime ● Compressor brush card temperature sensor harness wiring short circuit to ground, short circuit to power or high resistance ● Compressor brush card temperature sensor failure ● Compressor fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
U200701	Valve(s)	● Valve circuit short circuit to ground ● Water ingress to wiring harness or connectors ● Valve harness wiring short circuit to ground or high resistance	DTC C1A001D will be set first. Visually inspect the wiring harness and connectors between the Air suspension control module and the control valves for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		- Air suspension control module failure	
U200711	Valve(s)	- Valve circuit short circuit to ground when system is inactive - Water ingress to wiring harness or connectors - Valve harness wiring short circuit to ground or high resistance - Air suspension control module failure	Visually inspect the wiring harness and connectors between the Air suspension control module and the control valves for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
U200719	Valve(s)	- Valve circuit current above threshold - Valve supply circuit(s) intermittent short circuit to ground or high resistance - Valve failure - Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
U200767	Valve(s)	- Valve signal incorrect after event - Water ingress to wiring harness or connectors - Valve supply circuit(s) short circuit to ground, short circuit to power or high resistance - Air suspension control module failure	Visually inspect the wiring harness and connectors between the Air suspension control module and the control valves for water ingress. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect.

Vehicle Dynamic Suspension - Air Suspension System Depressurize and Pressurize

General Procedures

- WARNINGS:

⚠ A small amount of air pressure will be left in the air suspension system.

⚠ Eye protection must be worn.

⚠ Wear protective gloves.

- CAUTIONS:

⚠ Make sure tailgate, hood and all doors are closed.

⚠ Make sure the vehicle is in a clear working area.

1. ⚠ WARNING: The air suspension system is pressurised up to 16.8 bar (244 lbf/in^2). Make sure no dirt or grease enters the system. Always wear hand, eye and ear safety standard protection when working on the system.

Using T4, depressurize the air suspension.

2. Using T4, pressurize the air suspension.

- Start and run the engine.

Published: 11-May-2011

Vehicle Dynamic Suspension - Air Leaks

General Procedures

Special Tool(s)	
	Hose Cutter 204-494 (LRT 60-002)

1. ⚠ CAUTION: Any leak detection spray used must have a corrosion inhibitor, and must not cause damage to paintwork, plastics, metals or plastic lines.

   - NOTE: The recommended leak detection spray is GOTEC LDS, Landrover part number STC 1090.

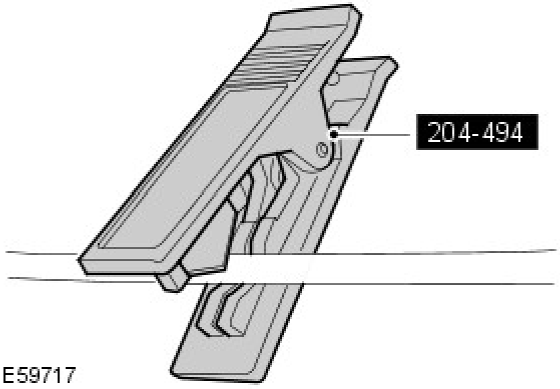
   The recommended leak detection spray should be used to identify any suspected leaks. This procedure should also be used where any of the air suspension components have been disturbed.

2. Clean around the area of the suspected air leak.

3. Using the recommended leak detection spray, spray around all of the air suspension components, working systematically until the source of the air leak has been found.

4. If any of the air suspension components are found to be leaking e.g. air spring, compressor, reservoir or a solenoid valve block, repair is effected by replacement only.

5. Using T4, depressurize the air suspension system.
   For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).



6. CAUTIONS:

   ⚠ Different air lines in the air suspension system have different material properties and wall thicknesses. It is important, in order to prevent subsequent air line failure, that the new air line material and wall thicknesses are identical to those of the air line being removed.

   ⚠ Replacement air line must be cut from a new air line with the equivalent Land Rover part number as the one being replaced. Do not use air line cut from a roll or coil.

   ⚠ Any existing heatsleeves and abrasion sleeves must be replaced as part of the repair.

   ⚠ Air line connectors should be positioned in areas away from heat sources such as the exhaust system, and away from any section of air line with a heat shield installed.

   ⚠ Do not trim air line ends. If the end of the air line is damaged, the air line must be cut and a new section added using a Land Rover approved air line connector, or the air line must be renewed completely.

   - NOTE: Air lines must only be cut using either Hose cutter 204-494 (LRT 60-002), available from SPX LTD or Hose cutter YA1000A, available from Snap-On Tools. Make sure the cut air line end is free from damage or burrs.

- NOTE: Only Land Rover approved air lines have been tested to the correct pressure and temperature specifications.

- NOTE: Only the Land Rover approved air line connector, RYC500210, has been tested to the correct pressure and temperature specifications.

- NOTE: If the markings or tape adjacent to the air line connections are removed when cutting air lines, the cut end of the air line must be clearly marked with a suitable colored tape or paint mark.

If the source of the air leak is found to be an air line connection, renew the Voss connector and, if required, the end of the air line. Using the special tool, cut off the damaged end of the air line and replace with new Land Rover approved air line and air line connectors as required.

7. If the source of the air leak is found to be in a section of air line, either; renew the air line, or, using the special tool, cut out the damaged section of air line and replace with new Land Rover approved air line, and air line connectors, as required.

8. NOTE: If the repair has been unsuccessful repeat the above steps until the air leak is rectified.

Using T4, pressurize the air suspension system.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

Vehicle Dynamic Suspension - Front Shock Absorber and Air Spring Assembly

Removal and Installation

Removal

- NOTE: Only the air spring being removed needs to be depressurised.
- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

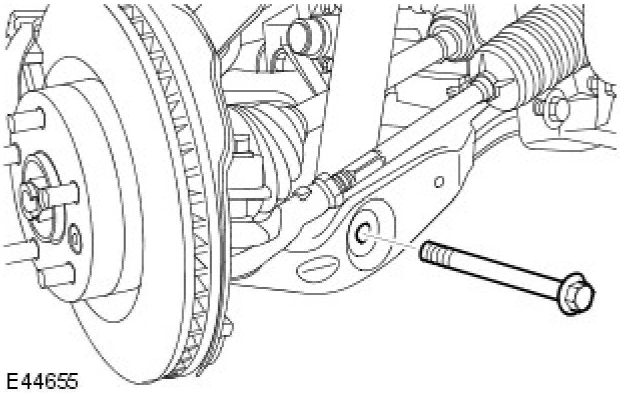
Raise and support the vehicle.

2. Remove the wheel and tire.

3. Using the Land Rover approved diagnostic system, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

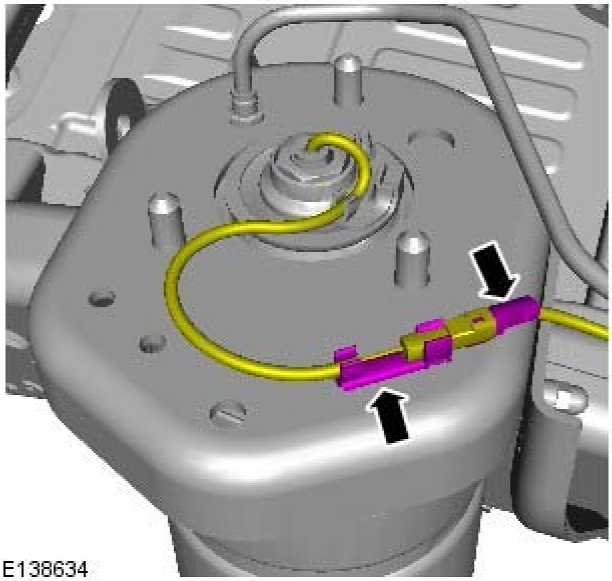
4. Disconnect the shock absorber and air spring assembly from the lower arm.

- Remove the nut and bolt.

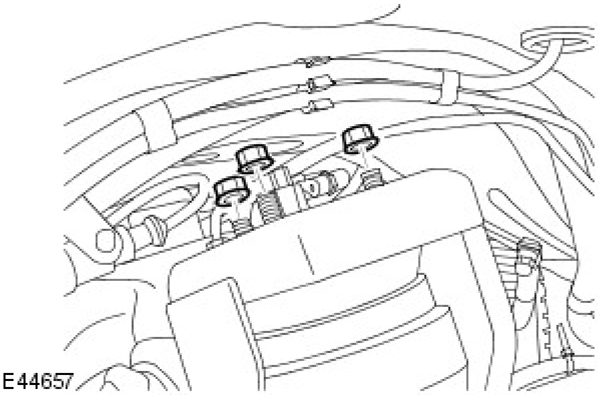


E44655

5. Disconnect the active damping wiring.



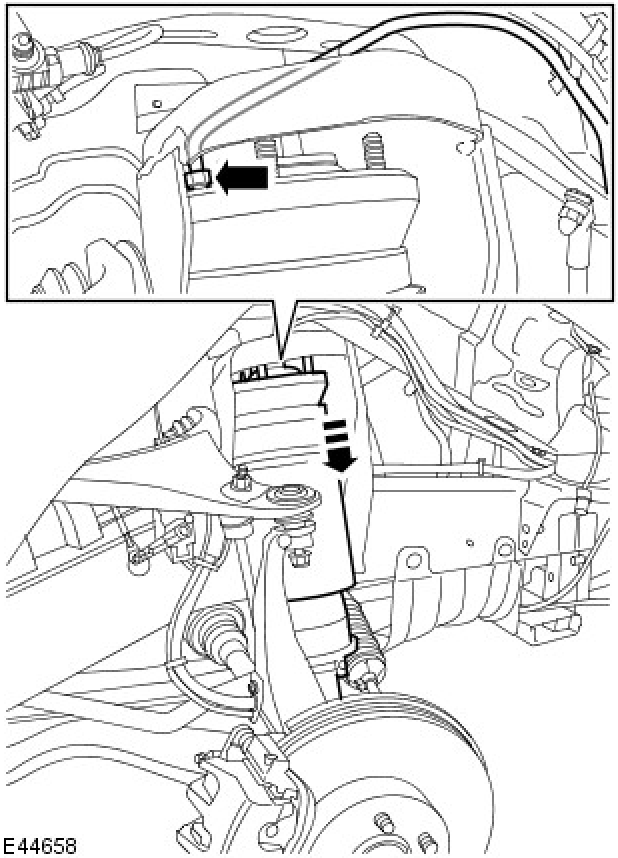
E138634



E44657

6. Release the shock absorber and air spring assembly.

- Remove the 3 nuts.



E44658

7. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Release the shock absorber and air spring assembly and disconnect the air line.

8. Remove the shock absorber and air spring assembly.

9. Remove the Voss connector from the air line.

- Remove and discard the collet and the union.

Installation

1. ⚠ CAUTION: Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air spring.

- Tighten to 3.5 Nm (2.6 lb.ft)

2. NOTE: Remove and discard the blanking caps.

Install the shock absorber and air spring assembly.

- Make sure the shock absorber and air spring assembly top mounting to body mating faces are clean.
- Fit the nuts and tighten to 63 Nm (46 lb.ft).
- Connect the air line into the Voss connector.
- Tug on the air line to make sure it is fully installed into the Voss connecter.

3. Attach the active damping wiring.

4. Connect the shock absorber and air spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

5. Using the Land Rover approved diagnostic system, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

6. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Vehicle Dynamic Suspension - Front Air Shock Absorber

Removal and Installation

<table>
<tr><th colspan="2">Special Tool(s)</th></tr>
<tr><td></td><td>Air spring tester
204-538</td></tr>
<tr><td></td><td>Remover front air shocker absorber spindle nut
204-700</td></tr>
</table>

Removal

- NOTE: This procedure should also be used to remove the front air spring.

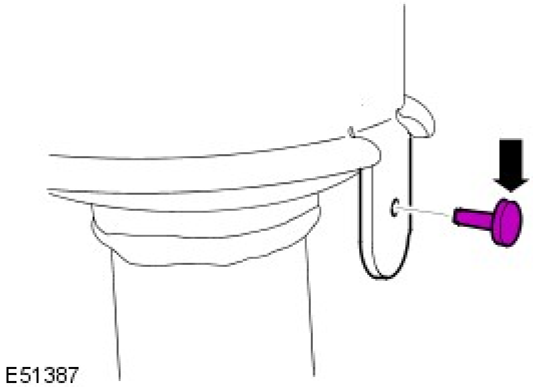
1. Remove the front shock absorber and air spring assembly.
For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

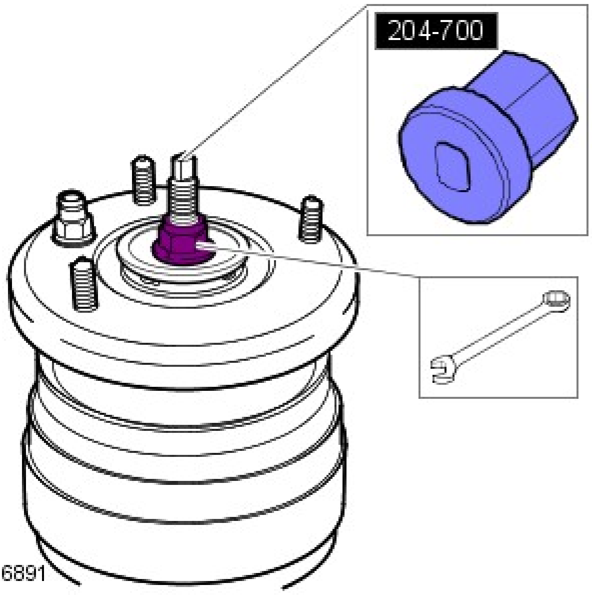
2. NOTE: If no leak is detected, investigate other areas of the air suspension for faults.

Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss using leak detector spray.
- If a leak is suspected, immerse the shock absorber and air spring assembly in a tank of water to locate the source of the leak and mark the area.

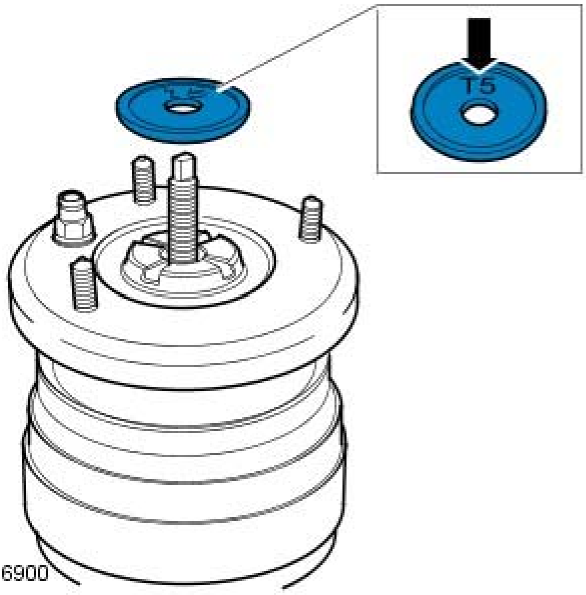
3. Remove the nylon retaining pin.





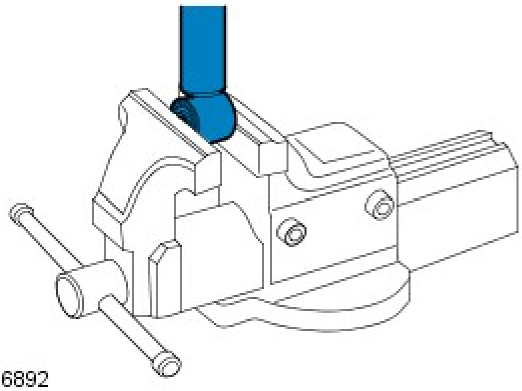
E96891

4. Using the special tool, remove the nut.



E96900

5. Remove the rebound washer.



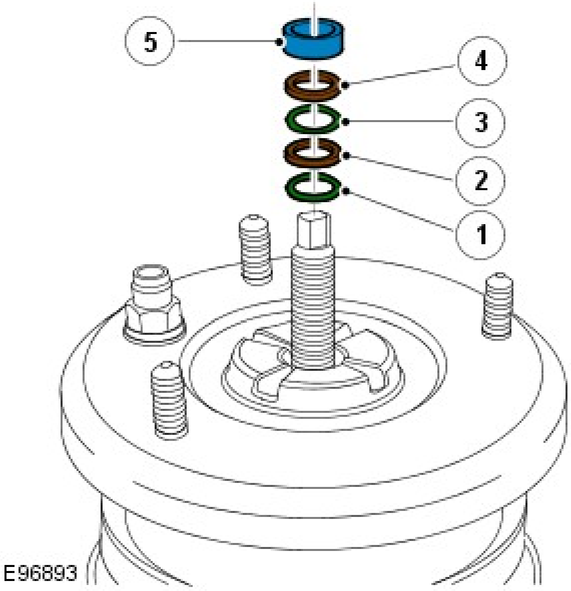
E96892

6. CAUTIONS:

⚠ Make sure protective jaws are installed to the vice. Failure to follow this instruction may result in damage to the component.

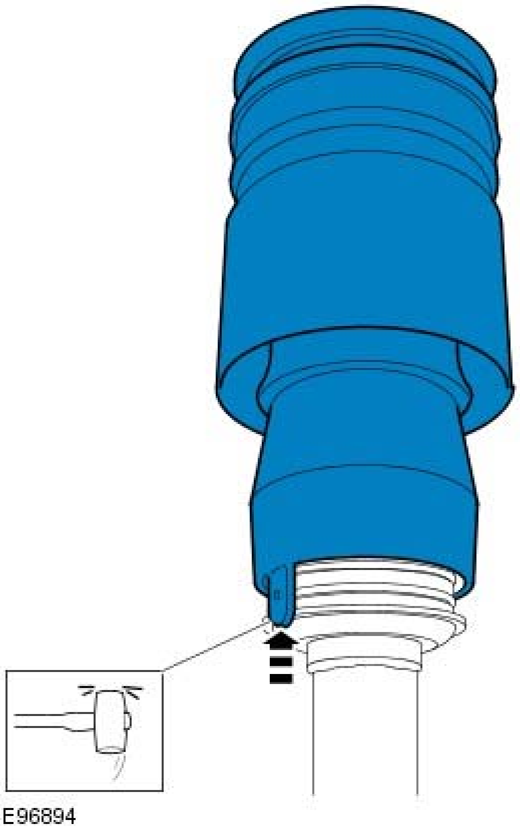
⚠ Do not clamp the shock absorber tube. Failure to follow this instruction may result in damage to the component.

Position the front shock absorber and air spring assembly in a vice.



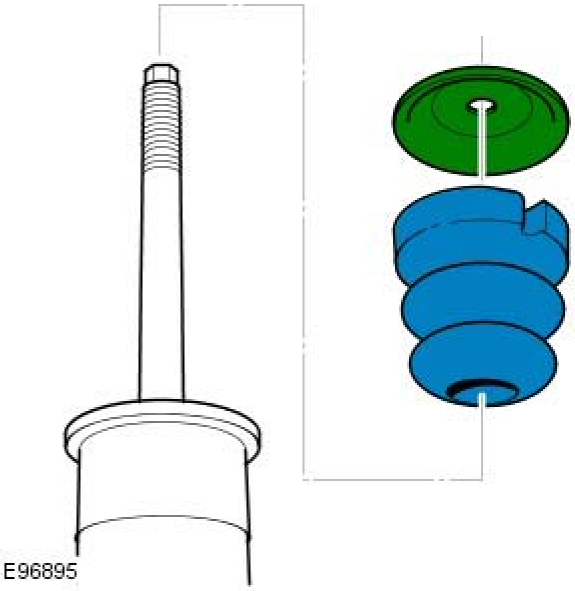
5
4
3
2
1
E96893

7. Remove and discard the 3 spacers and 2 O-ring seals.



8. Remove the air spring.

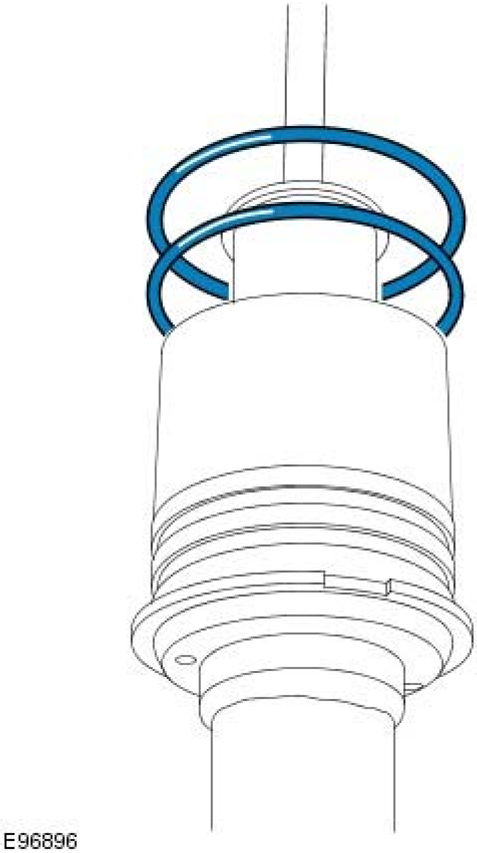
- Using a soft faced mallet, gently tap the sleeve support upwards to release it from the O-ring seals.



E96895

9. NOTE: Note the fitted position.

Remove the bump plate and spring aid.

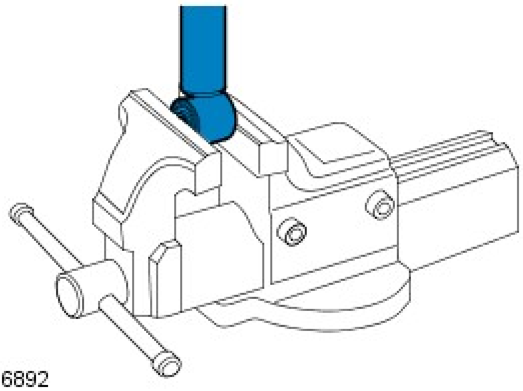


E96896

10. Remove and discard the 2 large black O-ring seals from the lower seal carrier.

11. Remove the front shock absorber and air spring assembly from the vice.

Installation



E96892

1. CAUTIONS:

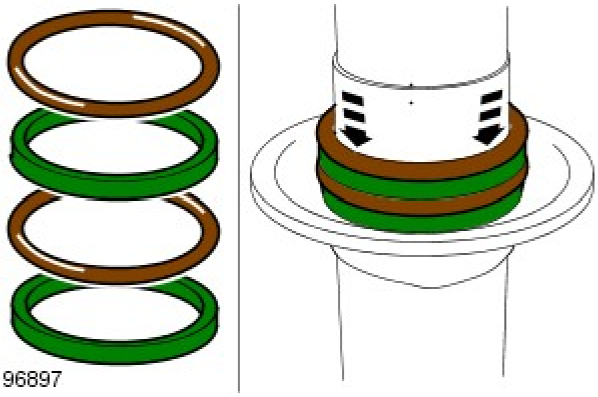
⚠ Make sure protective jaws are installed to the vice. Failure to follow this instruction may result in damage to the component.

⚠ Do not clamp the shock absorber tube. Failure to follow this instruction may result in damage to the component.

Position the front shock absorber and air spring assembly in a vice.

2. ⚠ CAUTION: Use compressed air and lint free non-flocking material.

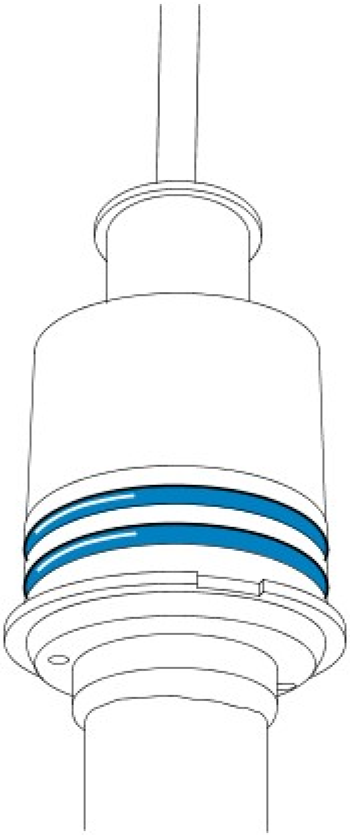
Clean the components.



E96897

3. Lift the seal carrier to expose the O-ring seal stack.

- Make sure that the damper body O-ring seals and spacers are fully seated to the spring seat.

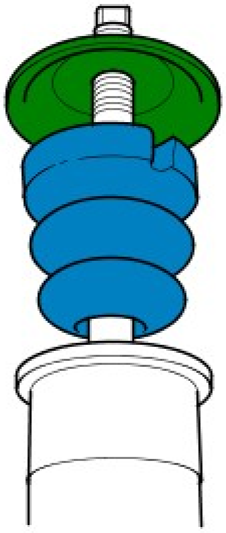


E96898

4. ⚠ CAUTION: Take care not to damage the O-ring seals during installation.

Install new O-ring seals to the seal carrier.

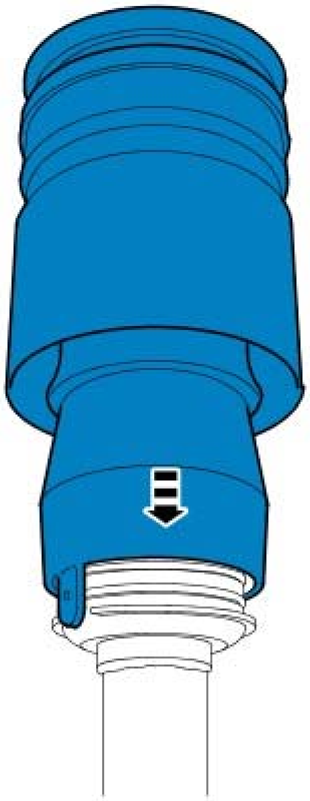
- Apply loctite 8021 (silicon-based oil) to the O-ring seals.



E96899

5. NOTE: Make sure that these components are installed to the noted removal position.

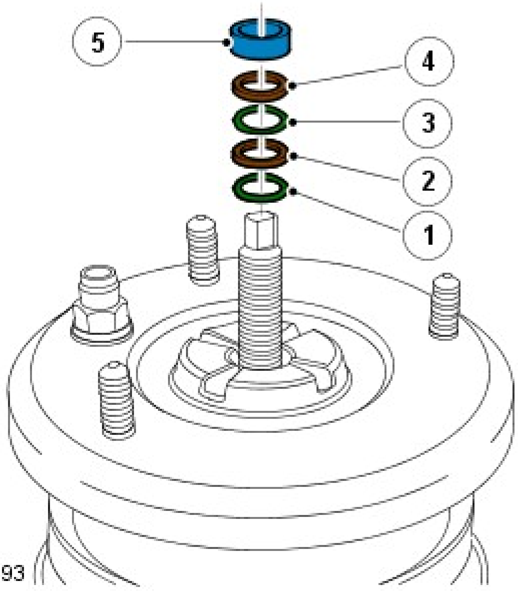
Install the bump plate and spring aid.



E99908

6. Install the air spring.

- Align the sleeve support with the first O-ring seal making sure that the location tag is correctly aligned with the spring seat cut-out.



E96893

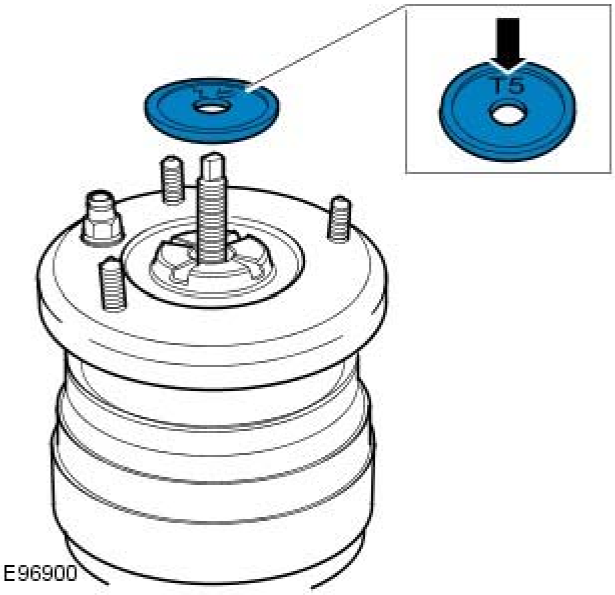
7. CAUTIONS:

⚠ Make sure that the threads of the front air shock absorber are covered with protective tape.

⚠ Take care not to damage the O-ring seals during installation.

Install the components in the following order:

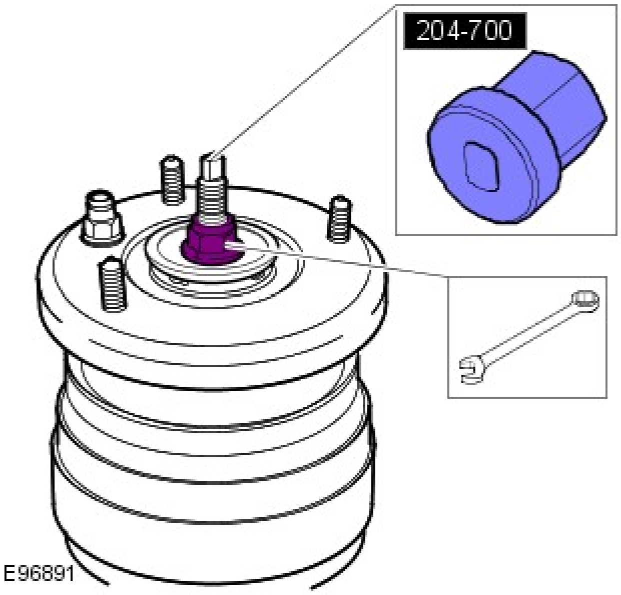
1. O-ring seal
2. Spacer
3. O-ring seal
4. Spacer
5. Spacer



T5
T5
E96900

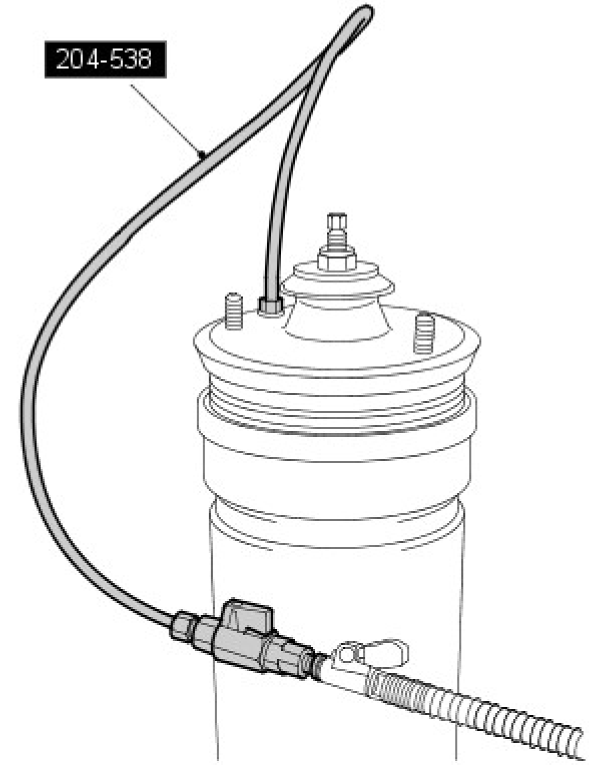
8. NOTE: The "T5" stamp on the upper face of the rebound washer must be visable after assembly.

Install the rebound washer.



204-700
E96891

9. Install a new nut and using the special tool, and tighten to 98 Nm (72 lb.ft).



E51445

10. CAUTIONS:

⚠ The air supply must be free of any moisture.

⚠ If during disassembly the air sleeve is unrolled, the air sleeve may inflate incorrectly (to one side). If this occurs, release the air pressure, and insert a suitable tool that will not damage the air sleeve or piston (a screw driver handle), into the side opposite the bulge. Inflate and deflate until the air sleeve inflates correctly (the air sleeve will be uniform inside the shroud).

• NOTE: To prevent damage when seating the sleeve support over the large black O-rings, compressed air should be used to inflate the air spring.

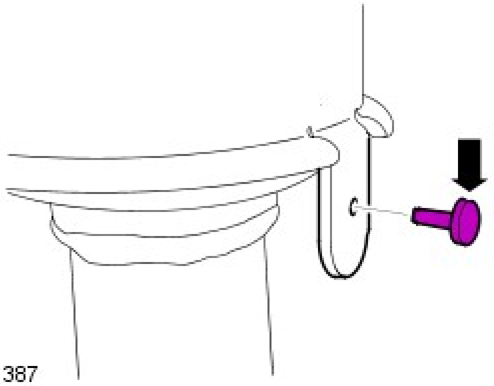
Using the special tool coupled to a tire inflator with a gauge, apply approximately 2 bar of air pressure to the air spring to fully seat the sleeve support over the O-ring seals.

11. Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss using leak detector spray.
- If a leak is suspected, immerse the shock absorber and air spring assembly in a tank of water to locate the source of the leak.

12. Depressurize and remove the special tool from the shock absorber and air spring assembly.

13. Install the nylon retaining pin.



E51387

14. NOTE: Install a new air spring pipe connector.

Install the front shock absorber and air spring assembly.
For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Vehicle Dynamic Suspension - Suspension Height Sensor

Removal and Installation

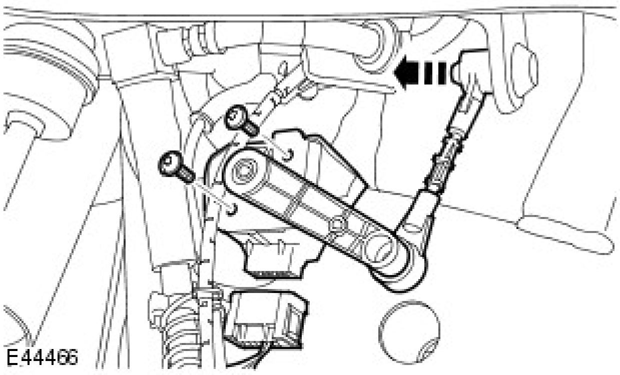
Removal

• NOTE: The rear height sensors are handed. The right hand sensor has a black colored lever and the left hand sensor has a white colored lever. The front height sensors are not handed, and are fitted with grey levers for identification.

• NOTE: This procedure covers removal and installation of both the front and rear suspension height sensors.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



2. CAUTION: Do not use excessive force to disconnect the height sensor link.

Remove the suspension height sensor.

- Disconnect the height sensor link.
- Disconnect the electrical connector.
- Remove the 2 Torx screws.

Installation

1. CAUTION: Make sure the Torx screw is not over tightened. Failure to follow this instruction will result in damage to the vehicle.

To install, reverse the removal procedure.

- Tighten the screws to 3 Nm (2 lb.ft).

2. Using Land Rover approved diagnostic equipment, calibrate the ride hight.

Published: 11-May-2011

Vehicle Dynamic Suspension - Air Suspension Reservoir

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Using T4, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

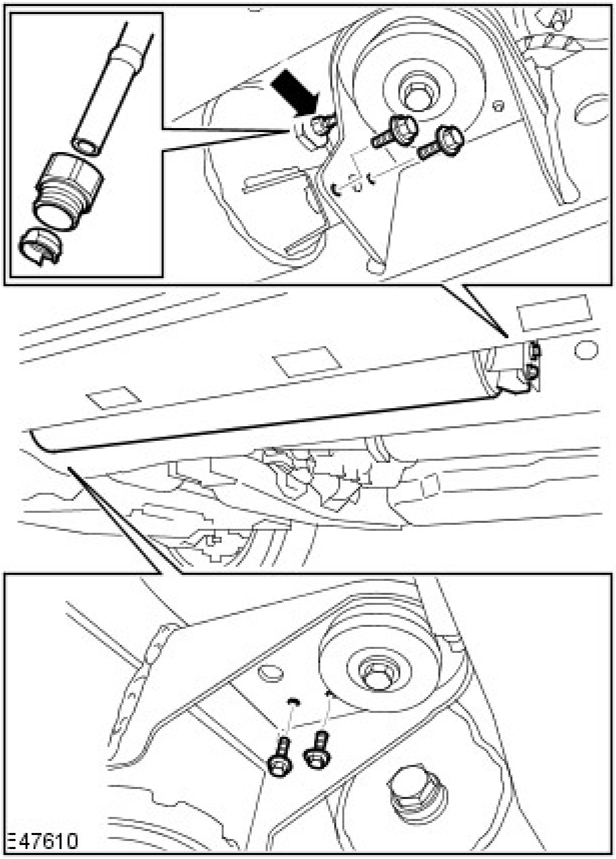
3. CAUTIONS:

⚠ Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

⚠ The air line must only be disconnected by removal of the voss connector. Do not remove the air line retaining boss from the air suspension reservoir. Failure to follow this instruction may result in damage to the vehicle.

⚠ Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

Disconnect the air line from the air suspension reservoir.



4. Remove the air suspension reservoir.

- Remove the 4 bolts.

5. Remove the Voss connector from the air line.

- Remove and discard the collet and the union.

Installation

1. ⚠ CAUTION: Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air reservoir.

- Tighten the new Voss connector to 5 Nm (4 lb.ft).

2. Install the air suspension reservoir.

- Locate the air reservoir to the chassis brackets, fit the bolts and tighten to 23 Nm (17 lb.ft).
- Fully seat the air line into the Voss connector.
- Pull on the air line to make sure it is fully installed into the Voss connecter.

3. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

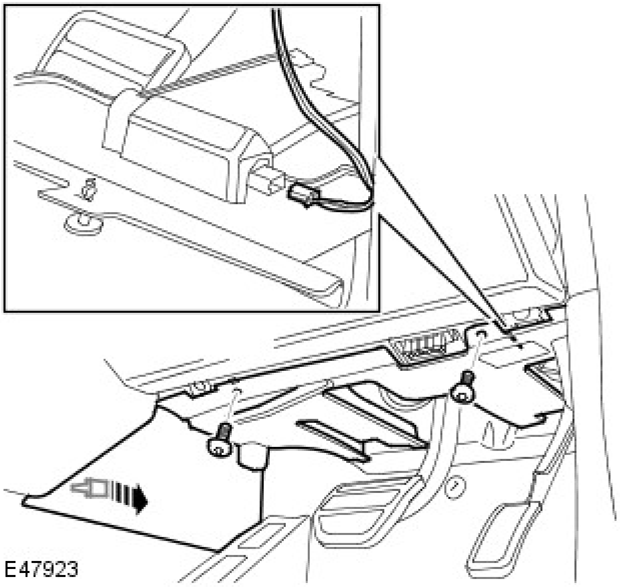
Published: 11-May-2011

Vehicle Dynamic Suspension - Air Suspension Control Module

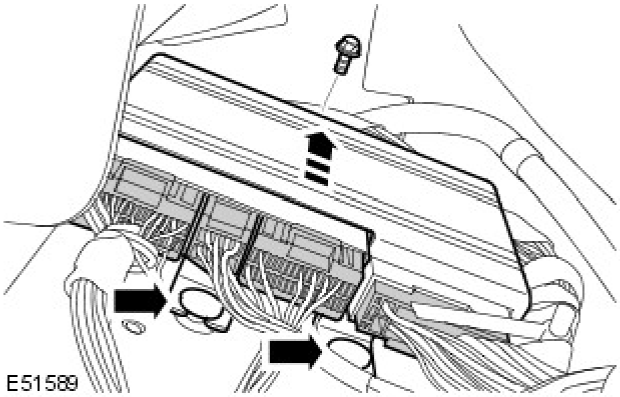
Removal and Installation

Removal

1. Driver side: Remove the cowl side trim panel.
   For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



2. Remove the closing trim panel.
   - Release the clip.
   - Remove the 2 screws.
   - Disconnect the electrical connector.



3. Remove the air suspension control module.
   - Disconnect the 4 electrical connectors.
   - Remove the bolt.
   - Release from the 2 clips.

Installation

1. Install the air suspension control module.
   - Secure with the clips.
   - Connect the electrical connectors.
   - Tighten the bolt to 9 Nm (7 lb.ft).
2. Install the closing trim panel.
   - Connect the electrical connector.
   - Secure the clip.
   - Tighten the screws.

3. Install the cowl side trim panel.
   For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Initiate a new control module using T4.

Published: 11-May-2011

Vehicle Dynamic Suspension - Air Suspension Reservoir Solenoid Valve Block

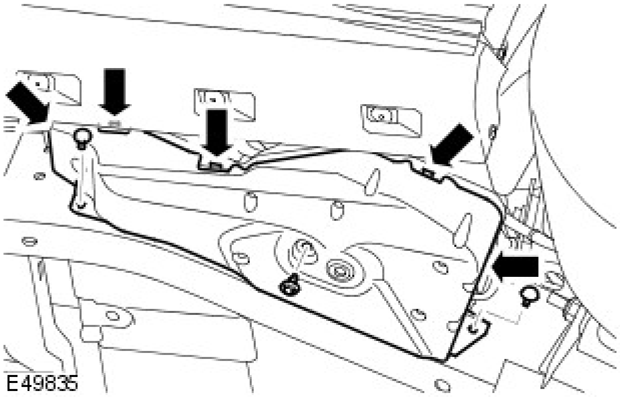
Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

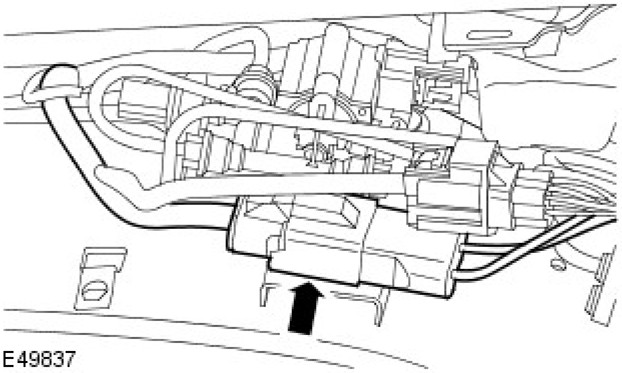
2. Using T4, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).



E49835

3. Remove the air suspension compressor lower cover.

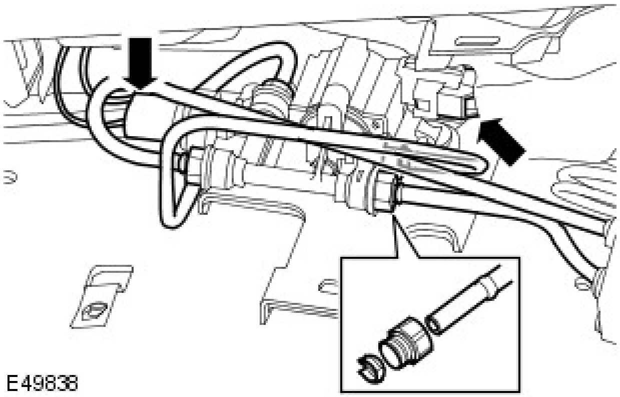
- Remove the 3 bolts.
- Release the 5 clips.



E49837

4. Move the air compressor electrical connector aside.

- Release the 2 clips.



E49838

5. CAUTIONS:

⚠ Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

⚠ Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

• NOTE: Note the air line fitted positions.

Remove the air suspension reservoir solenoid valve block.

- Disconnect the 4 air lines.
- Disconnect the 2 electrical connectors.

- Release the valve block 3 rubber insulators.

6. Remove the Voss connectors.

- Remove and discard the collets and the unions.

Installation

1. ⚠ CAUTION: Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

• NOTE: New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the air suspension reservoir solenoid valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

2. NOTE: Make sure the valve block does not become detached during connection of the air lines.

Install the air suspension reservoir solenoid valve block.

- Secure the 3 valve block rubber insulators.
- Connect the electrical connectors.
- Connect the air lines into the Voss connector.
- Pull on each air line to make sure it is fully installed into the Voss connecter.

3. Secure the air compressor electrical connector.

4. Install the air suspension compressor lower cover.

- Install the bolts and tighten to 10 Nm (7 lb.ft).

5. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

Vehicle Dynamic Suspension - Air Suspension Compressor

Removal and Installation

Removal

⚠WARNING: Steps 1 and 2 must be carried out within 10 minutes of each other, failure to follow this instruction may result in personnel injury.

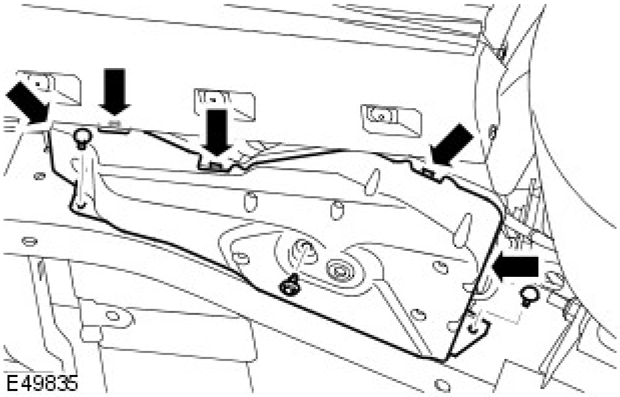
⚠CAUTION: If a new air suspension compressor, air compressor drier or air compressor delivery valve kit is installed due to failure, an air compressor relay must be installed. Failure to follow this instruction may result in damage to the air suspension system components.

1. ⚠CAUTION: Make sure the ignition switch is turned off, the park brake is on and the selector lever is in park position.

Open the front door.

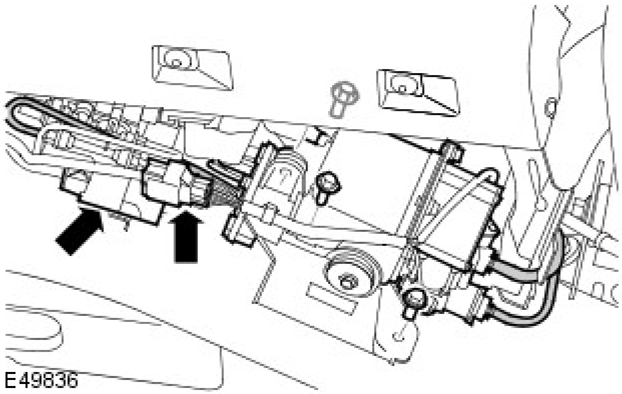
2. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle, make sure at least one of the wheels is off the ground.



3. Remove the air suspension compressor lower cover.

- Remove the bolt.
- Release the 5 clips.



4. ⚠CAUTION: Always plug any open connections to prevent contamination.

• NOTE: Access to the top compressor fixing bolt is very restricted. It is advisable to use a 3/8 inch drive socket with a flexible coupling.

Remove the air suspension compressor.

- Disconnect the 3 air lines.
- Disconnect the 2 electrical connectors.
- Remove the 3 bolts.

Installation

1. CAUTIONS:

⚠ Make sure that the wiring harness and the air suspension pipes are not trapped behind the air suspension compressor bracket.

⚠ Make sure the air suspension compressor upper cover is correctly positioned.

• NOTE: Install the upper retaining bolt, but do not fully tighten, before installing the 2 lower retaining bolts.

Install the air suspension compressor.

- Tighten the bolts to 23 Nm (17 lb.ft).
- Connect the air lines.
- Connect the electrical connectors.

2. CAUTIONS:

⚠ Make sure the air suspension exhaust pipe is correctly located in to the air suspension upper cover.

⚠ Make sure the air suspension compressor upper cover is correctly positioned.

Install the air suspension compressor lower cover.

- Install the bolt and tighten to 9 Nm (7 lb.ft).

Vehicle Dynamic Suspension - Air Suspension Front Solenoid Valve Block

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

3. Using T4, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

4. CAUTIONS:

⚠ Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

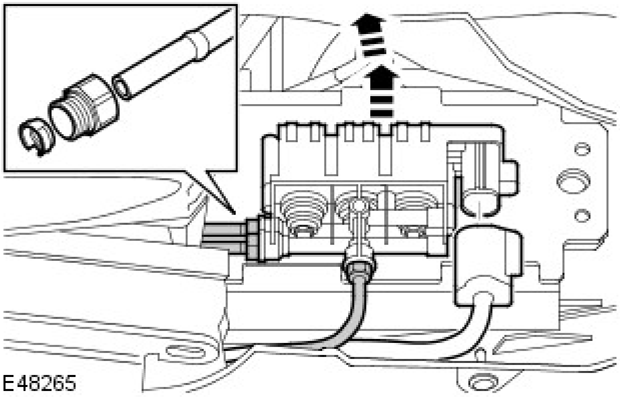
⚠ Visually inspect the air line ends for damage or wear. Replace the air line as necessary.

• NOTE: Note the air line fitted positions.

Disconnect the 3 air lines from the air suspension front solenoid valve block.

5. Remove the air suspension front solenoid valve block.

- Disconnect the electrical connector.
- Release the valve block 3 rubber insulators.



6. Remove the Voss connectors from the air lines.

- Remove and discard the collet and the union.

Installation

1. ⚠ CAUTION: Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

• NOTE: New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the air suspension front solenoid valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

2. NOTE: Make sure the valve block does not become detached during connection of the air lines.

Install the air suspension front solenoid valve block.

- Secure the 3 valve block rubber insulators.
- Connect the air lines into the Voss connector.
- Pull on each air line to make sure it is fully installed into the Voss connecter.
- Connect the electrical connector.

3. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

4. Install the RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

Vehicle Dynamic Suspension - Rear Shock Absorber and Air Spring Assembly

Removal and Installation

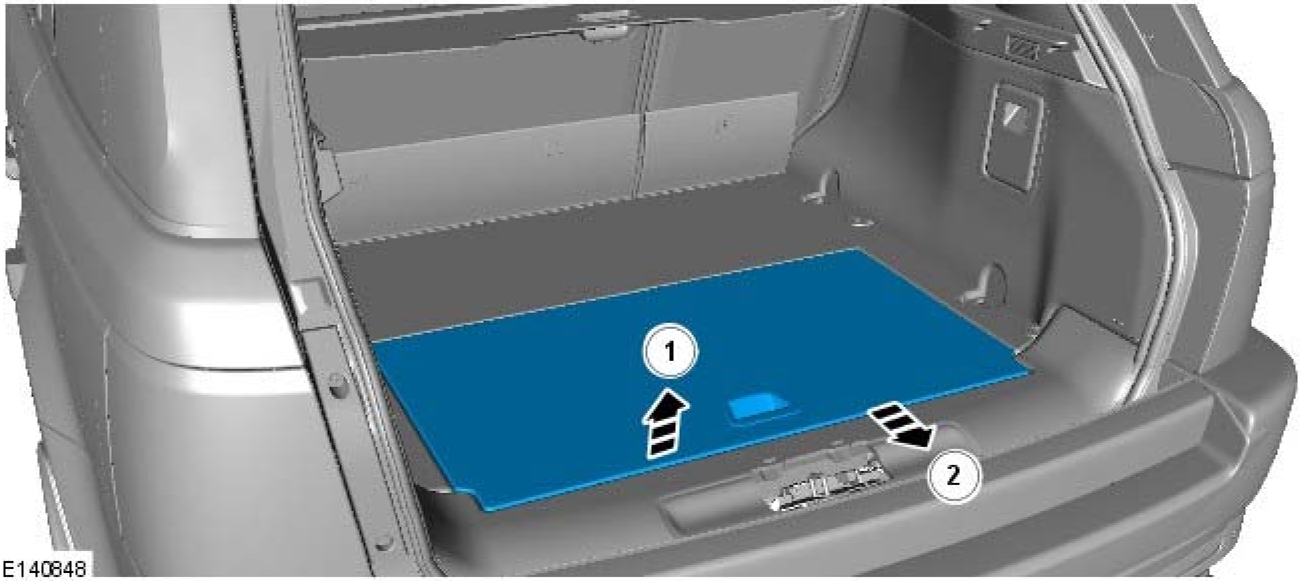
Removal

- NOTE: Only the air spring being removed needs to be depressurised.

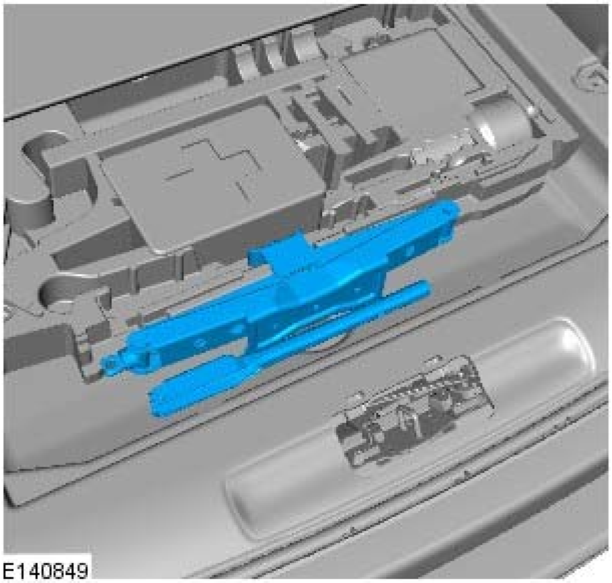
- NOTE: RH illustration shown, LH is similar.

1. Using the Land Rover approved diagnostic system, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

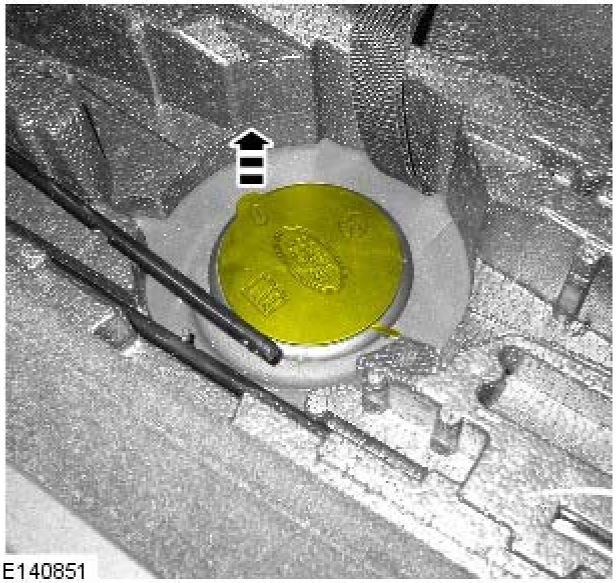
2. Remove the loadspace floor panel.



3. Remove the jack and wheel brace.

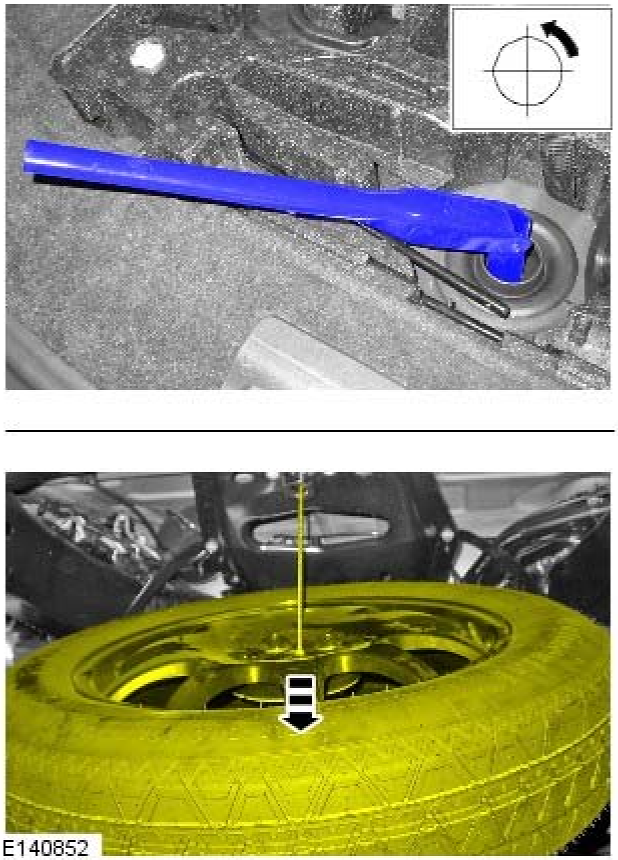


4. Remove the spare wheel/tool compartment cover.

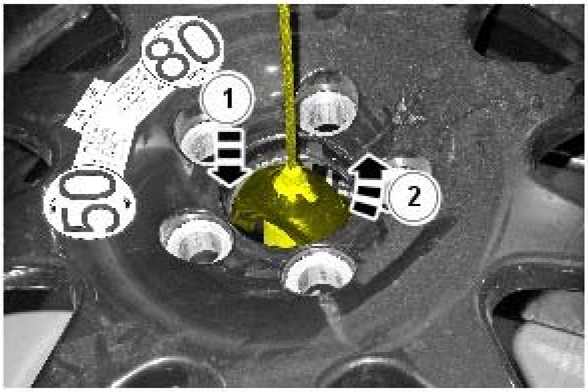


E140851

5. Lower the spare wheel and tire.



E140852



6. Remove the spare wheel.

- Disconnect the spare wheel release strap and position aside.

E140853

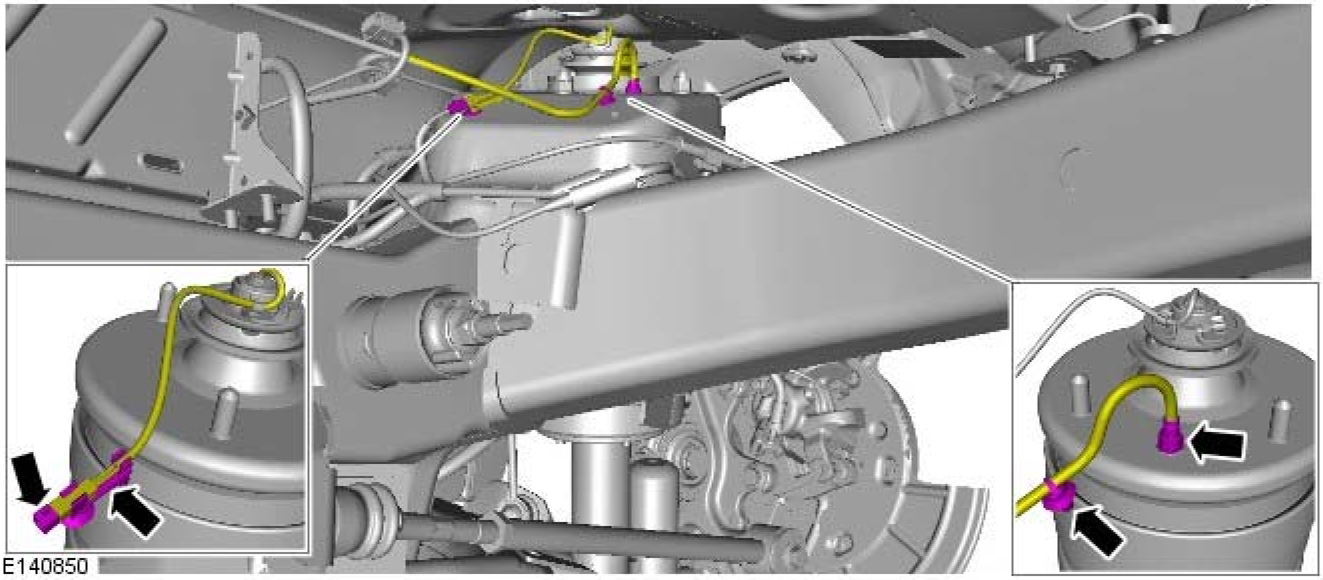
7. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

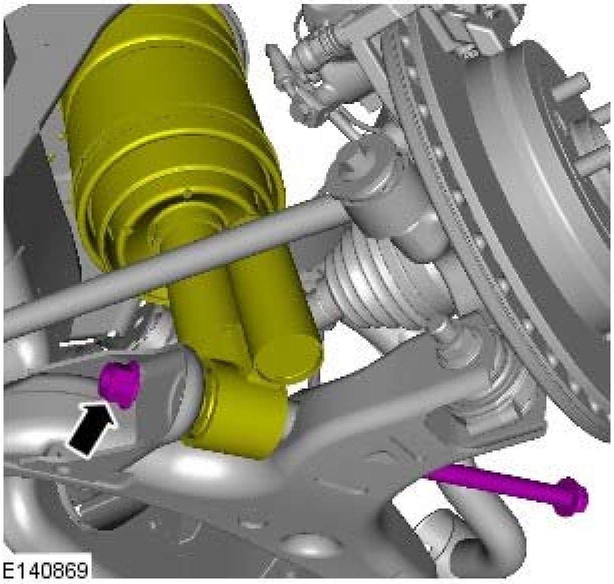
Raise and support the vehicle.

8. CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Remove the Voss connector from the air line.

- Remove and discard the collet and the union.
- Disconnect the active damping wiring.

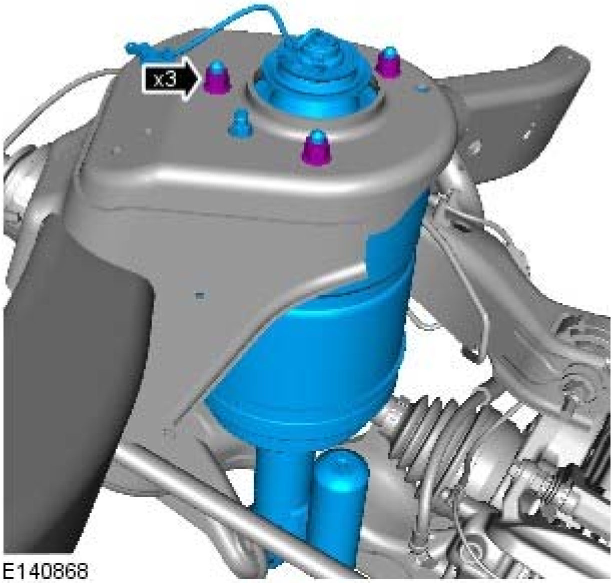




9. Remove the wheel and tire.

10. Disconnect the shock absorber and air spring assembly from the lower arm.

- Remove the nut and bolt.



11. Remove the three shock absorber and air spring retaining nuts.

- Remove the shock absorber and air spring assembly.

Installation

1. Install the shock absorber and air spring assembly.

- Make sure the shock absorber and air spring assembly top mounting to body mating faces are clean.
- Fit the nuts and tighten to 63 Nm (46 lb.ft).
- Connect the air line into the Voss connector.
- Tug on the air line to make sure it is fully installed into the Voss connecter.

2. Connect the shock absorber and air spring assembly to the lower arm.

- Tighten the nut and bolt to 300 Nm (221 lb.ft).

3. ⚠CAUTION: Make sure the new Voss connector is installed and fully tightened with the alignment plug installed.

Install a new Voss connector to the air spring.

- Tighten to 3.5 Nm (2.6 lb.ft)
- Attach the active damping wiring.

4. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

5. Lower the vehicle on the lift.

6. Connect the spare wheel release strap to the spare wheel and tire.

7. Install the spare wheel and tire.

- Raise the spare wheel and tire.

8. Install the spare wheel/tool compartment cover.

9. Install the jack and wheel brace.

10. Install the loadspace floor panel.

11. Using the Land Rover approved diagnostic system, pressurize

the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

Vehicle Dynamic Suspension - Rear Air Shock Absorber

Removal and Installation

Special Tool(s)	
 E51385	Air spring tester 204-538
 E57611	Band-it Thrift tool 100-050 (LRT-99-019)

Removal

- NOTE: This procedure should also be used to remove the rear air spring.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

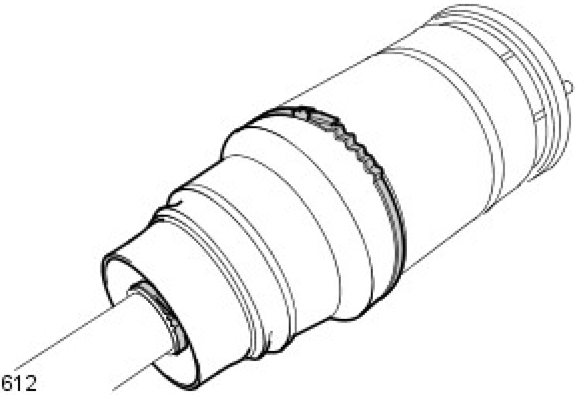
Raise and support the vehicle.

2. Remove the wheel and tire.

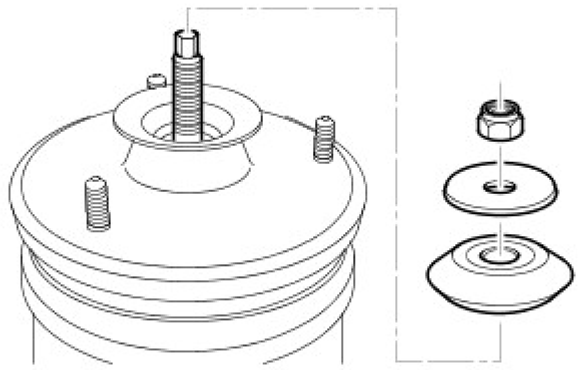
3. Remove the shock absorber and spring assembly.
For additional information, refer to: Rear Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

4. Remove the gaiter.

- Remove and discard the 2 straps.



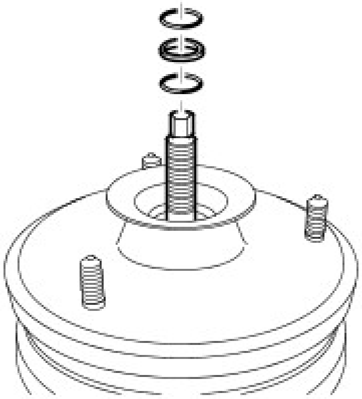
E57612



E51439

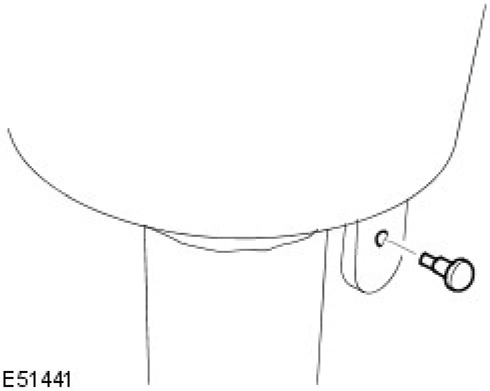
5. Remove the nut, rebound washer and rubber bushing.

- Discard the nut.



E51440

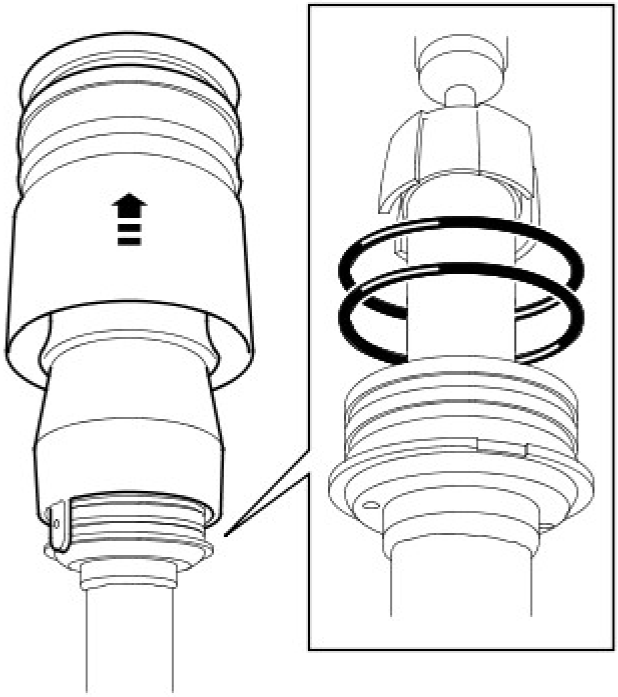
6. Remove and discard the O-ring seals and spacer.



E51441

7. Remove the nylon retaining pin.

8. Remove the rebound plate and spring aid.



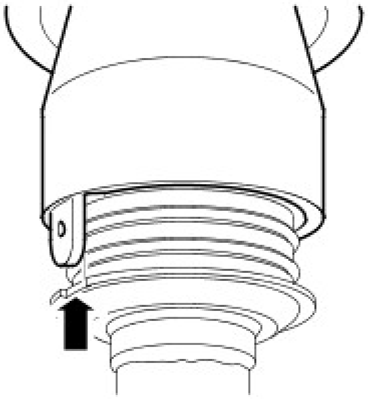
E51442

9. Remove the air spring.
   - Using a soft faced mallet, gently tap the sleeve support upwards to release it from the O-ring seals.
   - Remove and discard the 2 O-ring seals.

10. Remove the shock absorber from the vise.

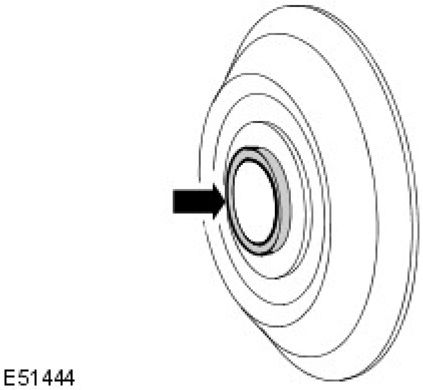
Installation

1. Install the shock absorber in the vise.
2. Clean the components.
3. Lubricate and install new O-rings to the seal carrier.
4. Install the spring aid and rebound plate.
5. Install the air spring.
   - Align the piston with the first O-ring seal, making sure the location tag is correctly aligned.



E51443

6. Install the new O-ring seals and spacer, taking care not to damage the seals.



7. Install the rubber bushing and rebound washer.

- Make sure the formed insert on the bushing is located against the O-ring seal.

8. Install and lightly tighten the nut.

9. CAUTIONS:

⚠ The air supply must be free of any moisture.

⚠ If during disassembly the air sleeve is unrolled, the air sleeve may inflate incorrectly (to one side). If this occurs, release the air pressure, and insert a suitable tool that will not damage the air sleeve or piston (a screw driver handle), into the side opposite the bulge. Inflate and deflate until the air sleeve inflates correctly (the air sleeve will be uniform inside the shroud).

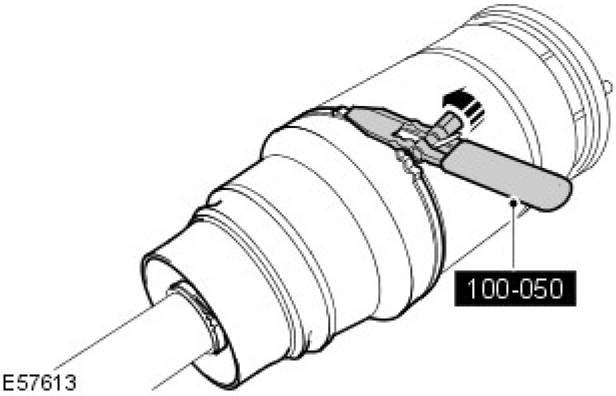
Install the air spring piston over the O-ring seals.

- Using the special tool coupled to a tire inflator with a gauge, apply approximately 2 bar of air pressure to the air spring to fully seat the piston over the O-ring seals.

10. Tighten the top nut to 98 Nm (72 lb.ft).

11. Check the assembly for leaks.

- Inflate the module to 4 bar and check for pressure loss.
- If a leak is suspected, immerse the spring and shock absorber assembly in a tank of water to locate the source of the leak.



12. Install the gaiter.

- Using the special tool, install new straps.

13. Install the shock absorber and spring assembly.
For additional information, refer to: Rear Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

Published: 11-May-2011

Vehicle Dynamic Suspension - Air Suspension Rear Solenoid Valve Block

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the LH rear wheel and tire.

3. Using T4, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

4. CAUTIONS:

⚠ Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

⚠ Visually inspect the air line ends for damage or wear. Repair or replace the air line as necessary.

• NOTE: Note the air line fitted positions.

Disconnect 3 air lines from the rear valve block.

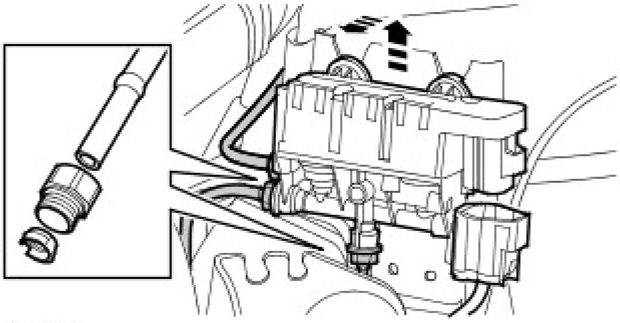
5. Disconnect the electrical connector.

6. Remove the rear valve block.

- Release the valve block 3 rubber insulators.

7. Remove the Voss connectors from the air lines.

- Remove and discard the collets and the unions.



E48266

Installation

1. NOTE: New air suspension components are supplied with new Voss connectors tightened to the correct torque. Do not install new voss connectors if a new component is being installed.

Install new Voss connectors to the rear valve block.

- Tighten to 2.5 Nm (1.7 lb.ft).

2. Install the rear valve block.

- Secure the 3 valve block rubber insulators.
- Connect the electrical connector.

- Connect the air lines into the Voss connector.
- Pull on each air line to make sure it is fully installed into the Voss connecter.

3. Using T4, pressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

4. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

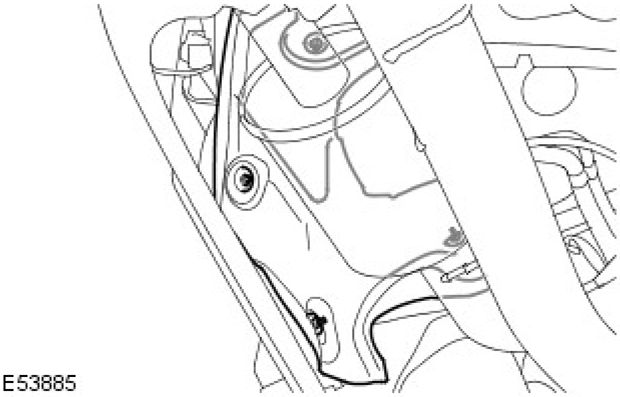
Published: 11-May-2011

Vehicle Dynamic Suspension - Air Suspension Air Filter

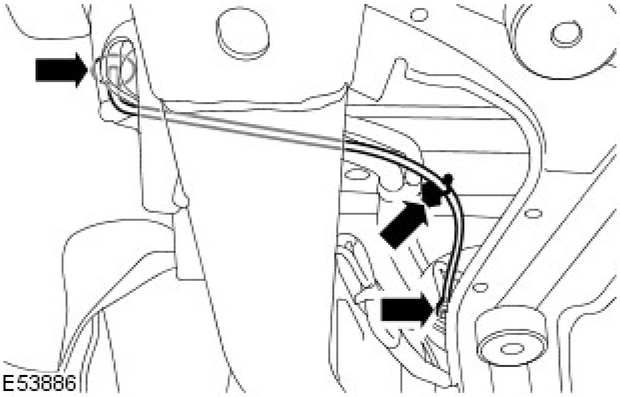
Removal and Installation

Removal

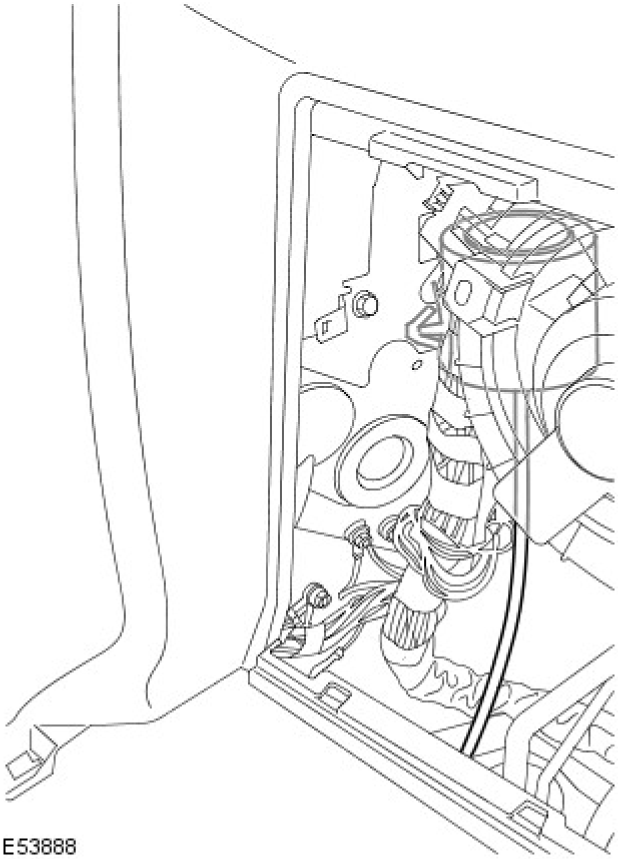
1. Open the liftgate and tailgate.
2. Remove the spare wheel and tire.
3. Remove the 4 nuts securing the LH rear tail pipe heat shield.



4. Reposition the LH rear tail pipe heat shield.
5. Disconnect the air suspension intake filter line.
6. Detach the air suspension intake filter.
   - Release the grommet.
   - Release from the clip.



7. Remove the LH lower rear quarter trim panel.
   For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).



8. Remove the air suspension intake filter.

Installation

1. NOTE: Make sure the air suspension air filter retaining clip is fully seated in the vehicle body. An audible click will be heard when the retaining clip is fully seated.

Install the air suspension intake filter.

- Install the grommet.

2. Install the LH rear quarter trim panel.
For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Attach the air suspension intake filter.

4. Connect the air suspension intake filter line.

5. Reposition the LH rear tail pipe heat shield.

- Install the nuts.

6. Install the spare wheel and tire.

7. Close the liftgate and tailgate.

Vehicle Dynamic Suspension - Air Suspension Muffler

Removal and Installation

Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

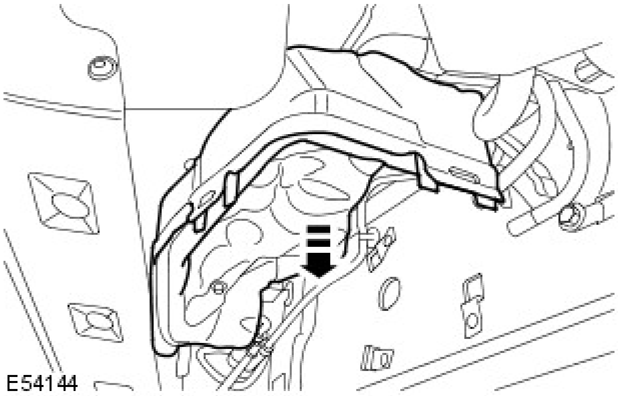
Raise and support the vehicle.

2. Remove the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

3. Remove the evaporative emissions canister.
For additional information, refer to: Evaporative Emission Canister (303-13B Evaporative Emissions - V8 4.4L Petrol, Removal and Installation).

4. Remove the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

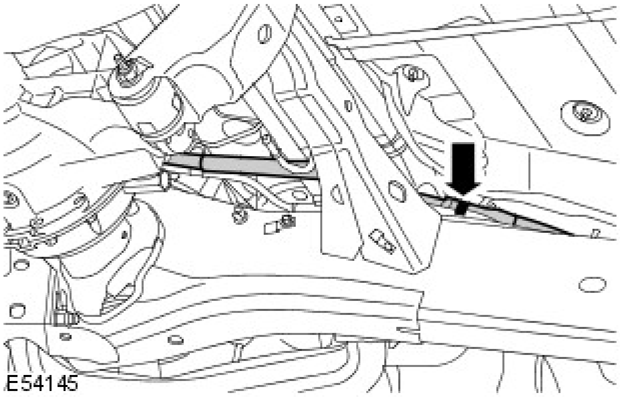
5. Remove the air suspension compressor upper cover.



6. Disconnect the air suspension intake filter pipe.

7. Remove the air suspension muffler.

- Release clip from the air suspension muffler pipe.
- Release the air suspension compressor to air suspension silencer pipes.



Installation

1. Install the air suspension muffler.

- Locate the air suspension muffler pipes.
- Secure the clip.

2. Connect the air suspension intake filter.

3. ⚠CAUTION: Make sure the air suspension compressor upper cover is correctly positioned.

Install the air suspension compressor upper cover.

4. Install the air suspension compressor.
For additional information, refer to: Air Suspension Compressor (204-05 Vehicle Dynamic Suspension, Removal and Installation).

5. Install the evaporative emissions canister.
For additional information, refer to: Evaporative Emission Canister (303-13B Evaporative Emissions - V8 4.4L Petrol, Removal and Installation).

6. Install the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

Vehicle Dynamic Suspension - Air Suspension Pressure Sensor

Removal and Installation

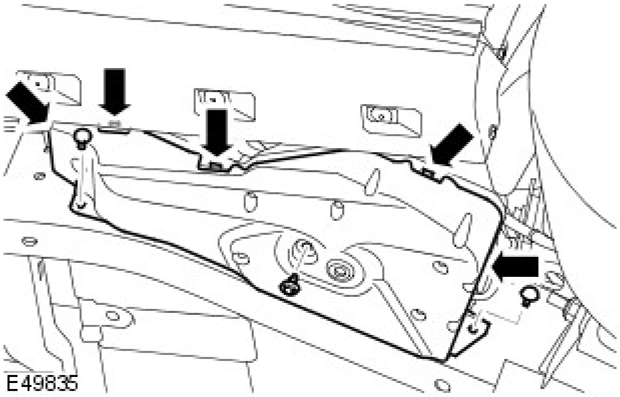
Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the air compressor housing cover.

- Remove the 3 bolts.
- Release the 5 clips.



3. Using T4, depressurize the air suspension.
For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

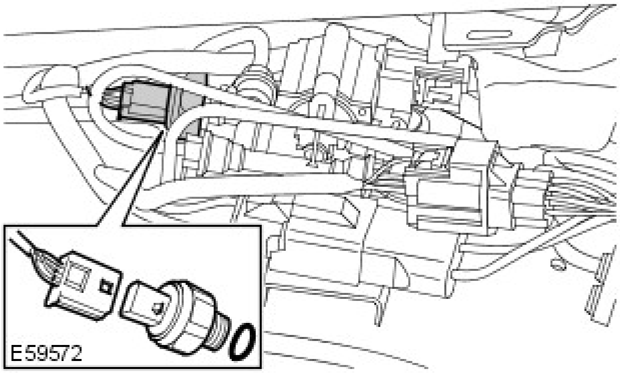
4. NOTE: Make sure the valve block does not become detached during removal of the air pressure sensor.

Disconnect the electrical connector.

5. CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the air pressure sensor.

- Remove and discard the O-ring seal.



Installation

1. NOTE: Make sure the valve block does not become detached during installation of the air pressure sensor.

Install the air pressure sensor.

- Install a new O-ring seal.
- Tighten to 5 Nm (4 lb.ft).

2. Connect the electrical connector.

3. Using T4, pressurize the air suspension.

For additional information, refer to: Air Suspension System Depressurize and Pressurize (204-05 Vehicle Dynamic Suspension, General Procedures).

4. CAUTIONS:

⚠ Make sure the air suspension compressor upper cover is correctly positioned.

⚠ Make sure the air suspension exhaust pipe is correctly located in to the air suspension upper cover.

Install the air compressor housing cover.

- Install the bolts and tighten to 9 Nm (7 lb.ft).

Ride and Handling Optimization -

General Specifications

Item	Specification
Dynamic Response fluid	Texaco Cold Climate Fluid 33270
Capacity	2.4 Liters (4.2 pints) (2.5 US quarts)

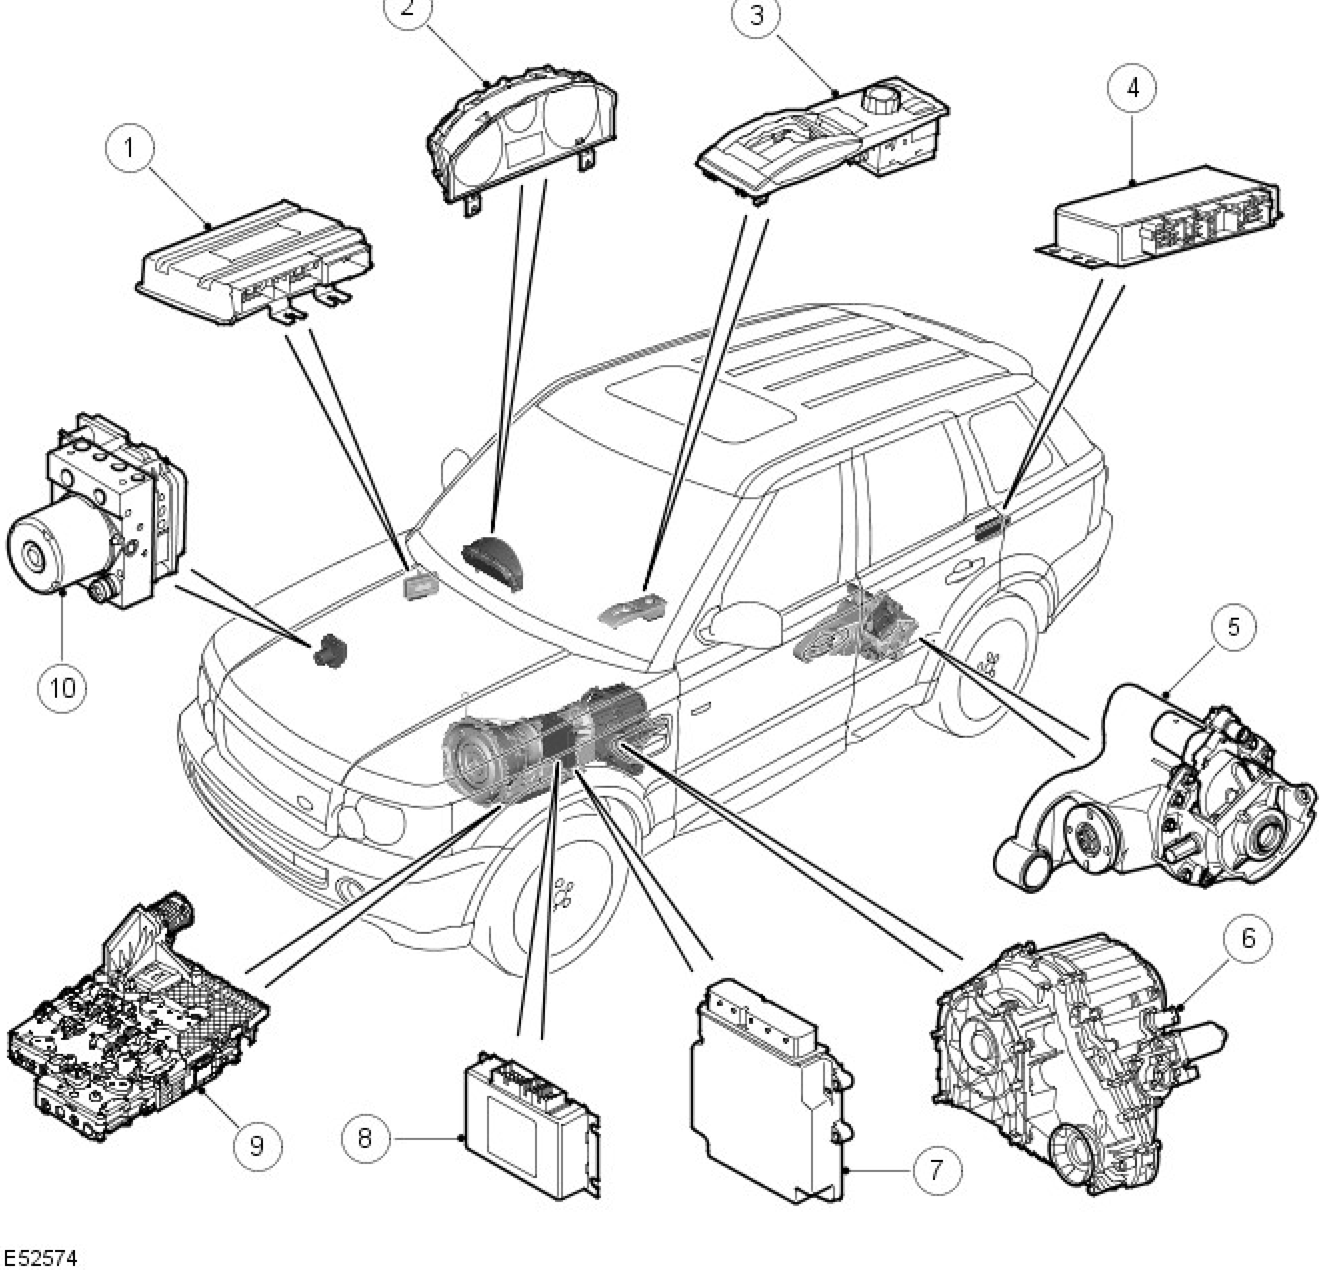
Ride and Handling Optimization - Ride and Handling Optimization

Description and Operation

Terrain Response - Component Location



E52574

Item	Part Number	Description
1	-	Air suspension control module
2	-	Instrument cluster
3	-	Terrain Response rotary control and control module
4	-	Rear differential control module (if fitted)
5	-	Rear differential
6	-	Transfer box (center differential and high/low range)
7	-	Engine control module
8	-	Transfer box control module
9	-	Transmission control module (automatic transmission only)
10	-	ABS module

GENERAL

The Terrain Response™ system allows the driver to select a program which aims to provide the optimum settings for traction and performance for the prevailing terrain conditions. The system cannot be switched off. The 'special programs off' is the default program and covers all general driving conditions. Four specific terrain programs are selectable to cover all terrain surfaces.

The system is controlled by a rotary control located on the center console, rearward of the selector lever (automatic transmission) or gearshift lever (manual transmission). The rotary control allows the selection of one of the following five programs:

- Special programs off
- Grass/Gravel/Snow
- Mud/Ruts
- Sand
- Rock crawl.

The rotary control can be rotated through 360 degrees or more in either direction and selects each program in turn. When Terrain Response is fitted to a vehicle the instrument cluster will display the selected program in the message center.

The Terrain Response system uses a combination of a number of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems make up the Terrain Response system:

- Engine management system
- Automatic transmission (if fitted)
- Transfer box (center differential)
- Rear differential (electronically controlled)
- Brake system (ABS/DSC/ETC/HDC functions)
- Air suspension.

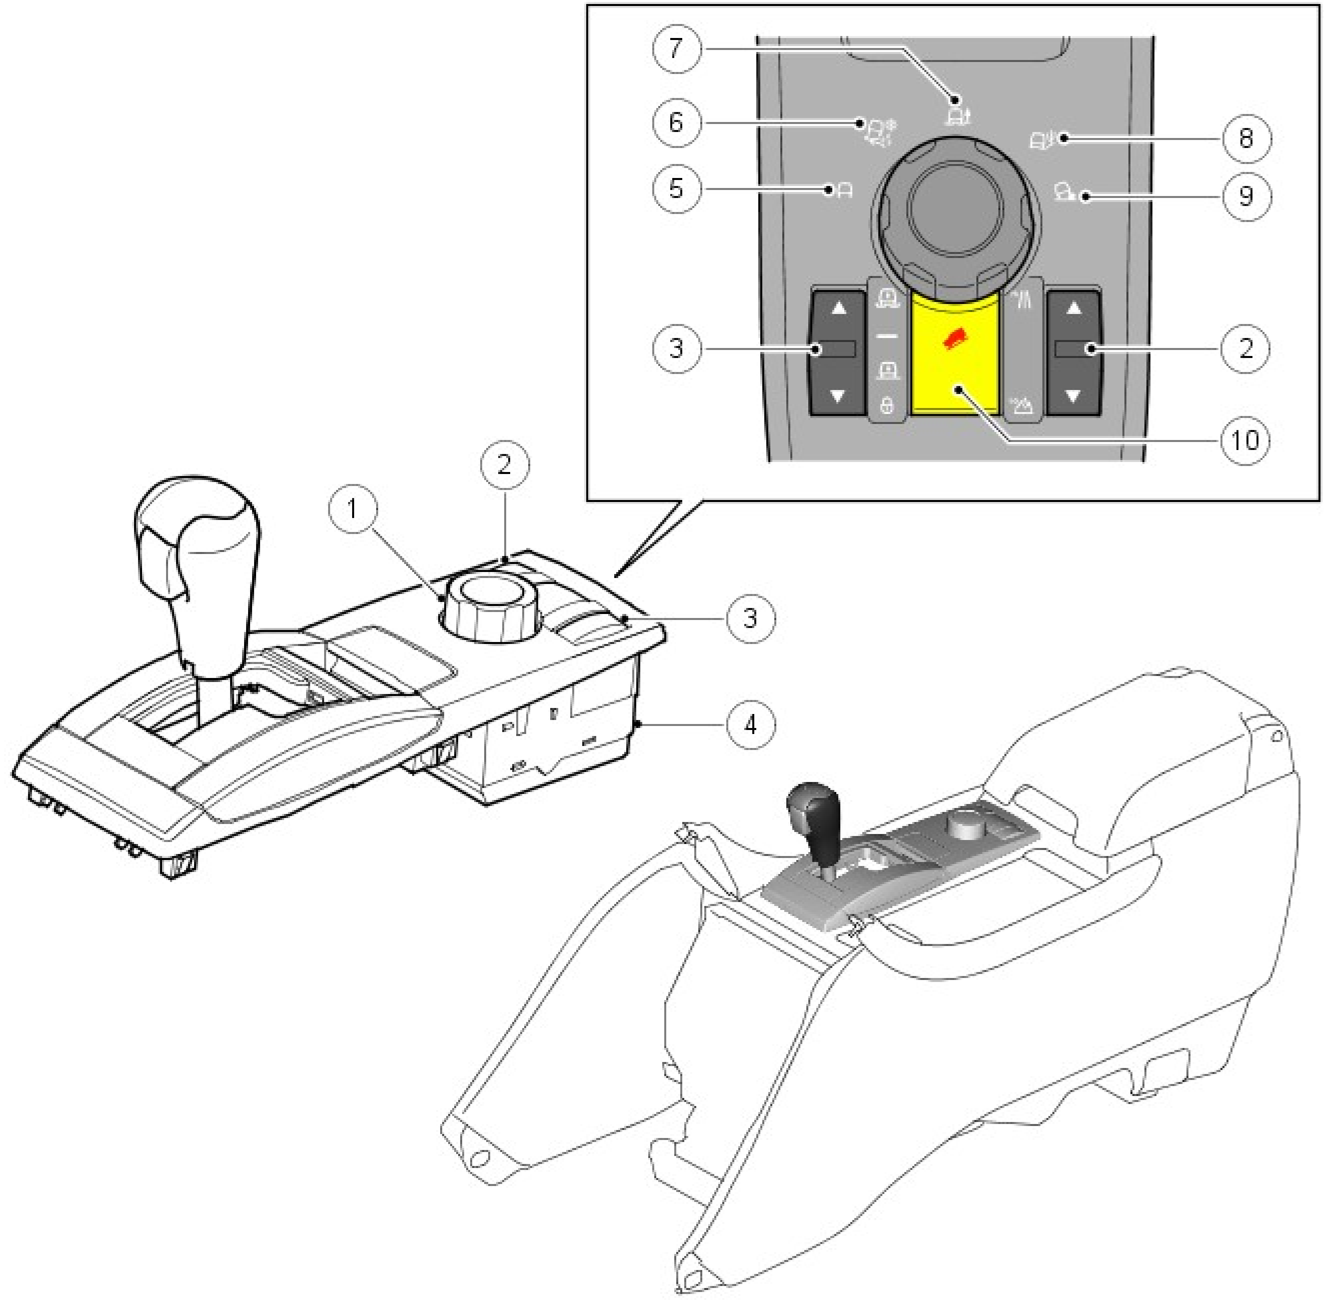
A Terrain Response control module is located below the rotary control. The control module detects the selection made on the rotary control and transmits a signal on the high speed CAN which is received by each of the subsystem control modules.

Each of the affected sub-system control modules contain software which applies the correct operating parameters to their controlled system for the Terrain Response program selection made.

Each sub-system control module also provides a feedback for the selected program so that the Terrain Response control module can check that all systems have changed to the correct operating parameters.

Information is displayed in the instrument cluster message center which informs the driver of improvements which can be made to the vehicle operating parameters to optimise the vehicle for the prevailing conditions. Inexperienced off-road drivers may benefit from the automatic assistance of the Terrain Response system and the driver information. Experienced off-road drivers can select the specific programs for extreme conditions to access control over the vehicle systems (e.g., throttle shift maps or traction settings) which are not accessible on vehicles without Terrain Response.

TERRAIN RESPONSE ROTARY CONTROL AND MODULE



E52575

Item	Part Number	Description
1	-	Terrain Response rotary control
2	-	Transfer box high/low range switch
3	-	Air suspension switch
4	-	Terrain Response control module
5	-	Special programs off
6	-	Grass/gravel/snow program
7	-	Mud/ruts program
8	-	Sand program
9	-	Rock/crawl program
10	-	HDC switch

The Terrain Response rotary control is located in the center console and allows the selection of five operating programs. Each program is denoted by a symbol which represents the terrain encountered. The rotary control can be depressed downwards to lock it in a position flush with the trim surround. A second push of the control releases the lock and the control emerges from the surround allowing it to be rotated.

The rotary control can be rotated to select the required program. The control will only select the last program in its direction of rotation. Further rotation of the control once the last program in either direction has been selected, will have no effect, e.g. once rock crawl has been selected, further rotation in a clockwise direction will have no effect.

The Terrain Response control module is located below the rotary control. The module is connected via a harness connector which also contains the wiring for the HDC switch, the transfer box high/low range switch, the air suspension switch and the switch illumination circuits. The control module and switch uses four of these wires for a 12V battery supply when the ignition switch is in ignition position II, a ground and high speed CAN positive and negative.

TERRAIN RESPONSE OPERATION

The following vehicle subsystem control modules are used for the Terrain Response system:

- Engine management (engine control module)
- Transmission control (transmission control module - automatic transmission only)
- Transfer box control (transfer box control module)
- Rear differential control (rear differential control module - if fitted)
- Air suspension control (air suspension control module)
- Brake system (ABS/DSC/ETC/HDC functions) (ABS module)

Each subsystem operates in different ways in relation to the selected Terrain Response program to achieve the optimum traction, stability and ease of control for the terrain encountered. The system has a safety factor built in which ensures that any program can be safely used on any surface, even when an inappropriate program selection has been made.

Engine Management System (EMS)

The EMS varies the throttle pedal response to control the engine torque output. The EMS can change the throttle maps to change the amount of torque per percentage of pedal travel. The EMS can also change the throttle response to control the allowed torque change relative to the percentage pedal travel.

Each terrain program uses a combination of operating parameters for each subsystem. Changing between terrain programs initiates a different set of operating characteristics which will be noticeable to the driver. The driver will notice differences in engine and throttle response when, for example, the throttle pedal is held in a constant position and the terrain program is changed from grass/gravel/snow to sand, the driver will notice the torque and engine speed increase. If the terrain program is changed from sand to grass/gravel/snow the driver will notice a reduction in torque and engine speed.

• NOTE: The change in torque and engine speed can take approximately 30 seconds and care must be taken not to confuse the Terrain Response system operation with an EMS fault.

Transmission Control

The transmission control module changes the shift maps for the Terrain Response program selected. This changes the shift points providing early or late upshifts and downshifts.

On slippery surfaces the transmission will select 2nd gear in high range or 3rd gear in low range for starting from a standstill to minimise wheel slip. In muddy conditions the transmission will provide maximum torque output from the transmission. In sand the transmission will provide an output which passes maximum engine power from the transmission.

In rock crawl special program (low range) the transmission will select 1st gear for driving off.

Sport mode is only available when the general program is selected and the transfer box is in high range. Sport mode is disabled in low range and all Terrain Response special programs. CommandShift™ is available in any program and also in high or low range.

If the transmission is in 'Sport' mode and a special program is subsequently selected, the transmission will automatically change to manual 'CommandShift™' mode. If a special program is already selected and the transmission selector lever is moved from drive 'D' to the 'Sport' mode position, the transmission will automatically change to 'CommandShift™' mode.

Transfer Box and Rear Differential Control

The transfer box electronically controlled differential and the rear electronically controlled differential (if fitted) are treated as one system. The electronic rear differential is an optional fitment on vehicles fitted with the Terrain Response system. The differential control has two operating strategies; pre-emptive and reactive.

The pre-emptive strategy anticipates and predicts the locking torque value required for each differential to minimise slip and maximise stability. Each Terrain Response program has a different threshold and input criteria for the pre-emptive strategy. The pre-emptive strategy improves vehicle traction and composure by avoiding wheel spin. This is achieved by anticipating the amount of differential lock required for the program selected. For example, a high locking torque would be applied for rock crawl or slippery surfaces.

The reactive strategy varies the amount of locking torque in response to the actual slip level and the dynamic behaviour of the vehicle. Each Terrain Response program has a different threshold and input for the reactive strategy. The reactive strategy improves vehicle traction and composure by eliminating any wheel spin which has occurred after the pre-emptive strategy was applied. The locking response applied is applicable to the terrain program selected, for example, very sensitive on slippery surfaces to provide maximum traction and minimise surface damage.

The locking torque calculations use various signals from other subsystems, for example, engine torque, throttle position, selected gear, steering angle, vehicle speed, lateral acceleration and yaw behaviour.

The Dynamic Stability Control function of the ABS system can override the Terrain Response differential control and reduce any applied locking torque during DSC action.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

Air Suspension Control

The air suspension control module contains a strategy which provides automatic switching between normal and off-road heights. Changes in vehicle height settings will be relayed to the driver via the instrument cluster message center and LED illuminated icons on the switch. The automatic selection and deselection of the vehicle height provides automatic increase and decrease in ground clearance and aims to provide maximum benefit to the selected terrain program.

On a vehicle fitted with a correctly installed, Land Rover approved trailer socket, if an electrical load is sensed on the trailer socket, height changes are prohibited and the message center displays a message advising that a trailer is connected and off-road height is not automatically selected. The driver can raise the suspension manually using the air suspension switch.

• NOTE: The prohibiting of the automatic ride height selection is only operational if a Land Rover approved trailer socket is fitted and an electrical load is sensed on the socket.

ABS Control

The ABS module controls several vehicle functions and adjusts the operating parameters of these functions to optimise the selected Terrain Response program.

Traction control uses different slip/acceleration thresholds to improve traction and vehicle composure. For example, the system sensitivity is increased on slippery surfaces to reduce wheel spin.

If DSC is switched off (with the DSC switch on the instrument panel) when using a Terrain Response special program, if the special program is subsequently changed for a different program DSC is automatically switched back on.

The stability control uses different threshold values for the selected program to automatically reduce DSC intervention, removing the requirement for the driver to disable the DSC system in order to reduce engine intervention which is sometimes induced in extreme off-road conditions. In extreme sand conditions, there may be an additional benefit of disabling the DSC function using the DSC switch on the instrument panel in addition to selecting the sand program.

HDC is automatically switched on or off and target speeds are adjusted in response to the Terrain Response program selected. The responsiveness of the HDC function is also increased where required.

Automatic operation of HDC aims to assist the driver by switching the system on or off when it is of most benefit. Target speeds for HDC operation are also adjusted according the vehicle operating conditions.

Incorrect Program Usage

Selection of an inappropriate program is discouraged in the following ways:

- The active program icon is continually displayed in the instrument cluster message center
- The Terrain Response control module 'locks' out certain functions in some programs, e.g. ,
    - cruise control is only available with the special programs off or grass/gravel/snow program
    - transmission 'Sport' mode is deactivated in all special programs.
- In any special program, except the grass/gravel/snow program, when the ignition has been in the off position, continually for more than six hours, the Terrain Response system defaults to the Special Programs off. When in the grass/gravel/snow program, the Terrain Response system will never default to the Special Programs off. This is to allow for drivers in cold climates where continuous use of the grass/gravel/snow program would be beneficial.
- The rock crawl program is only available with the transfer box in low range.

Selection of an inappropriate program for the terrain conditions will not endanger the driver or cause damage to the vehicle. Continued use of an inappropriate program may reduce the life of some components. The driver may notice reduced vehicle response, with the engine and transmission being less responsive than in the special programs off. Also, in some programs, HDC will remain on, signified by illumination of the HDC indicator in the instrument cluster. The driver may also notice torque 'wind-up' in the center and rear differentials causing a 'braking' effect when the vehicle is manoeuvred in some special programs.

The use of the special programs in the Terrain Response system is monitored by the Terrain Response control module which records the mileage and time the vehicle has operated in a specific program in high and low range. This information can be retrieved using T4 and used by the dealer technician to check customer concerns, e.g. high fuel consumption which may be due to continued use of a certain program.

Driver Information

The instrument cluster contains a message center which displays vehicle information to the driver. The message center contains the Terrain Response program icons which display the currently selected program. If no symbol is displayed, no special program is selected and the system is in special programs off.

Any required changes to the subsystems are also passed to the driver in the form of indicator illumination in the instrument cluster or appropriate messages in the message center, HDC off or air suspension height change for example.

In certain operating conditions, the Terrain Response system also displays advice or warning messages to ensure the driver is using the vehicle to its full potential, e.g.,

- Steering angle is displayed in the message center to avoid driving in deep ruts with steering lock applied
- gear information is displayed to recommend a gear for slippery conditions
- if the system automatically provided off road ride height, but the driver subsequently lowers the vehicle to normal height, then the system may advise that this will cause a risk of grounding.

The messages which can be displayed in the instrument cluster message center are detailed in the Information and Message Center section.
For additional information, refer to: Information and Message Center (413-08 Information and Message Center, Description and Operation).

DIAGNOSTICS

The Terrain Response control module stores information on detected Terrain Response faults and CAN errors which can be interrogated using T4. The Terrain Response sub-systems and the instrument cluster also store fault information relating to CAN errors from the Terrain Response control module.

The control module also stores the miles travelled and time elapsed in high range for the individual programs and in low range for use of all programs which can also be retrieved using T4. This information aids diagnosis of the Terrain Response system and also provides an indication of Terrain Response system abuse by the driver which can lead to premature component failure.

Terrain Response System Fault Diagnosis

Terrain Response relies on the correct functionality of the five sub-systems. If one of the sub-systems develops a fault, the Terrain Response system will not function, even though the fault is not in the Terrain Response system. The Terrain Response control module and rotary control should only be investigated if there are no apparent faults in any of the sub-systems. If a fault in a sub-system is subsequently corrected, the Terrain Response system will function normally after an ignition on and off cycle.

Terrain Response Sub-System Faults

If a fault occurs in a sub-system, the driver is alerted by the illumination of a warning indicator and/or an appropriate message for that sub-system in the instrument cluster message center. There will be no warning of a Terrain Response system fault.

When a sub-system fault is present and the driver attempts to select a different Terrain Response program using the rotary control or at the next ignition on cycle, a message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' will appear in the message center. This implies that the Terrain Response system has a fault, but only because a sub-system fault is preventing its operation. This message will be displayed for 5 seconds per ignition cycle, but is repeated if a further selection is made by the driver using the Terrain Response rotary control or at the next ignition on cycle.

• NOTE: The message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' can also be generated by a fault in the Terrain Response rotary control or control module. See following section for details of rotary control or control module faults.

It is not possible for the Terrain Response control module to cause any fault behaviour (warning indicator illumination or message generation) in any of the five sub-systems. Illumination of a sub-system warning indicator and/or a sub-system related message will never be associated with a Terrain Response control module or Terrain Response system fault.

The sub-system control modules can detect a fault with the CAN signal from the Terrain Response control module. If a fault in the Terrain Response system is detected, the sub-system control modules will operate in the 'special programs off' setting. The sub-system control modules will record a fault code for a failure of the Terrain Response CAN signal. These faults can be retrieved using T4 and will provide useful information to indicate investigation of the Terrain Response control module or the CAN network.

Terrain Response Rotary Control or Control Module Fault

If a fault occurs in the Terrain Response rotary control, all rotary control icon amber LEDs will be turned off (background illumination will remain on) and rotation of the rotary control is ignored. The instrument cluster message center will display a message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' when the fault occurs, if the fault is present and the driver attempts to select a special program (if the control module is able to do this) or at the next ignition on cycle.

If a failure of a rotary control icon amber LED occurs, the Terrain Response system will still function. Any selected special program will default to 'special programs off' at every ignition on cycle, with the exception of the grass/gravel/snow program.

The Terrain Response rotary control and the control module are an integral unit. If a fault occurs in either component, the whole unit will require replacement.

CAN Faults

If a CAN fault exists and prevents Terrain Response system operation, all of the Terrain Response rotary control icon LEDs will be illuminated and rotation of the rotary control is ignored.

If the instrument cluster does not receive a Terrain Response system CAN message from the Terrain Response Control module, the message 'SYSTEM FAULT SPECIAL PROGRAMS NOT AVAILABLE' will be displayed when the fault occurs and will be repeated at every ignition on cycle.

User Error

The following incorrect usage of the system may be misinterpreted as a system fault:

- Engine not running - Program changes and driver advisory messages are only available with the engine running
- Rock crawl program selected but transfer box in high range
- Special program change attempted with DSC or ABS active (this includes ABS cycling which is operational when HDC is being used on slippery or loose surfaces).
- Special program change attempted with overheat condition present on center or rear differential.

OVERVIEW

The Dynamic Response system provides improved vehicle handling and ride characteristics and is active for both on and off-road driving.

The Dynamic Response system uses two accelerometers to detect vehicle cornering forces and inputs from the steering angle sensor to supply data to a dynamic response control module. The control module then operates solenoid valves in a valve block which apply hydraulic pressure to actuators fitted to the front and rear stabilizer bars. The application of hydraulic pressure to the actuators applies a specified amount of torque to the stabilizer bars to counteract the cornering forces and minimize vehicle body roll.

The following illustrations demonstrate the difference in body angle between a conventional 'passive' (non-Dynamic Response) stabilizer bar vehicle and a vehicle fitted with the Dynamic Response system.

D	-	Tire squash
E	-	Stabilizer bar
F	-	Direction of stabilizer bar twist
G	-	Dampers
H	-	Drive line roll angle
I	-	Reduced body roll with Dynamic Response system

The Dynamic Response system is electrically and hydraulically operated. Electrical and hydraulic operation is controlled by the Dynamic Response control module which is located on the driver's side 'A' pillar, behind the instrument panel.

The Dynamic Response system comprises front and rear stabilizer bars with integral actuators, two accelerometers, a control module, a hydraulic pump, a valve block and a fluid reservoir.

The Dynamic Response system prevents body roll with cornering forces of up to 0.4 g. From 0.4 g there is a progressive increase in body roll but significantly lower than on a 'passive' system. A 'passive' system will have a progressive increase in body roll angle as soon as cornering forces are applied and will have a greater roll angle than the Dynamic Response system for the same cornering force.

The Dynamic Response system can also detect when the vehicle is driven off-road. If off-road conditions are detected and the vehicle is traveling at 25 mph (40 km/h) or less, the control module will reduce roll compensation. On side slopes of more than 11 degrees the Dynamic Response system will switch to a 'locked bars' condition at slow speed.

Lateral acceleration of the body is sensed by two accelerometers and signals from these are transmitted to the control module. The engine driven hydraulic pump supplies a constant hydraulic flow to the valve block. Two directional control valves are solenoid operated by the control module and supply hydraulic pressure to the applicable side of each actuator to apply a force equal to and opposite to the force applied to the stabilizer bar. In operation the Dynamic Response system maintains the attitude of the vehicle body when cornering.

The Dynamic Response hydraulic system uses a semi-synthetic hydraulic fluid which is the same fluid used in the power steering system. The total capacity of the Dynamic Response system is 2.50 liters (0.66 US gallons).

⚠ CAUTION: The Dynamic Response hydraulic system is extremely sensitive to the ingress of dirt and debris. The smallest amount can cause the system to become unserviceable. It is imperative that the following precautions are followed:

- Dynamic Response components are thoroughly cleaned externally before work commences
- All opened pipe and component ports are capped immediately
- All fluid is stored in clean containers.

In the event of a control module or hydraulic failure the system will 'fail-safe' to a 'locked bars' condition. The 'locked bars' condition will allow the stabilizer bars to operate in a similar manner as conventional 'passive' stabilizer bars. Prolonged cornering forces will allow a progressive increase in roll angle due to hydraulic leakage through the actuators and valve block. Failures of the system are relayed to the driver by illumination of the air suspension/dynamic response warning indicator in the instrument cluster, an audible warning chime and a message displayed in the instrument cluster message centre. Faults are recorded by the control module and can be retrieved using a Land Rover approved diagnostic system.

When the ignition switch is moved to position II, the warning indicator is illuminated for two seconds to check functionality. The warning indicator functionality can also be checked using a Land Rover approved diagnostic system.

A Land Rover approved diagnostic system must also be used to perform a bleeding procedure after repair or maintenance operations have been performed. This is to ensure that the system is completely free from air. Trapped air in the system can significantly reduce system performance.

FLUID RESERVOIR

The fluid reservoir is located in the front right hand side of the engine compartment. The reservoir is attached to the front of air cleaner housing by two slotted rails which positively locate the reservoir.

The reservoir is a moulded plastic container with a threaded neck which is fitted with a sealed cap. Two connections on the bottom of the reservoir provide for connection of the feed pipe to the pump and the return pipe from the valve block.

A non-serviceable filter assembly is fitted to the base of the reservoir. The filter is made from a fine nylon mesh which is moulded into the bottom of the reservoir. The filter removes particulate matter from the fluid before it is drawn into the pump.

Upper and lower fluid level marks are moulded onto the reservoir body. The capacity of the reservoir to the upper level mark is 0.4 liter (0.11 US gallon).

DYNAMIC RESPONSE PUMP

The Dynamic Response hydraulic pump is located on the RH side of the engine. The pump is attached to a mounting bracket below the generator on TdV6 and TdV8 engines and above the generator on V8 petrol engines. On both engines the pump is driven by the accessory drive belt from the crankshaft.

10	-	Housing
11	-	Counter balance
12	-	Pulley attachment flange

The hydraulic pump is driven at approximately 1.7 times crankshaft speed by the auxiliary drive belt. The pump is a radial piston type which delivers fluid at high pressures.

The radial pump has eight pistons located in bores in a cylinder housing. A balanced central shaft, which is driven by a pulley and the auxiliary drive belt, has a cam which operates the pistons as the shaft rotates.

As the cam lobe reaches each piston, the piston is pushed outward, moving the fluid above the piston. The pressure created by the fluid flow from the bore opens a spring loaded discharge valve. When the valve opens, the now pressurized fluid flows, via the silencer volume area of the cylinder housing, to the outlet port. The silencer volume assists with damping out operating noise from the pump. When the piston reaches its full stroke, the flow reduces and the discharge valve closes under spring pressure.

As the cam lobe moves away from the piston, a spring pushes the piston down the bore, creating a vacuum above the piston. As the piston moves down the bore, ports in the piston are exposed and connect with the fluid inlet port. The vacuum draws fluid into the piston filling the piston and the chamber above it. As the piston is again pushed upwards, the ports in the piston are closed off by the bore and the pressurized fluid opens the discharge valve and flows to the outlet port.

The above sequence is applied to each of the eight pistons for every revolution of the shaft and cam. When the engine is running the sequence occurs rapidly creating a constant flow of fluid. The fluid flow varies with engine speed and the rotational speed of the shaft. The pressure applied to the actuators, created by the flow from the pump, is controlled by the pressure control valve in the valve block.

The pump has a displacement of 6cm^3/rev and an operational pressure of 165 bar (2248 lbf/in^2). The pump output flow ranges from 6.5 l/min (1.7 US Gallons/min) at idle to 10 l/min (2.64 US Gallons/min) at 1000 rev/min and above.

DYNAMIC RESPONSE VALVE BLOCK

The valve block is located below the RH sill of the body and is secured with three bolts and rubber bushes to captive nuts located in the chassis. The rubber bushes isolate the valve block preventing hydraulic noise from transmitting through the body.

20	-	Spacer (3 off)
21	-	Captive nut (3 off) (chassis mounting)

The valve block directs hydraulic pressure to the actuators via solenoid operated directional control valves. A solenoid operated pressure control valve regulates the required pressure to the actuators. The three solenoid valves are controlled by signals received from the dynamic response control module. A pressure transducer monitors the pressure generated by the Pressure Control Valve (PCV). A serviceable high pressure filter is installed into the underside of the valve block and filters the hydraulic fluid before it reaches the control valves. The filter must be changed at the intervals defined on the vehicle service schedule.

The two Directional Control Valves (DCV's) are fitted to ports in the top face of the valve block. The DCV's are screwed into the valve block and are sealed with O rings. Each DCV has a solenoid for electrical operation of the valve. The solenoid is sealed to the DCV with two O rings and secured with a threaded nut. The nut, coil and O rings are serviceable parts. The DCV's are non-serviceable and failure of a DCV requires replacement of the valve block assembly.

The PCV is fitted to a port in the rear facing end of the valve block. The PCV is screwed into the valve block and is sealed with O rings. The PCV has coil for electrical operation which is sealed to the PCV with two O rings and secured with a threaded nut. The nut, coil and O rings are serviceable items. The PCV is non-serviceable and failure of the PCV requires replacement of the valve block assembly.

The pressure transducer is located in the forward facing end of the valve block and is sealed with an O ring. The pressure transducer measures the hydraulic pressure and returns a signal to the Dynamic Response control module.

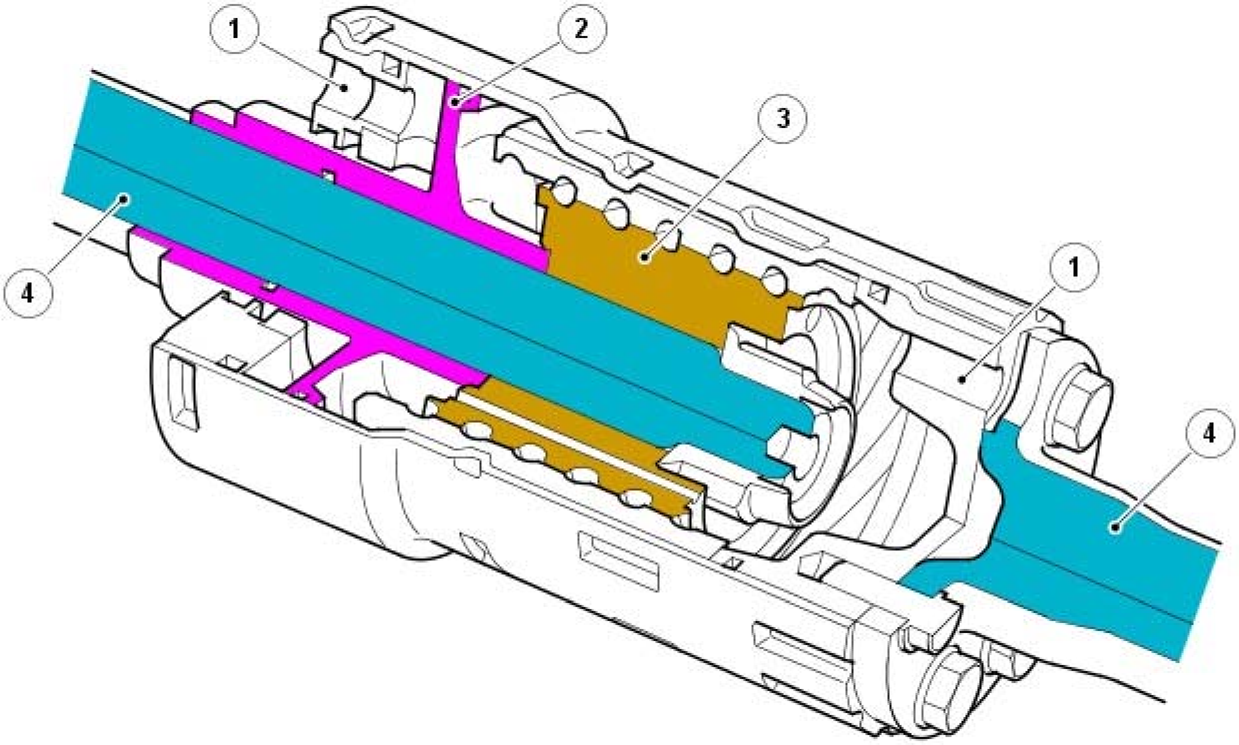
A high pressure filter locates in a port on the lower face of the valve block. The gauze and fibre filter is sealed in the port with O rings and is secured with a threaded cap which is also sealed with an O ring. A threaded hole in the lower face of the filter allows a bolt to be fitted to remove the filter from the port. If a system hydraulic component is replaced, the filter must also be replaced.

Four ports are located on the forward facing end of the valve block and two ports on the opposite end. Each port is fitted with a seal pack which contains two O rings and backing rings. The pipes locate and seal in the seal packs and are secured to the valve block with studs and nuts.

ACTUATORS AND STABILIZER BARS

Two stabilizer bars with integral hydraulic actuators are used for the Dynamic Response system. The actuators apply a hydraulically generated force or rotational torque to the stabilizer bar to oppose lateral forces caused by the vehicle cornering.

Actuator Sectional View



E56408

Item	Part Number	Description
1	-	Air bleed ports
2	-	Piston
3	-	Ball screw
4	-	Stabilizer bar

Each actuator has a piston which is attached to the inner part of a rotor linear ball screw, which is splined to half of the stabilizer bar. The outer part of the ball screw is crimped and welded into a housing which is attached to the other half of the stabilizer bar. As pressure is applied to one side of the piston or the other, the ball screw converts the linear force applied to the piston into a rotational torque between the two halves of the stabilizer bar.

Front Actuator and Stabilizer Bar

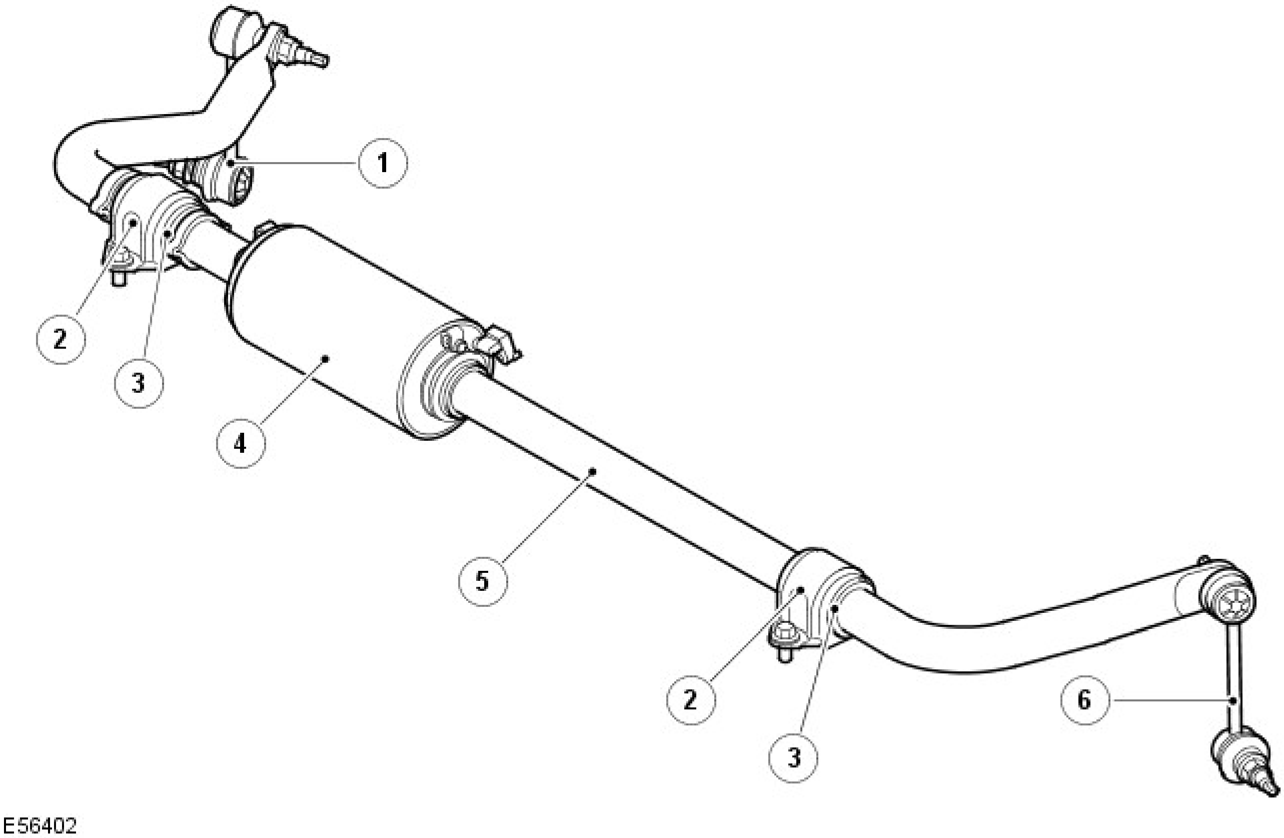
8	-	Pipe fluid connections

Rear Actuator and Stabilizer Bar



Item	Part Number	Description
1	-	RH stabilizer link
2	-	Stabilizer bar bracket
3	-	Stabilizer bar mounting bush
4	-	Actuator
5	-	Stabilizer bar
6	-	LH stabilizer link

- NOTE: TdV8 models are fitted with a different rear actuator to that fitted to TdV6 or petrol V8 models. The TdV8 actuator has a larger internal piston diameter and care must be taken in service to ensure that the correct part is fitted.

- NOTE: On vehicles from 2007MY, the positions of the front actuator ports have been moved and therefore care must be taken to ensure the correct parts are fitted in service.

Two hydraulic connections provide for the attachment of the hydraulic pipes from the valve block. The connections provide hydraulic flow to each side of the actuator piston.

The front and rear actuator assemblies are similar in their construction, with the rear actuator being smaller than the front. Each stabilizer bar is made from 34 mm (1.34 in) diameter spring steel bar.

The actuator assembly and the stabilizer bars are not serviceable items. Only the stabilizer bar attachment bushes, brackets and stabilizer links are serviceable components.

The front stabilizer links are not handed on the front stabilizer bar and are also common to vehicles not fitted with Dynamic Response. The rear stabilizer links are unique to vehicles with Dynamic Response. The Dynamic Response rear links are identified by a gray color plastic bearing moulding. The passive (non-Dynamic Response) links can be identified by a white colored plastic bearing moulding.

The front stabilizer bar and actuator is attached to a chassis strengthening member known as the secondary load path and to the front cross-member. Two serviceable, split rubber bushes are fitted to the stabilizer bar and are located in cast brackets. Each bracket is secured to the secondary load path with two bolts and to the front cross-member with a third bolt.

The rear stabilizer bar and actuator is attached to fabricated brackets which are located on the outside of the chassis side members, forward of the rear wheels.

Two rubber bushes are fitted to each stabilizer bar and are located in clamp brackets. The front and rear bushes and brackets are not interchangeable.

On both the front and rear stabilizer bars, roll correction force is transmitted to the suspension arm via ball jointed stabilizer bar links. The front links are attached to the front suspension upper arm and the rear links are attached to the rear lower arm.

Each front stabilizer link is fitted with a hardened steel washer which is located between the stabilizer bar and the link ball joint and the upper arm and the link ball joint. It is important that these washers are in the correct position and the correct, hardened washers are fitted. Failure to fit the washers or using incorrect washers will result in relaxation of the torque on the self-locking nut and damage will be caused to the stabilizer bar, link and suspension upper arm.

SYSTEM PIPES

Fluid is moved through the Dynamic Response system via a series of six pipes and hoses. The pipes are mounted on brackets at strategic points to provide quiet operation of the system.

The six pipes connecting the pump, reservoir and actuators are one-piece components. If the pipes require replacement during service, the pipes are supplied individually and are removed and replaced in one piece. The front and rear pipes require the body to be lifted slightly to allow access for removal and replacement.

On TdV8 models from 2007MY, the high pressure hose and pipe from the pump to the valve block are available as two separate service parts. The high pressure hose has a quick release connector located in a position below the Air Conditioning (A/C) compressor. This allows the hose to be split into two parts to assist with service repairs. The connector is sealed with an O-ring and a back-up ring which are available as service items. A special tool is required to separate the connector. The tool is inserted into a slot in the connector, which separates the two components. It is not necessary to use the tool as a lever to 'push' the two components apart.

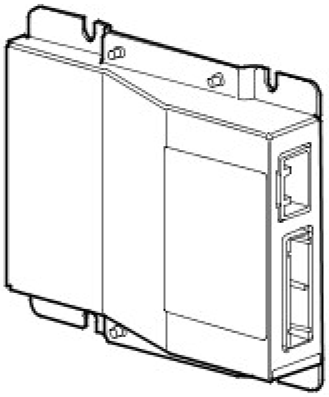
The flexible high pressure hose which supplies pressure from the pump to the high pressure pipe is fitted with attenuators. The attenuators comprise of tuned lengths of PTFE pipe and restrictors within the flexible hose. The attenuators damp pressure pulsations in the hydraulic fluid produced by the pump, reducing noise and strain on components downstream. The attenuator is integral with the high pressure hose and cannot be serviced separately.

⚠CAUTION: Under no circumstances during repairs should clamps be used on the high pressure hose or the front and rear actuator feed pipes to prevent fluid loss. The use of clamps will damage the pipes and hoses leading to premature failure.

DYNAMIC RESPONSE CONTROL MODULE

The Dynamic Response control module is located on the driver's side 'A' pillar, behind the instrument panel. The control module is secured to the vehicle body with two screws. Two connectors are located on the rear face of the control module and allow for the connection of the harness connectors. The two connectors supply power, ground, signal and sensor information to and from the control module for control of the Dynamic Response system.

On vehicles from 2007MY, the Dynamic Response control module contains 2 tunes; One for TdV6 and V8 petrol models and one for TdV8 models. When a replacement control module is fitted, the correct tune is selected from the data contained within the Car Configuration File (CCF) retained in the instrument cluster.



E56403

The Dynamic Response control module receives a power supply from the main relay via fuse 9E in the Battery Junction Box (BJB).

An engine speed signal is transmitted to the control module from the Engine Control Module (ECM) via the high speed Controller Area Network (CAN) bus. The engine speed signal is used by the Dynamic Response control module to detect that the engine is running and hydraulic pressure for the Dynamic Response system is available.

A road speed signal is transmitted to the control module from the ABS module on the high speed CAN. A steering angle signal is transmitted on the high speed CAN bus from the steering angle sensor. The Dynamic Response control module uses the road speed and steering angle signals to calculate lateral acceleration and for on and off-road roll compensation.

When reverse gear is selected and reverse wheel rotation is transmitted on the high speed CAN bus, the Dynamic Response system reverts to a 'locked bars' condition. This condition is maintained until reverse gear is deselected and a forward wheel rotation message is transmitted on the CAN bus.

The Dynamic Response control module receives an ignition on signal on the high speed CAN bus. The ignition signal provides an input into the control module to inform the control module that the ignition switch is in position II. The control module initiates a 250 ms start time which is used to prevent functions operating when the software routines are being initialized.

When the ignition on CAN signal is removed, the control module senses that the ignition has been switched off. The control module remains powered for a 30 second period to allow fault information and adaptive values to be stored in the memory. The values and fault information are read by the control module when the ignition is next switched on. The power supply to the control module is maintained for as long as the main relay remains energized.

The Dynamic Response control module is connected on the high speed CAN bus to the diagnostic socket which allows diagnostic interrogation of the control module. The diagnostic socket allows for the connection of a Land Rover approved diagnostic system to read any stored fault codes in the control module. The control module can also be updated with revised software using a Land Rover approved diagnostic system should a software update be required.

When system faults are detected, the control module issues a message on the CAN bus which is received by the instrument cluster. The instrument cluster then illuminates the air suspension/Dynamic Response warning indicator as follows:

- Minor faults - warning indicator illuminated in an amber color with an applicable message in the message centre
- Major faults - warning indicator illuminated in a flashing red color with an applicable message in the message centre and an audible warning. The message will instruct the driver to stop the vehicle immediately or drive with caution.

Two messages relating to Dynamic Response are displayed in the instrument cluster message centre:

- SUSPENSION FAULT, VEHICLE LEAN, WHEN CORNERING
- SUSPENSION FAULT, STOP SAFELY, STOP ENGINE.

The Dynamic Response control module supplies a control current to the Pressure Control Valve (PCV) in the valve block. The current supplied is determined by a number of input signals from the upper and lower accelerometers, road speed, steering angle etc.. The PCV controls the hydraulic pressure supplied to the actuators proportional to the current supplied by the control module.

Power is supplied to the two solenoid operated Directional Control Valves (DCV) in the valve block by the control module. Together, the two DCV's control the direction of flow of hydraulic fluid to the actuators. When the control module supplies power to the solenoids the valves open allowing hydraulic fluid to flow to the actuators. When power is removed, the DCV's close. DCV1 is left open for left hand corners and DCV2 is opened for right hand corners.

The pressure transducer located in the valve block receives a 5V current from the control module. The transducer measures the hydraulic pressures in the range of 0 to 180 bar (0 to 2610 lbf/in^2) and returns a linear output voltage to the control module dependant on the hydraulic pressure.

The Dynamic Response control module supplies a 5V current to each of the accelerometers. Each accelerometer is capable of measuring lateral acceleration in the range of ± 1.11 g. An analogue input to the control module of between 0.5 and 4.5V relative to the lateral acceleration sensed is returned by each accelerometer. The control module processes the two signals received, together with the steering angle and vehicle speed signals, to produce a 'pure' lateral acceleration signal which is then used as the main control signal for the Dynamic Response system.

Failure Modes

Failures where the vehicle can still be driven safely are indicated by the air suspension/Dynamic Response warning indicator in the instrument cluster illuminating continuously in an amber color. The amber indicator will remain illuminated until the ignition is switched off. For all faults, the warning indicator will only illuminate again if the fault is still present.

Failures which require the driver to stop the vehicle immediately are indicated by the air suspension/Dynamic Response warning indicator flashing in a red color and an audible warning. This will also be accompanied by an applicable message displayed in the message centre.

All faults are recorded by the control module and can be retrieved using a Land Rover approved diagnostic system. The diagnostic system provides a description of the fault, possible causes and corrective action to rectify the fault. The control module can fail to one of two states; 'locked bars' or 'reduced operation'.

The 'locked bars' condition means that pump flow is directed through the valve block and returns to the reservoir. Both DCV's close, trapping the fluid in the actuators. The fluid can flow from one actuator to the other via the valve block. The stabilizer bars will perform similar to a conventional stabilizer bar, resisting roll but still allowing suspension articulation.

The 'reduced operation' condition means that the system can still operate, but one of the input signals is not being received and so the system performance is not optimum.

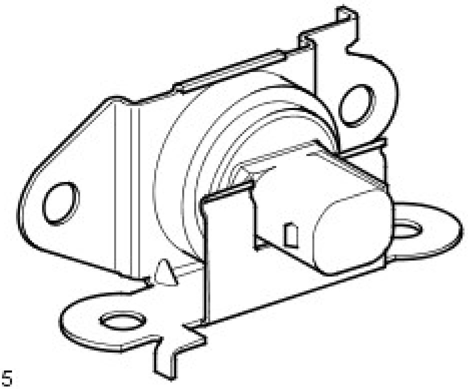
If the steering angle sensor develops a fault or is out of calibration, there is a possibility that the dynamic response control module will record a fault code. A Land Rover approved diagnostic system should be used to check for fault codes and the adaptive data should be cleared by resetting the fault codes in the control module after the steering angle sensor has been

recalibrated.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

ACCELEROMETERS

Two accelerometers are used; an upper and a lower. Both accelerometers are identical in their construction.

The lower accelerometer is secured to the underside of the vehicle floor, on the RH inner sill panel, below the front door. The upper accelerometer is secured to a bracket on the body roof panel, in a central position at the top of the windscreen.



E56405

The lower accelerometer is the primary sensor used to measure lateral acceleration of the vehicle for roll control. The upper accelerometer is used by the Dynamic Response control module for roll correction and fault detection in conjunction with the lower accelerometer.

Each accelerometer is a capacitive acceleration sensor and operates on a 5V supply from the dynamic response control module. The upper and lower accelerometers can measure acceleration in the range of ±1.11 g and return an output to the control module of between 0.5 and 4.5V.

Failures of an accelerometer are recorded by the control module and can be retrieved using a Land Rover approved diagnostic system. A special tool is required to remove and replace the accelerometer in the mounting bracket.

DYNAMIC RESPONSE SYSTEM OPERATION

Vehicle Not Moving

When the engine is running and the vehicle is not moving, both DCV's are closed, locking fluid in each side of the actuator piston. The hydraulic pump draws fluid from the reservoir and passes it at very low pressure to the valve block.

Because both DCV's are closed, after the fluid passes through the high pressure filter, it is directed through the PCV to the reservoir.

The PCV is open fully to allow the full flow to pass to the reservoir. The DCV's will remain closed until the control module detects a requirement to operate.

Vehicle Moving and Turning Left

When the vehicle is turning left, the accelerometers detect the cornering forces applied and transmit signals to the control module. The control module determines that an opposing force must be applied to the stabilizer bars to counter the cornering forces. The control module supplies a current to the solenoid of DCV2. Simultaneously, a current is supplied from the control module to the PCV which operates to restrict the flow of fluid returning to the reservoir.

The restriction causes the hydraulic pressure in the system to rise and the pressure is sensed by the pressure transducer which sends a signal to the control module. The control module determines from the inputs it receives what pressure is required and adjusts the pressure accordingly.

The pressure in the system is applied to the piston of each actuator, applying an opposing force to the stabilizer bar and minimizing the cornering effect on the vehicle and maintaining the vehicle attitude. The fluid displaced from the other side of the piston is returned to the reservoir via the valve block.

As the cornering force is removed when the vehicle straightens up, the control module opens the PCV to reduce the pressure in the system. The fluid bleeds from the actuator back into the system as the cornering force is reduced, removing the force applied to the stabilizer bar. When the vehicle is moving in a straight line DCV2 closes.

Vehicle Moving and Turning Right

When the vehicle is turning right, the accelerometers detect the cornering forces applied and transmit signals to the control module. The control module determines that an opposing force must be applied to the stabilizer bars to counter the cornering forces. The control module supplies a current to the solenoid of DCV1. Simultaneously, a current is supplied from the control module to the PCV which operates to restrict the flow of fluid through the by-pass gallery.

The restriction causes the hydraulic pressure in the system to rise and the pressure is sensed by the pressure transducer which sends a signal corresponding to the pressure to the control module. The control module determines from the inputs it receives what pressure is required and adjusts the pressure control valve accordingly.

The pressure in the system is applied to the piston of each actuator, applying an opposing force to the stabilizer bar and minimizing the cornering effect on the vehicle and maintaining the vehicle attitude. The fluid displaced from the other side of the piston is returned to the reservoir via the valve block.

As the cornering force is removed when the vehicle straightens up, the control module opens the PCV to reduce the pressure in the system. The fluid bleeds from the actuator back into the system as the cornering force is reduced, removing the force applied to the stabilizer bar. When the vehicle is moving in a straight line DCV1 closes.

Vehicle Moving in a Straight Line

The control module is constantly monitoring the signals received and operates the DCV's and PCV to maintain the vehicle attitude when the vehicle is moving.

Off-Road Driving

Off-road detection is achieved by the control module by monitoring the signals from the upper and lower accelerometers for varying degrees of body movement. Off-road driving generates differing signals to the accelerometers which in turn produce differing outputs due to their vertical separation and the location of the roll centre of the vehicle.

The two signals are passed through a filter to remove any offset caused by the vehicle leaning or the terrain. The control module then uses this signal to calculate the percentage of road roughness.

Below 25 mph (40 km/h) the percentage of road roughness calculated is used by the control module to limit the operation of the Dynamic Response system. At speeds above 25 mph (40 km/h) the system disables the percentage road roughness signal and full Dynamic Response system assistance is restored. The system is completely inoperative at speeds below 2 mph (3 km/h).

Side Slope Detection

The control module uses side slope detection when the upper and lower accelerometers detect an average acceleration of more than ± 0.2 g or 11 degrees of side slope and a road speed of less than 25 mph (40 km/h).

When side slope is detected, both DCV's close to provide a 'locked bars' condition. This condition increases stability and gives a constant vehicle response. As the road speed increases up to 25 mph (40 km/h), the level of average lateral acceleration must also increase and be maintained for the system to recognize that the vehicle is on a side slope. If the side slope angle is steep and the road speed is low, the control module will detect the side slope in a short time.

Ride and Handling Optimization - Ride and Handling Optimization

Diagnosis and Testing

Overview

Ride and handling optimization incorporates the terrain response system which links a number of modules around the vehicle to give the best combination of settings in the different systems.

For information on the description and operation of the system, refer to section 204-06 - Ride and Handling Optimization of the workshop manual.

Inspection and Verification

⚠CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Mechanical	Electrical
● Tire condition, pressures, etc ● Driveline components (correct installation, damage, etc) ● Engine components (correct installation, damage, etc) ● Transmission components (correct installation, damage, etc) ● Suspension components (correct installation, damage, etc)	● Fuses ● Harnesses/Connectors ● Terrain response module ● Engine control module (ECM) ● Transmission control module (TCM) ● Transfer case control module ● ABS control module ● Rear differential control module ● Dynamic suspension control module ● Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index. Refer to the relevant section of the workshop manual.
    - Make sure that all DTCs are cleared following rectification.

Symptom chart

Because the overall function of the system is dependent on sub-systems, it is possible to misinterpret displays in the message center as being terrain response faults when they are actually a result of a fault in one of the sub-systems.

Refer to the table below for help in deciding when to investigate terrain response faults and when the fault is likely to be in a sub-system.

Symptom	Description	Possible causes	Action
Message center display indicating a sub-system fault	The message center indicates to the driver that a fault has occurred and in which sub-system	● Any sub-system fault supported by the message center	For details of the available messages, refer to the relevant section of the workshop manual. Carry out a complete vehicle DTC read and follow the diagnostic routine(s) indicated.
Message center display: **System fault special programs not available**, terrain response switch operation normal	This message will display when a sub-system fault has occurred if the driver attempts to change the special program, and at each ignition on cycle for 5 seconds until the fault is rectified	● Any sub-system fault supported by the message center	For details of the available messages, refer to the relevant section of the workshop manual. Carry out a complete vehicle DTC read and follow the diagnostic routine(s) indicated.
Message center display: **System fault special programs not available**, **ALL** terrain response switch LEDs illuminated	CAN circuit errors	● CAN circuit: short circuit to ground ● CAN circuit: short circuit to power ● CAN circuit: high	Carry out a complete vehicle DTC read and follow the diagnostic routine(s) indicated.

Symptom	Description	Possible causes	Action
		resistance	
Special program changes not available	User error	● Engine not running ● Rock crawl selected with transfer box in high range ● Special program change attempted with ABS or DSC active - This includes ABS cycling as part of HDC ● Special program change attempted with an overheat condition present in the center or rear differential	Refer to the relevant section of the workshop manual. Make sure that the driver is familiar with the correct operation of the system.

DTC index

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: When performing voltage or resistance tests, always use a digital multimeter (DMM) accurate to three decimal places and with a current calibration certificate. When testing resistance, always take the resistance of the DMM leads into account.

DTC	Description	Possible causes	Action
C1A00-46	Control module - calibration / parameter memory failure	● The terrain response control module has indicated a calibration / parameter memory failure for embedded systems using FLASH memory. This is equivalent to EEPROM in RAM/ROM /EEPROM embedded systems ● Corruption in the non-volatile memory storage system (EEPROM) in the terrain response control module	Rectify this DTC before attempting to rectify others. Record all DTCs logged and clear them. With ignition on select a terrain response special program, turn off the ignition, then turn back on the ignition and verify the selected special program is still active. If the selected terrain response special program is not still active and has returned to the general program, confirm if DTC has returned. Repeat procedure again once more. If DTC is still present install a new terrain response rotary control and control module.
C1A01-96	LED – component internal failure	● Terrain response rotary control and control module - LED short circuit to ground ● Terrain response rotary control and control module - LED open circuit	• NOTE: If the system is in 'failsafe default mode due to another issue no LEDs will illuminate. This fault does not cause the system to go to 'failsafe default'. Refer to the Description and Operation section of workshop manual. Check terrain response system, special program LEDs. One or more of the LEDs is suspected of not illuminating as appropriate. With the engine running move the terrain response rotary control through all five programs and confirm the appropriate special program LED does not illuminate when the terrain response rotary control is in that position. Suspect the terrain response rotary control and control module, check and install a new terrain response rotary control and control module as required, refer to the new module/component installation note at the top of the DTC Index.
C1A02-94	Rotary encoder stuck in intermediate position –	● The terrain response rotary control is held in an intermediate position (between the special	Check that the terrain response control is correctly located into a detent. Using the manufacturer approved diagnostic system, clear the DTC. With the engine running check the system responds to switch rotation and the DTC does not return. Check for foreign

DTC	Description	Possible causes	Action
	unexpected operation	programs) for more than 60 seconds ● Foreign object preventing correct operation of terrain response rotary control ● Mechanical damage to the terrain response rotary control	object preventing correct operation of terrain response rotary control. Check for mechanical damage to the terrain response rotary control. Rectify as required.
U0073-88	Control module communication bus ‘A’ off – bus off	● Bus off. The terrain response control module has detected the data bus is not available ● CAN bus open circuit ● CAN bus short circuit to ground ● CAN bus short circuit to power ● Failure of another control module on the CAN bus	Refer to electrical circuit diagrams, check CAN circuit for open circuit, short to ground, short to power, repair/renew as necessary. Using the manufacturer approved diagnostic system, carry out network integrity test. Check the system is operating correctly and the DTC does not return.
U0100-87	Lost communication with ECM/PCM ‘A’ – missing message	● The terrain response control module has not received one or more expected messages from the engine control module ● High speed CAN circuit communications failure ● Open circuit engine control module, power feed ● Open circuit engine control module, ground supply ● Engine control module disconnected from the high speed CAN communication bus ● Open circuit engine control module high speed CAN low circuit ● Open circuit engine control module high speed CAN high circuit ● Engine control module not configured ● Engine control module failure	Using the manufacturer approved diagnostic system, check the engine control module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the engine control module. Refer to electrical circuit diagrams, check power feed and ground supplies, to engine control module for open circuit. Check for open circuit engine control module high speed CAN low circuit. Check for open circuit engine control module high speed CAN high circuit, repair as necessary. Suspect the engine control module, check and install a new engine control module as required, refer to the new module/component installation note at the top of the DTC Index. Check the system is operating correctly and the DTC does not return.
U0101-87	Lost communication with transmission control module – missing message	● The terrain response control module has not received one or more expected messages from the transmission control module ● High speed CAN circuit communications failure ● Open circuit transmission control module, power feed ● Open circuit transmission control module, ground supply ● Transmission control module disconnected from the high speed CAN	Using the manufacturer approved diagnostic system, check the transmission control module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the transmission control module. Refer to electrical circuit diagrams, check power feed and ground supplies, to transmission control module for open circuit. Check for open circuit transmission control module high speed CAN low circuit. Check for open circuit transmission control module high speed CAN high circuit, repair as necessary. Suspect the transmission control module, check and install a new transmission control module as required, refer to the new module/component installation note at the top of the DTC Index. Check the system is operating correctly and the DTC does not return.

DTC	Description	Possible causes	Action
		communication bus - Open circuit transmission control module high speed CAN low circuit - Open circuit transmission control module high speed CAN high circuit - Transmission control module not configured - Transmission control module failure	
U0102-87	Lost communication with transfer case control module - missing message	- The terrain response control module has not received one or more expected messages from the transfer box control module - High speed CAN circuit communications failure - Open circuit transfer box control module, power feed - Open circuit transfer box control module, ground supply - Transfer box control module disconnected from the high speed CAN communication bus - Open circuit transfer box control module high speed CAN low circuit - Open circuit transfer box control module high speed CAN high circuit - Transfer box control module not configured - Transfer box control module failure	Using the manufacturer approved diagnostic system, check the transfer box control module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the transfer box control module. Refer to electrical circuit diagrams, check power feed and ground supplies, to transfer box control module for open circuit. Check for open circuit transfer box control module high speed CAN low circuit. Check for open circuit transfer box control module high speed CAN high circuit, repair as necessary. Suspect the transfer box control module, check and install a new transfer box control module as required, refer to the new module/component installation note at the top of the DTC Index. Check the system is operating correctly and the DTC does not return.
U0122-87	Lost communication with vehicle dynamics control module - missing message	- The terrain response control module has not received one or more expected messages from the dynamic response control module - High speed CAN circuit communications failure - Open circuit dynamic response control module, power feed - Open circuit dynamic response control module, ground supply - Dynamic response control module disconnected from the high speed CAN communication bus - Open circuit dynamic response control module high speed CAN low circuit - Open circuit dynamic response control module high speed CAN high circuit	Using the manufacturer approved diagnostic system, check the dynamic response control module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the dynamic response control module. Refer to electrical circuit diagrams, check power feed and ground supplies, to dynamic response control module for open circuit. Check for open circuit dynamic response control module high speed CAN low circuit. Check for open circuit dynamic response control module high speed CAN high circuit, repair as necessary. Suspect the dynamic response control module, check and install a new dynamic response control module as required, refer to the new module/component installation note at the top of the DTC Index. Check the system is operating correctly and the DTC does not return.

DTC	Description	Possible causes	Action
		- Dynamic response control module not configured - Dynamic response control module failure	
U0132-87	Lost communication with suspension control module ‘A’ - missing message	- The terrain response control module has not received one or more expected messages from the air suspension control module - High speed CAN circuit communications failure - Open circuit air suspension control module, power feed - Open circuit air suspension control module, ground supply - Air suspension control module disconnected from the high speed CAN communication bus - Open circuit air suspension control module high speed CAN low circuit - Open circuit air suspension control module high speed CAN high circuit - Air suspension control module not configured - Air suspension control module failure	Using the manufacturer approved diagnostic system, check the air suspension control module for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the air suspension control module. Refer to electrical circuit diagrams, check power feed and ground supplies, to air suspension control module for open circuit. Check for open circuit air suspension control module high speed CAN low circuit. Check for open circuit air suspension control module high speed CAN high circuit, repair as necessary. Suspect the air suspension control module, check and install a new air suspension control module as required, refer to the new module/component installation note at the top of the DTC Index. Check the system is operating correctly and the DTC does not return.
U0155-87	Lost communication with instrument panel cluster (IPC) control module - missing message	- The terrain response control module has not received one or more expected messages from the instrument cluster - High speed CAN circuit communications failure - Open circuit instrument cluster, power feed - Open circuit instrument cluster, ground supply - Instrument cluster disconnected from the high speed CAN communication bus - Open circuit instrument cluster high speed CAN low circuit - Open circuit instrument cluster high speed CAN high circuit - Instrument cluster not configured - Instrument cluster failure	Using the manufacturer approved diagnostic system, check the instrument cluster for DTCs and refer to the relevant DTC index. Using the manufacturer approved diagnostic system, carry out network integrity test. Using the manufacturer approved diagnostic system, re-configure the instrument cluster. Refer to electrical circuit diagrams, check power feed and ground supplies, to instrument cluster for open circuit. Check for open circuit instrument cluster high speed CAN low circuit. Check for open circuit instrument cluster high speed CAN high circuit, repair as necessary. Suspect the instrument cluster, check and install a new instrument cluster as required, refer to the new module/component installation note at the top of the DTC Index. Check the system is operating correctly and the DTC does not return.
U0300-55	Internal control module software incompatibility - not configured	- The terrain response control module has failed to recognise the correct master configuration ID from the CAN data bus master, the instrument	Using the manufacturer approved diagnostic system, check the vehicle configuration file, rectify as necessary. Check correct software version is installed to both terrain response control module and instrument cluster, update as necessary. Check the system is operating correctly and the DTC does not return.

DTC	Description	Possible causes	Action
		cluster - Terrain response control module not correctly configured - Instrument cluster not correctly configured	
U0401-94	Invalid data received from ECM/PCM A - unexpected operation	- The terrain response control module has detected that the engine control module component had operated in a way or at a time that it had not been commanded to operate - The engine management system, engine control module is unable to support normal terrain response functionality, the terrain response system will go into default condition - Engine management system fault - Engine control module failure	Using the manufacturer approved diagnostic system, check the engine control module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. Suspect the engine control module, check and install a new engine control module as required, refer to the new module/component installation note at the top of the DTC Index.
U0402-94	Invalid data received from transmission control module - unexpected operation	- The terrain response control module has detected that the transmission control module component had operated in a way or at a time that it had not been commanded to operate - The transmission system, transmission control module is unable to support normal terrain response functionality, the terrain response system will go into default condition - Transmission system fault - Transmission control module failure	Using the manufacturer approved diagnostic system, check the transmission control module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. Suspect the transmission control module, check and install a new transmission control module as required, refer to the new module/component installation note at the top of the DTC Index.
U0403-94	Invalid data received from transfer case control module - unexpected operation	- The terrain response control module has detected that the transfer box control module component had operated in a way or at a time that it had not been commanded to operate - The transfer box system, transfer box control module is unable to support normal terrain response functionality, the terrain response system will go into default condition - Transfer box system fault - Transfer box control module failure	Using the manufacturer approved diagnostic system, check the transfer box control module for DTCs and refer to the relevant DTC index, rectify as required. Check the system is operating correctly and the DTC does not return. Suspect the transfer box control module, check and install a new transfer box control module as required, refer to the new module/component installation note at the top of the DTC Index.

Ride and Handling Optimization - Active Stabilization System

Diagnosis and Testing

Overview

Active stabilization is also known as dynamic response, active roll control or active cornering enhancement, and refers to the control of the front and rear stabilizer (or anti-roll) bars.

For information on the description and operation of the system:
REFER to: Active Stabilization System (204-06 Ride and Handling Optimization, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Mechanical	Electrical
● Fluid level/condition, pipes, reservoir, etc ● Pump and pulley ● Drive belt condition ● Hoses ● Valve block ● Accelerometers (correct fitment, etc) ● Tire condition, pressures, etc ● Suspension components (correct fitment, damage, etc)	● Fuses (battery junction box) ● Engine control module (ECM) relay ● Harnesses/Connectors ● Upper accelerometer ● Lower accelerometer ● Steering wheel rotation sensor ● Dynamic response control module ● Air suspension control module ● ABS control module ● Instrument cluster module ● Transmission control module (TCM) ● Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
   - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
   - Make sure that all DTCs are cleared following rectification

Symptom chart

Symptom	Possible cause	Action
Poor on-center response	● System bleed required ● Stabilizer bar bushes ● Residual pressure ● Steering angle sensor offset ● Control module adaptive data	Carry out the manual bleed procedure. REFER to: Active Stabilization System Bleeding (204-06 Ride and Handling Optimization, General Procedures). Check the stabilizer bar bushes. REFER to: Front Stabilizer Bar - V8 S/C 4.2L Petrol (204-06 Ride and Handling Optimization, Removal and Installation) / Rear Stabilizer Bar (204-06 Ride and Handling Optimization, Removal and Installation). Check for residual pressure in the system. Check and calibrate the steering angle sensor, clear the adaptive data after calibration. REFER to: Steering Angle Sensor (211-02 Power Steering, Removal and Installation).
Asymmetrical response	● Steering angle sensor offset ● Accelerometer calibration ● System bleed required	Check and calibrate the steering angle sensor, clear the adaptive data after calibration. REFER to: Steering Angle Sensor (211-02 Power Steering, Removal and Installation). Calibrate the accelerometers using the approved diagnostic system. Carry out the manual bleed procedure. REFER to: Active Stabilization System Bleeding (204-06 Ride and Handling Optimization, General Procedures).

Symptom	Possible cause	Action
Excessive roll	- System bleed required - Stabilizer bar bushes - Stabilizer bar drop-links	Carry out the manual bleed procedure. REFER to: Active Stabilization System Bleeding (204-06 Ride and Handling Optimization, General Procedures). Check the stabilizer bar bushes and drop links. REFER to: Front Stabilizer Bar - V8 S/C 4.2L Petrol (204-06 Ride and Handling Optimization, Removal and Installation) / Rear Stabilizer Bar (204-06 Ride and Handling Optimization, Removal and Installation).
Powered roll-rock	- Harness faults - Valve block fault - Control module adaptive data - Accelerometer fault	Check for DTCs indicating any of the possible causes are present.
Oversteer or understeer	- Stabilizer bar drop-links - System actuators	Check the stabilizer bar drop links and the system actuators. REFER to: Front Stabilizer Bar - V8 S/C 4.2L Petrol (204-06 Ride and Handling Optimization, Removal and Installation) / Rear Stabilizer Bar (204-06 Ride and Handling Optimization, Removal and Installation).

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B1A8700	Battery disconnection/control module reset	- Loss of power to the dynamic response control module while the vehicle is in motion	Check the harness and connectors, check the EMS relay, check the ground connections.
C111122	Control lateral acceleration	- Internal control module calculation fault	Check for associated codes giving more information. Refer to the warranty policy and procedures manual if a module is suspect.
C111127	Control lateral acceleration	- Intermittent lower lateral accelerometer signal - Lower lateral accelerometer fault - Internal control module calculation fault	Check for associated codes giving more information. Carry out the accelerometer tests using the approved diagnostic system.
C111200	Roll angle	- Internal control module calculation fault	Check for associated codes giving more information. Refer to the warranty policy and procedures manual if a module is suspect.
C111229	Roll angle	- Internal control module calculation fault	Check for associated codes giving more information. Refer to the warranty policy and procedures manual if a module is suspect.
C111300	Off-Road determination	- Internal control module calculation fault	Check for associated codes giving more information. Refer to the warranty policy and procedures manual if a module is suspect.
C111400	Roll axis torque	- Internal control module calculation fault	Check for associated codes giving more information. Refer to the warranty policy and procedures manual if a module is suspect.
C111629	Torque/Pressure	- Internal control module calculation fault	Check for associated codes giving more information. Refer to the warranty policy and procedures manual if a module is suspect.
C111729	Direction control valve(s)	- Internal control module calculation fault	Check for associated codes giving more information. Refer to the warranty policy and procedures manual if a module is suspect.
C111771	Direction control valve(s)	- Sticking direction control valves	Install a new valve block. REFER to: Valve Block (204-06 Ride and Handling Optimization, Removal and Installation).
C111795	Direction control valve(s)	- Incorrect connection of the pressure control and direction control valves - Damaged direction control valve - High resistance	Check the valve connections and rectify as necessary. Check the direction control valves. Check the harnesses and connectors.

DTC	Description	Possible causes	Action
		harness/connectors	
C111909	Hydraulic pressure	● Low fluid ● Leak in high pressure primary circuit ● Leaking reservoir ● Leak in secondary circuit ● Direction control valves stuck open ● Pressure control valve fault ● Pressure transducer fault ● Blocked filter ● Actuator fault	Check and top up the fluid. Rectify leaks as necessary. For sticking/faulty valves, install a new valve block. REFER to: Valve Block (204-06 Ride and Handling Optimization, Removal and Installation). For a pressure transducer fault, install a new pressure transducer. REFER to: Valve Block Transducer (204-06 Ride and Handling Optimization, Removal and Installation). Install a new filter as necessary. REFER to: Valve Block Filter (204-06 Ride and Handling Optimization, Removal and Installation). Check the system actuators.
C111962	Hydraulic pressure	● Low fluid ● Leak in high pressure primary circuit ● Leaking reservoir ● Leak in secondary circuit ● Direction control valves stuck open ● Pressure control valve fault ● Pressure transducer fault ● Blocked filter ● Actuator fault ● Broken drop link ● Broken stabilizer bar ● Air in system	Check and top up the fluid. Rectify leaks as necessary. For sticking/faulty valves, install a new valve block. REFER to: Valve Block (204-06 Ride and Handling Optimization, Removal and Installation). For a pressure transducer fault, install a new pressure transducer. REFER to: Valve Block Transducer (204-06 Ride and Handling Optimization, Removal and Installation). Install a new filter as necessary. REFER to: Valve Block Filter (204-06 Ride and Handling Optimization, Removal and Installation). Check the system actuators. Install new drop links or stabilizer bars as necessary. REFER to: Front Stabilizer Bar - V8 S/C 4.2L Petrol (204-06 Ride and Handling Optimization, Removal and Installation) / Rear Stabilizer Bar (204-06 Ride and Handling Optimization, Removal and Installation). Carry out the manual bleed procedure. REFER to: Active Stabilization System Bleeding (204-06 Ride and Handling Optimization, General Procedures).
C11197B	Hydraulic pressure	● Low fluid ● Leak in high pressure primary circuit ● Leaking reservoir ● Leak in secondary circuit ● Blocked filter ● Low pump flow ● Blocked or kinked suction hose	Check and top up the fluid. Rectify leaks as necessary. Install a new filter as necessary. REFER to: Valve Block Filter (204-06 Ride and Handling Optimization, Removal and Installation). Check and replace the pump as necessary. REFER to: Fluid Pump - V8 4.4L Petrol/V8 S/C 4.2L Petrol (204-06 Ride and Handling Optimization, Removal and Installation). Check the suction hose, rectify as necessary.
C111991	Hydraulic pressure	● Pressure control valve fault ● Contaminated fluid ● Kinked or blocked return pipe ● Pressure transducer fault	For sticking/faulty valves, install a new valve block. REFER to: Valve Block (204-06 Ride and Handling Optimization, Removal and Installation). Clean the system, replace the fluid. Check and replace the return pipe as necessary. For a pressure transducer fault, install a new pressure transducer. REFER to: Valve Block Transducer (204-06 Ride and Handling Optimization, Removal and Installation).
C1A0001	Dynamic response control module	● Harness fault ● Damaged isolation switch	Check the control module harness. Refer to the electrical guides.
C1A0004	Dynamic response control module	● Internal control module fault	Refer to the warranty policy and procedures manual if a module is suspect.
C1A0043	Dynamic response control module	● Internal control module fault	Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
C1A0045	Dynamic response control module	- Internal control module fault	Refer to the warranty policy and procedures manual if a module is suspect.
C1A0047	Dynamic response control module	- Internal control module fault	Refer to the warranty policy and procedures manual if a module is suspect.
C1A0052	Dynamic response control module	- New control module	Configure the new module using the approved diagnostic system
C1A0054	Dynamic response control module	- New control module	Configure the new module using the approved diagnostic system
C1A0916	Pressure transducer signal	- Pressure transducer signal circuit: short circuit to ground - Pressure transducer fault	Check the pressure transducer circuit, rectify as necessary. Install a new pressure transducer as necessary. REFER to: Valve Block Transducer (204-06 Ride and Handling Optimization, Removal and Installation).
C1A0917	Pressure transducer signal	- Pressure transducer signal circuit: short circuit to power - Pressure transducer fault	Check the pressure transducer circuit, rectify as necessary. Install a new pressure transducer as necessary. REFER to: Valve Block Transducer (204-06 Ride and Handling Optimization, Removal and Installation).
C1A091C	Pressure transducer signal	- Pressure control valve circuit: short circuit to power - Pressure control valve fault - Pressure transducer fault	For sticking/faulty valves, install a new valve block. REFER to: Valve Block (204-06 Ride and Handling Optimization, Removal and Installation). Install a new pressure transducer as necessary. REFER to: Valve Block Transducer (204-06 Ride and Handling Optimization, Removal and Installation).
C1A0926	Pressure transducer signal	- Low fluid - Pressure transducer fault - Blocked filter	Check and top up the fluid. Install a new filter as necessary. REFER to: Valve Block Filter (204-06 Ride and Handling Optimization, Removal and Installation). Install a new pressure transducer as necessary. REFER to: Valve Block Transducer (204-06 Ride and Handling Optimization, Removal and Installation).
C1A9762	Lateral accelerometer circuit	- Damaged accelerometers - Bent brackets	Check the accelerometers and brackets. Rectify as necessary.
C1B0312	Directional control valve 1	- Directional control valve 1 circuit: short circuit/very low resistance - Directional control valve 1 circuit: short circuit to power	Check the directional control valve circuit. For sticking/faulty valves, install a new valve block. REFER to: Valve Block (204-06 Ride and Handling Optimization, Removal and Installation).
C1B0314	Directional control valve 1	- Directional control valve 1 circuit: short circuit to ground	Check the directional control valve circuit. Refer to the electrical guides.

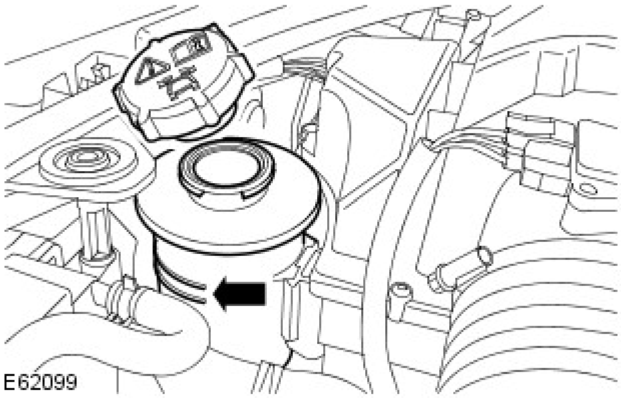
Ride and Handling Optimization - Active Stabilization System Bleeding

General Procedures

Special Tool(s)	
	Dynamic Response Bleed Bottle 204-591-01
	Dynamic Response Control Box 204-591-02

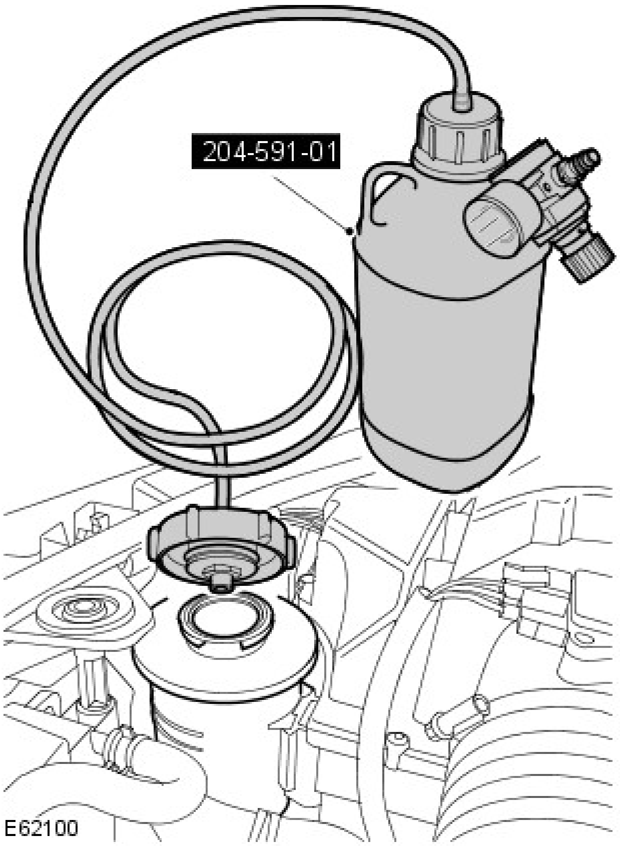
⚠CAUTION: Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

• NOTE: This procedure should be carried out if the following components have been removed or replaced: front or rear stabilizer bar, front or rear valve block to actuator bar pipe assemblies, or the valve block. It is possible to bleed only the front or rear of the system if only a stabilizer bar or pipe assembly has been removed. If the valve block has been removed, the complete system must be bled.



1. Check and top-up the dynamic response system fluid reservoir.

- Top-up the fluid level to the mid-way mark on the reservoir.



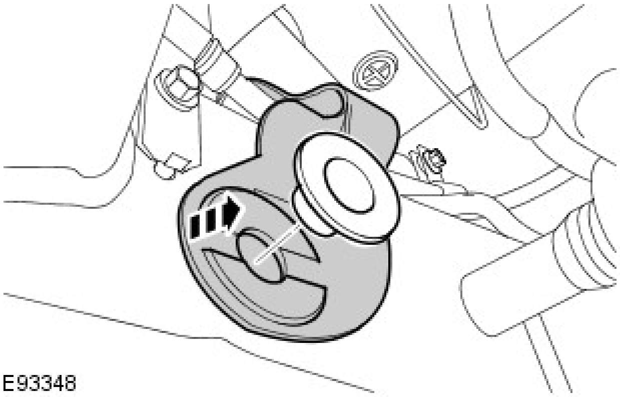
2. Install the special tool to the dynamic response reservoir.
   - Completely fill the reservoir with fluid.
   - Make sure the pressure regulator on the special tool is turned OFF.
   - Fill the special tool bottle approximately three-quarters full with fluid.
   - Connect the special tool to a suitable workshop air supply.

3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

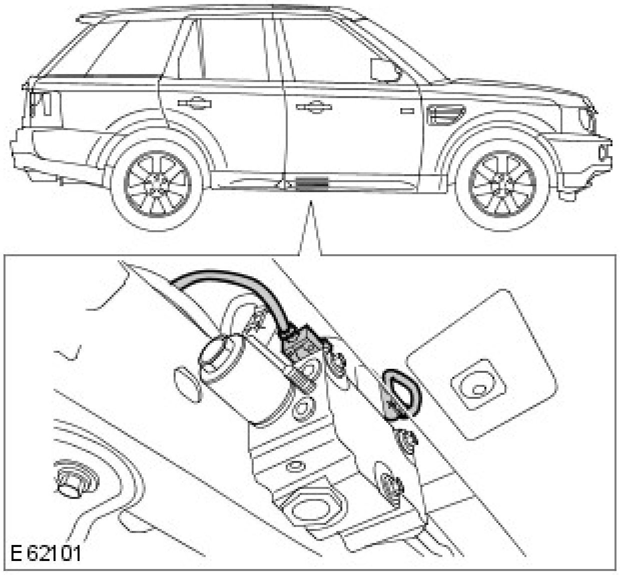
   Raise and support the vehicle.

4. Remove the RH rear wheel and tire.

5. RH side rear: To improve access to RH rear actuator bleed screw, remove bracket from body frame securing fuel breather pipes.

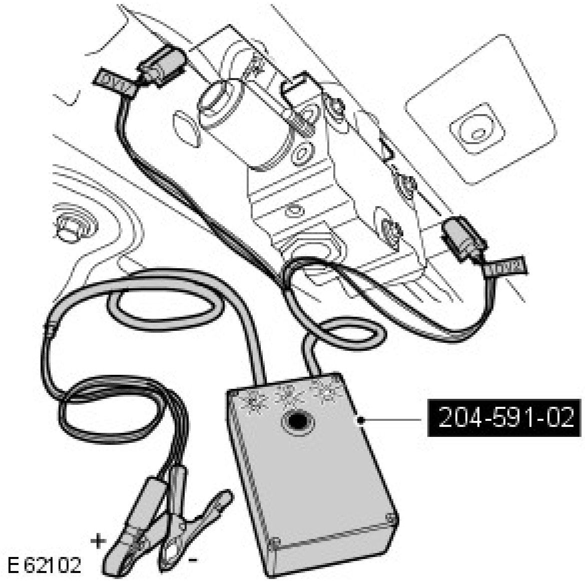


6. Disconnect the two direction control valve electrical connectors.



7. Connect the special tool electrical connectors to the valve block.

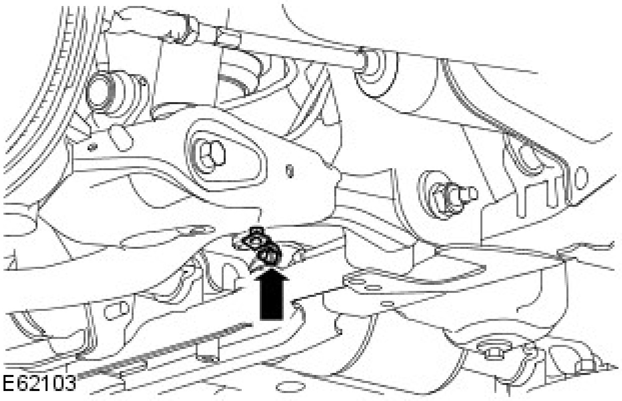
- Connect the special tool power supply leads to the vehicle battery.



8. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

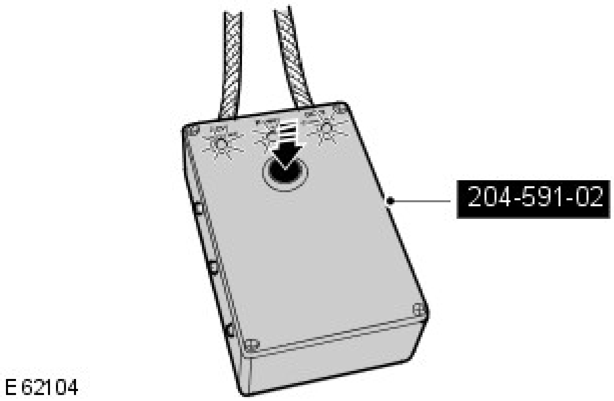
9. Connect the hose from special tool kit to the front stabilizer bar bleed screws.

- Remove the bleed screw covers.



10. Loosen the front actuator RH bleed screw by one-half of a turn.

11. Using the special tool, open both actuator control valves.

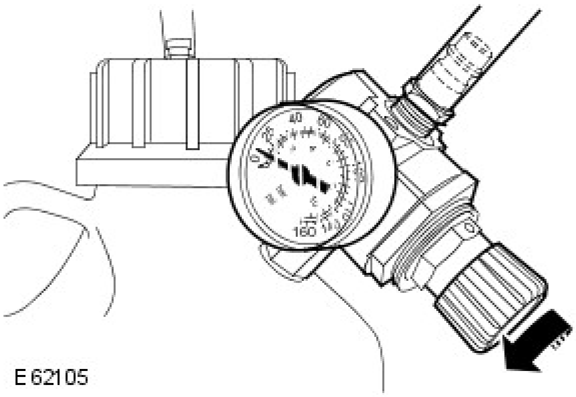


12. ⚠CAUTION: The Dynamic Response bleed tool fluid reservoir must remain full with new, clean fluid, at all times during bleeding.

• NOTE: It may be necessary to operate the switch several times to help pulse the air out of the actuator.

Bleed the dynamic response system until a flow of clean, air-free fluid, is being pumped into the bleed jar.

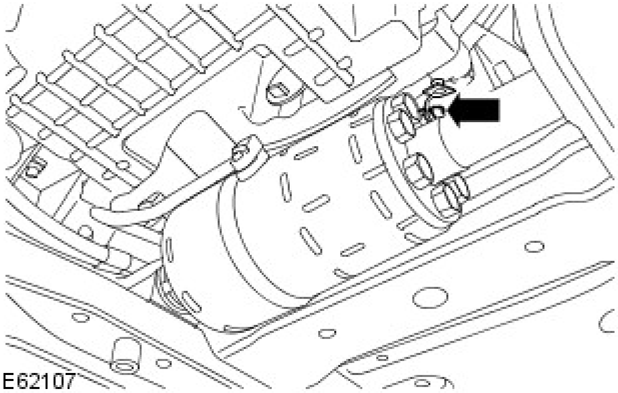
- Using the special tool pressure regulator, carefully increase the air pressure to approx. 5 - 10 PSI / 0.3 - 0.7 kPa, until air/fluid is being expelled from bleed screw.

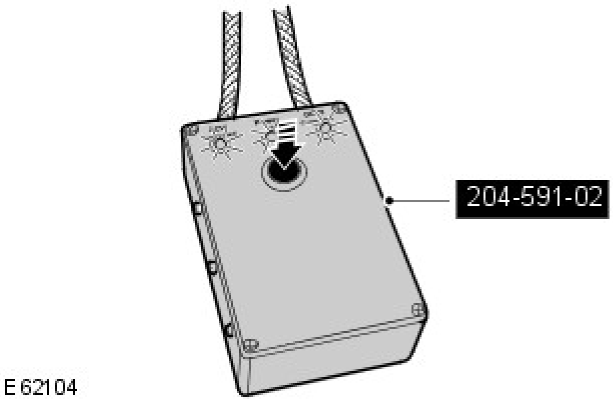


13. When a steady flow of clean air free fluid is running from the bleed point, tighten the bleed screw to 15 Nm (11 lb.ft).

- Release the switch on the special tool to switch off the actuator control valves.

14. Loosen the front actuator LH bleed screw by one-half of a turn.





15. Using the special tool, open both actuator control valves.

16. NOTE: It may be necessary to operate the switch several times to help pulse the air out of the actuator.

Bleed the dynamic response system until a flow of clean, air-free fluid, is being pumped into the bleed jar.

17. When a steady flow of clean air free fluid is running from the bleed point, tighten the bleed screw to 15 Nm (11 lb.ft).

- Release the switch on the special tool to switch off the actuator control valves.

18. Repeat the front stabilizer bar bleed procedure, from steps 9 to 17, a further two times, to make sure all air is removed from the actuator.

19. Disconnect the special tool hose from the front stabilizer bar bleed screws.

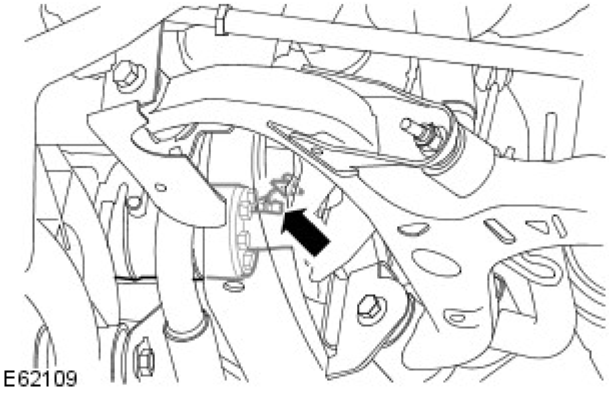
- Install the bleed screw covers.
- Discard the fluid from the bleed jar.

20. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

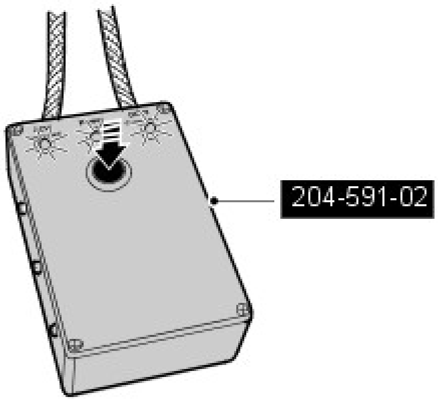
21. Check and top-up the special tool fluid reservoir.

22. Connect the hose from the special tool kit to the rear stabilizer bar bleed screws.

- Remove the bleed screw covers.

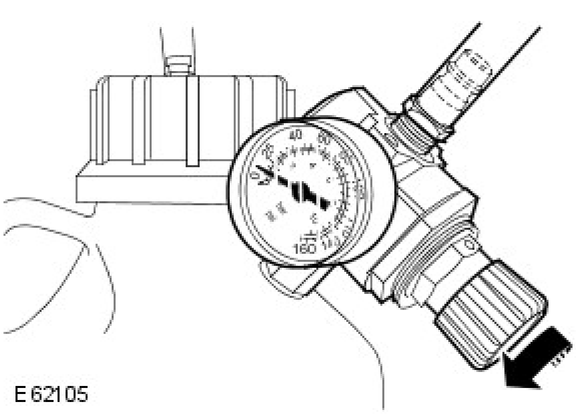


23. Loosen the rear actuator RH bleed screw by one-half of a turn.



E62104

24. Using the special tool, open both actuator control valves.

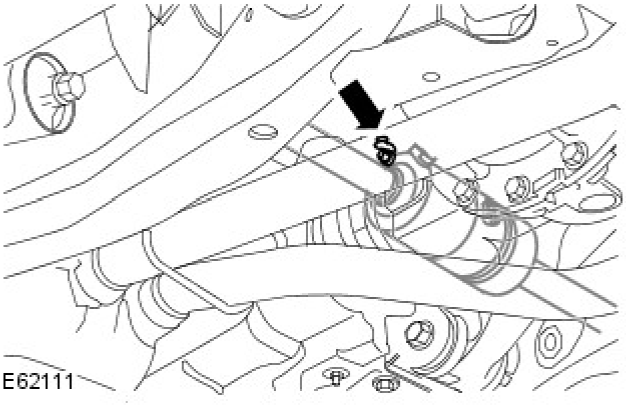


E62105

25. CAUTION: The Dynamic Response bleed tool fluid reservoir must remain full with new, clean fluid, at all times during bleeding.

• NOTE: It may be necessary to operate the switch several times to help pulse the air out of the actuator.

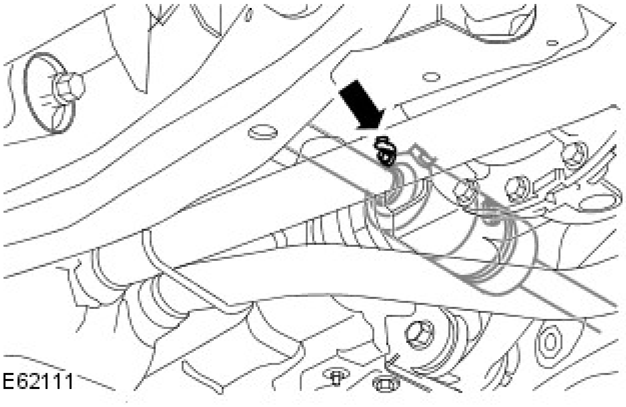
Bleed the dynamic response system until a flow of clean, air-free fluid, is being pumped into the bleed jar.



E62111

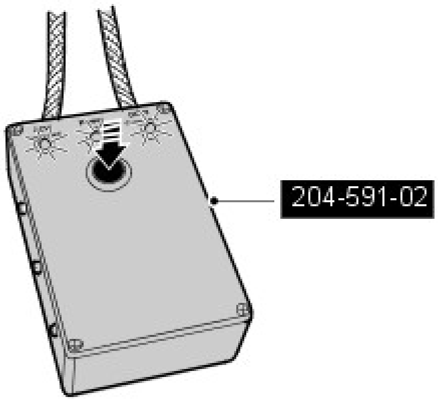
26. When a steady flow of clean air free fluid is running from the bleed point, tighten the bleed screw to 15 Nm (11 lb.ft).

- Release the switch on the special tool to switch off the actuator control valves.



E62111

27. Loosen the rear actuator LH bleed screw by one-half of a turn.



28. Using the special tool, open both actuator control valves.

29. NOTE: It may be necessary to operate the switch several times to help pulse the air out of the actuator.

Bleed the dynamic response system until a flow of clean, air-free fluid, is being pumped into the bleed jar.

30. When a steady flow of clean air free fluid is running from the bleed point, tighten the bleed screw to 15 Nm (11 lb.ft).

- Release the switch on the special tool to switch off the actuator control valves.

31. Repeat the rear stabilizer bar bleed procedure, from steps 22 to 30, a further two times, to make sure all air is removed from the actautor.

32. Disconnect the special tool hose from the rear stabilizer bar bleed screws.

- Discard the fluid from the bleed jar.
- Install the bleed screw covers.

33. Disconnect the special tool from the valve block.

- Connect the valve block electrical connectors.

34. ⚠ WARNING: The special tool is still pressurised when the source air pressure is removed. Release air pressure within special tool slowly before removing.

Remove the special tool from the dynamic response system reservoir.

- Remove the special tool.
- Top-up the fluid level to the mid-way mark on the reservoir.

35. Install bracket securing fuel breather pipes.

36. Using IDS, check operation of the dynamic response system.

37. If necessary, repeat the above procedure.

38. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Ride and Handling Optimization - Ride and Handling Optimization Switch

Removal and Installation

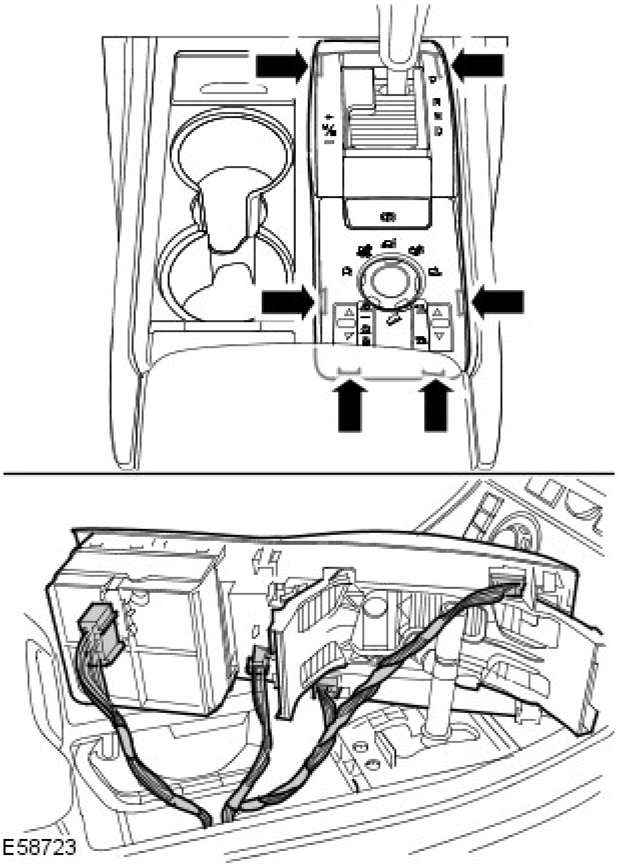
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the selector lever knob.
For additional information, refer to: Selector Lever Knob (307-05C Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel, Removal and Installation).

3. Remove the ride and handling optimization switch.

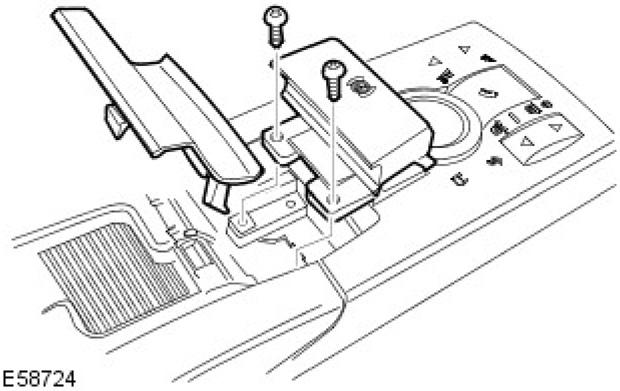
- Release the 6 clips.
- Disconnect the 4 electrical connectors.



4. NOTE: Do not disassemble further if the component is removed for access only.

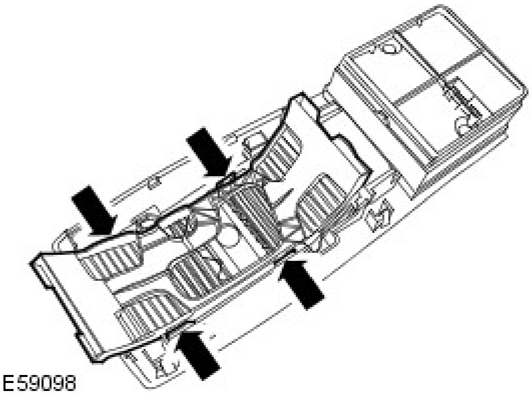
Remove the screw cover.

- Release the clip.



5. Remove the parking brake switch.

- Remove the 2 screws.



6. Remove the selector lever panel.

- Release the 4 clips.

Installation

1. Install the selector lever panel.

- Secure the clips.

2. Install the parking brake switch.

- Tighten the screws.

3. Install the screw cover.

4. Install the ride and handling optimization switch.

- Connect the electrical connectors.
- Secure the clips.

5. Install the selector lever knob.
For additional information, refer to: Selector Lever Knob (307-05C Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel, Removal and Installation).

6. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

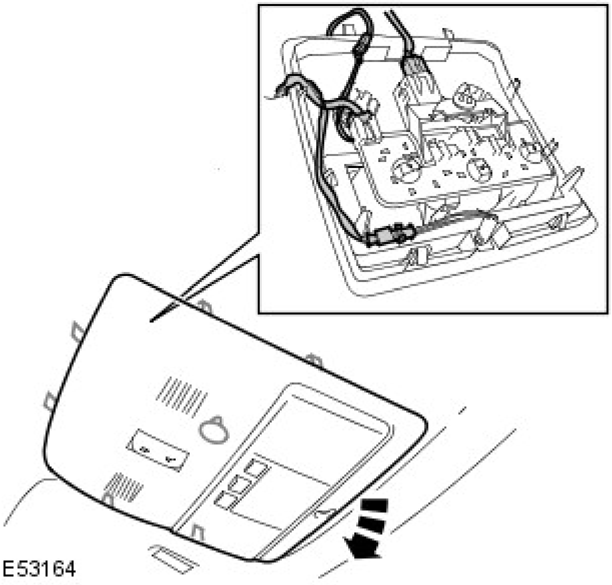
Ride and Handling Optimization - Upper Accelerometer

Removal and Installation

Special Tool(s)	
	Accelerometer remover/replacer 204-505 (LRT-60-014A)

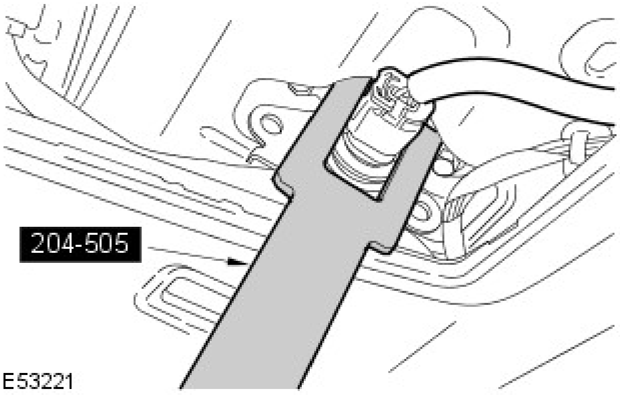
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the front overhead console.
   - Carefully release the 9 clips.
   - Disconnect the 2 electrical connectors.



3. ⚠ CAUTION: The accelerometer is an extremely delicate component and can easily be rendered unserviceable. Never use an accelerometer which has been dropped or subjected to mistreatment of any type.

   Remove the upper accelerometer.
   - Using the special tool, release the accelerometer.
   - Release and disconnect the electrical connector.



Installation

1. Using the special tool, install the upper accelerometer.
   - Connect and secure the electrical connector.

2. Install the front overhead console.

- Connect and secure the electrical connectors.
- Carefully secure the clips.

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. Using T4, calibrate the dynamic response system.

Published: 11-May-2011

Ride and Handling Optimization - Lower Accelerometer

Removal and Installation

Special Tool(s)	
 E53225	Accelerometer remover/replacer 204-505 (LRT-60-014A)

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

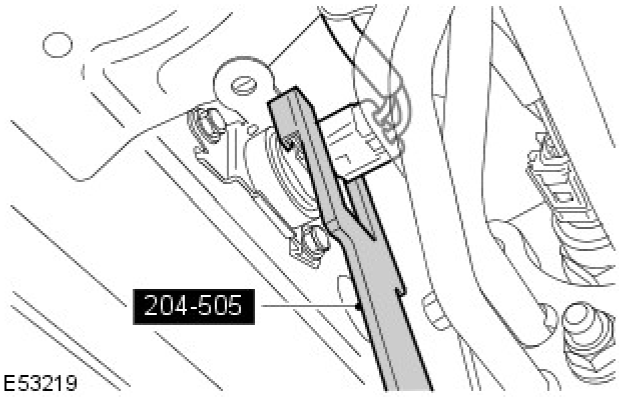
2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. ⚠ CAUTION: The accelerometer is an extremely delicate component and can easily be rendered unserviceable. Never use an accelerometer which has been dropped or subjected to mistreatment of any type.

Remove the lower accelerometer.

- Using the special tool , release the accelerometer.
- Release and disconnect the electrical connector.



E53219

Installation

1. Using the special tool, install the lower accelerometer.

- Connect and secure the electrical connector.

2. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Using T4, calibrate the dynamic response system.

Ride and Handling Optimization - Fluid PumpTDV8 3.6L Diesel

Removal and Installation

Removal

⚠ CAUTION: Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

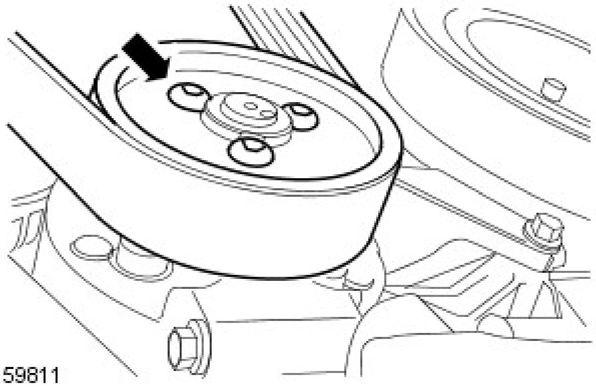
2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the cooling fan.
For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).

4. Loosen the fluid pump drive pulley bolts.

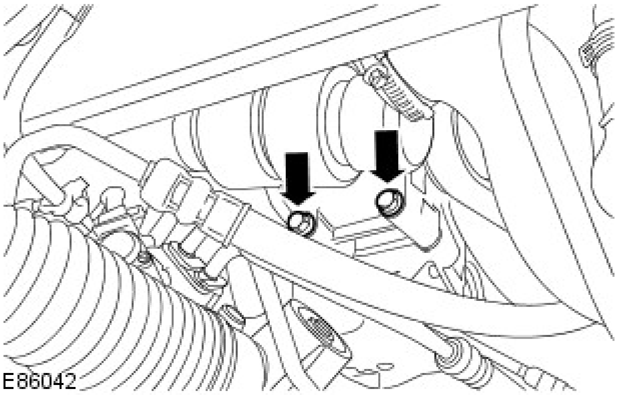
- Loosen the 3 bolts.



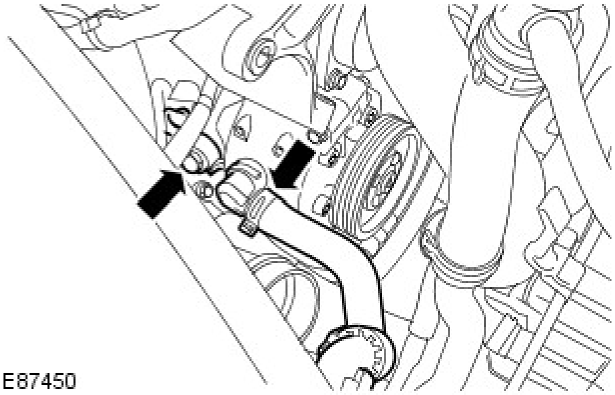
E59811

5. Remove the generator.
For additional information, refer to: Generator (414-02D Generator and Regulator - TDV8 3.6L Diesel, Removal and Installation).

6. Remove the 2 fluid pump lower bolts.



E86042



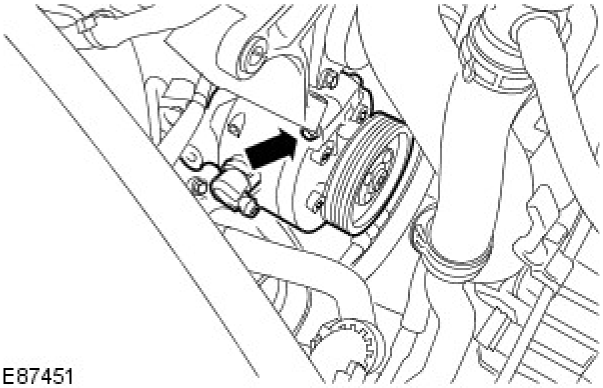
E87450

7. ⚠CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid pump hoses.

- Clamp the fluid pump to reservoir hose.
- Release the hose clip.
- Remove the banjo bolt.
- Disconnect the hoses.
- Discard the O-ring seals.



E87451

8. Remove the fluid pump.

- Remove the remaining fluid pump bolt.

9. Remove the fluid pump drive pulley.

- Remove the 3 bolts.

Installation

1. Install the fluid pump drive pulley.

- Install the bolts, but do not tighten fully at this stage.

2. Install the fluid pump.

- Tighten the bolts to 23 Nm (17 lb.ft).

3. ⚠CAUTION: Make sure both O-ring seals are correctly installed on the high-pressure union.

Connect the hoses.

- Clean the component mating faces.
- Lubricate and install new O-rings to the high-pressure union.
- Tighten the union to 35 Nm (26 lb.ft).
- Install the hose clip.
- Remove the hose clamp.

4. Install the generator.
For additional information, refer to: Generator (414-02D Generator and Regulator - TDV8 3.6L Diesel, Removal and Installation).

5. Tighten the fluid pump drive pulley bolts to 22 Nm (16 lb.ft).

6. Install the cooling fan.
For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).

7. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

8. Fill the fluid reservoir.

9. Make sure there is fluid circulation through the reservoir.

- Start the engine and allow to idle.

Ride and Handling Optimization - Fluid PumpTDV6 2.7L Diesel

Removal and Installation

Removal

⚠CAUTION: Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

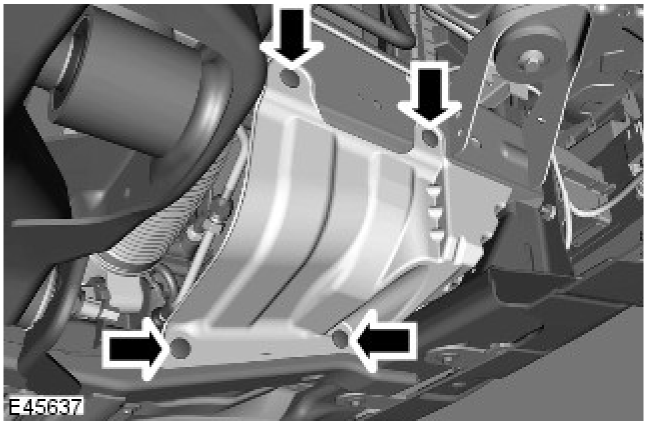
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

2. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the front RH splash shield.

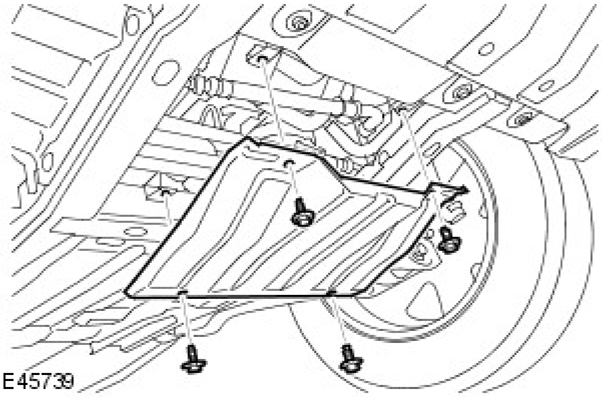
- Remove the 4 clips.



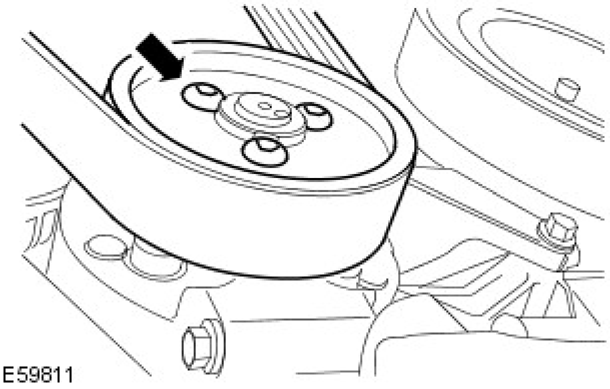
4. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02, Removal and Installation).

5. Remove the radiator access panel.

- Remove the 4 bolts.



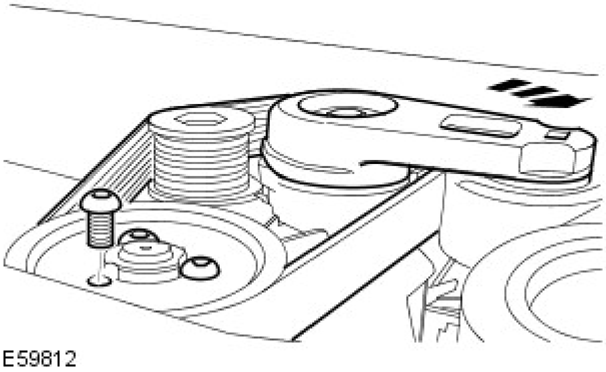
6. Remove the front RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).



7. NOTE: Loosen the bolts prior to removing the accessory drive belt.

Loosen the fluid pump drive pulley retaining bolts.

- Loosen the 3 Torx bolts.

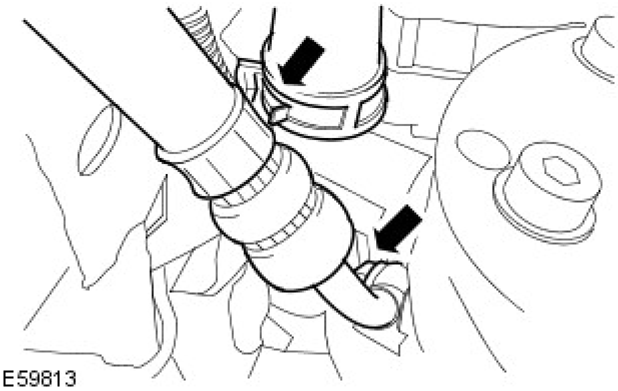


8. Release the tension from the belt.

- Remove the accessory drive belt.

9. Remove the fluid pump drive pulley.

- Remove the 3 bolts.



10. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

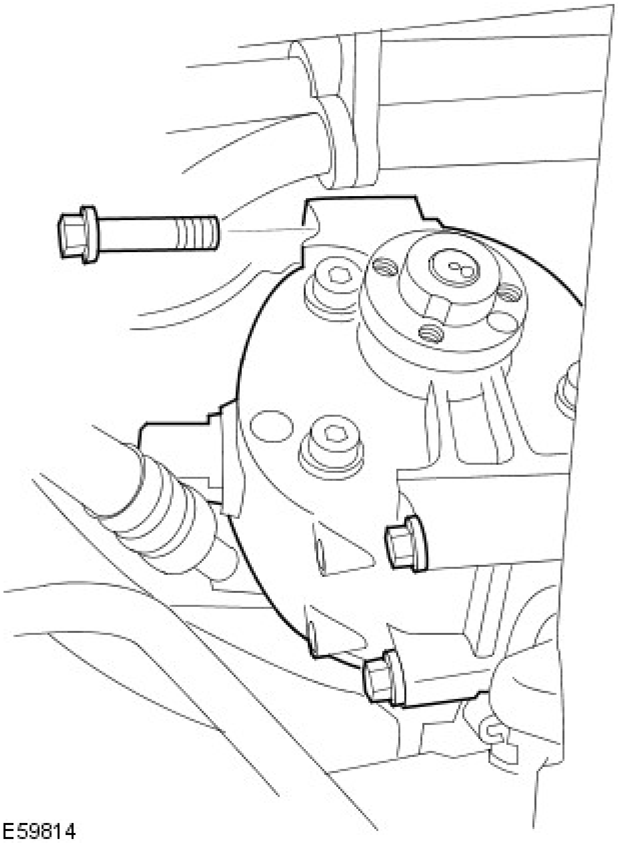
• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid pump hoses.

- Clamp the fluid pump to reservoir hose.
- Release the hose clip.
- Disconnect the hoses.
- Discard the O-ring seals.

11. Remove the fluid pump.

- Remove the 3 bolts.



E59814

Installation

1. Install the fluid pump.

- Clean the locating dowels.
- Install and tighten the bolts to 22 Nm (16 lb.ft).
- Prime the pump with clean fluid.

2. CAUTION: Make sure both O-ring seals are correctly installed on the high pressure union.

Connect the hoses.

- Clean the component mating faces.
- Lubricate and install new O-rings to the high-pressure union.
- Tighten the union to 35 Nm (26 lb.ft).
- Install the hose clip.
- Remove the hose clamp.

3. Install the fluid pump drive pulley.

- Install the Torx bolts, but do not tighten fully at this stage.

4. Install the belt.

5. Tighten the fluid pump drive pulley retaining bolts to 22 Nm (16 lb.ft).

6. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02,

Removal and Installation).

7. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

8. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02, Removal and Installation).

9. Install the front RH splash shield.

10. Refill the fluid reservoir.

11. Connect the battery ground lead, tighten the nut to 5 Nm (4 lb.ft).
For additional information, refer to: Specifications (414-00, Specifications).

12. Make sure there is fluid circulation through the reservoir.

- Start the engine and allow to idle.

Ride and Handling Optimization - Dynamic Response Module

Removal and Installation

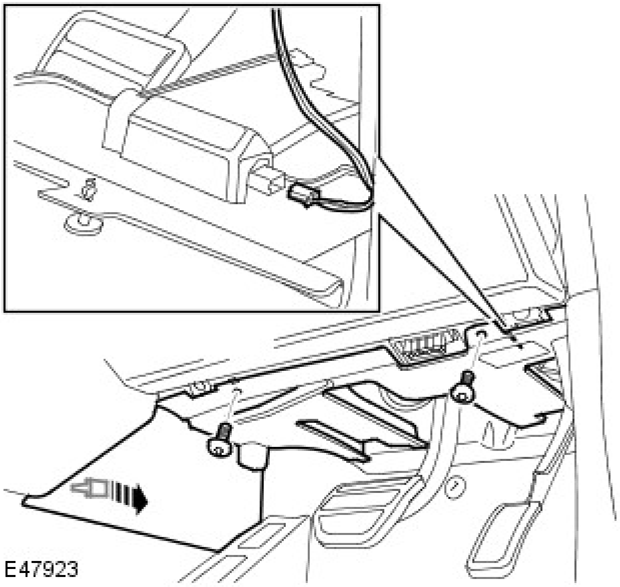
Removal

- NOTE: The dynamic response module is always located on the driver's side of the vehicle.

1. Remove the cowl side trim panel.
For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).

2. Remove the closing trim panel.

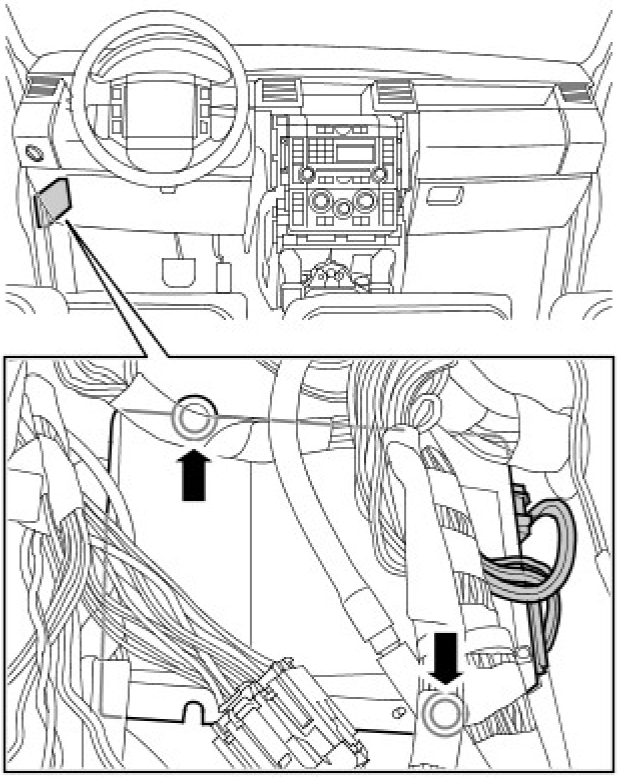
- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.



E47923

3. Remove the dynamic response module.

- Remove the 2 bolts.
- Disconnect the 2 electrical connectors.



E53030

Installation

1. Install the dynamic response module.
    - Connect the electrical connectors.
    - Tighten the 2 bolts to 4 Nm (3 lb.ft).
2. Install the closing trim panel.
    - Connect the electrical connector.
    - Secure the clip.
    - Tighten the screws.
3. Install the cowl side trim panel.
   For additional information, refer to: Cowl Side Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Initiate a new control module using T4.

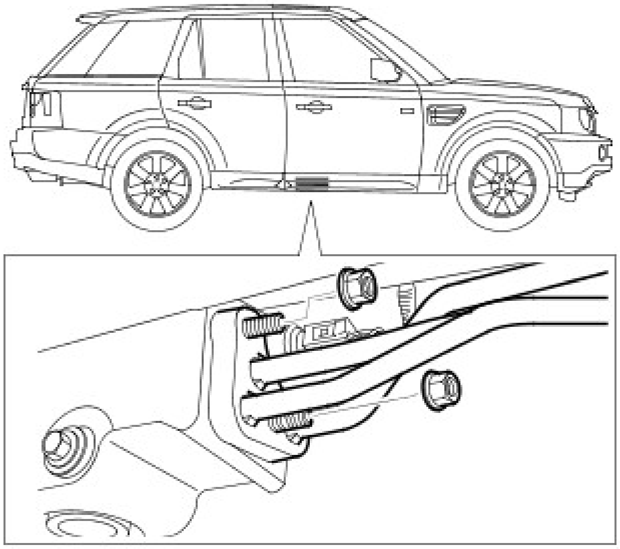
Ride and Handling Optimization - Valve Block

Removal and Installation

Removal

CAUTION: Dynamic Response system components are manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the Dynamic Response system.

• NOTE: The valve block seals do not require replacement unless there is evidence of a fluid leak. A new valve block is supplied with new seals installed.



E57817

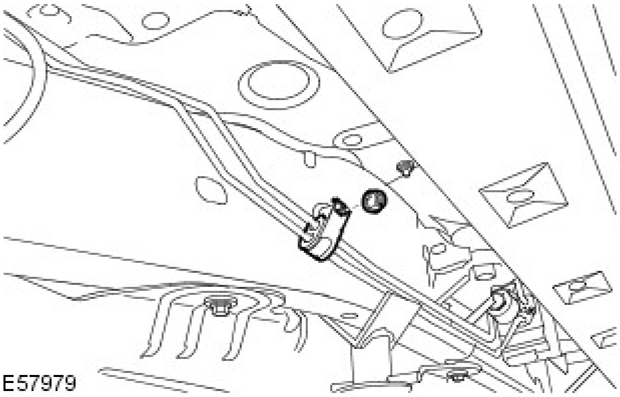
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. NOTE: Some fluid spillage is inevitable during this operation.

   Release the front actuator pipes from the valve block.

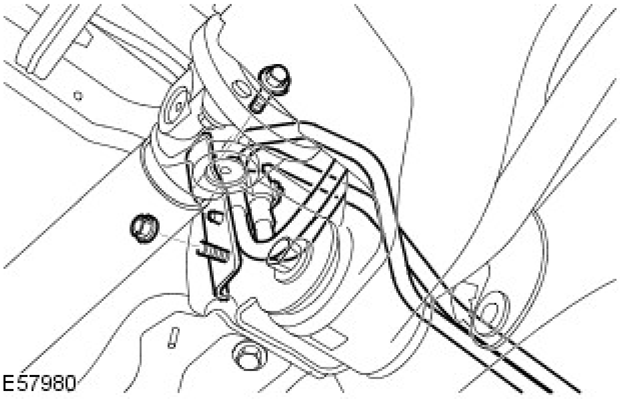
   - Position a container to collect the fluid spillage.
   - Remove and discard the 2 nuts.



E57979

3. Release the valve block to rear stabilizer bar actuator pipe assembly mounting.

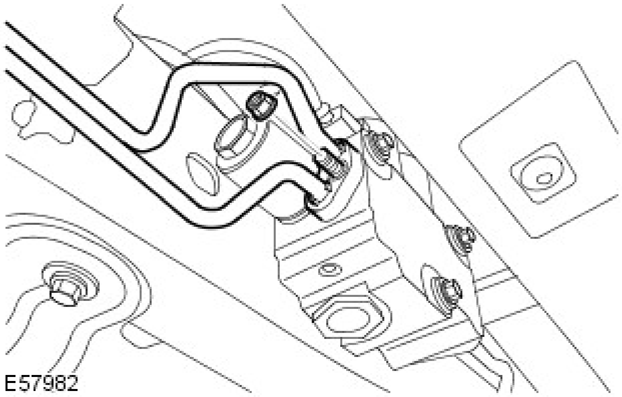
   - Remove the nut.



E57980

4. Release the valve block to rear stabilizer bar actuator pipe assembly mounting.

- Remove the bolt.
- Remove the nut.
- Remove the bracket.



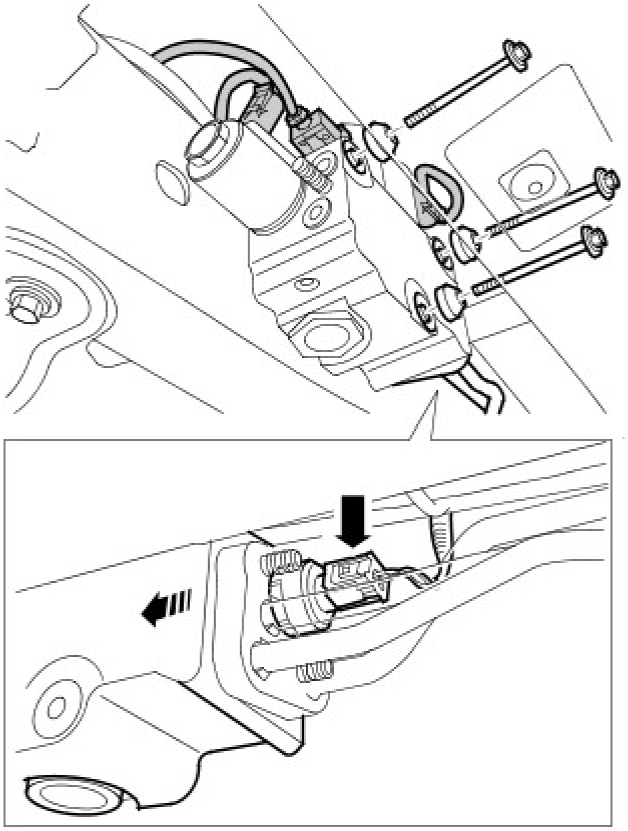
E57982

5. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the rear actuator pipes from the valve block.

- Position a container to collect the fluid spillage.
- Remove and discard the nut.



E57983

6. CAUTIONS:

⚠ Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not clamped or kinked. Failure to follow this instruction will result in damage to the vehicle.

• NOTE: Some fluid spillage is inevitable during this operation.

• NOTE: Note the fitted position of the washers.

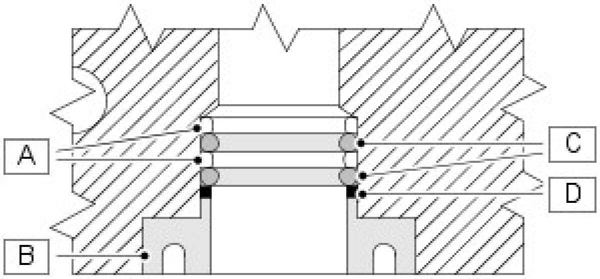
Remove the valve block.

- Disconnect the 4 electrical connectors.
- Remove the 3 bolts.
- Collect the 4 washers.
- Disconnect the front actuator pipes from the valve block.

Installation

1. Check the valve block O-rings seals and plastic spacer washers are correctly installed.

- A: Backing rings (white)
- B: Outer clamping ring
- C: O-ring seals
- D: Outer backing ring (Black)

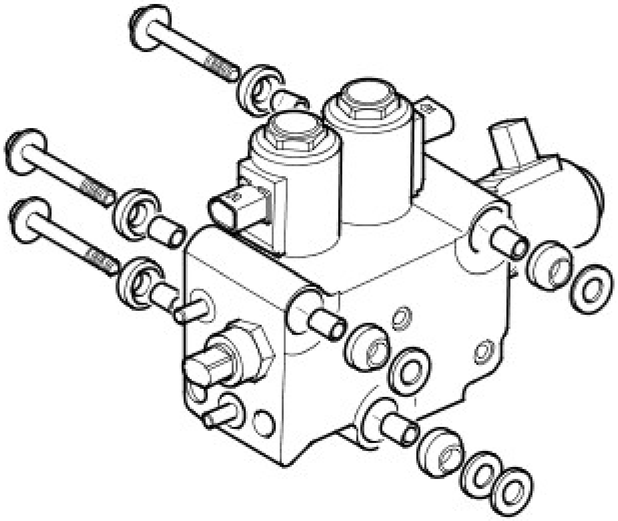


E58627

2. NOTE: Make sure there are two washers installed between the integrated body frame and the valve block lower retaining bolt.

Install the valve block.

- Remove the blanking caps from the ports.
- Connect the front actuator pipes to the valve block.
- Install 3 new nuts and tighten to 23 Nm (17 lb.ft).
- Discard the 3 valve block retaining bolts, fit new ones and tighten to 20 Nm (15 lb.ft).
- Connect the electrical connectors.



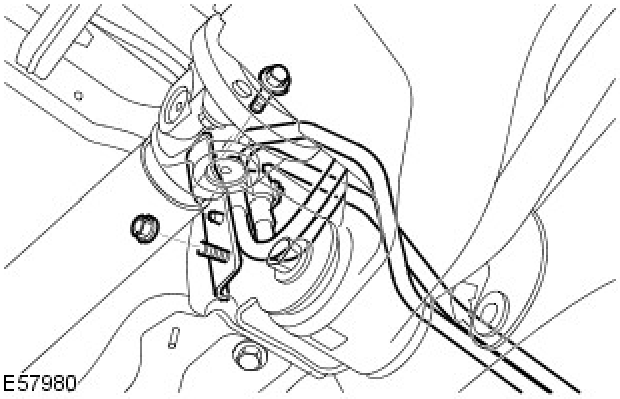
E58615

3. Connect the rear actuator pipes to the valve block.

- Remove the blanking caps from the ports.
- Install a new nut and tighten to 22 Nm (16 lb.ft).
- Remove the container.

4. Secure the valve block to rear stabilizer bar actuator pipe assembly mounting.

- Install the bracket.
- Install the nut and bolt and tighten to 9 Nm (7 lb.ft).



E57980

5. Secure the valve block to rear stabilizer bar actuator pipe assembly mountings.

- Tighten the nut to 9 Nm (7 lb.ft)

6. Using T4, bleed the Dynamic Response system.

Published: 11-May-2011

Ride and Handling Optimization - Valve Block Filter

Removal and Installation

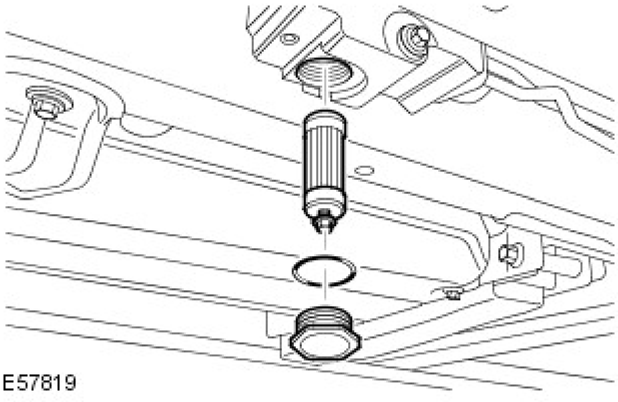
Removal

CAUTION: Dynamic Response system components are manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the Dynamic Response system.

• NOTE: This procedure does not require the Dynamic Response system to be bled.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



E57819

2. CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove and discard the valve block filter.

- Position container to collect fluid loss.
- Remove the access plug.
- Remove and discard the access plug O-ring seal.
- Using a suitable M6 bolt, release the filter from the valve block.

Installation

1. Install the new valve block filter.

- Clean the component mating faces.
- Install a new access plug O-ring seal.
- Tighten the access plug to 62 Nm (46 lb.ft).
- Remove the container.

2. Start the engine and allow to idle.

3. Check and top-up the Dynamic Response system fluid reservoir.

Removal and Installation

Special Tool(s)	
	Ball joint separator 205-754(LRT-54-027)

Removal

⚠ CAUTION: Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

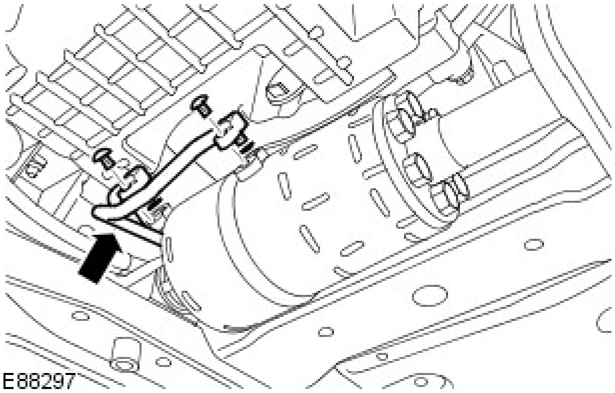
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

4. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



5. CAUTIONS:

⚠ Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

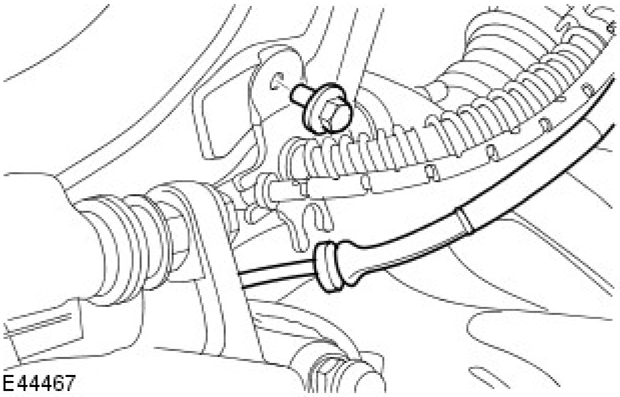
- NOTE: Some fluid spillage is inevitable during this operation.

Disconnect and reposition the fluid lines.

- Position container to collect fluid loss.
- Remove the fluid line bracket bolt.
- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.
- Remove and discard the plastic spacer washers.

6. Remove the front wheels and tires.

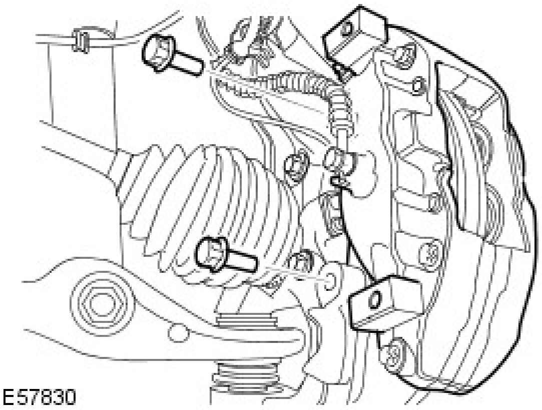
7. RH front: Remove the shock absorber and air spring assembly.
For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).



E44467

8. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.

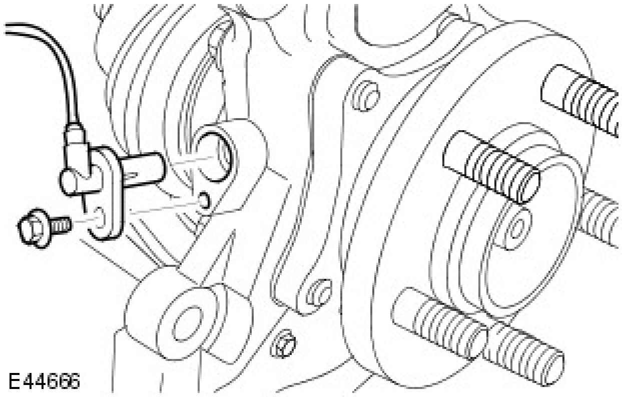


E57830

9. ⚠CAUTION: Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper from the wheel knuckle.

- Remove the 2 bolts.
- Tie the brake caliper aside.



E44666

10. NOTE: The brake disc is shown removed for clarity.

Release the wheel speed sensor from the wheel knuckle.

- Remove the bolt.

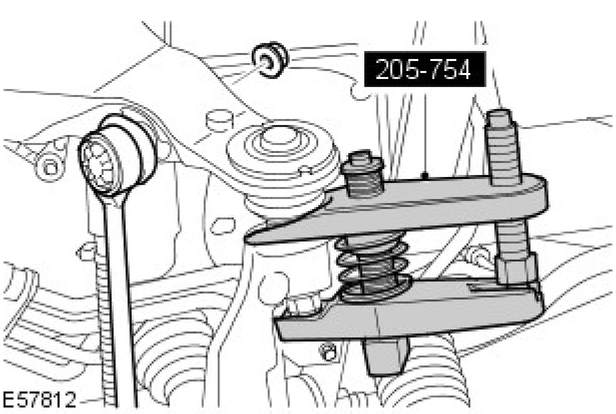
11. CAUTIONS:

⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

Release the stabilizer bar link.

- Remove and discard the nut.

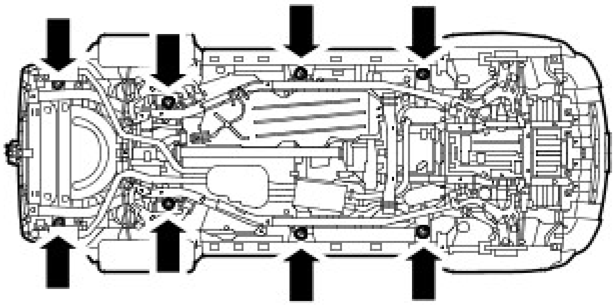


12. ⚠ CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Using the special tool, release the upper arm ball joint.

- Remove and discard the nut.

13. Remove the 8 body mount bolts.

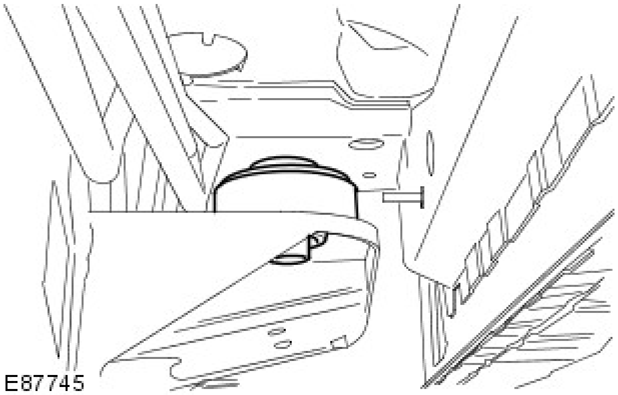


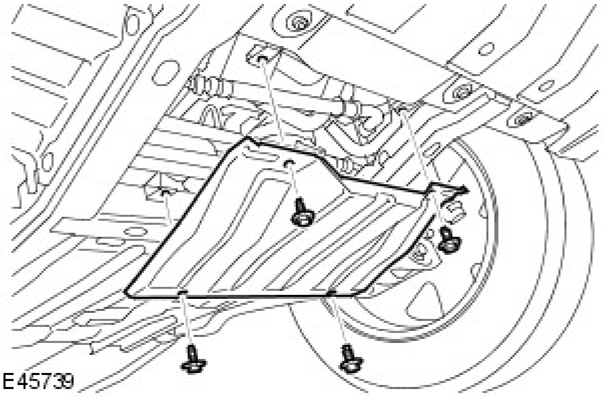
14. ⚠ CAUTION: Only raise the body sufficiently to remove the body mount.

Carefully raise the body.

- Using suitable stands, raise the body to release the body mounts.

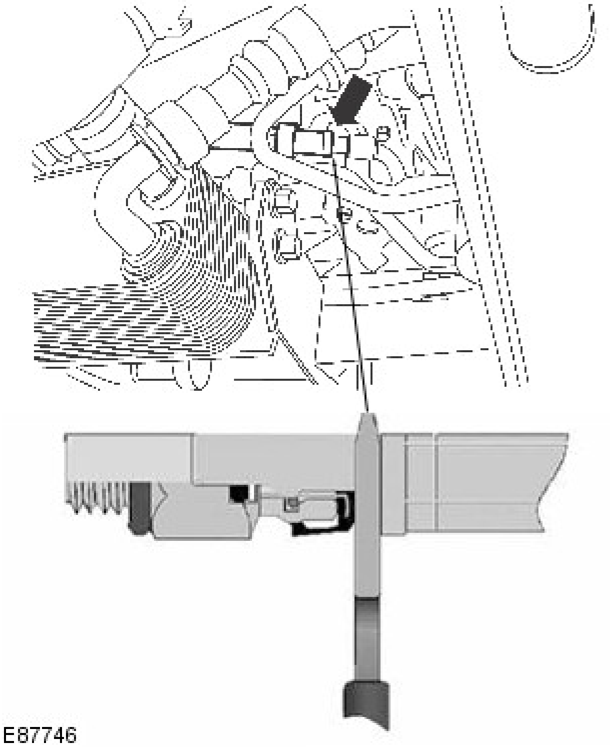
15. Remove the body mount.





16. Remove the radiator splash shield.

- Remove the 4 bolts.



17. ⚠ WARNING: Fluid loss is unavoidable, use absorbent cloth or a container to collect the fluid.

• CAUTIONS:

⚠ Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

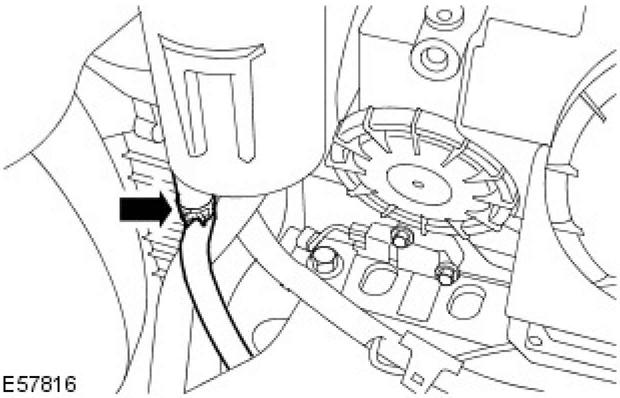
⚠ Make sure the release sleeve is pushed back no further than 3 mm (0.12 inches). Failure to follow this instruction may result in damage to the vehicle.

⚠ Do not lever the connection apart. Failure to follow this instruction may result in damage to the vehicle.

Using a suitable tool, disconnect the high-pressure line.

1. Insert the suitable tool behind the release sleeve.
2. Disconnect the high-pressure line.

18. Remove the air cleaner.
For additional information, refer to: Air Cleaner (303-12D Intake Air Distribution and Filtering - TDV8 3.6L Diesel, Removal and Installation).

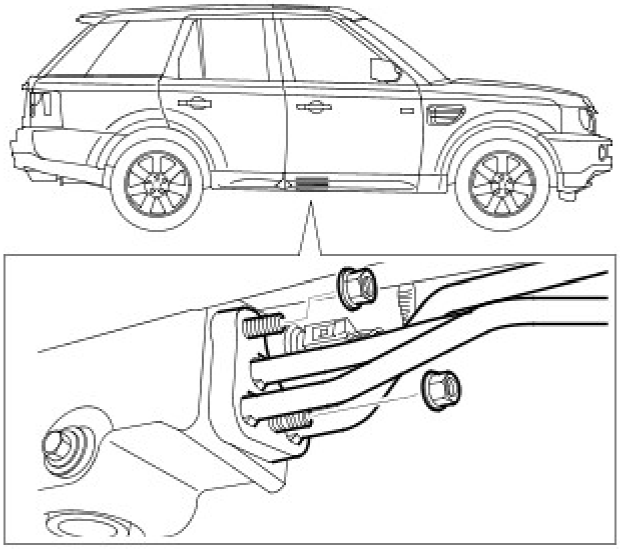


19. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid return line from the reservoir.

- Position a container to collect the fluid spillage.
- Reposition the fluid line into the wheel arch area.



E57817

20. CAUTIONS:

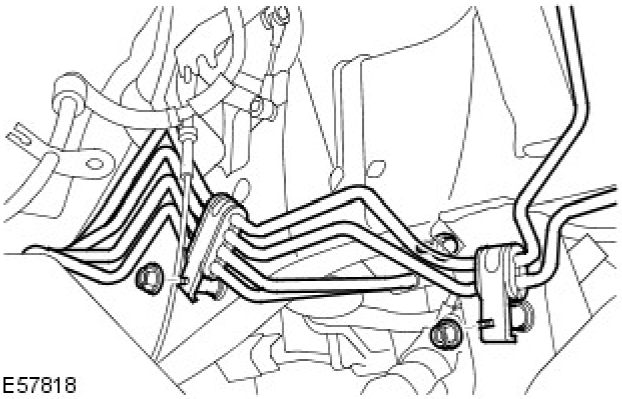
⚠ Always plug any open connections to prevent contamination.

⚠ Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the front actuator pipes from the valve block.

- Position a container to collect the fluid spillage.
- Remove and discard the 2 nuts.
- Install blanking caps to the exposed ports.



E57818

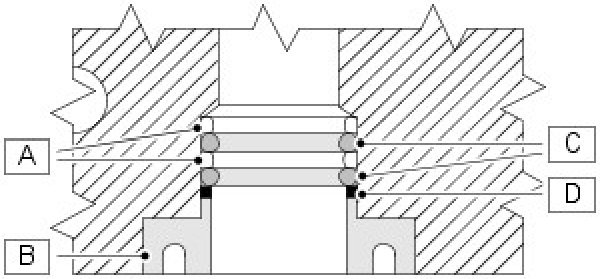
21. Release the valve block to front stabilizer bar actuator pipe assembly mountings.

- Remove the 2 nuts and 1 bolt.

22. Remove the valve block to front stabilizer bar actuator pipe assembly.

Installation

1. Check the valve block O-rings and plastic spacer washers are correctly installed.



E58627

- A: Backing rings (white)
- B: Outer clamping ring
- C: O-ring seals
- D: Outer backing ring (Black)

2. Install the valve block to front stabilizer bar actuator pipe assembly.

- Clean the components.

3. Connect the front actuator pipes to the valve block.

- Remove the blanking caps from the ports.
- Install 2 new nuts and tighten to 22 Nm (16 lb.ft).
- Remove the container.

4. Attach the valve block to front stabilizer bar actuator pipe assembly mountings.

- Tighten the 2 nuts and 1 bolt to 9 Nm (7 lb.ft).

5. Connect the fluid line to the reservoir.

- Reposition the fluid line from the wheel arch area.
- Install the clip.
- Remove the container.

6. Install the air cleaner.
For additional information, refer to: Air Cleaner (303-12D Intake Air Distribution and Filtering - TDV8 3.6L Diesel, Removal and Installation).

7. NOTE: Pull on the 2 halves of the high-pressure line connector to make sure the latch has fully engaged.

Connect the high-pressure line.

- Remove the blanking caps from the ports.
- Remove the container.

8. Install the radiator splash shield.

- Tighten the M6 bolts to 10 Nm (7 lb.ft).
- Tighten the M10 bolts to 62 Nm (46 lb.ft).

9. Install the body mount.

10. Lower the body.

- Remove the stands.

11. Install the body mount bolts.

- Tighten the bolts to 133 Nm (98 lb.ft).

12. Connect the upper arm and wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

13. Install the wheel speed sensor.

- Tighten the bolt to 9 Nm (7 lb.ft).
- Connect the electrical connector.
- Secure the wiring harness in the clips.

14. Secure the brake caliper to the wheel knuckle.

- Tighten the bolts to 275 Nm (203 lb.ft).

15. Secure the brake hose bracket to the wheel knuckle.

- Tighten the bolt to 23 Nm (17 lb.ft).

16. Install the shock absorber and air spring assembly.
For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

17. CAUTIONS:

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

⚠ Care must be taken to avoid damage to the plastic spacer washers and O-ring seals during installation of the fluid lines to the actuator.

• NOTE: Some fluid spillage is inevitable during this operation.

Connect the fluid lines to the actuator.

- Clean the component mating faces.
- Remove the blanking caps from the ports.
- Install new plastic spacer washers and O-ring seals.
- Tighten the 2 bolts to 22 Nm (16 lb.ft).
- Tighten the fluid line bracket bolt to 4 Nm (3 lb.ft).

18. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

19. Using the approved Land Rover diagnostic system, bleed the active stabilization system.
For additional information, refer to: Active Stabilization System Bleeding (204-06 Ride and Handling Optimization, General Procedures).

20. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

21. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Secure the stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

22. Install the front wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

23. Install the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

Published: 11-May-2011

Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the Dynamic Response system.

- NOTE: The valve block seals do not require replacement unless there is evidence of a fluid leak.

1. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

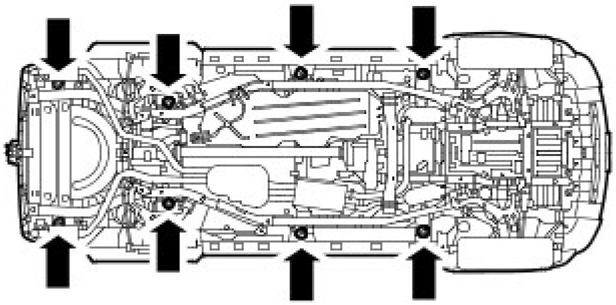
2. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

3. Remove the spare wheel and tire.

4. Remove the rear wheels and tires.

5. Remove the body mount retaining bolts.

- Remove the 8 bolts.



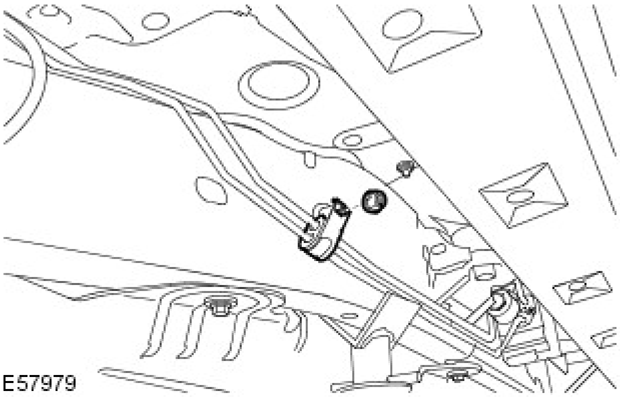
E52217

6. ⚠CAUTION: Only raise the body sufficiently to remove the valve block to rear stabilizer bar actuator pipe.

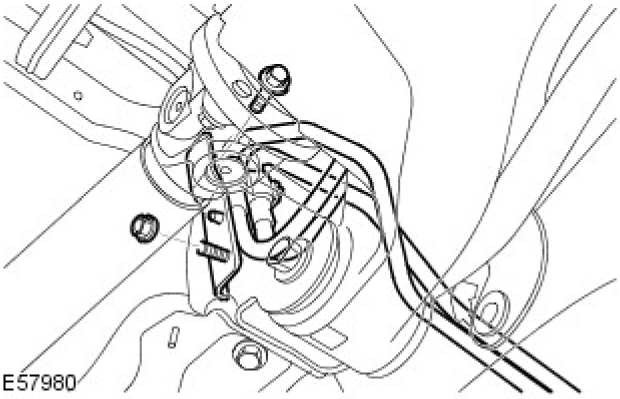
Using suitable stands, raise the body.

7. Release the valve block to rear stabilizer bar actuator pipe assembly mounting.

- Remove the nut.

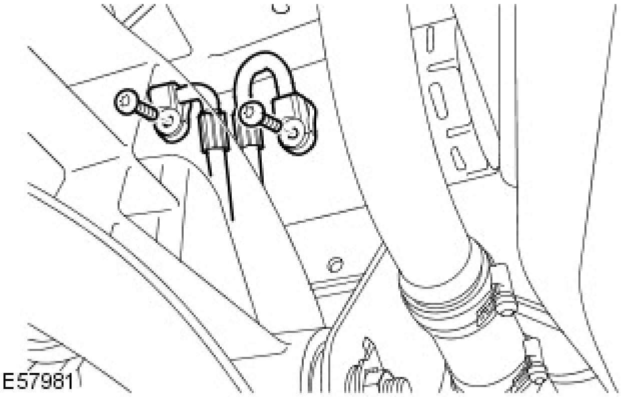


E57979



8. Release the valve block to rear stabilizer bar actuator pipe assembly mounting.

- Remove the nut.
- Remove the bolt.
- Remove the bracket.



9. CAUTIONS:

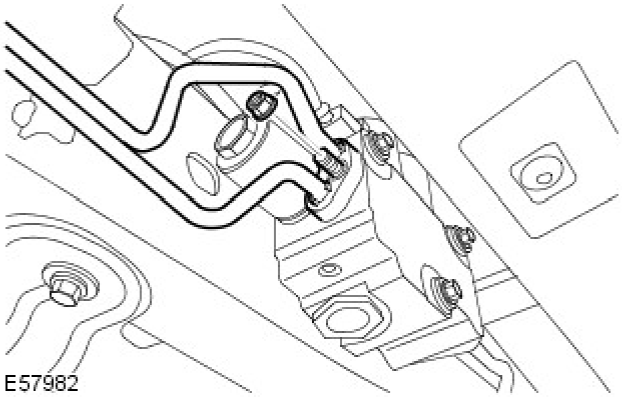
⚠ Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid lines from the actuator.

- Position container to collect fluid loss.
- Remove the 2 bolts.
- Remove and discard the O-ring seals.
- Remove and discard the plastic spacer washers.
- Install blanking caps to the exposed ports.



10. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

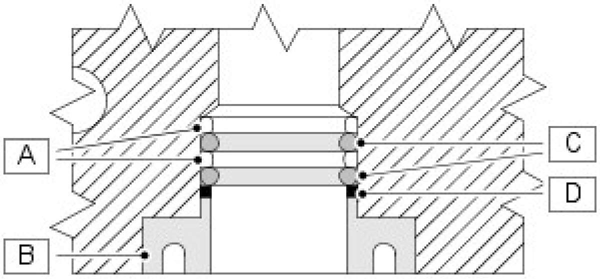
• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the rear actuator pipes from the valve block.

- Position a container to collect the fluid spillage.
- Remove and discard the nut.

11. Remove the valve block to rear stabilizer bar actuator pipe assembly.

Installation



E58627

1. Check the valve block O-rings and plastic spacer washers are correctly installed.

- A: Backing rings (white)
- B: Outer clamping ring
- C: O-ring seals
- D: Outer backing ring (Black)

2. ⚠ CAUTION: Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

Install the valve block to rear stabilizer bar actuator pipe assembly.

3. NOTE: Some fluid spillage is inevitable during this operation.

Connect the rear actuator pipes to the valve block.

- Remove the blanking caps from the ports.
- Install a new nut and tighten to 22 Nm (16 lb.ft).
- Remove the container.

4. CAUTIONS:

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

⚠ Care must be taken to avoid damage to the plastic spacer washers and O-ring seals during installation of the fluid lines to the actuator.

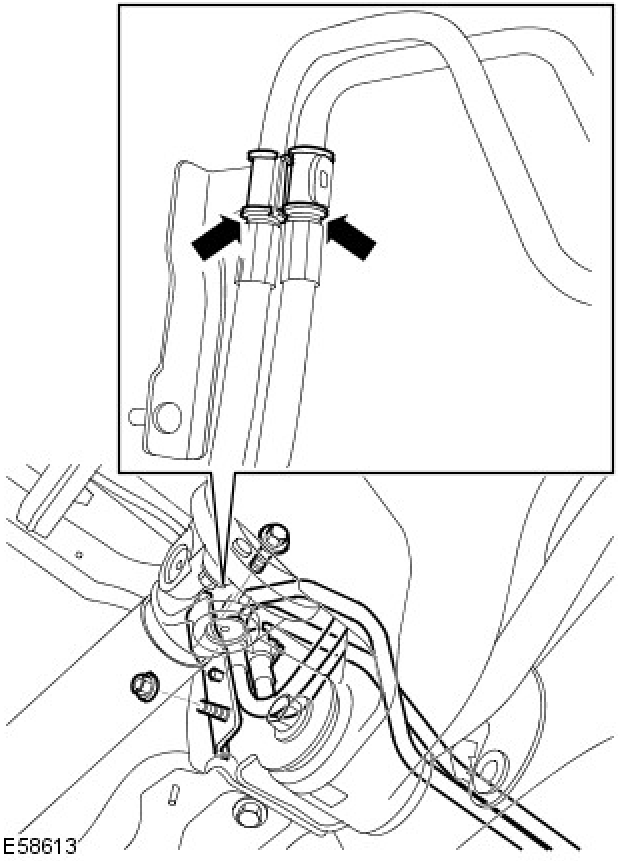
• NOTE: Some fluid spillage is inevitable during this operation.

Connect the fluid lines to the actuator.

- Clean the component mating faces.
- Remove the blanking caps from the ports.
- Install new plastic spacer washers and O-ring seals.
- Tighten the 2 bolts to 22 Nm (16 lb.ft).

5. Secure the valve block to rear stabilizer bar actuator pipe assembly mounting.

- Install the bracket.
- Install the nut and bolt and tighten to 9 Nm (7 lb.ft).



6. Secure the valve block to rear stabilizer bar actuator pipe assembly mounting.

- Tighten the nut to 9 Nm (7 lb.ft)

7. Bleed the rear of the Dynamic Response system using T4.
For additional information, refer to: Active Stabilization System Bleeding (204-06 Ride and Handling Optimization, General Procedures).

8. Lower the body.

- Remove the stands.

9. Install the body mount retaining bolts.

- Tighten the 8 retaining bolts to 133 Nm (98 lb.ft).

10. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

11. Install the spare wheel and tire.

12. Install the rear bumper cover.

- CAUTIONS:

⚠ Do not remove or loosen the 6 bolts on the stabilizer bar. Failure to follow this instruction may result in damage to or failure of the stabilizer bar.

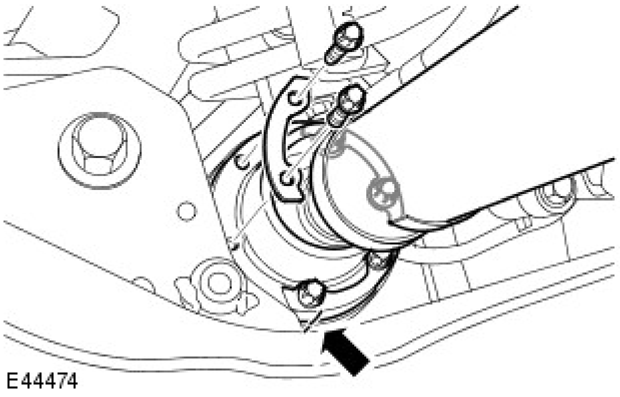
⚠ Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheels and tires.

3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



E44474

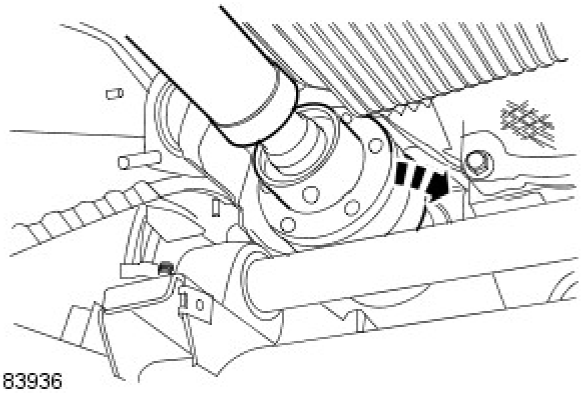
4. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

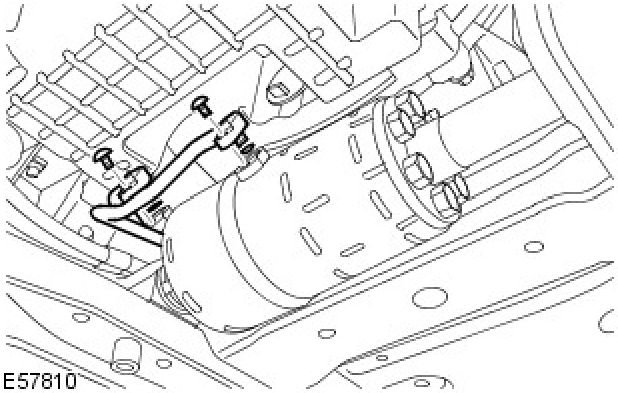
- Remove the 6 Torx bolts and washers.
- Discard the bolts.



E83936

5. Support the driveshaft.

- Compress the joints to disengage the drive flanges.
- Using suitable securing strap, reposition and support the driveshaft.



E57810

6. CAUTIONS:

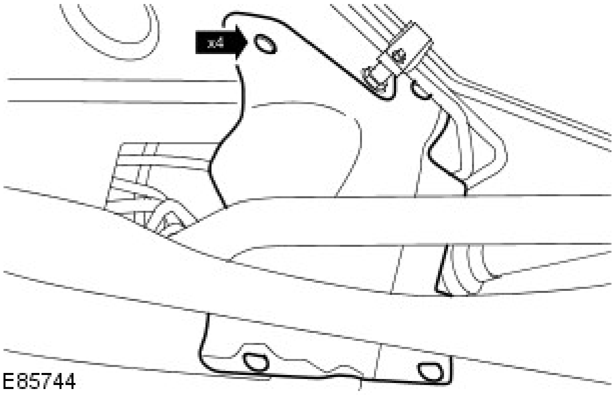
⚠ Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect and reposition the fluid lines.

- Position container to collect fluid loss.
- Remove the 2 bolts.
- Remove and discard the 2 O-ring seals.
- Remove and discard the plastic spacer washers.



E85744

7. Remove the RH splash shield.

- Remove the 4 clips.

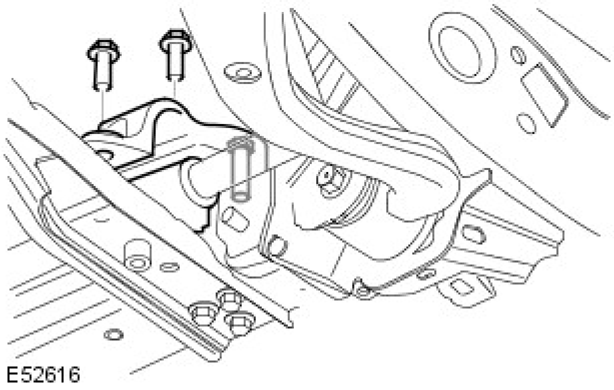
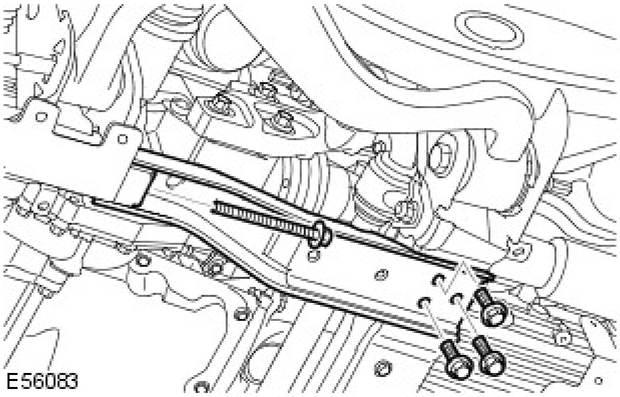
Position the special tools.



13. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar clamps.

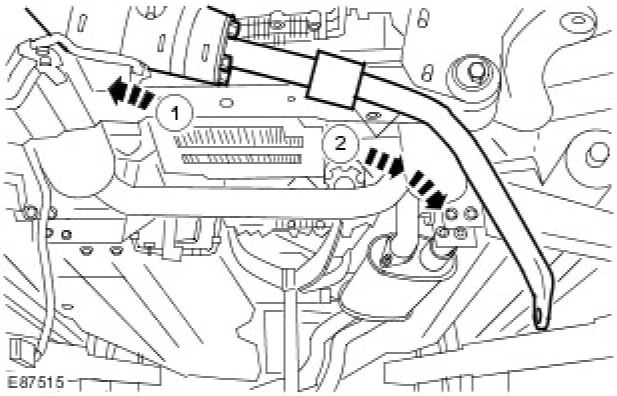
- Using the special tools, remove and discard the 6 bolts.
- Remove the stabilizer bar clamps.



14. Remove the front axle crossmember.

- Remove the 4 bolts.

15. Remove the stabilizer bar and actuator assembly.

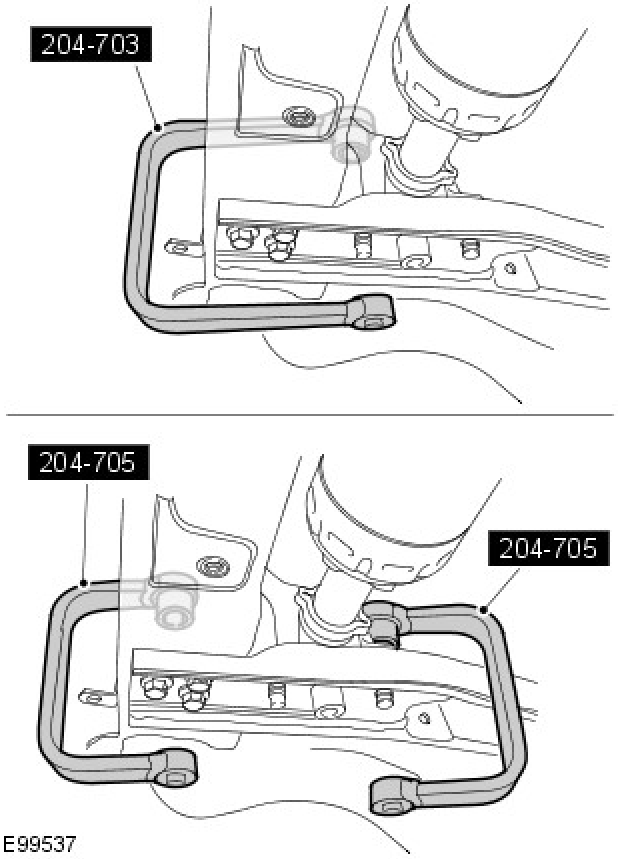


Installation

1. Install the stabilizer bar and actuator assembly.

2. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).



E99537

3. Install the stabilizer bar clamps.

- Clean the components.
- Install the stabilizer bar clamps.
- Using the special tools, tighten the bolts to 115 Nm (85 lb.ft).

4. Secure the fuel pipes in the clips.

5. Install the fuel pipe heat shield.

- Tighten the nuts to 8 Nm (6 lb.ft).

6. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Connect the LH stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

7. Install the LH splash shield.

- Install the clips.

8. CAUTIONS:

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

⚠ Care must be taken to avoid damage to the plastic spacer washers and O-ring seals during installation of the fluid lines to the actuator.

• NOTE: Some fluid spillage is inevitable during this operation.

Connect the fluid lines to the actuator.

- Clean the component mating faces.
- Remove the blanking caps from the ports.
- Install new plastic spacer washers and O-ring seals.
- Tighten the 2 bolts to 22 Nm (16 lb.ft).

9. Using the approved Land Rover diagnostic system, bleed the active stabilization system. For additional information, refer to: Active Stabilization System Bleeding (204-06 Ride and Handling Optimization, General Procedures).

10. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Connect the RH stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

11. Install the RH splash shield.

- Install the clips.

12. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Secure the driveshaft to the front axle drive flange.

- Remove and discard the tie strap.
- Clean the components.
- Compress the joints to engage the drive flanges.
- Install new retaining bolts.
- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

13. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

14. Install the front wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Ride and Handling Optimization - Rear Stabilizer Bar

Removal and Installation

Removal

- CAUTIONS:

⚠ Do not remove or loosen the 6 bolts on the stabilizer bar. Failure to follow this instruction may result in damage to or failure of the stabilizer bar.

⚠ It is possible to install the stabilizer bar incorrectly. Note the position of the stabilizer bar before removal.

⚠ Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the Dynamic Response system.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

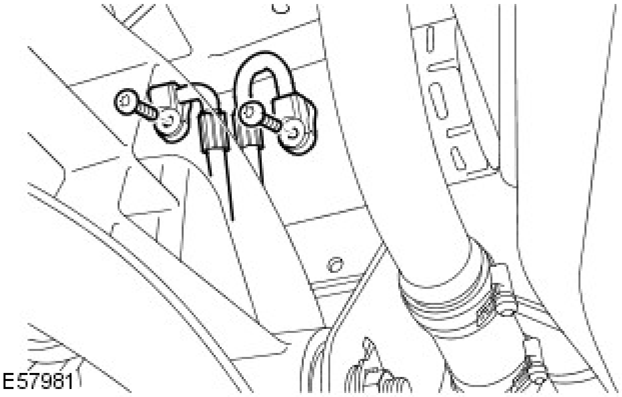
Raise and support the vehicle.

2. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

3. Remove the spare wheel and tire.

4. Raise the vehicle.

5. Remove the rear wheels and tires.



6. CAUTIONS:

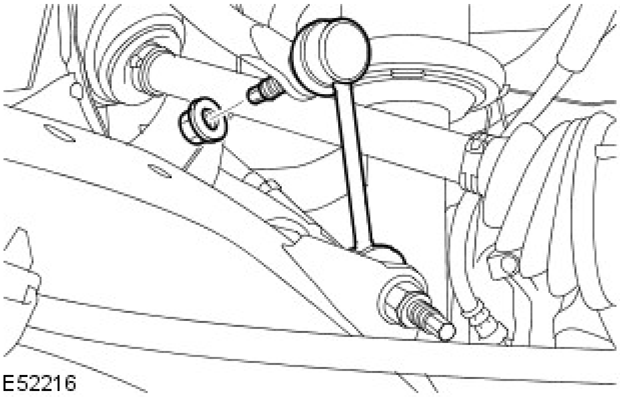
⚠ Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

- NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid lines from the actuator.

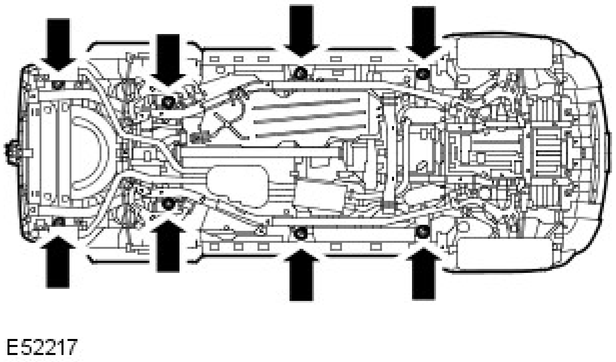
- Position container to collect fluid loss.
- Remove the 2 bolts.
- Remove and discard the plastic spacer washers.
- Remove and discard the O-ring seals.
- Install blanking caps to the exposed ports.



7. ⚠ CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Release both stabilizer bar links.

- Remove the 2 nuts.



8. Remove the body mount retaining bolts.

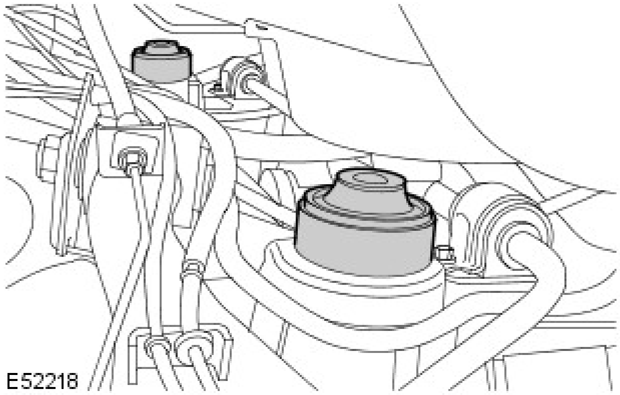
- Remove the 8 bolts.

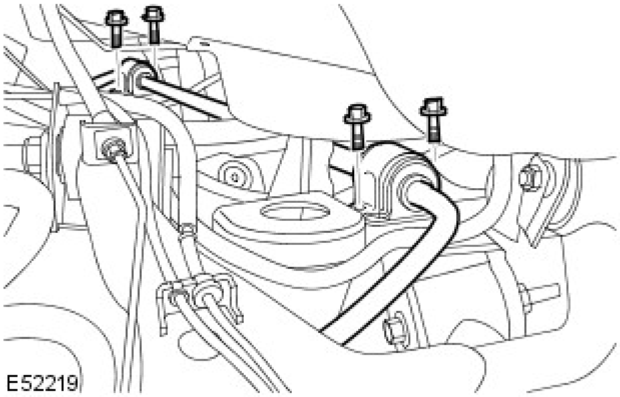
9. ⚠ CAUTION: Only raise the body sufficiently to remove the body mount.

Raise the body.

- Using suitable stands, raise the body to release the body mounts.

10. Remove the 2 rear body mounts.





11. Remove the stabilizer bar and actuator assembly bushings.

- Remove and discard the 4 bolts.
- Remove the 2 clamps.

12. NOTE: Note the fitted position.

With assistance, remove the stabilizer bar and actuator assembly.

Installation

1. ⚠CAUTION: Make sure the stabilizer bar is correctly installed.

With assistance, install the stabilizer bar and actuator assembly.

2. Install the stabilizer bar and actuator assembly bushings.

3. Install the stabilizer bar clamps.

- Tighten the 4 retaining bolts to 62 Nm (46 lb.ft).

4. ⚠CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Connect the RH stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

5. CAUTIONS:

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

⚠ Care must be taken to avoid damage to the plastic spacer washers and O-ring seals during installation of the fluid lines to the actuator

• NOTE: Some fluid spillage is inevitable during this operation.

Connect the fluid lines to the actuator.

- Clean the component mating faces.
- Remove the blanking caps from the ports.
- Install new plastic spacer washers and O-ring seals.
- Tighten the 2 bolts to 22 Nm (16 lb.ft).

6. Bleed the rear of the Dynamic Response system using T4.

7. ⚠CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Connect the LH stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

8. Install the body mounts.

9. Lower the body.

- Remove the stands.

10. Install the body mount retaining bolts.

- Tighten the 8 retaining bolts to 133 Nm (98 lb.ft).

11. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

12. Lower the vehicle.

13. Install the spare wheel and tire.

14. Install the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

Ride and Handling Optimization - Fluid PumpV8 4.4L Petrol/V8 S/C 4.2L Petrol

Removal and Installation

Removal

CAUTION: Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

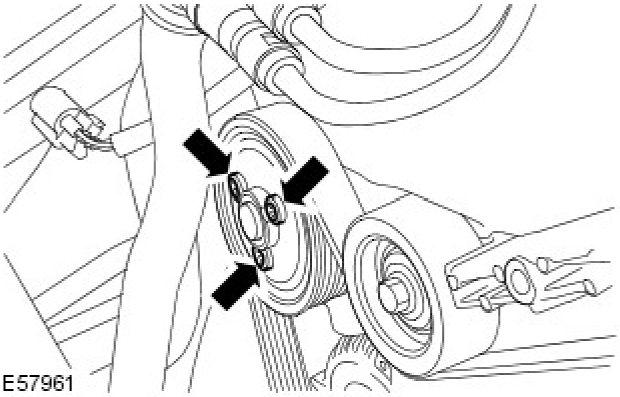
Raise and support the vehicle.

3. Remove the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

4. Remove the viscous fan assembly.
For additional information, refer to: Cooling Fan (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).

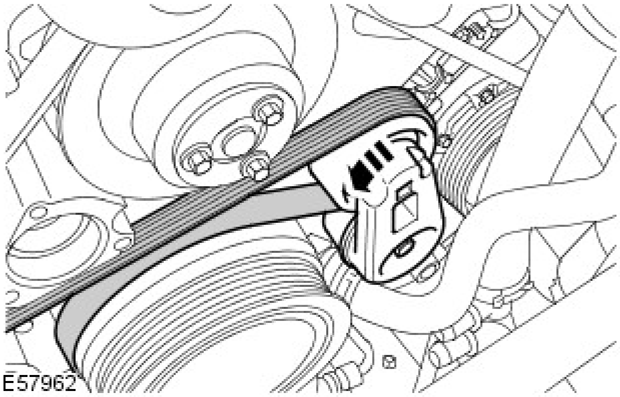
5. Remove the front RH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

6. NOTE: Loosen the bolts prior to removing the accessory drive belt.



Loosen the fluid pump drive pulley retaining bolts.

- Loosen the 3 Torx bolts.

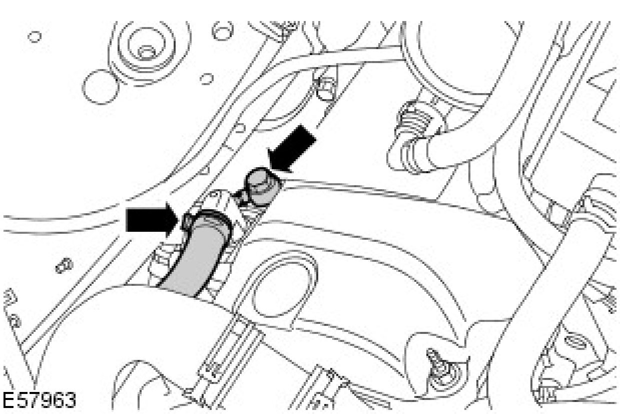


7. Release the tension from the belt.

- Remove the accessory drive belt.

8. Remove the fluid pump drive pulley.

- Remove the 3 bolts.

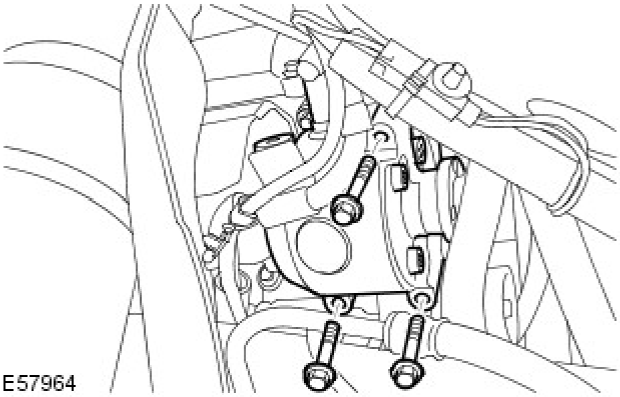


9. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid pump hoses.

- Clamp the fluid pump to reservoir hose.
- Release the hose clip.
- Disconnect the hoses.
- Discard the O-ring seals.



10. Remove the fluid pump.

- Remove the 3 bolts.

Installation

1. Install the fluid pump.

- Clean the locating dowels.
- Install and tighten the bolts to 22 Nm (16 lb.ft).
- Prime the pump with clean fluid.

2. ⚠ CAUTION: Make sure both O-ring seals are correctly installed on the high pressure union.

Connect the hoses.

- Clean the component mating faces.
- Lubricate and install new O-rings to the high-pressure union.
- Tighten the union to 35 Nm (26 lb.ft).
- Install the hose clip.
- Remove the hose clamp.

3. Install the fluid pump drive pulley.

- Install the Torx bolts, but do not tighten fully at this stage.

4. Install the belt.

5. Tighten the fluid pump drive pulley retaining bolts to 22 Nm (16 lb.ft).

6. Install the viscous fan assembly.
For additional information, refer to: Cooling Fan (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Removal and Installation).

7. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

8. Install the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

9. Refill the fluid reservoir.

10. Connect the battery ground lead, tighten the nut to 5 Nm (4 lb.ft).
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

11. Make sure there is fluid circulation through the reservoir.

- Start the engine and allow to idle.

Removal

⚠CAUTION: Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the Dynamic Response system.

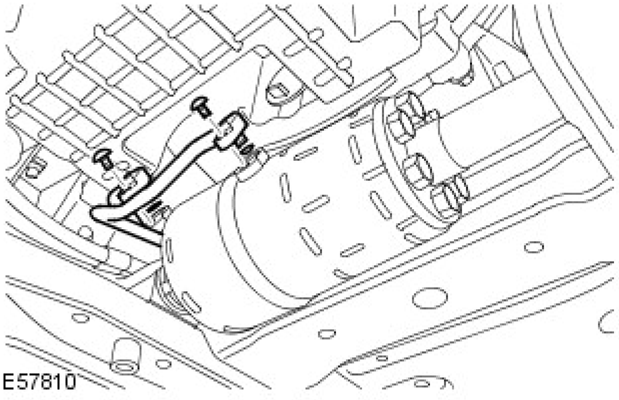
1. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

3. Remove the spare wheel and tire.

4. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



5. CAUTIONS:

⚠ Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

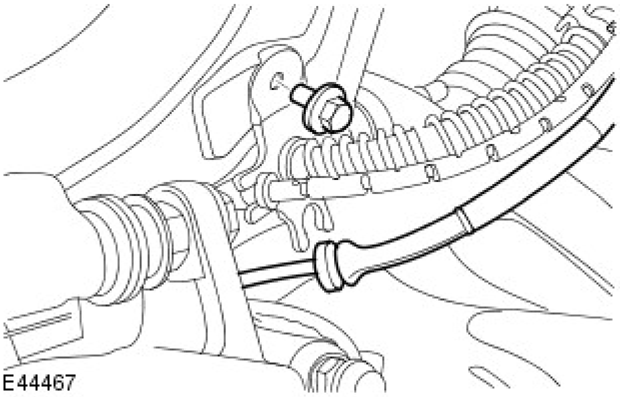
- NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid lines from the actuator.

- Position container to collect fluid loss.
- Remove the 2 bolts.
- Remove and discard the O-ring seals.
- Remove and discard the plastic spacer washers.
- Install blanking caps to the exposed ports.

6. Remove the front wheels and tires.

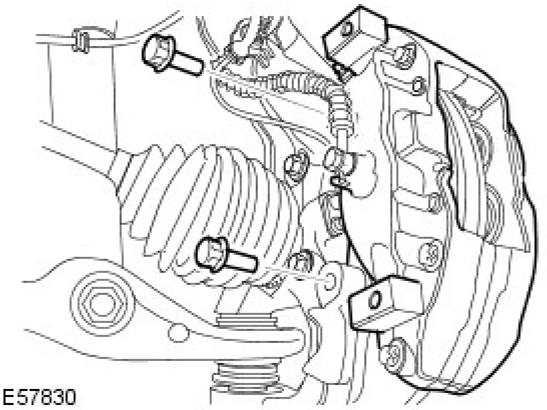
7. RH front: Remove the shock absorber and air spring assembly.
For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).



E44467

8. Release the brake hose bracket from the wheel knuckle.

- Remove the retaining bolt.

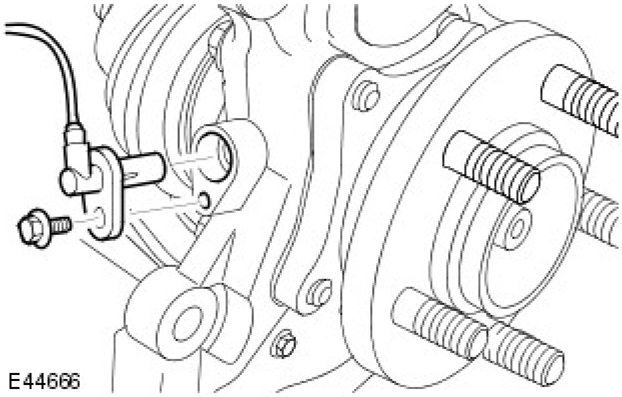


E57830

9. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper from the wheel knuckle.

- Remove the 2 retaining bolts.
- Tie the brake caliper aside.



E44666

10. NOTE: The brake disc is shown removed for clarity.

Release the wheel speed sensor from the wheel knuckle.

- Remove the bolt.

11. CAUTIONS:

⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

Remove the stabilizer bar link nut.

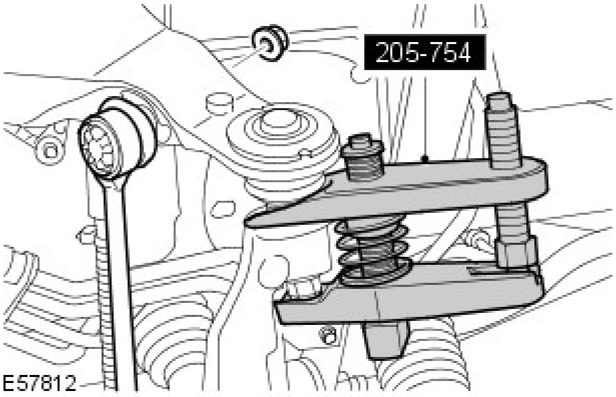
- Discard the nut.

12. ⚠ CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

Loosen the upper arm retaining nut.

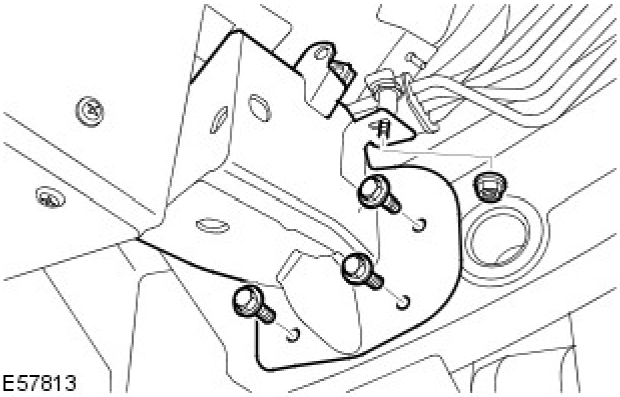
13. Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.



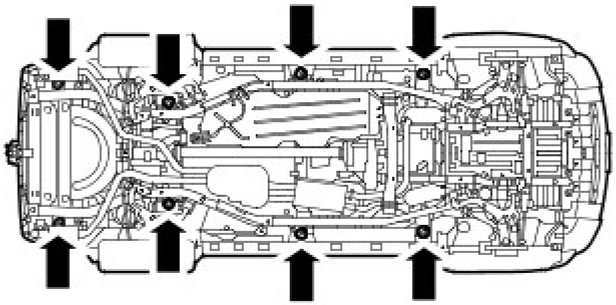
14. Remove the integrated body frame bracket.

- Remove the 3 bolts and 1 nut.



15. Remove the body mount retaining bolts.

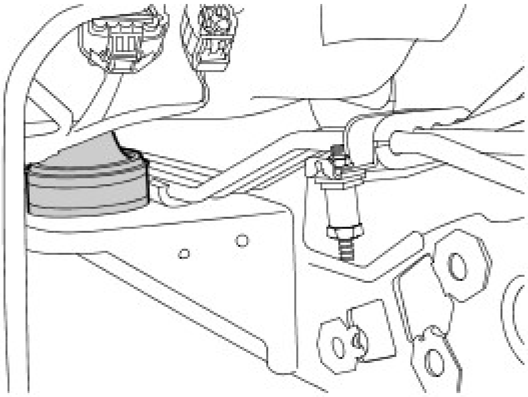
- Remove the 8 bolts.



16. ⚠CAUTION: Only raise the body sufficiently to remove the body mount.

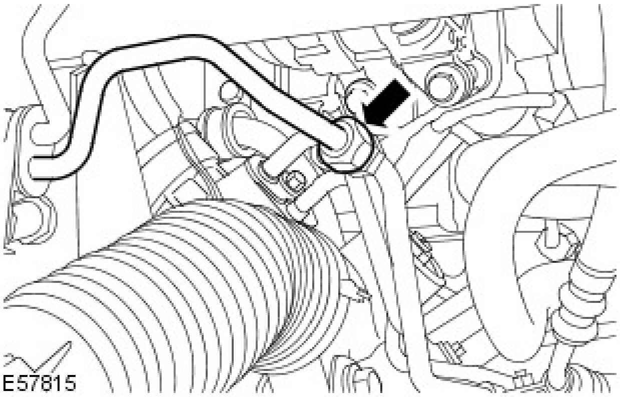
Raise the body.

- Using suitable stands, raise the body to release the body mounts.



E57814

17. Remove the body mount.



E57815

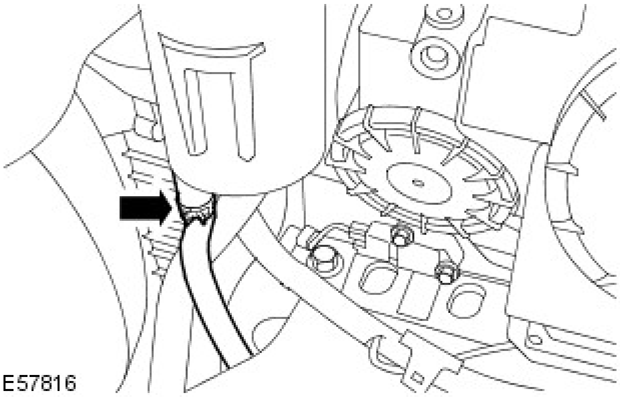
18. ⚠CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the high pressure line.

- Position a container to collect the fluid spillage.
- Install blanking caps to the exposed ports.

19. Remove the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).



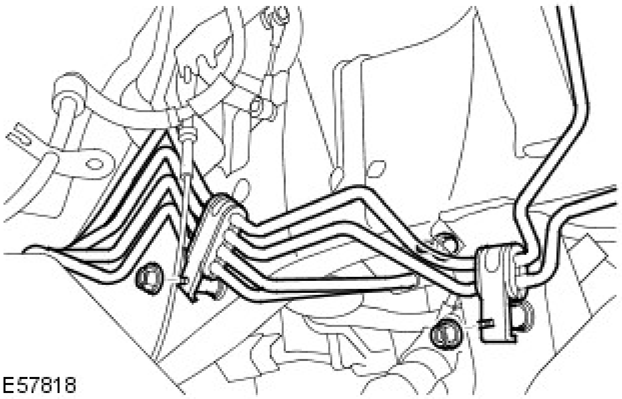
E57816

20. ⚠CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid return line from the reservoir.

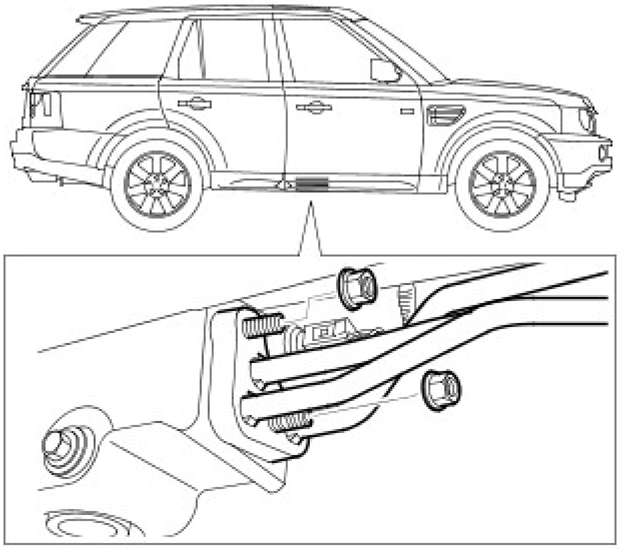
- Position a container to collect the fluid spillage.
- Reposition the fluid line into the wheel arch area.



E57818

21. Release the valve block to front stabilizer bar actuator pipe assembly mountings.

- Remove the 2 nuts and 1 bolt.



E57817

22. CAUTIONS:

⚠ Always plug any open connections to prevent contamination.

⚠ Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the front actuator pipes from the valve block.

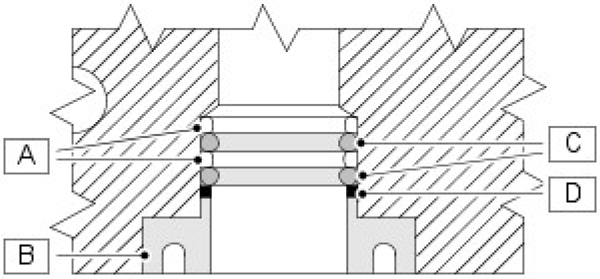
- Position a container to collect the fluid spillage.
- Remove and discard the 2 nuts.
- Install blanking caps to the exposed ports.

23. Remove the valve block to front stabilizer bar actuator pipe assembly.

Installation

1. Check the valve block O-rings and plastic spacer washers are correctly installed.

- A: Backing rings (white)
- B: Outer clamping ring
- C: O-ring seals
- D: Outer backing ring (Black)



E58627

2. Install the valve block to front stabilizer bar actuator pipe assembly.

- Clean the components.

3. Connect the front actuator pipes to the valve block.

- Remove the blanking caps from the ports.
- Install 2 new nuts and tighten to 22 Nm (16 lb.ft).
- Remove the container.

4. Attach the valve block to front stabilizer bar actuator pipe assembly mountings.

- Tighten the 2 nuts and 1 bolt to 9 Nm (7 lb.ft).

5. Connect the fluid line to the reservoir.

- Reposition the fluid line from the wheel arch area.
- Install the clip.
- Remove the container.

6. Install the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

7. Connect the high pressure line.

- Remove the blanking caps from the ports.
- Tighten the union to 21 Nm (15 lb.ft).
- Remove the container.

8. Install the body mount.

9. Lower the body.

- Remove the stands.

10. Install the body mount retaining bolts.

- Tighten the 8 retaining bolts to 133 Nm (98 lb.ft).

11. Install the integrated body frame bracket.

- Install the 3 bolts and tighten to 40 Nm (30 lb.ft).
- Tighten the nut to 9 Nm (7 lb.ft)

12. Connect the upper arm and wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

13. Install the wheel speed sensor.

- Tighten the bolt to 9 Nm (7 lb.ft).
- Connect the electrical connector.
- Secure the wiring harness in the clips.

14. Secure the brake caliper to the wheel knuckle.

- Tighten the bolts to 275 Nm (203 lb.ft).

15. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 23 Nm (17 lb.ft).

16. Install the shock absorber and air spring assembly.

For additional information, refer to: Front Shock Absorber and Air Spring Assembly (204-05 Vehicle Dynamic Suspension, Removal and Installation).

17. CAUTIONS:

Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

Care must be taken to avoid damage to the plastic spacer washers and O-ring seals during installation of the fluid lines to the actautor.

• NOTE: Some fluid spillage is inevitable during this operation.

Connect the fluid lines to the actuator.

- Clean the component mating faces.
- Remove the blanking caps from the ports.
- Install new plastic spacer washers and O-ring seals.
- Tighten the 2 bolts to 22 Nm (16 lb.ft).

18. Bleed the front of the Dynamic Response system using T4.

19. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

20. CAUTIONS:

Make sure the hardened steel washer is installed between the stabilizer bar link and the upper arm. Failure to follow this instruction may result in damage to the vehicle.

Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Secure the stabilizer bar link.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

21. Install the front wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

22. Install the spare wheel and tire.

23. Install the rear bumper cover.
For additional information, refer to: Rear Bumper Cover (501-19 Bumpers, Removal and Installation).

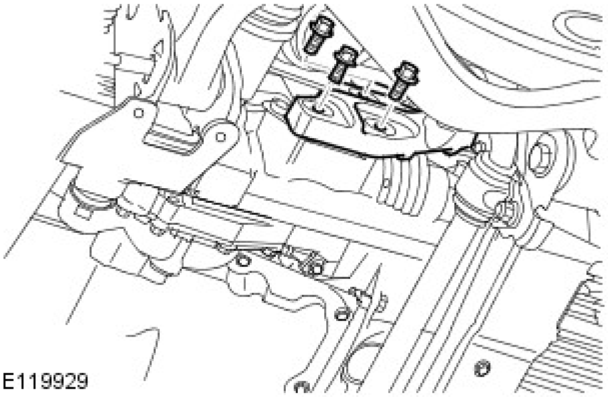
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

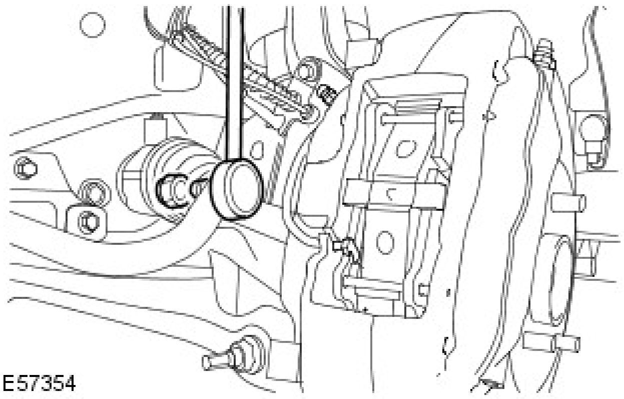
2. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

3. NOTE: Crossmember shown removed for clarity.



Using a suitable jack, support the differential.

- Remove and discard the three differential mounting bolts.
- Raise and reposition the front differential case.



E57354

4. CAUTIONS:

⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

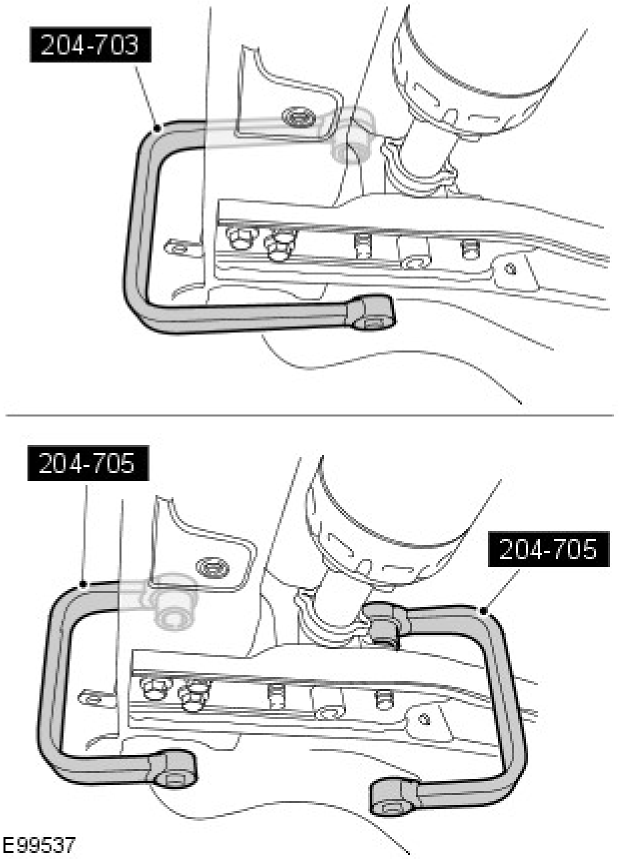
• NOTE: Left-hand shown, right-hand similar.

Disconnect both the stabilizer bar links from the stabilizer bar.

- Remove and discard the 2 nuts.

5. NOTE: Right-hand shown, left-hand similar.

Position the special tools.

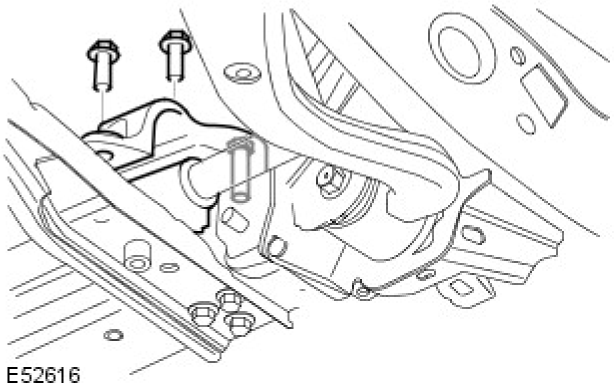


E99537

6. NOTE: Left-hand shown, right-hand similar.

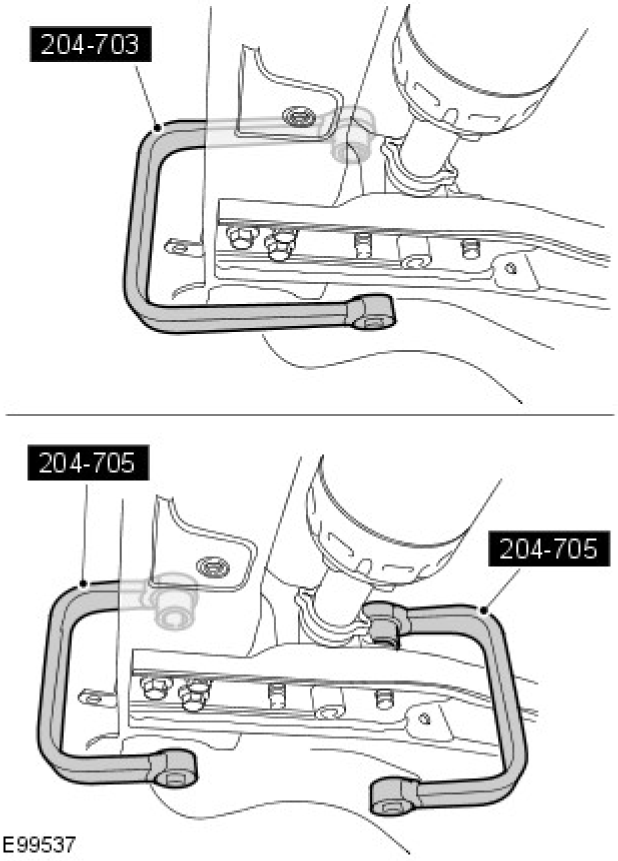
Remove the stabilizer bar bushings.

- Using the special tools, remove and discard the 6 bolts.
- Remove the stabilizer bar clamps.



E52616

Installation



1. Install the stabilizer bar bushings.

- Clean the components.
- Install the stabilizer bar clamps.
- Using the special tools, tighten the bolts to 115 Nm (85 lb.ft).

2. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Connect both stabilizer bar links to the stabilizer bar.

- Install new nuts and tighten to 175 Nm (129 lb.ft).

3. Align and secure the front differential case.

- Tighten the new axle carrier bracket bolts to 80 Nm (59 lb.ft), then a further 60 degrees.

4. Install the engine undershield.

	Front Stabilizer Bar Bushing Tightening Tool 204-705

Removal

• CAUTIONS:

⚠ Do not remove or loosen the 6 bolts on the stabilizer bar. Failure to follow this instruction may result in damage to or failure of the stabilizer bar.

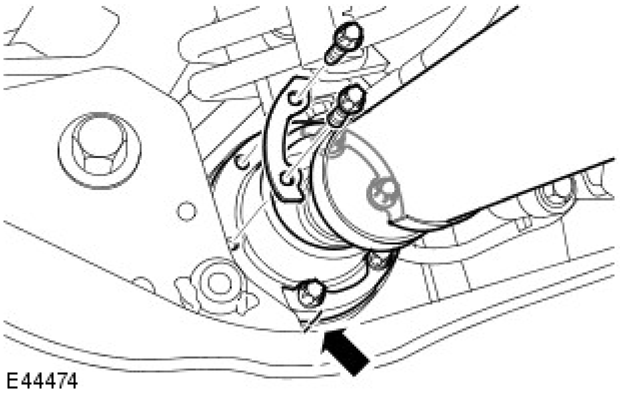
⚠ Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheels and tires.

3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



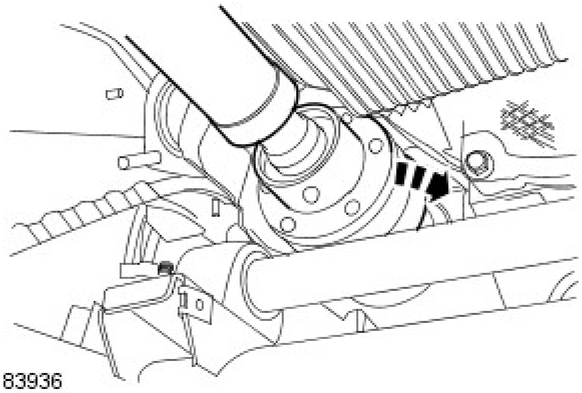
4. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

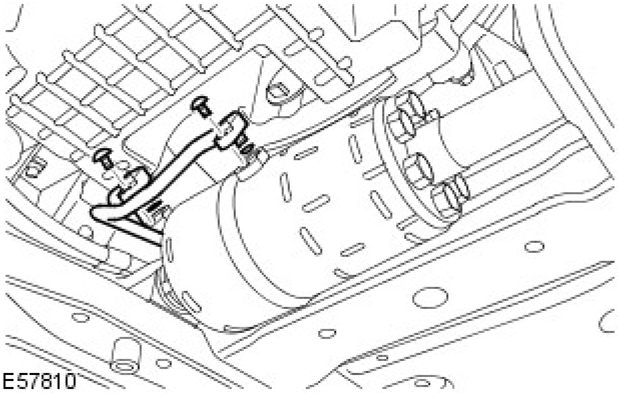
- Remove the 6 Torx bolts and washers.
- Discard the bolts.



E83936

5. Support the driveshaft.

- Compress the joints to disengage the drive flanges.
- Using suitable securing strap, reposition and support the driveshaft.



E57810

6. CAUTIONS:

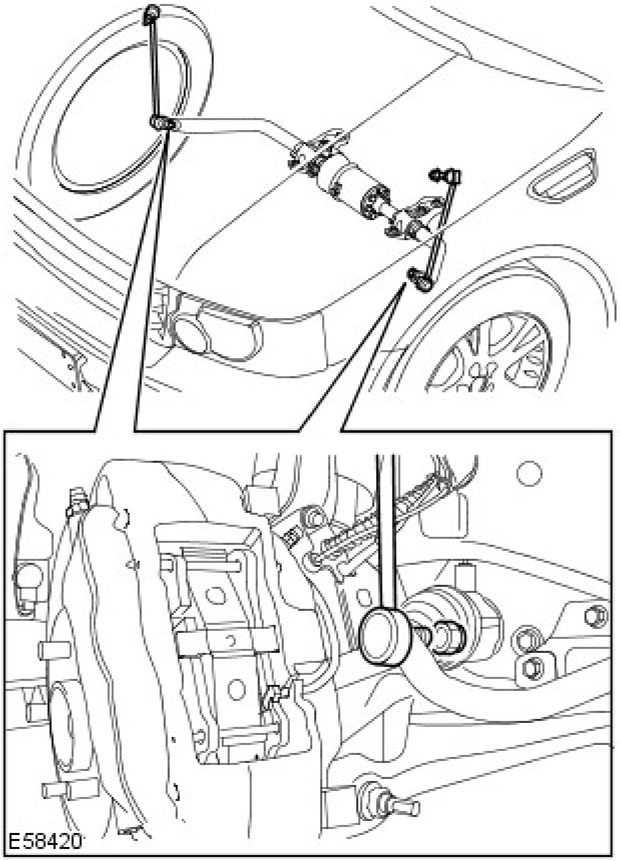
⚠ Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the fluid lines from the actuator.

- Position container to collect fluid loss.
- Remove the 2 bolts.
- Remove and discard the O-ring seals.
- Remove and discard the plastic spacer washers.



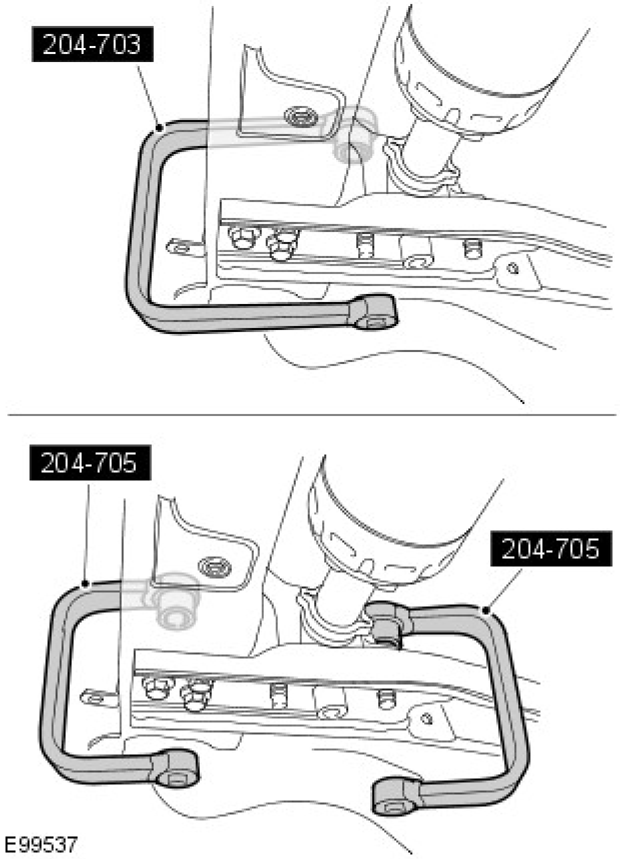
7. CAUTIONS:

⚠ Note the position of the hardened steel washer. The hardened steel washer must be installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst removing the nut.

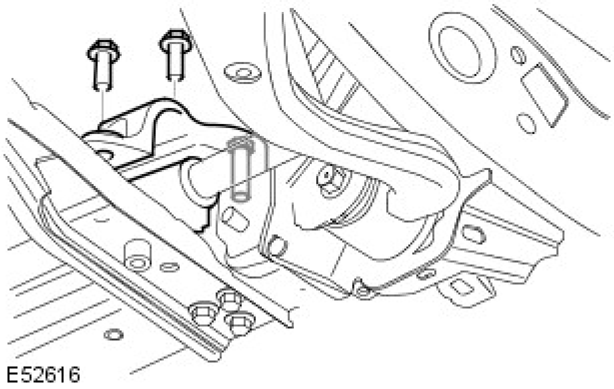
Release both of the stabilizer bar links from the stabilizer bar.

- Remove and discard the 2 nuts.



8. NOTE: Right-hand shown, left-hand similar.

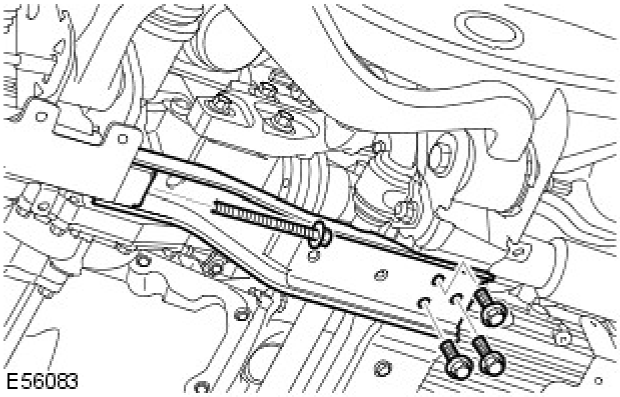
Position the special tools.



9. NOTE: Left-hand shown, right-hand similar.

Remove the stabilizer bar bushings.

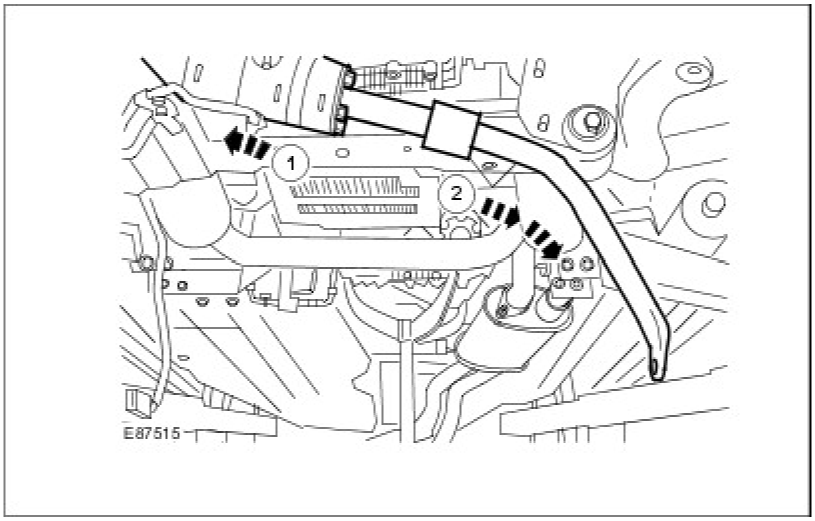
- Using the special tools, remove and discard the 6 bolts.
- Remove the stabilizer bar clamps.



10. Remove the front axle crossmember.

- Remove the 4 bolts.

11. Remove the stabilizer bar and actuator assembly.



Installation

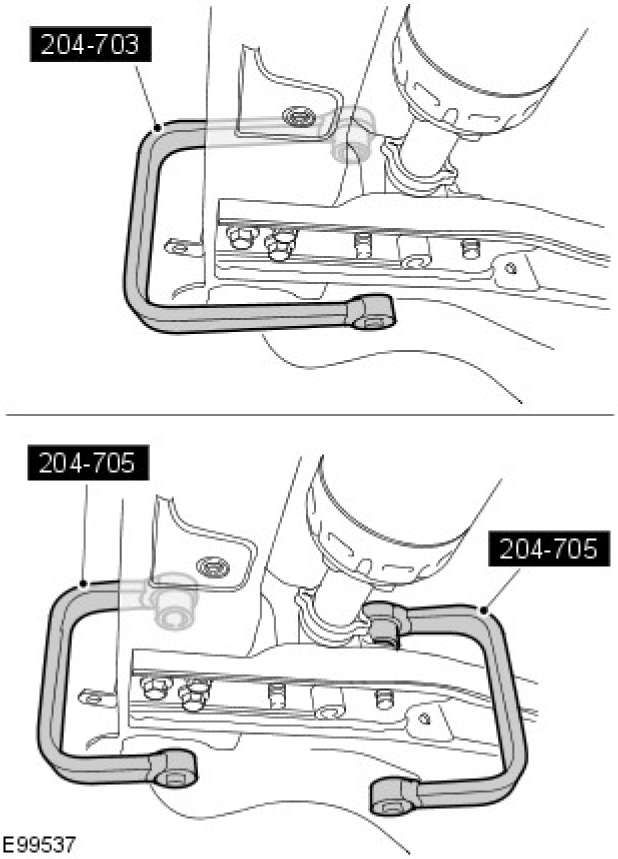
1. Install the stabilizer bar and actuator assembly.

2. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

3. Install the stabilizer bar clamps.

- Clean the components.
- Install the stabilizer bar clamps.
- Using the special tools, tighten the bolts to 115 Nm (85 lb.ft).



4. CAUTIONS:

⚠ Make sure the hardened steel washer is installed between the stabilizer bar link and the stabilizer bar. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a Torx socket to prevent the ball joint rotating whilst installing the nut.

Secure both stabilizer bar links to the stabilizer bar.

- Install a new nut and tighten to 175 Nm (129 lb.ft).

5. CAUTIONS:

⚠ Make sure the actuator fluid lines are not damaged or kinked during removal or installation.

⚠ Care must be taken to avoid damage to the plastic spacer washers and O-ring seals during installation of the fluid lines to the actuator.

• NOTE: Remove and discard the blanking caps.

Connect the fluid lines to the actuator.

- Clean the component mating faces.
- Install new plastic spacer washers and O-ring seals.
- Tighten the 2 bolts to 22 Nm (16 lb.ft).

6. Using the approved Land Rover diagnostic system, bleed the active stabilization system.

7. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Secure the driveshaft to the front axle drive flange.

- Remove and discard the tie strap.
- Clean the components.
- Compress the joints to engage the drive flanges.
- Install new retaining bolts.
- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

8. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

9. Install the front wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Ride and Handling Optimization - Pressure Control Valve

Removal and Installation

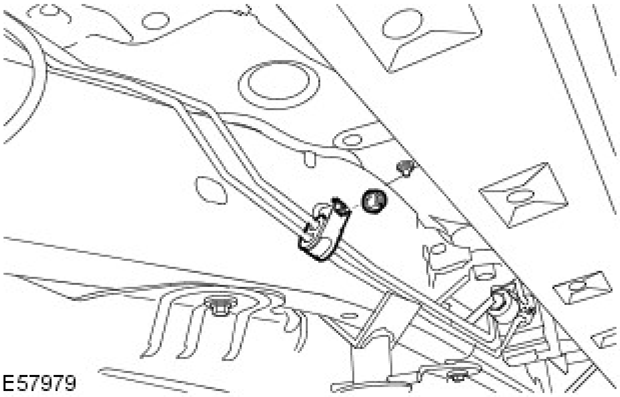
Removal

⚠CAUTION: Dynamic Response system components are manufactured to very precise tolerances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the dynamic response system.

- NOTE: This procedure does not require the Dynamic Response system to be bled.

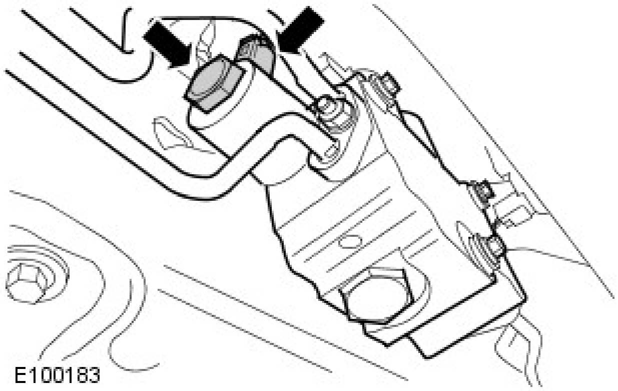
1. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



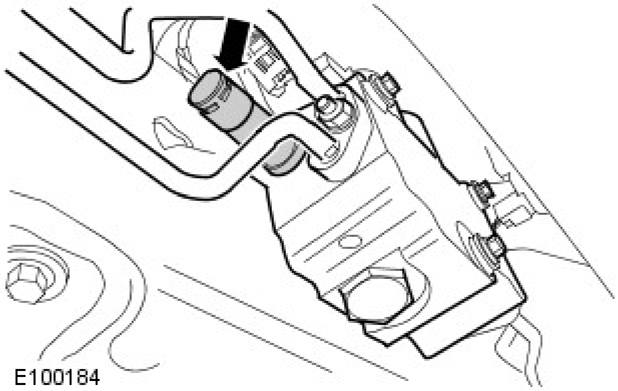
2. Release the valve block to rear stabilizer bar actuator pipe assembly mounting.

- Remove the nut.
- Remove the bracket.



3. Remove the solenoid.

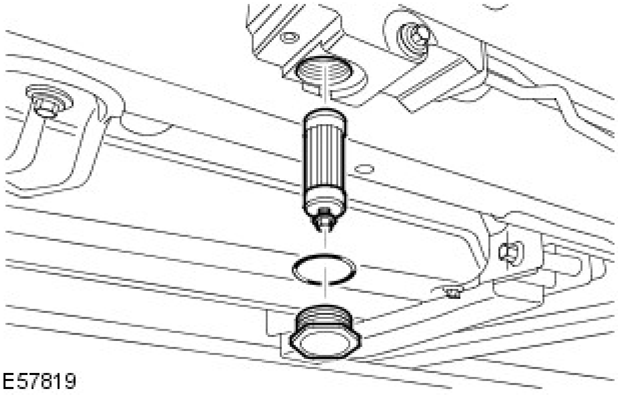
- Remove the electrical connector.
- Remove the solenoid nut.
- Remove and discard the O-ring seal.



4. ⚠CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the PCV valve.

- Clamp the fluid pump supply and return hoses to minimise fluid loss.
- Position container to collect fluid loss.
- Remove the PCV valve.



5. CAUTIONS:

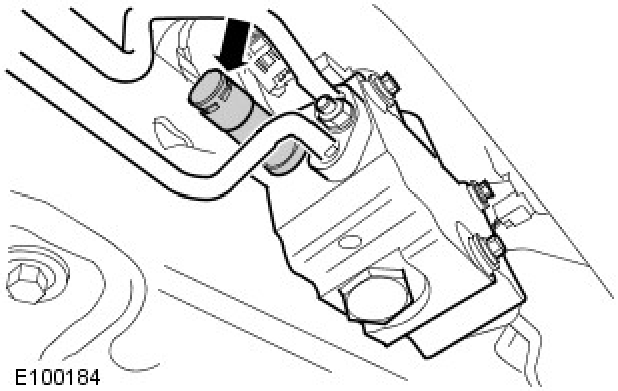
⚠ Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

⚠ Make sure the actuator fluid lines are not clamped or kinked. Failure to follow this instruction will result in damage to the vehicle.

Remove and discard the valve block filter.

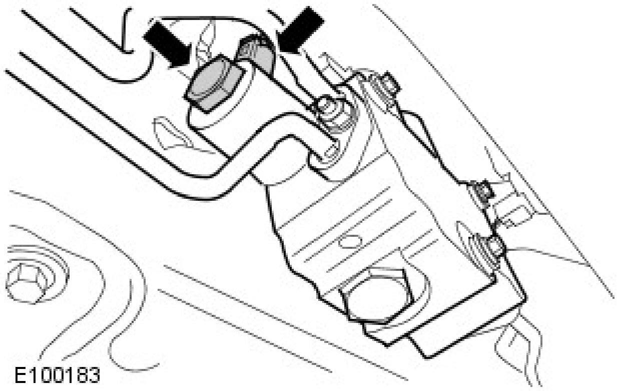
- Remove the access plug.
- Remove and discard the access plug O-ring seal.
- Using a suitable M6 bolt, release the filter from the valve block.

Installation



1. Install the PCV valve.

- Clean the component mating faces.
- Install the PCV valve.
- Torque: 35 Nm (26 lb.ft).



2. Install the solenoid.

- Install the O-ring seal.
- Tighten to 12 Nm.
- Install the electrical connector.

3. Install the new valve block filter.

- Clean the component mating faces.
- Install a new access plug O-ring seal.
- Tighten the access plug to 62 Nm (46 lb.ft).
- Remove the container.
- Remove the hose clamps.

4. Secure the valve block to rear stabilizer bar actuator pipe assembly mountings.

- Tighten the nut to 9 Nm (7 lb.ft)

5. Check and top-up the dynamic response system fluid reservoir.

6. Start the engine and allow to idle.

7. Check and top-up the dynamic response system fluid reservoir.

- Make sure there is fluid circulation through the reservoir.

Driveline System - General Information - Driveline System

Diagnosis and Testing

Overview

The driveline system is a fairly straightforward design requiring no specialized techniques for diagnosis.

This section will not deal with the electronic differential which is covered in:
REFER to: Rear Drive Axle and Differential (205-02 Rear Drive Axle/Differential, Diagnosis and Testing).

For information on the description and operation of the system: REFER to:

Driveshaft (205-01 Driveshaft, Description and Operation),
Universal Joints (205-01 Driveshaft, Description and Operation),
Rear Drive Axle and Differential (205-02 Rear Drive Axle/Differential, Description and Operation),
Front Drive Axle and Differential (205-03 Front Drive Axle/Differential, Description and Operation),
Front Drive Halfshafts (205-04 Front Drive Halfshafts, Description and Operation),
Halfshaft Joint (205-04 Front Drive Halfshafts, Description and Operation),
Rear Drive Halfshafts (205-05 Rear Drive Halfshafts, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer concern.
    - ○ If a road test is necessary make sure the vehicle is safe to do so.
2. **2.** Visually inspect for obvious mechanical faults.

Visual inspection

Mechanical
● Wheel rim and tire damage or runout ● Check all the driveshafts and halfshafts for damage including dents, cracks and excessive runout ● Check all the CV joint gaiters for splits, damage and security ● Check all the driveshafts and halfshafts for correct alignment ● Check the driveshaft mounting bolts security ● Check all the driveshaft and halfshaft joints for excessive movement ● Check the rear driveshaft centre support bearing for security, damage and excessive wear ● Check the front and rear differential mounting bolts and bushes for wear, damage and security ● Check the front and rear differentials for oil leaks

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step

Symptom chart

Symptom	Possible causes	Action
Vibration through the vehicle body at a specified speed	● Road wheel imbalance ● Driveshaft imbalance	Road test the vehicle. If the vibration is only at a specified speed, balance the road wheels. Test for normal operation. Disconnect the rear driveshaft. Check CV and universal joints for smooth and full movement. Disconnect the front driveshaft. Check CV joints for smooth and full movement. If any joints are faulty, replace the driveshaft. Test for normal operation.
Vibration through the vehicle body at all speeds	● Misalignment of the rear driveshaft ● Bent or misaligned stub axle	Road test the vehicle. Check the rear driveshaft for correct alignment through the centre support bearing. Rectify as necessary. Test for normal operation. Check for a damaged or bent stub axle. Rectify as necessary.
Rumbling noise from the rear of the vehicle varying at different vehicle speed and load	● Rear differential bearings worn ● Rear wheel bearings worn ● Rear driveshaft centre support bearing worn	Using a suitable listening device (e.g. stethoscope) listen to the rear differential pinion bearings and output bearings, the rear wheel bearings and the rear driveshaft centre bearing. Rectify as necessary. Test for normal operation.

Symptom	Possible causes	Action
Rumbling noise from the front of the vehicle varying at different vehicle speed and load	● Front differential bearings worn ● Front wheel bearings worn	Using a suitable listening device (e.g. stethoscope) listen to the front differential pinion bearings and output bearings and the front wheel bearings. Rectify as necessary. Test for normal operation.
Whining noise from the rear of the vehicle during acceleration and overrun conditions	● Rear differential gears worn or damaged	Check and top up the rear differential oil level if necessary. Using a suitable listening device (e.g. stethoscope) listen to the rear differential. Replace the rear differential unit if there is excessive gear noise. REFER to: Axle Assembly (205-02 Rear Drive Axle/Differential, Removal and Installation).
Whining noise from the front of the vehicle during acceleration and overrun conditions	● Front differential gears worn or damaged	Check and top up the front differential oil level if necessary. Using a suitable listening device (e.g. stethoscope) listen to the front differential. Replace the front differential unit if there is excessive gear noise. REFER to: (205-03 Front Drive Axle/Differential) Axle Assembly - V8 S/C 4.2L Petrol (Removal and Installation), Axle Assembly - 4.4L (Removal and Installation), Axle Assembly - TDV6 2.7L Diesel (Removal and Installation).
Knocking, clicking or clunking noise from rear of vehicle during acceleration and overrun conditions	● Rear driveshaft joint fixings insecure ● Rear driveshaft joints worn or damaged ● Rear halfshaft joints or splined shaft worn or damaged ● Rear differential internal components worn or damaged	Disconnect the rear driveshaft. Check joint mounting bolt holes for elongation. Check the joints. Disconnect the rear halfshafts. Check the shaft splines for wear or damage. Check the CV joints. Rectify as necessary. With the rear driveshaft and halfshafts disconnected, check the rear differential for tight spots or excessive play. Rectify as necessary.
Knocking, clicking or clunking noise from front of vehicle during acceleration and overrun conditions	● Front driveshaft CV joints worn or damaged ● Front halfshaft joints or splined shaft worn or damaged ● Front differential internal components worn or damaged	Disconnect the front driveshaft. Check joint mounting bolt holes for elongation. Check the joints. Disconnect the front halfshafts. Check the shaft splines for wear or damage. Check the CV joints. Rectify as necessary. With the front driveshaft and halfshafts disconnected check the front differential for tight spots or excessive play. Rectify as necessary.

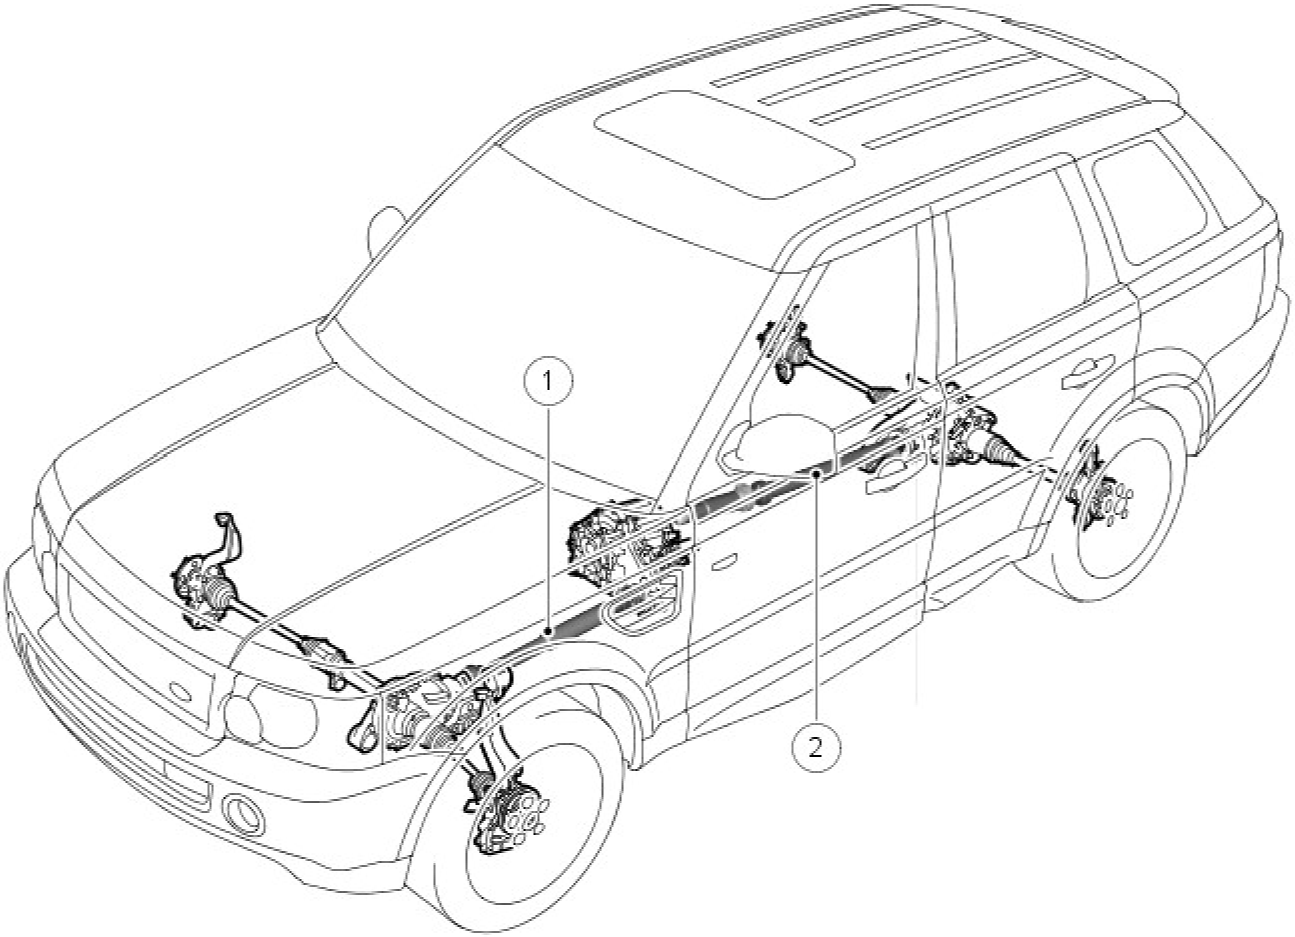
Driveshaft - Driveshaft

Description and Operation

Drive shaft Component Location



E56469

Item	Part Number	Description
1	-	Front drive shaft
2	-	Rear drive shaft

GENERAL

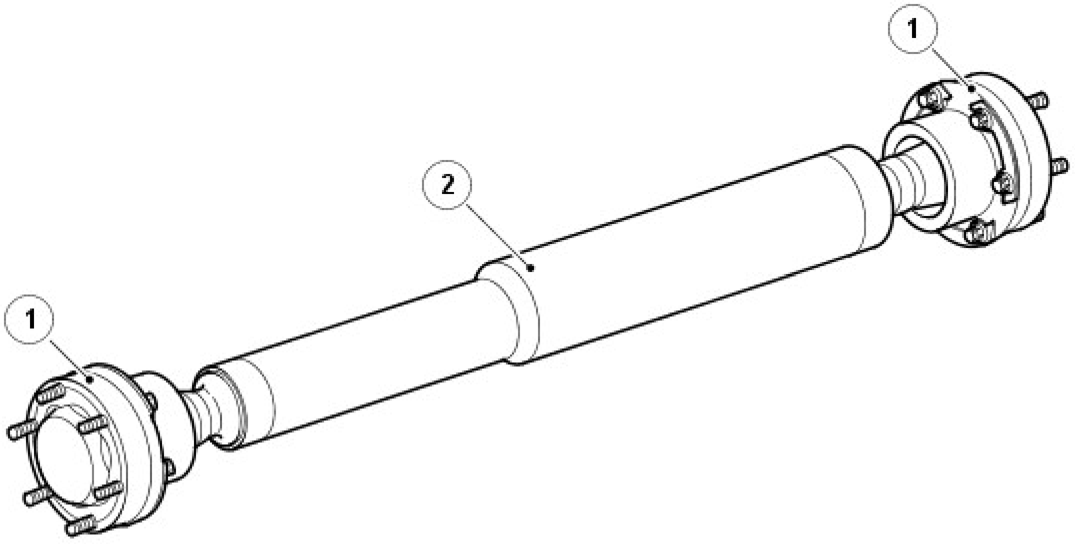
Drive shafts are used to transmit drive from the transfer box to the front and rear differentials.

The front drive shaft is a one-piece unit, connected to the transfer box and front differential unit via Constant Velocity (CV) joints.

The rear drive shaft is a two-piece unit, supported on a central bearing due to its increased length. The rear drive shaft is connected to the transfer box via a CV joint and the rear differential with a universal joint. These joints allow for angular deviations of the drive shaft due to acceleration and braking.

The front and rear drive shafts are not serviceable items and a failure will require the replacement of the complete drive shaft assembly.

FRONT DRIVE SHAFT



E46305

Item	Part Number	Description
1	-	CV joint
2	-	Front drive shaft

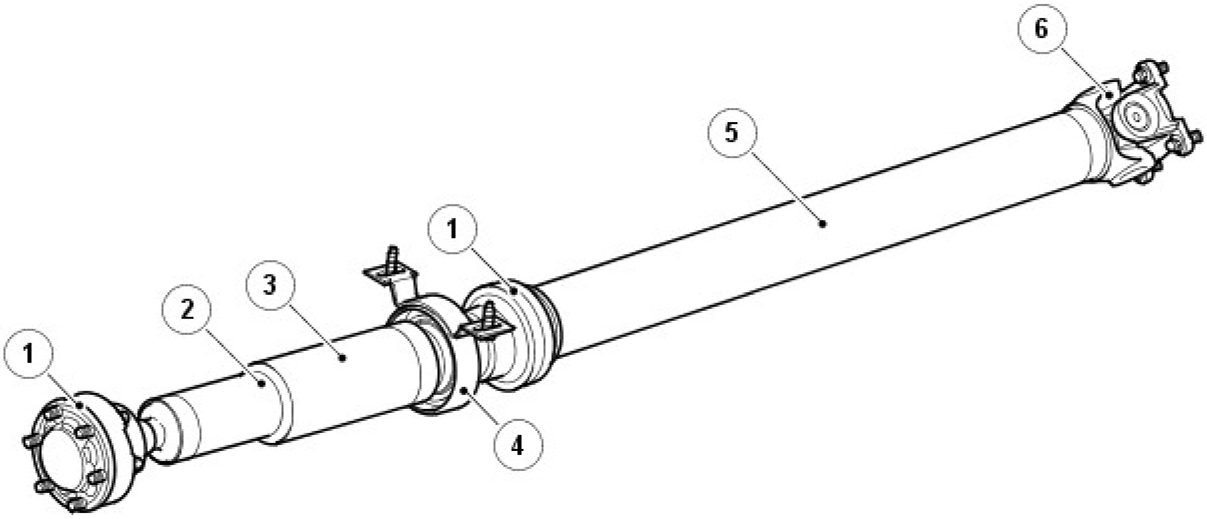
The front drive shaft is constructed from 1.7 mm wall tubular steel. A CV joint is attached to each end of the drive shaft (see 'Halfshaft Joint' section for more information on CV joints).

Each CV joint has six holes, which allow for attachment to the input flange of the front differential and the front output flange of the transfer box. The CV joints are secured to the front differential and transfer box with six Torx head adhesive retained bolts.

Three compression link washers are fitted under each pair of bolts. The washers are required to prevent compression of the CV joints attachment flange.

A shroud is pressed over the CV joint. The shroud seals to the joint body using an internal gasket and to the front output flange of the transfer box using an end cap and internal gasket. This prevents the ingress of dirt and moisture. The CV joints allow for movement of the drive shaft caused by small movements in the transmission and transfer box mountings.

REAR DRIVE SHAFT ASSEMBLY



E46306

Item	Part Number	Description
1	-	CV joints
2	-	Collapsible crash section
3	-	Front shaft assembly
4	-	Support bearing
5	-	Rear shaft assembly
6	-	Universal joint

The rear drive shaft assembly comprises front and rear shaft assemblies and a centrally mounted shaft bearing.

Front Shaft Assembly

The front shaft assembly incorporates a crash feature within the tube, which controls the collapse of the drive shaft during a crash.

The front shaft assembly comprises a CV joint at each end (see 'Halfshaft Joint' section for more information on CV joints).

The front CV joint (transfer box end) has six radial holes, which provide for the attachment to the transfer box rear output flange. The joint is secured to the output flange with six torx bolts, which screw into threaded holes in the flange. Three compression link washers are fitted under each pair of bolts. The rear splined shaft mates with splines in the rear shaft CV joint hub and is pressed in and fixed with Locktite. A machined surface on the shaft accepts the shaft bearing, which is a press fit.

Rear Shaft Assembly

The rear shaft assembly comprises a Hookes type universal joint at the rear (rear differential end).

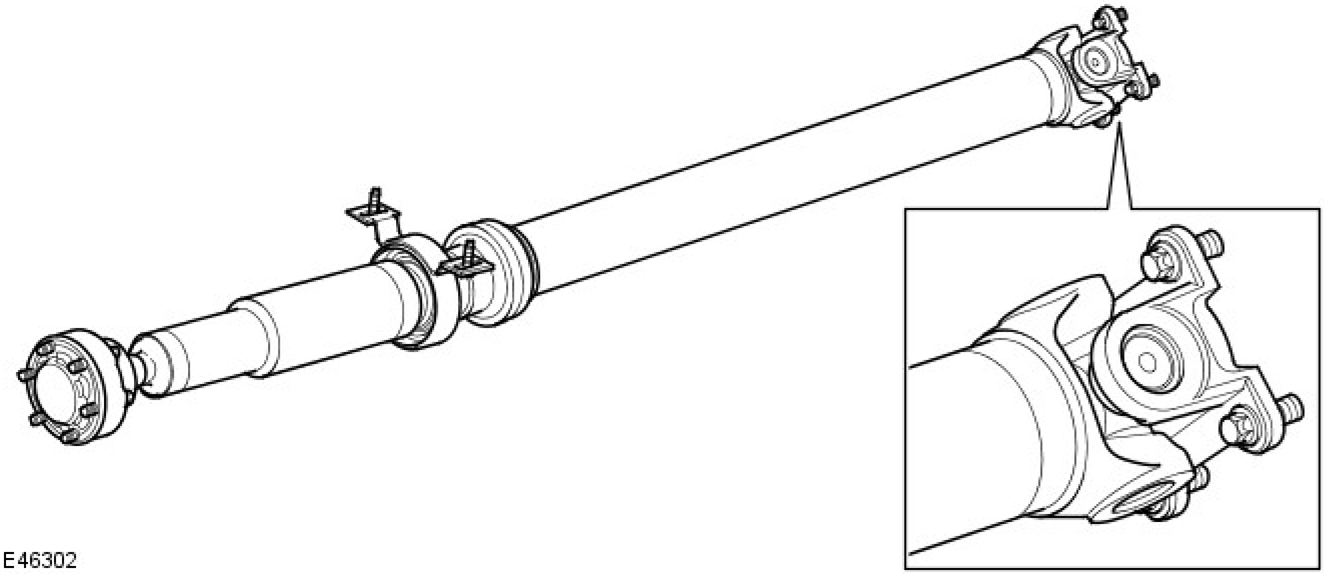
The universal joint is welded to the rear shaft tube and is secured to the input shaft of the rear differential with four flanged nuts. The opposite end of the rear shaft tube is welded directly to the CV joint body.

Shaft Bearing Assembly

The shaft bearing assembly comprises a pressed steel housing, a rubber diaphragm and a ball bearing. The diaphragm is bonded into the housing. An internal metal ring, bonded to the bush, allows for the bearing to be press fitted into it. The rubber bush allows for small deviations in alignment and also absorbs vibrational forces. The shaft bearing assembly is located by screws, which pass through plain holes in the bearing assembly and locate into nuts welded on the inside face of the chassis cross-member.

Driveshaft - Universal Joints

Description and Operation



A Hookes type universal joint is used to connect the rear drive shaft assembly to the rear differential, allowing for angular deviations of the drive shafts due to acceleration and braking.

The joint is bolted to the input shaft of the rear differential with four flanged adhesive screws and is lubricated during manufacture and sealed for life.

Removal and Installation

Removal

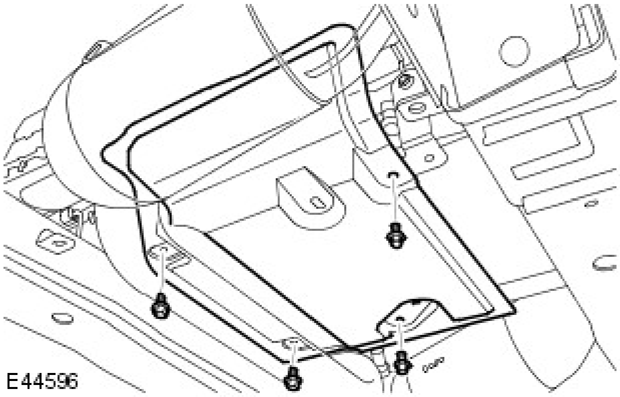
⚠ CAUTION: It is possible to fit the driveshaft incorrectly. Note the orientation before removal.

• NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

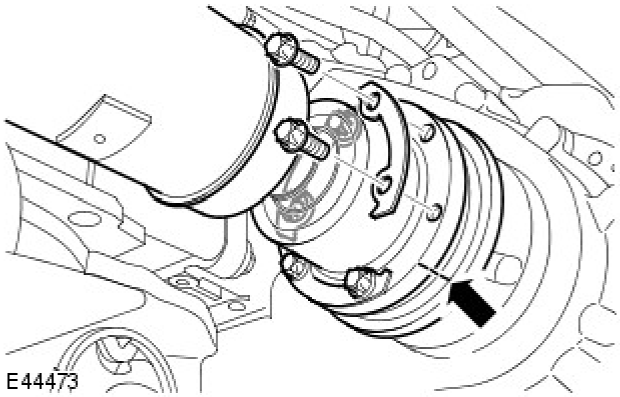
Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).



3. Remove the transmission heat shield.

- Remove the 4 bolts.



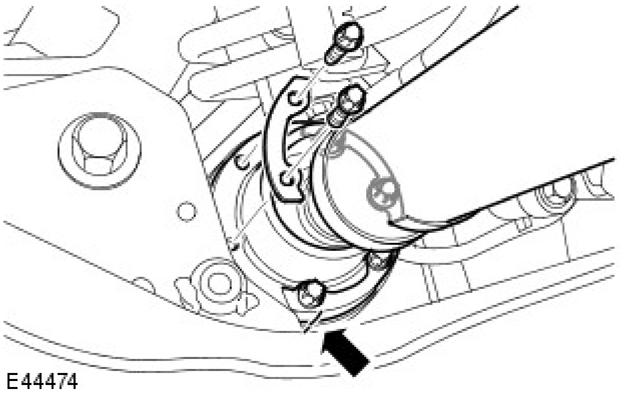
4. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 bolts and washers, discard the bolts.



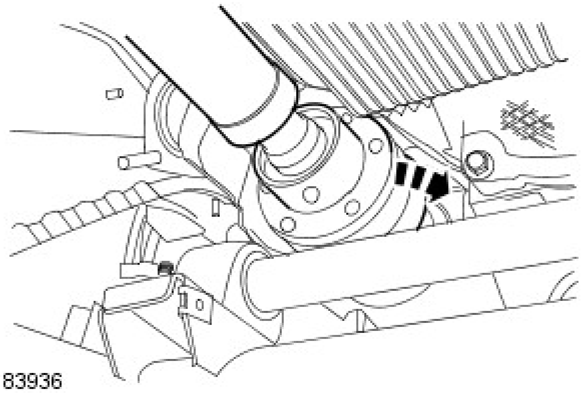
5. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 bolts and washers, discard the bolts.



6. Remove the front driveshaft.

- Compress the joints to disengage the drive flanges.

Installation

1. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Install the driveshaft.

- Clean the components.
- Compress the joints to engage the drive flanges.

2. Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

3. Secure the driveshaft to the transfer case drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

4. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

5. Install the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

Driveshaft - Rear Driveshaft

Removal and Installation

Removal

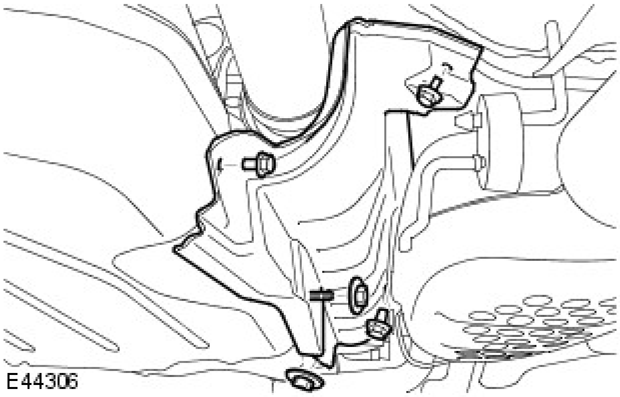
• NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.



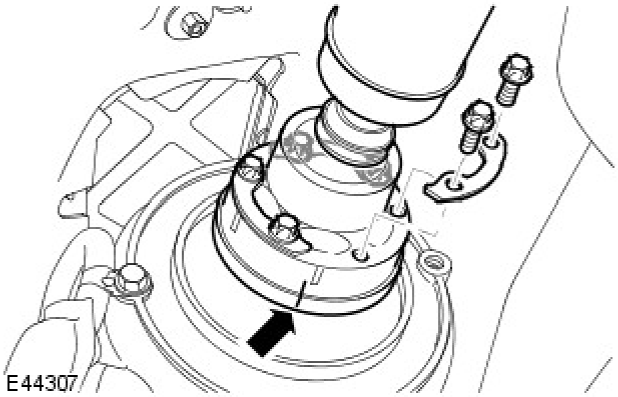
3. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers.



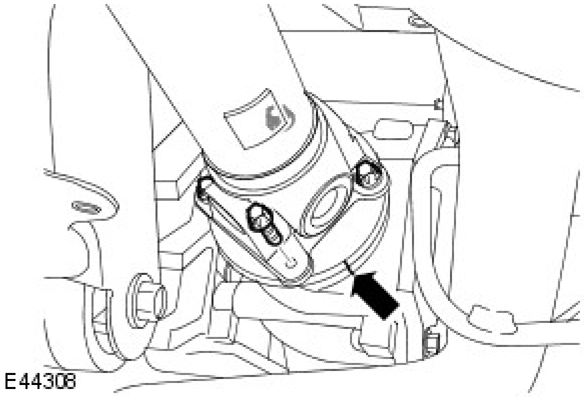
4. CAUTIONS:

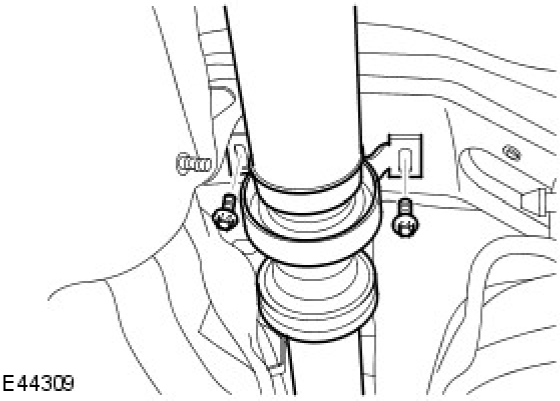
⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the rear axle drive flange.

- Remove and discard the 4 Torx bolts.





5. With assistance, remove the driveshaft.

- Remove the 2 driveshaft center bearing mount bolts.

Installation

1. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Attach the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Attach the driveshaft to the rear axle drive flange.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

2. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durability of the joint.

Attach the driveshaft to the transfer case drive flange.

- Clean the component mating faces.
- Tighten the Torx bolts to 73 Nm (54 lb.ft).

3. CAUTIONS:

⚠ Align the driveshaft center bearing mount by moving the floating front section of the shaft backward or forwards until the bolt holes in the mount align with the holes in the chassis.

⚠ Make sure the center bearing mount is not under tension.

Install the driveshaft center bearing mount bolts.

- Align the center bearing mount.
- Tighten the driveshaft center bearing retaining bolts to 30 Nm (22 lb.ft).

4. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

Removal and Installation

Removal

⚠ CAUTION: It is possible to fit the driveshaft incorrectly. Note the orientation before removal.

• NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durabilty of the joint.

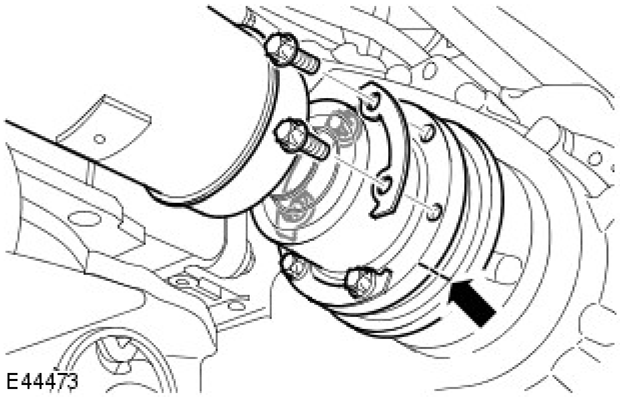
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

4. Remove the crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).



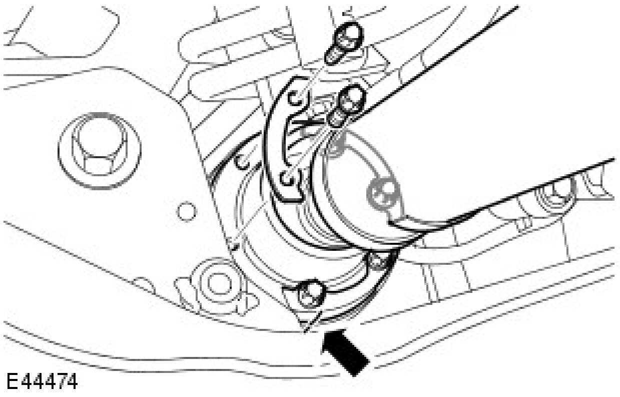
5. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the transfer case drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.



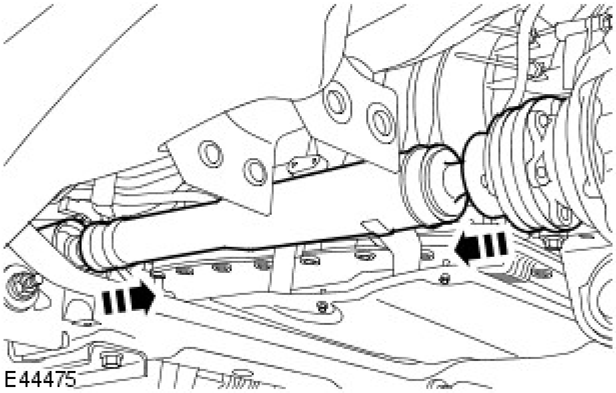
6. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.



7. Remove the front driveshaft.

- Compress the joints to disengage the drive flanges.
- Remove the washer from the transfer case drive flange.

Installation

1. NOTE: A small amount of oil may weep from the driveshaft joints during storage. The loss of this oil will not affect the operation or durabilty of the joint.

Install the driveshaft.

- Clean the components.
- Install the washer.
- Compress the joints to engage the drive flanges.

2. Attach the driveshaft to the front axle drive flange.

- Tighten the new Torx bolts to 45 Nm (33 lb.ft), then a further 90 degrees.

3. Attach the driveshaft to the transfer case drive flange.

- Tighten the new Torx bolts to 45 Nm (33 lb.ft), then a further 90 degrees.

4. Install the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

5. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

6. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2	-	Electronic rear differential
3	-	RH rear drive halfshaft
4	-	Actuator (locking) motor assembly
5	-	LH rear drive halfshaft
6	-	Rear differential

The open rear differential converts the 'angle of drive' through 90° and distributes drive, via the rear drive halfshafts, to the rear wheels.

The open rear differential for the V8 petrol variants utilise the same output ratio, which differs to that used on the TdV6.

The open rear differential is located centrally in the rear of the chassis.

The units are mounted to the chassis via rubber bushes and bolts; two mounting points at the rear of the unit and one at the front.

The cast iron casing comprises two parts; a cover and a carrier. The carrier provides locations for all the internal components. The carrier is sealed to the cover via an O-ring seal and secured with twelve bolts. The cover and carrier have cast fins, which assist mobility. A breather tube is fitted to the top of the carrier. This allows a plastic tube to be fitted and routed to a high point under the vehicle body, preventing the ingress of water when the vehicle is wading.

The carrier contains an oil drain plug. The differential unit contains approximately 1.16 litres of oil from a dry fill. If oil is being replaced, a smaller quantity of oil will be required due to residual oil retained in the pinion housing.

The differential is a conventional design using a hypoid gear layout, similar to the front differential. The open rear differential is available in two ratios. V8 petrol engine vehicles use a differential with a final drive ratio of 3.73:1 and TdV6 engine vehicles use a final drive ratio of 3.54. Changing the number of teeth between the crown wheel drive gear and pinion gear changes the ratio.

The differential comprises a pinion shaft and hypoid pinion gear and a crown wheel drive gear with an integral cage, which houses two planet gears. Two sun wheels are also located in the cage and pass the rotational drive to the drive shafts.

The pinion shaft is mounted on two opposed taper roller bearings, with a collapsible spacer located between them. The spacer is used to hold the bearings in alignment and also collapses under the pressure applied to the pinion-flanged nut. This allows the flanged nut to be tightened to a predetermined torque, which collapses the spacer, setting the correct bearing preload.

The pinion shaft has an externally splined outer end, which accepts and locates the input flange, which is retained by the pinion nut and retainer. The input flange has four threaded holes and mates with the rear drive shaft. Four bolts secure the rear drive shaft to the input flange. An oil seal is pressed into the pinion housing and seals the input flange to the pinion housing. The pinion shaft has a hypoid gear at its inner end, which mates with the crown wheel drive gear.

The crown wheel drive gear is located on the differential case and secured with ten bolts. The differential case is mounted on taper roller bearings located in machined bores on each side of the pinion housing. Shims are retained in the casing behind the bearing cups, the shim thickness is selected to apply the correct bearing preload and hypoid backlash.

The differential carrier has a through hole, which provides location for the shaft. The shaft is supported by a sun gear and a needle roller bearing. The shaft is fitted with a snap ring at one end, which locates in a machined groove in the sun gear, locking the shaft in position.

The sun gears are located in pockets in the carrier cage and mesh with the planet gears. Spacers are fitted between the sun wheels and the carrier and set the correct mesh contact between the planet gears and the sun wheels. Each sun wheel has a machined bore with internal splines and machined groove near the splined end. The groove provides positive location for a snap ring fitted to the end of each output flange.

Each output shaft has a spline, which locates in each sun wheel. A snap ring fitted to the splined shaft locates in the groove of the sun wheel bore and positively locates the output shaft. Oil seals are pressed into each side of the pinion housing and seals the output shaft.

Differential Operation

The operating principles of the front and rear differentials are the same. Rotational input from the drive shaft is passed via the input flange to the pinion shaft and pinion gear. The angles of the pinion gear to the crown wheel drive gear moves the rotational direction through 90°.

The transferred rotational motion is now passed to the crown wheel drive gear, which in turn rotates the differential casing. The shaft, which is secured to the casing, also rotates at the same speed as the casing. The planet gears, which are mounted on the shaft, also rotate with the casing. In turn, the planet gears transfer their rotational motion to the left and right hand sun wheels, rotating the drive halfshafts.

When the vehicle is moving in a forward direction, the torque applied through the differential to each sun wheel is equal. In this condition both drive halfshafts rotate at the same speed. The planet gears do not rotate and effectively lock the sun wheels to the differential casing.

If the vehicle is turning, the outer wheel will be forced to rotate faster than the inner wheel by having a greater distance to travel. The differential senses the torque difference between the sun wheels. The planet gears rotate on their axes to allow the outer wheel to rotate faster than the inner one.

SERVICE

The oil used in the open rear differential is Castrol SAF-XO. The oil contains unique additives, which enhance the differentials operation. No other oil must be used in the open rear differential.

34	-	O ring
35	-	Cover
36	-	Bolt, 12 of
37	-	Temperature sensor

The electronic rear differential has the same functionality as the open rear differential but incorporates a locking feature.

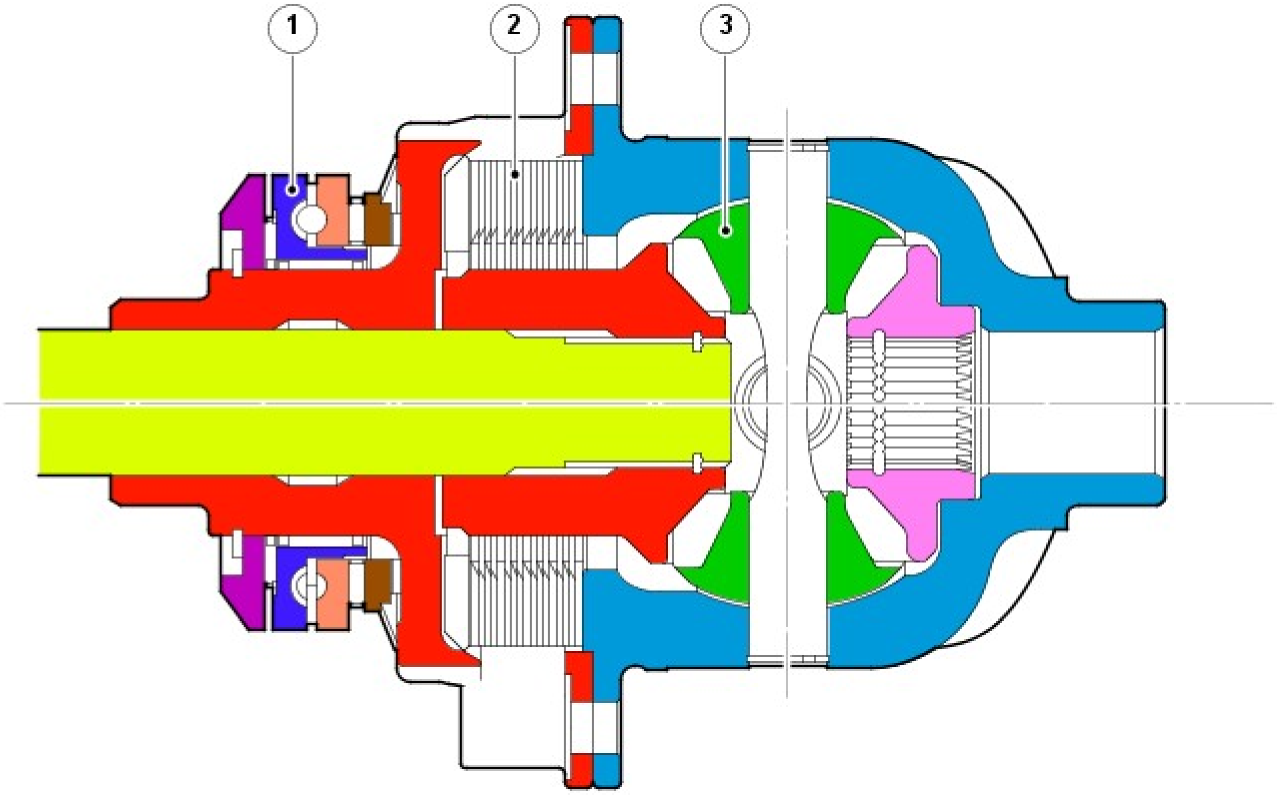
An electronically controlled multi-plate clutch provides a rear differential lock and torque biasing function to give improved traction performance and vehicle dynamic stability.

A strategy, to electronically control the rear differential multi-plate clutch assembly, has been developed to provide:

- a pre-loading function, increasing locking torque with increased driving torque
- a slip controller to increase locking torque under off-road conditions and decrease locking torque for optimum comfort, e.g. parking.

The unit receives a torque input from the transfer box output shaft, which is passed through the unit to two outputs for the rear drive halfshafts.

The unit detects wheel slip via various vehicle system inputs to the electronic rear differential control module and locks the differential accordingly.

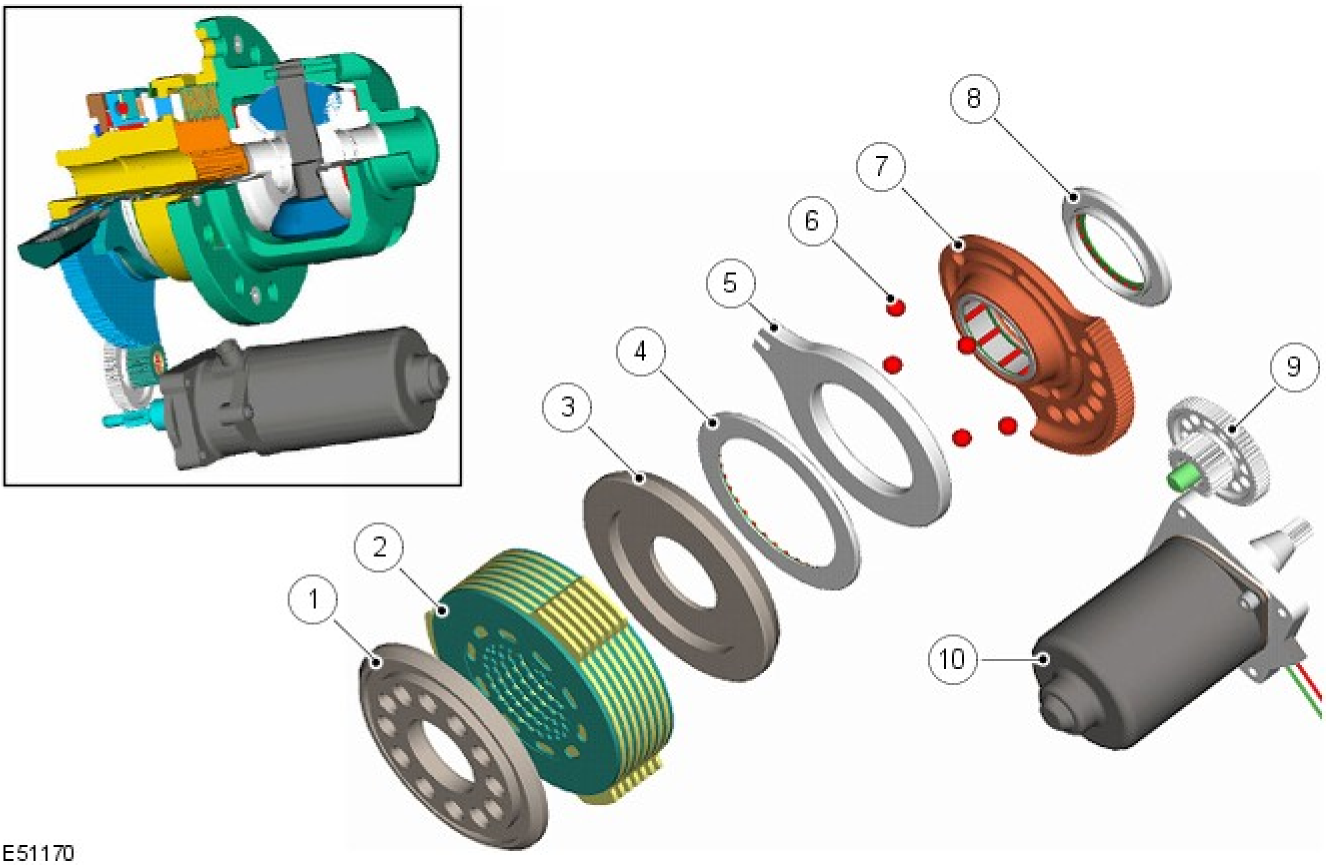


E51169

Item	Part Number	Description
1	-	Actuator
2	-	Clutch pack
3	-	Differential

The electronic rear differential locking and biasing feature is actuated via a DC motor, which is controlled by the electronic rear differential control module, via a Pulse Width Modulation (PWM) signal.

Multi-plate Clutch Assembly



E51170

Item	Part Number	Description
1	-	Pressure disc
2	-	Clutch plate assembly
3	-	Pressure disc
4	-	Thrust race
5	-	Output actuator
6	-	Actuator balls
7	-	Input actuator
8	-	Bearing pre-load spacer
9	-	Reduction gearset
10	-	Actuator motor

The multi-plate clutch assembly for both centre (transfer box) and electronic rear differentials act in a similar way. The aim of the multi-plate clutch assembly is to prevent excessive differential slip and therefore maximise the traction performance of the vehicle. This is fundamentally different from the 'braked' traction control, which can only counteract differential slip when it occurs.

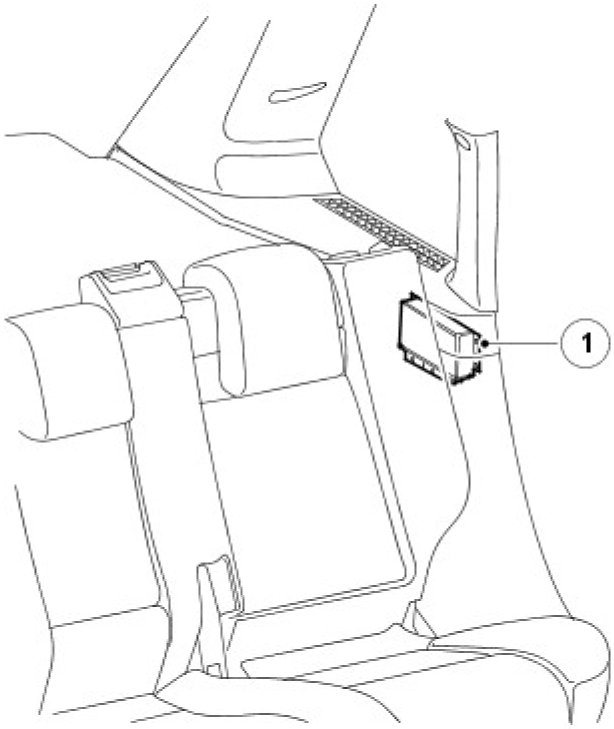
A certain amount of differential slip is required to allow the vehicle to turn corners and to remain stable under control of the Anti-lock Braking System (ABS). The transfer box control module monitors the driver's demands through primary vehicle controls and automatically sets the slip torque at the rear differential via the electronic rear differential control module. The system is completely automatic and does not require any special driver input.

The multi-plate clutch assembly actively controls the torque flow through the rear differential and optimises the torque distribution in the driveline. The clutch assembly biases the torque from the differential to the wheels with the higher grip and prevents the wheels with the lower grip from spinning.

By turning the input actuator disc, via the motor shaft, the output actuator is rotated. This movement acts on 5 balls in a ramp mechanism between the input and output actuators and gives a defined axial movement. The movement forces the pressure disc to induce friction between the sun gear and differential case via the clutch plates supported by the sun gear and the plates supported by the clutch basket on the differential case. This frictional force inhibits the differential rotation; the differential case and left hand differential side gear are locked together.

Electronic Rear Differential Control Module

The electronic rear differential control module controls the multi-plate clutch actuation. The control module is mounted on a bracket located on the LH C-pillar, behind the trim.



E56476

Item	Part Number	Description
1	-	Electronic rear differential control module

The control module is connected on the Controller Area Network (CAN) bus and controls the differential operation using CAN messages from other control modules on the network.

The control module uses three connectors for all inputs and outputs. It receives a permanent power supply via a 40A fusible link located in the Battery Junction Box (BJB), and an ignition supply via fuse 24 located in the Central Junction Box (CJB).

The control module memorises the position of the electronic rear differential motor when the ignition is switched off.

The control module controls the closed loop position sensing system within the motor and regulates the power supply to the motor.

If the control module is replaced, T4 must be connected to the vehicle and the electronic rear differential control module self-calibration procedure must be performed. This procedure must also be performed if the motor or differential assembly is replaced.

If a fault occurs with the electronic rear differential, the control module or one of the required input signals, i.e. road speed signal, the control module records an error code and a warning lamp, in the instrument cluster, illuminates permanently.

Electronic Rear Differential Control Module Pin Out Details

Connector C2162

Pin No.	Description	Input/output
1	Not used	-
2	CAN bus low	Input/output
3	CAN bus high	Input/output

18	Motor brake solenoid	Input

CAN Bus Messages

The CAN bus is a high speed broadcast network connected between various vehicle control modules. It allows the fast exchange of data between control modules every few microseconds. The bus comprises two wires, which are twisted together to minimise electromagnetic interference (noise) produced by the CAN messages.
For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

The electronic rear differential control module is connected on the CAN bus, via the transfer box control module, and controls differential operation using CAN messages from other control units on the network. Wheel speed, steering angle, automatic transmission speed, temperature information, car configuration, axle ratios and mode inputs, are some of the main signals received by the control module.

The control module also sends messages via the CAN bus to tell other control modules on the network, the status of the electronic rear differential. The clutch torque and default mode status are some of the main signals sent out by the control module.

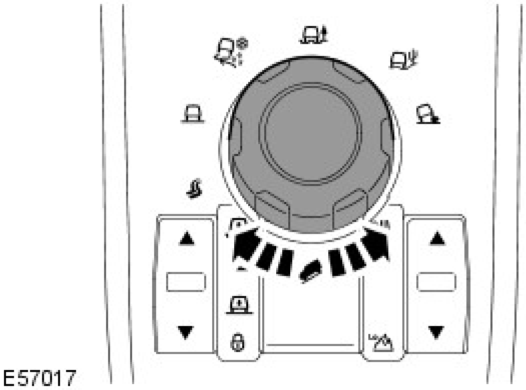
The following table shows the messages that can be displayed in the message centre of a high-line instrument cluster relating to the electronic rear differential:

Message	Description	Chime
'TRANSMISSION OVERHEAT' 'SLOW DOWN'	Rear differential temperature has reached or is approaching the overheat threshold.	None
'TRANSMISSION FAULT' 'TRACTION REDUCED'	Transfer box control module has stopped transmitting CAN bus messages. Defaults to open centre differential. Message also displayed when fault occurs with electronic rear differential.	None
'TRANSMISSION FAULT' 'STOP SAFELY'	Fault has occurred with electronic rear differential. Stop vehicle at earliest opportunity.	Single

On vehicles fitted with the low line instrument cluster, in place of the message centre there will be a status lamp, which has the following logic:

- Amber - Over temperature
- Red - Failure, stop vehicle

TERRAIN RESPONSE



The Terrain Response system allows the driver to select a program, which will provide the optimum settings for traction and performance for the prevailing terrain conditions.

The system is controlled by a rotary control located on the centre console.

The system uses a combination of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems form the Terrain Response system:

- Engine management system
- Automatic transmission
- Transfer box
- Brake system
- Air suspension.

Each subsystem control module provides a feedback for the selected program so that the Terrain Response control module can check that all systems are controlling the system correctly. The exception to this is the electronic rear differential control module, which does not provide feedback to the Terrain Response system as it is a slave to the transfer box control module.
For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

SERVICE

The oil used in the electronic rear differential is Castrol SAF-Carbon Mod Plus. The oil contains unique additives and friction modifiers, which enhance the differentials operation. No other oil must be used in the electronic rear differential.

Electronic Rear Differential Serviceable Components

- Halfshaft seals
- Needle roller bearing assembly
- Chassis bush/fixings
- Actuator motor
- Temperature sensor
- Control module and bracket
- Lubricant.

DIAGNOSTICS

The electronic rear differential control module can store fault codes, which can be retrieved using T4 or a diagnostic tool using ISO-14229 protocol.

The information is communicated via a diagnostic socket.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems and T4 or another suitable diagnostic tool. The information is communicated to the socket via the CAN bus. This allows the retrieval of diagnostic information and programming of certain functions using T4 or another suitable diagnostic tool.

The electronic rear differential control module uses Diagnostic Trouble Codes (DTC), which relate to electronic rear differential electrical faults.

Rear Drive Axle/Differential - Rear Drive Axle and Differential

Diagnosis and Testing

Principle of Operation

For additional information, refer to section 205-02 - Rear Drive Axle/Differential of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Confirm which, if any, warning lights and/or messages were displayed on the instrument cluster. For a list of messages, refer to the relevant section of the workshop manual.
3. **3.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Differential oil leakage ● Sensor installation	● power ● Fuse(s) ● Wiring harness physical damage or water ingress ● Loose or corroded electrical connectors ● Controller area network (CAN) circuits ● Sensors ● Rear differential control module

4. **4.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. **5.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible message	Possible other warnings	Possible causes	Action
Running at reduced capability with fault present	● Rear differential fault	● Driveline overheat warning lamp illuminated ● Rear differential/driveline fault warning lamp illuminated	● Water ingress to wiring harness or connectors ● Reduced differential capability ● Differential increased tolerances ● Internal fault ● Rear differential control module fault (Rear differential control module)	Visually inspect the wiring harness and connectors for water ingress. Refer to the warranty policy and procedures manual if a module is suspect.
Rear differential overheat	● Rear differential Overheat Slow Down	● Driveline overheat warning lamp illuminated	● Oil level incorrect ● Oil level incorrect specification ● Sensor fault ● Internal fault	Check for correct oil quantity and specifications. Refer to the relevant section of the workshop manual.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: Intermittent faults may cause DTCs to be logged, however some DTCs may be cleared during an ignition off, ignition on cycle. Carry out a road test (if safe to do so), check the functionality of the system and retrieve any DTCs **before** turning the ignition off.

DTC	Description	Possible causes	Action
P0562-00	System Voltage Low - no sub type information	● Rear differential control module voltage supply below 9V	Check the power charge condition, refer to the electrical guides and check the differential actuator sensor circuit, repair as necessary
P0563-00	System Voltage High - no sub type information	● Rear differential control module voltage supply below 16V	Check the charging circuit and power condition
P0604-00	Internal Control Module Random Access Memory (RAM) Error - no sub type information	● Rear differential control module internal error	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0605-00	Internal Control Module Read Only Memory (ROM) Error - no sub type information	● Rear differential control module internal error	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0606-00	Control Module Processor - no sub type information	● Watchdog reset	This is a control module internal check DTC and is not necessarily a fault. If no other DTCs are logged and no customer complaint exists, clear/ignore this DTC
P0607-00	Control Module Performance - no sub type information	● Rear differential control module internal error	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0652-00	Sensor Reference Voltage 'B' Circuit Low - no sub type information	● Actuator internal position sensor supply voltage below 57V	Refer to the electrical guides and check the differential actuator sensor position circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P0653-00	Sensor Reference Voltage 'B' Circuit High - no sub type information	● Actuator internal position sensor supply voltage below 83V	Refer to the electrical guides and check the differential actuator sensor position circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P0666-00	PCM/ECM/TCM Internal Temperature Sensor 'A' Circuit - no sub type information	● Rear differential control module internal temperature sensor value above 105°C	This is a control module internal check DTC and is not necessarily a fault. If no other DTCs are logged and no customer complaint exists, clear this DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P0712-00	Transmission Fluid Temperature Sensor 'A' Circuit Low - no sub type information	● Differential actuator internal temperature sensor open circuit or short circuit to ground	Refer to the electrical guides and check the differential actuator sensor circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P0713-00	Transmission Fluid Temperature Sensor 'A' Circuit High - no sub type information	● Differential actuator internal temperature sensor open circuit or short circuit to power	Refer to the electrical guides and check the differential actuator sensor circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P0806-00	Clutch Position Sensor Circuit Range/Performance - no sub type information	● Mismatch of actual and expected/calculated actuator position - Internal differential actuator error	Calibrate the clutch and range change mechanism using the approved diagnostic system or by the procedure listed in the description and operation. Refer to the relevant section of the workshop manual. Clear the DTC and retest. If the problem persists, renew the differential actuator
P0807-00	Clutch Position Sensor Circuit Low - no sub type information	● Differential actuator internal position sensor supply, ground, signal 1 or 2 open circuit or sensor supply, signal 1 or 2 short circuit to ground	Refer to the electrical guides and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P0808-00	Clutch Position Sensor Circuit High - no sub type information	● Differential actuator internal position sensor signal 1 or 2 short circuit to power	Refer to the electrical guides and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P080A-00	Clutch Position Not Learned - no sub type information	● Rear differential control module (RDCM) not calibrated ● Differential clutch stuck or out of tolerance	Using the approved diagnostic equipment, calibrate the rear differential control module. Clear the DTC and retest. If the problem persists, renew the rear differential assembly. Refer to the warranty policy and procedures manual if a differential is suspect

DTC	Description	Possible causes	Action
P0810-92	Clutch Position Control Error - performance or incorrect operation	- This DTC is for information only	If DTC P186D-00 is also logged in the rear differential control module, refer to repair actions as necessary. **If DTC P186D-00 is not logged no repair action is necessary.**
P0894-00	Transmission Component Slipping - no sub type information	- Differential actuator internal magnetic brake is slipping	Renew the differential actuator
P0900-00	Clutch Actuator Circuit/Open - no sub type information	- Differential actuator supply open circuit	Refer to the electrical guides and check the differential actuator circuit, repair as necessary
P0901-00	Clutch Actuator Circuit Range/Performance - no sub type information	- Differential actuator supply short circuit	Refer to the electrical guides and check the differential actuator circuit, repair as necessary
P0902-00	Clutch Actuator Circuit Low - no sub type information	- Differential actuator supply circuit short to ground.	Refer to the electrical guides and check the differential actuator circuit, repair as necessary
P0903-00	Clutch Actuator Circuit High - no sub type information	- Differential actuator supply circuit short to power	Refer to the electrical guides and check the differential actuator circuit, repair as necessary
P1603-00	EEPROM Malfunction - no sub type information	- Rear differential control module internal error	Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect
P1783-00	Transmission Over-Temperature Condition - no sub type information	- Rear Differential oil sump temperature sensor value above 150°C	Confirm the customer complaint and vehicle usage at the time of DTC event. Check the operation of the rear differential. Check the rear differential oil quantity and specification. Refer to the relevant section of the workshop manual. Clear the DTC and retest. If the problem persists, renew the rear differential assembly. Refer to the warranty policy and procedures manual if a differential is suspect
P186A-00	Differential Lock-Up Actuator Brake Control Circuit/Open - no sub type information	- Open circuit of actuator internal magnetic brake supply leads	Refer to the electrical guides and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P186B-00	Differential Lock-Up Actuator Brake Control Circuit Low - no sub type information	- Short circuit to ground of both differential actuator internal magnetic brake pins	Refer to the electrical guides and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P186C-00	Differential Lock-Up Actuator Brake Control Circuit High - no sub type information	- Short circuit to power of both differential actuator internal magnetic brake pins	Refer to the electrical guides and check the differential actuator circuit, repair as necessary. If no circuit problems exist, renew the differential actuator
P186D-00	Clutch Actuator Stuck - no sub type information	- Actuator fault	Using the approved diagnostic equipment, calibrate the rear differential control module/clutch actuator. Clear the DTC and retest. If the problem persists, renew the actuator
P2742-00	Transmission Fluid Temperature Sensor 'B' Circuit Low - no sub type information	- Rear differential oil sump temperature sensor short circuit to ground	Refer to the electrical guides and check the differential oil temperature sensor circuit, repair as necessary
P2743-00	Transmission Fluid Temperature Sensor 'B' Circuit High - no sub type information	- Rear differential oil sump temperature sensor open circuit or short circuit to power	Refer to the electrical guides and check the differential oil temperature sensor circuit, repair as necessary
P2785-00	Clutch Actuator Temperature Too High - no sub type information	- Actuator internal temperature sensor value above 150°C - Extensive prolonged off-road use - Insufficient oil quantity - Incorrect oil specification - Internal differential problem	Confirm the customer complaint and vehicle usage at the time of DTC event. Check the operation of the rear differential. Check the rear differential oil quantity and specification. Refer to the relevant section of the workshop manual. Clear the DTC and retest. If the problem persists, renew the rear differential assembly. Refer to the warranty policy and procedures manual if a differential is suspect

DTC	Description	Possible causes	Action
P2787-00	Clutch Temperature Too High - no sub type information	● Rear differential clutch pack temperature (calculated) above 200°C	Confirm the customer complaint and vehicle usage at the time of DTC event. Check the operation of the rear differential. Check the rear differential oil quantity and specification. Refer to the relevant section of the workshop manual. Clear the DTC and retest. If the problem persists, renew the rear differential assembly. Refer to the warranty policy and procedures manual if a differential is suspect
U0001-88	High Speed CAN Communication Bus - bus off	● High speed CAN communication Bus (CAN Bus Off)	Refer to the Network Communications section of the workshop manual
U0102-87	Lost Communication With Transfer Case Control Module - missing message	● Lost communication with TCCM	Refer to the bus off statement within workshop manual section 418-00. Refer to the Network Communications section of the workshop manual
U0122-87	Lost Communication With Vehicle Dynamics Control Module - missing message	● Lost communication with VDM	Refer to the bus off statement within workshop manual section 418-00. Refer to the Network Communications section of the workshop manual
U0300-55	Internal Control Module Software Incompatibility - not configured	● Rear differential control module not configured	Configure the module using the approved diagnostic system
U1A14-49	CAN Initialization Failure - internal electronic failure	● Rear differential control module supervision software failure ● Internal control module failure	Configure the module using the approved diagnostic system. Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect

Rear Drive Axle/Differential - Differential Draining and Filling

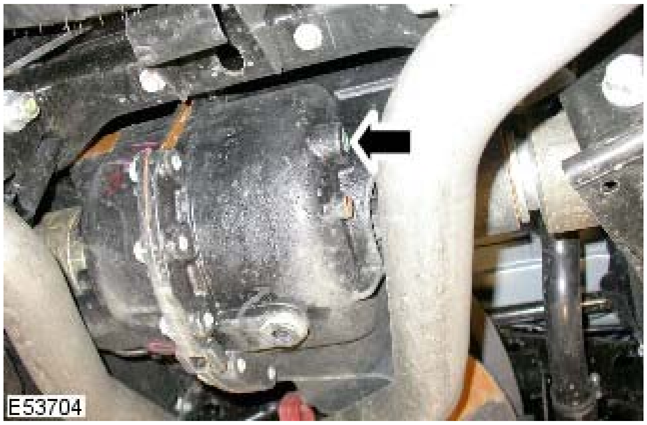
General Procedures

⚠ CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

• NOTE: The only way to check the fluid level in the differential is to drain all the fluid out and refill with the correct quantity, shown in the specification section.
For additional information, refer to: Specifications (205-02 Rear Drive Axle/Differential, Specifications).

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

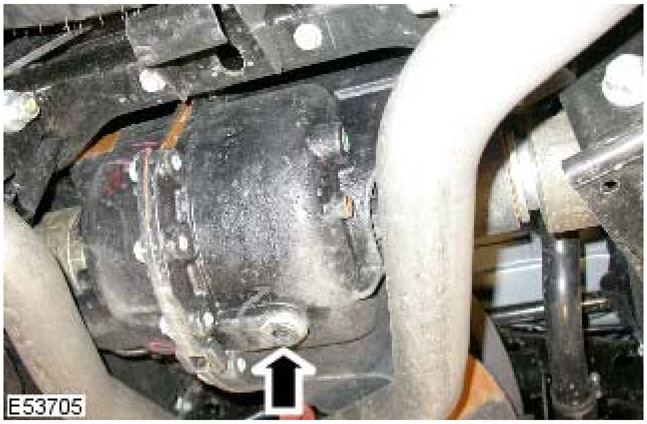
Raise and support the vehicle.



2. ⚠ CAUTION: Do not undo or remove the large protruding hexagon on the differential casing.

Remove the differential case lubricant filler plug.

- Clean the area around the lubricant filler plug.
- Position container to collect fluid loss.



3. Drain the differential lubricant.

- Clean the area around the drain plug.
- Remove the fluid drain plug.

4. ⚠ CAUTION: There has been 2 different types of fixings used for the drain plug. Note the type and make sure the correct torque is applied, see below.

Install the lubricant drain plug.

- Clean the drain plug.
- Up to differential serial number 254325: Tighten the hexagonal drive drain plug to 54 Nm (40 lb.ft).
- From differential serial number 254326: Tighten the 3/8'' square drive drain plug to 28 Nm (21 lb.ft).

5. CAUTIONS:

⚠ There have been 2 different types of fixings used for the drain plug. Note the type and differential serial number, and make sure the correct torque is applied, see below.

⚠ Make sure the correct specification and quantity of oil is used.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Specifications (205-02 Rear Drive Axle/Differential, Specifications).

6. Install the differential filler plug.

- Clean the filler plug.
- Tighten the filler plug to 34 Nm (25 lb.ft).

Published: 11-May-2011

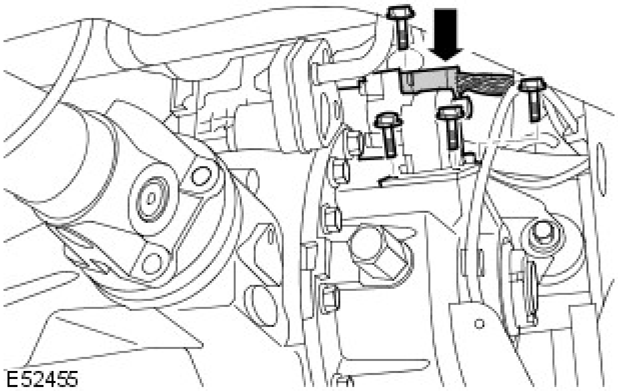
Rear Drive Axle/Differential - Differential Locking Motor

In-vehicle Repair

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

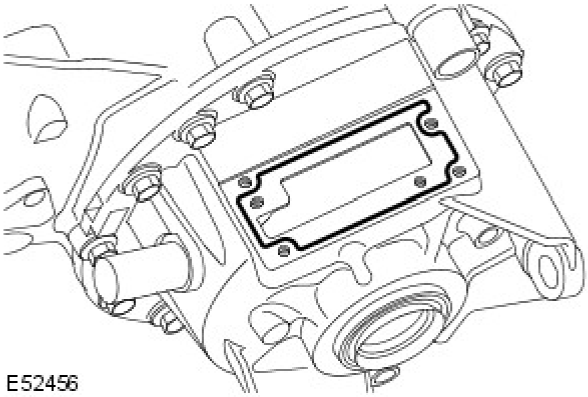


2. Remove the differential locking motor.

- Disconnect the electrical connector.
- Remove the 4 bolts.

Installation

1. Clean the component mating faces.



2. Apply continuous bead of sealant to the motor mating face on the differential.

3. Install the differential locking motor.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Connect the electrical connector.

4. Lower the vehicle.

5. Calibrate the differential locking motor using the diagnostic tool.

Published: 11-May-2011

Rear Drive Axle/Differential - Rear Axle Oil Temperature Sensor

In-vehicle Repair

Removal

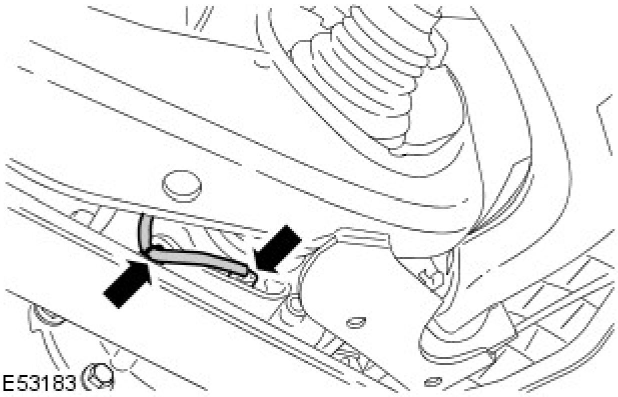
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

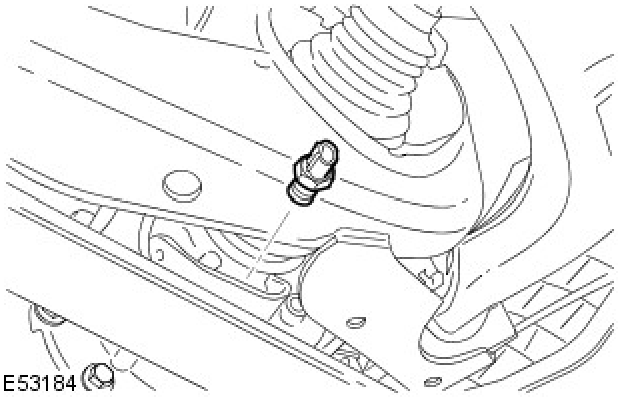
3. Disconnect the electrical connector.

- Release the wiring harness retaining clip.



4. Remove the oil temperature sensor.

- Remove and discard the O-ring seal.



Installation

1. Clean the component mating faces.

2. Install the oil temperature sensor.

- Tighten to 22 Nm (16 lb.ft).

3. Connect the electrical connector.

- Secure the wiring harness clip.

4. Fill the differential with the correct amount of lubricant.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

Rear Drive Axle/Differential - Drive Pinion Seal

In-vehicle Repair

Special Tool(s)	
 205-053 E54574	Flange holding tool 205-053
 205-053 E54585	Adapter for 205-053
 100-012 E54135	Impulse extractor 100-012(LRT-99-004)
 205-821 E54586	Installer drive pinion oil seal 205-821
 205-824 E54587	Remover drive flange 205-824
 205-823 E54700	Remover drive pinion seal 205-823

 E112195	Seal installer, adaptor 205-821-01

Removal

• CAUTIONS:

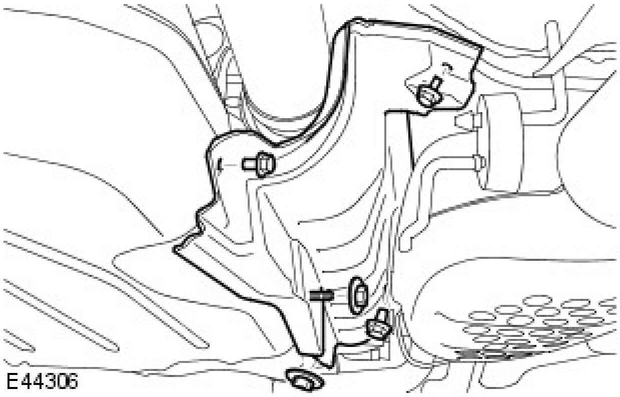
⚠ The input flange must not be change for one from another unit.

⚠ The drive pinion seal must only be renewed for 1 repair.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

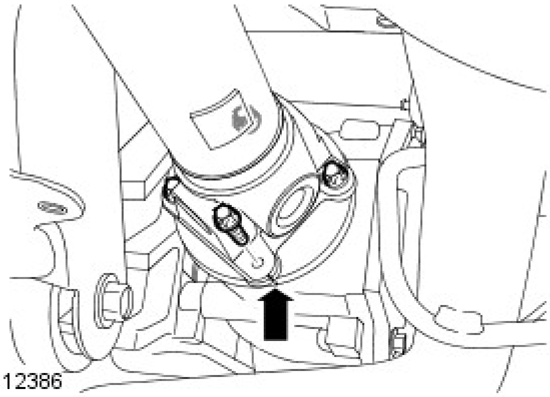
2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).



E44306

3. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

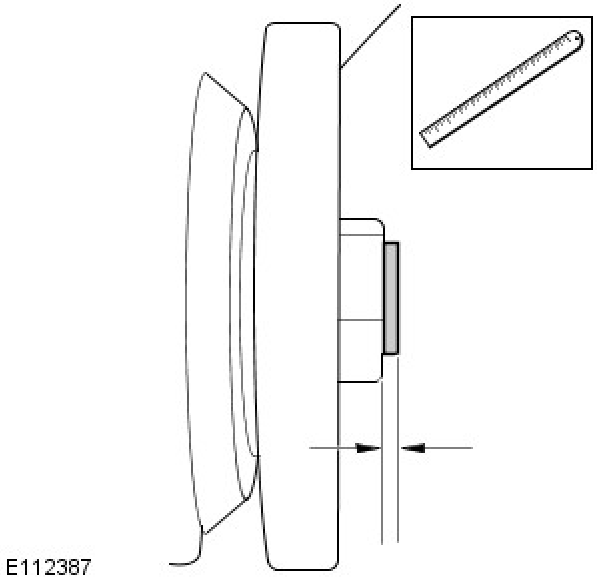


E112386

4. ⚠ CAUTION: Mark the position of the driveshaft flange in relation to the drive pinion flange.

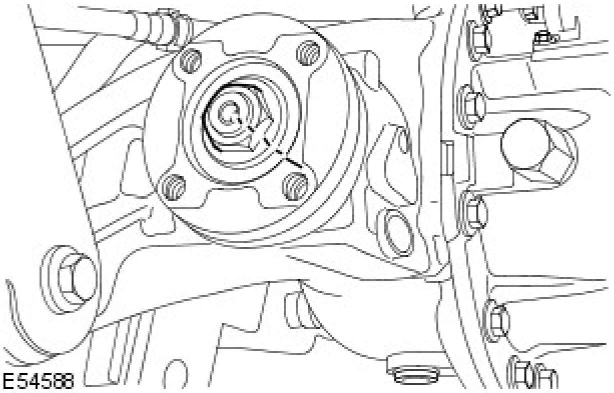
Release the driveshaft from the rear axle drive pinion flange.

- Remove and discard the 4 Torx bolts.



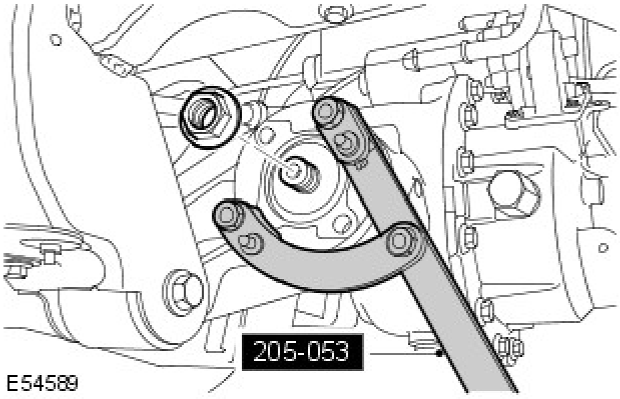
5. Measure the depth of the pinion nut on the pinion shaft.

- Note measurement for installation.



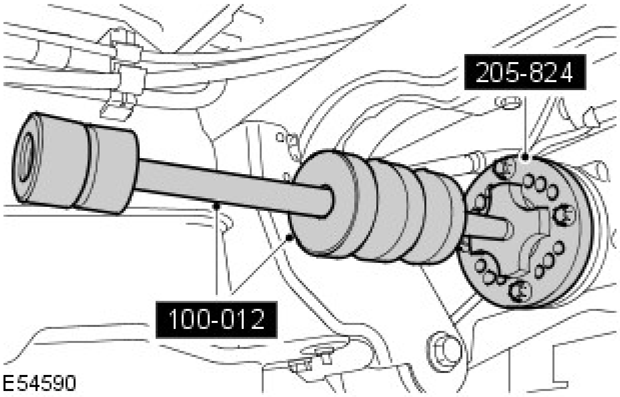
6. ⚠ CAUTION: This step must be carried out to make sure that the drive pinion nut is correctly tightend on assembly.

Accurately scribe a line to mark the drive pinion shaft to the drive pinion nut and pinion flange.



7. Remove the drive pinion flange retaining nut.

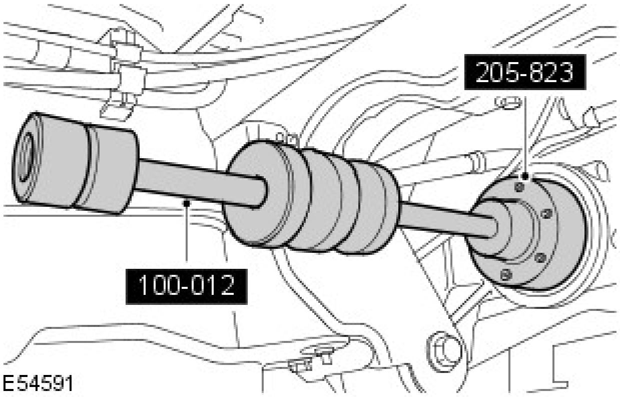
- Using the special tool, counter hold the drive pinion flange.
- Note number of turns for installation.



205-824
100-012
E54590

8. Using the special tool, remove the drive pinion flange.

- Check flange seal journal for any damage.



205-823
100-012
E54591

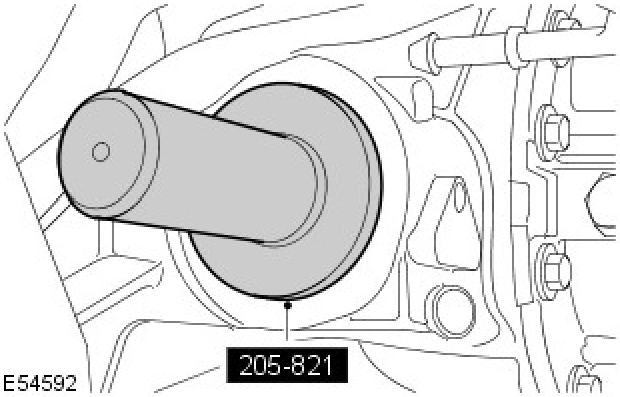
9. Using the special tool, remove the drive pinion seal.

Installation

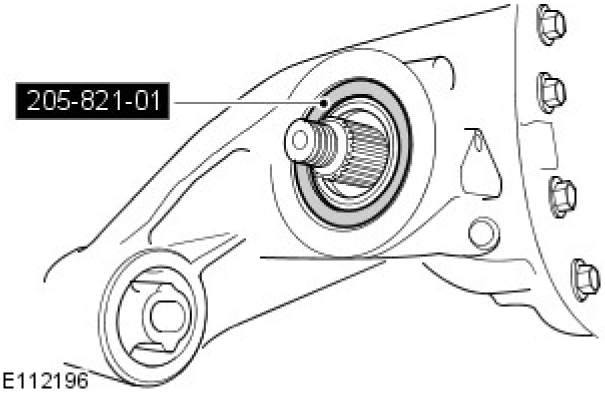
1. Clean the drive pinion flange.

2. Clean the drive pinion seal mating faces.

3. Using the special tool, install the new drive pinion seal.

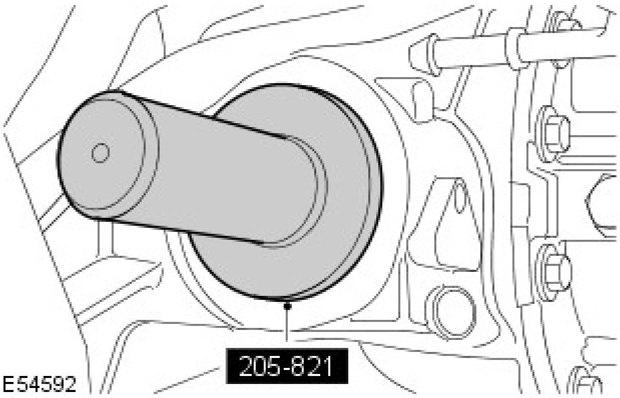


205-821
E54592



4. Remove the special tool.

- Install special tool 205-821-01 to the seal face.



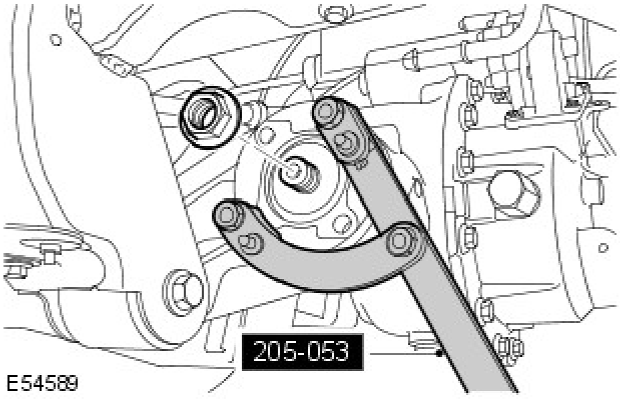
5. ⚠ CAUTION: Make sure adaptor is removed or damage to the vehicle may occur.

Using the special tool, install the new drive pinion seal.

- Remove the special tools.

6. ⚠ CAUTION: Make sure the drive pinion flange scribed marks are aligned.

Install the drive pinion flange.



7. CAUTIONS:

⚠ Make sure the mark on the drive pinion nut is never tightened short of the scribed mark on the drive pinion shaft.

⚠ Make sure the drive pinion flange has no end float and is free to rotate.

⚠ Make sure the scribed mark on the drive pinion nut is no more than a maximum of 5 degrees past the scribed mark on the drive pinion shaft.

Install the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Install nut to previously noted number of turns.
- Measure the depth of the pinion nut on the pinion shaft.

8. Attach the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Attach the driveshaft to the rear axle drive flange.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

9. Install the fuel tank heat shield.

- Tighten the bolts and nuts to 10 Nm (7 lb.ft).

10. ⚠ CAUTION: Make sure the correct specification and quanity of oil is used.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

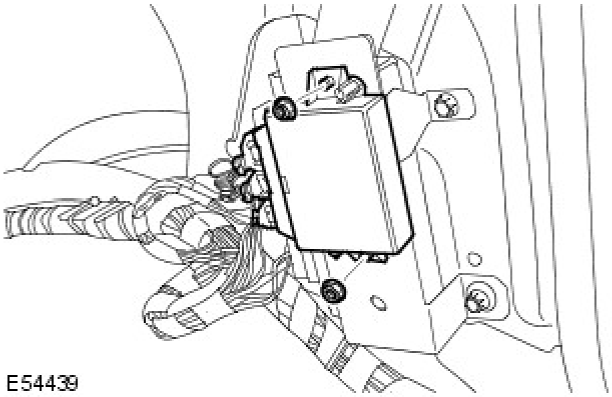
Published: 11-May-2011

Rear Drive Axle / Differential - Differential Locking Module

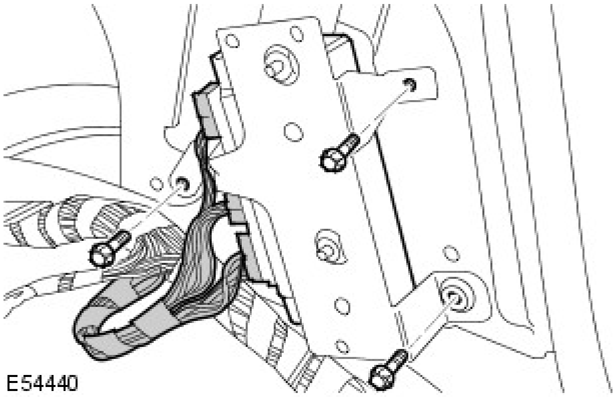
In-vehicle Repair

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the rear quarter trim panel.
   For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Release the parking aid module.
   - Remove the 2 nuts.



4. Remove the differential locking module.
   - Disconnect the 3 electrical connectors.
   - Remove the 3 bolts.



Installation

1. Install the differential locking module.
   - Install the bolts and tighten to 10 Nm (7 lb.ft).
   - Connect and secure the electrical connectors.
2. Install the parking aid module.
   - Tighten the nuts to 10 Nm (7 lb.ft).
3. Install the rear quarter trim panel.
   For additional information, refer to: Rear Quarter Trim Panel (501-05 Interior Trim and Ornamentation, Removal and Installation).
4. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

5. Use T4 to calibrate a new differential locking module.

Rear Drive Axle/Differential - Axle Assembly

Removal and Installation

Removal

⚠ CAUTION: Do not undo or remove the large protruding hexagon on the differential casing.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

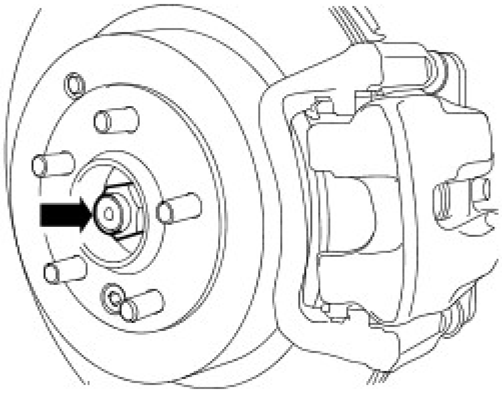
Raise and support the vehicle.

2. Remove the rear wheels and tires.

3. Remove the exhaust system.
For additional information, refer to: Muffler (309-00A Exhaust System - V8 S/C 4.2L Petrol, Removal and Installation).

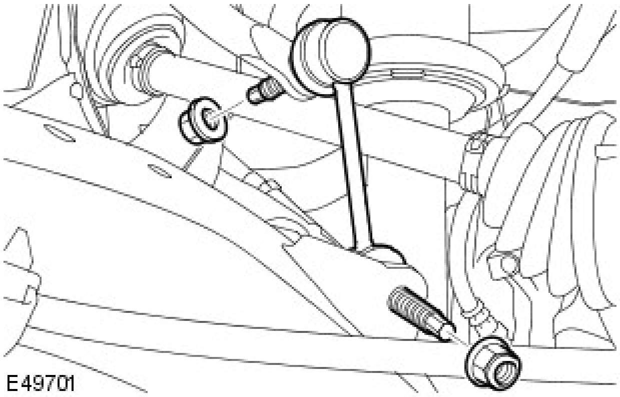
4. Drain the differential fluid.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

5. Remove the RH halfshaft.
For additional information, refer to: Rear Halfshaft (205-05 Rear Drive Halfshafts, Removal and Installation).



6. Remove the LH halfshaft retaining nut.

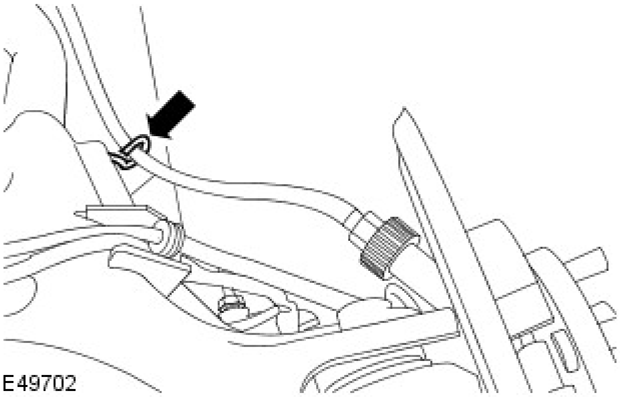
- Discard the nut.



7. ⚠ CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

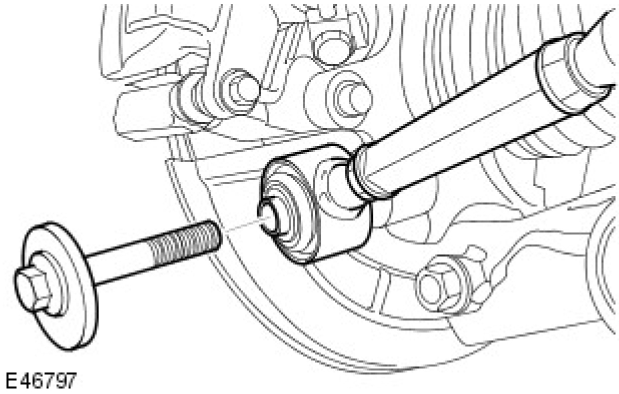
Remove the LH stabilizer bar link and discard the nuts.

8. Release the LH parking brake cable from the lower arm.



9. Disconnect the LH toe link.

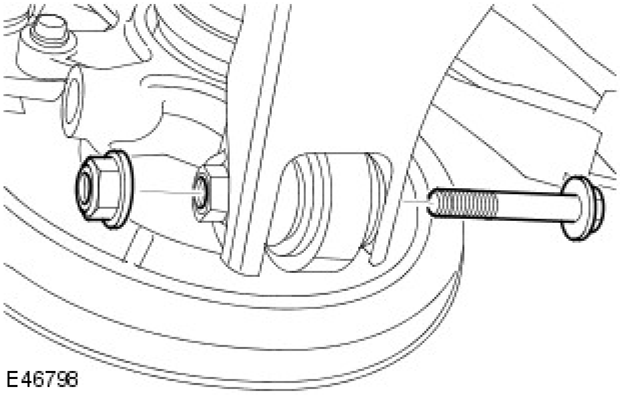
- Remove the bolt.



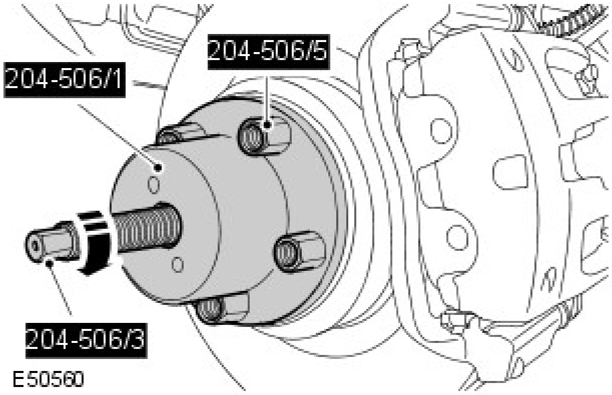
10. ⚠CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Release the LH knuckle from the lower arm.

- Remove the bolt.



11. Using the special tools, release the LH halfshaft from the wheel hub.



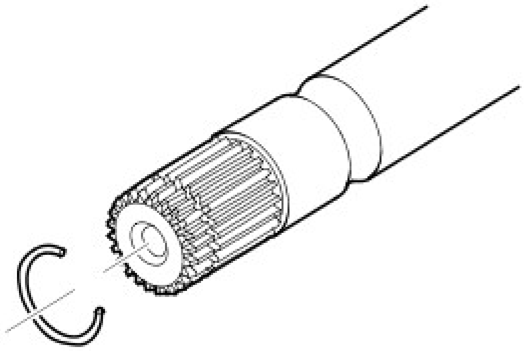
204-506/1
204-506/5
204-506/3
E50560

12. Position a container to collect the oil spillage.

13. Release the LH halfshaft from the differential housing.

14. With assistance, remove the LH halfshaft.

- Remove and discard the snap ring.



E45752

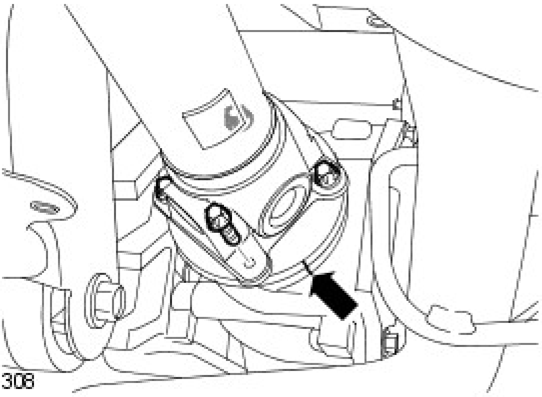
15. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the rear axle drive flange.

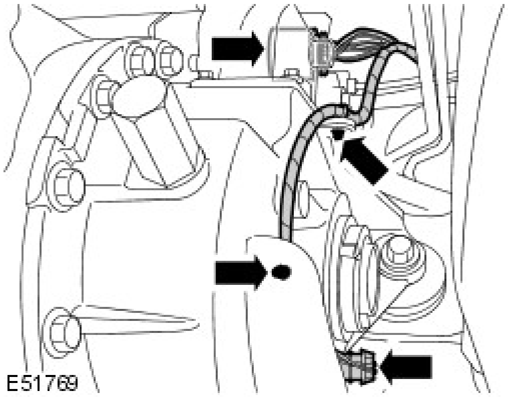
- Remove and discard the 4 Torx bolts.
- Tie aside.



E44308

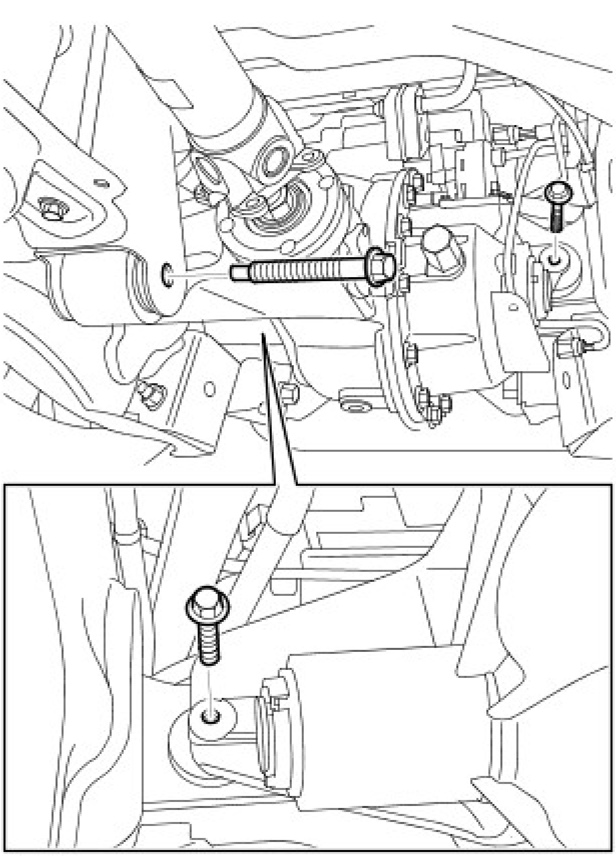
16. Vehicles with differential locking motor: Disconnect the 2 electrical connectors.

- Release the 2 wiring harness clips.



E51769

17. Using a transmission jack, support the differential.



E51590

18. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the rear differential.

- Remove the 3 bolts.
- Disconnect the breather line.

Installation

1. Install the rear differential.

- Connect the breather line.
- Tighten the front mounting bolt to 275 Nm (203 lb.ft).
- Tighten the rear mounting bolts to 175 Nm (129 lb.ft).

2. Vehicles with differential locking motor: Connect the electrical connectors.

- Secure the wiring harness clips.

3. Attach the driveshaft to the rear axle drive flange.

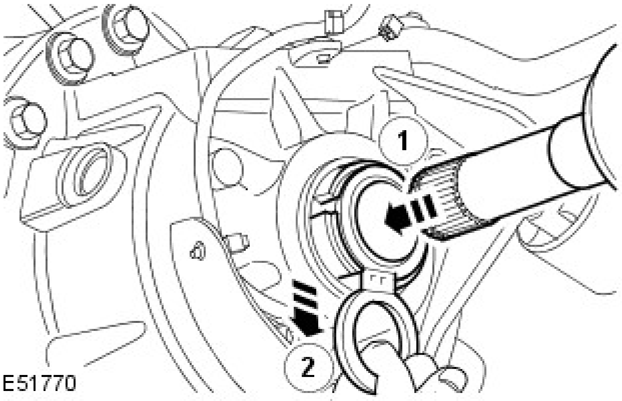
- Clean the component mating faces.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

4. Install the exhaust system.
For additional information, refer to: Muffler (309-00A Exhaust System - V8 S/C 4.2L Petrol, Removal and Installation).

5. Clean the components.

6. With assistance, install the LH halfshaft.

- Install the snap ring.
- Open the halfshaft oil seal protector.
- Make sure the snap ring is fully engaged and retains the halfshaft.

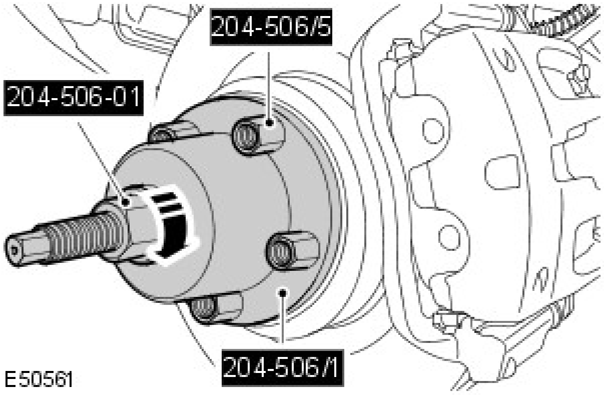


7. NOTE: The oil seal protector is designed to break into two pieces.

- NOTE: RH illustration shown, LH is similar.

Remove and discard the halfshaft oil seal protector.

- Use pull ring to break seal protector as shown.



8. Using the special tools, install the LH halfshaft in the wheel hub.

9. ⚠ CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Connect the LH lower arm to the wheel knuckle.

- Tighten to 275 Nm (203 lb.ft).

10. Install a new halfshaft retaining nut and lightly tighten.

11. Connect the LH toe link.

- Tighten the bolt to 175 Nm (129 lb.ft).

12. Secure the LH parking brake cable to the lower arm.

13. Install the LH stabilizer bar link.

- Tighten the new nuts to 115 Nm (85 lb.ft).

14. Tighten the LH halfshaft retaining nut to 350 Nm (258 lb.ft).

- Stake the nut to the halfshaft.

15. Install the RH halfshaft.
For additional information, refer to: Rear Halfshaft (205-05 Rear Drive Halfshafts, Removal and Installation).

16. Fill the differential with fluid.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

17. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Removal

- NOTE: Take note of the fitted position of the bush.

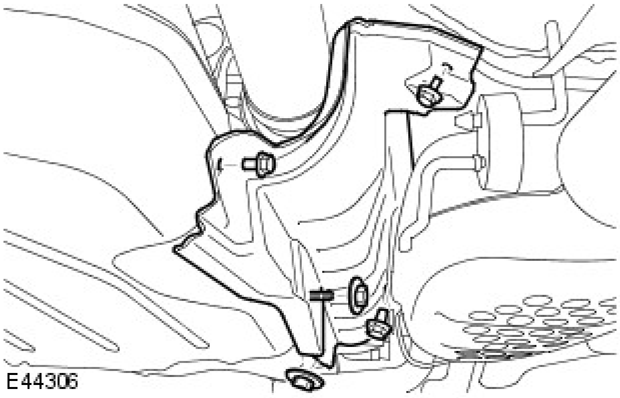
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

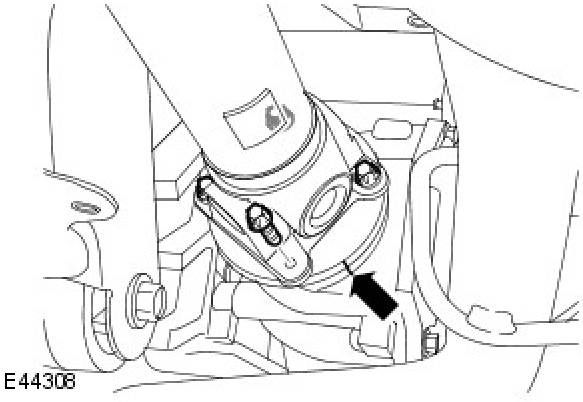
Raise and support the vehicle.

2. Remove the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

3. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.





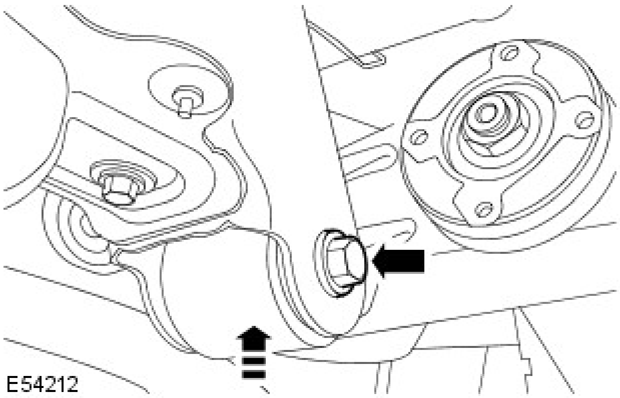
4. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft from the rear axle drive flange.

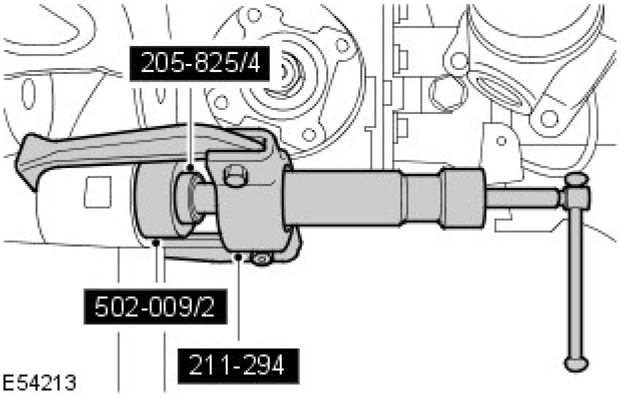
- Remove and discard the 4 Torx bolts.



5. ⚠CAUTION: Make sure the weight of the axle is always supported.

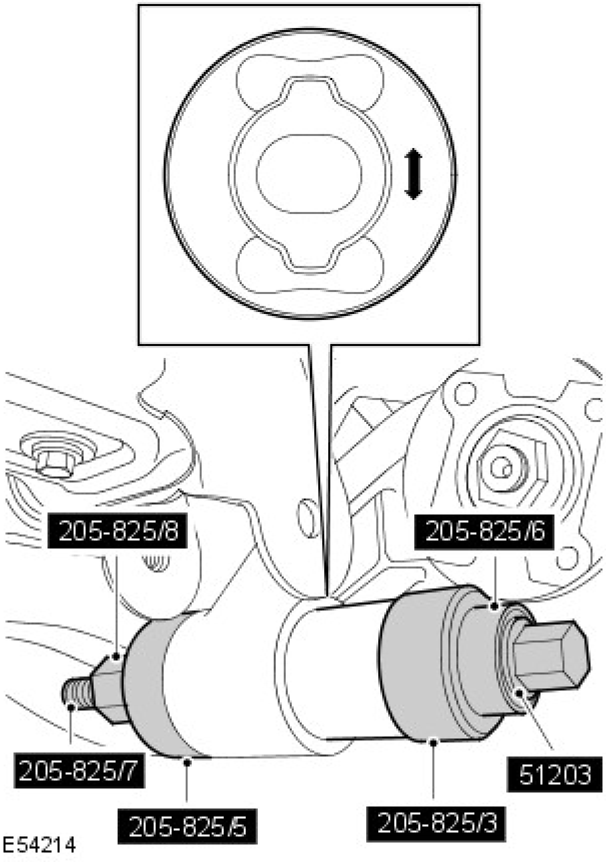
Using a suitable jack, lower the front of the axle.

- Remove the axle front retaining bolt.



6. Using the special tools, remove the axle housing bushing.

Installation



1. Using the special tools, install the axle housing bushing.

2. ⚠CAUTION: Make sure the weight of the axle is always supported.

Using a suitable jack, raise the front of the differential.

- Install the axle front retaining bolt.
- Tighten to 275 Nm (203 lb.ft).

3. Attach the driveshaft to the rear axle drive flange.

- Clean the component mating faces.
- Attach the driveshaft to the rear axle drive flange.
- Tighten the new Torx bolts to 150 Nm (110 lb.ft).

4. Install the fuel tank heat shield.

- Tighten the bolts and nuts to 10 Nm (7 lb.ft).

5. Install the muffler assembly.
For additional information, refer to: Muffler (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

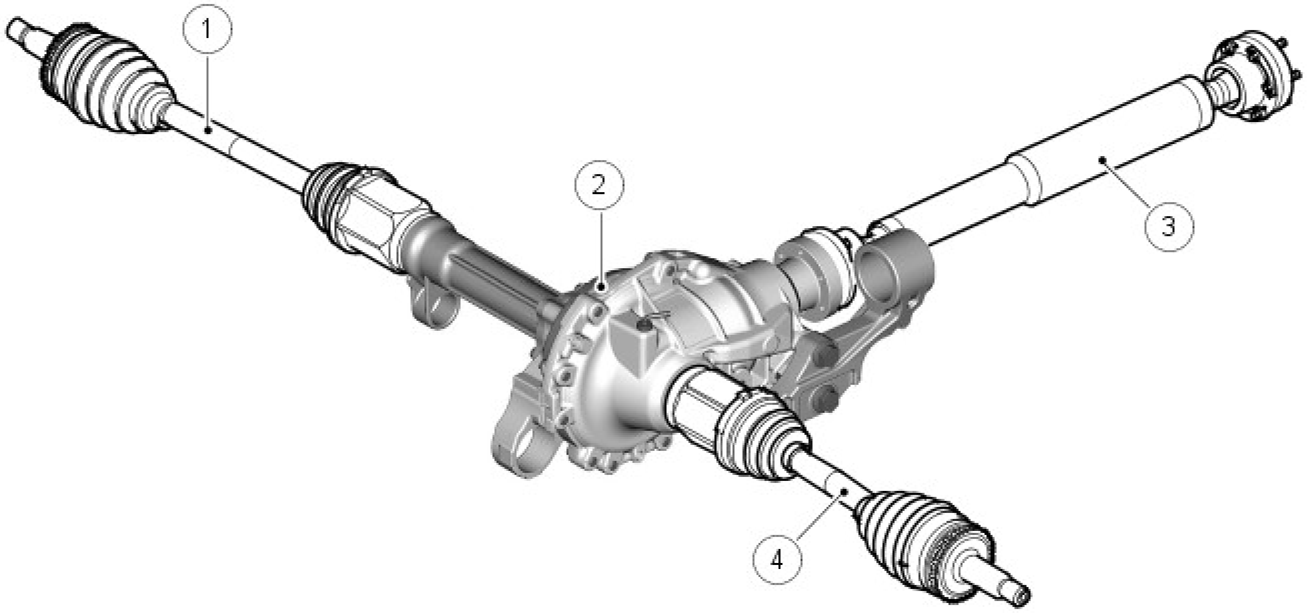
Front Drive Axle/Differential - Front Drive Axle and Differential

Description and Operation

GENERAL



E50981

Item	Part Number	Description
1	-	RH front drive halfshaft
2	-	Front differential assembly
3	-	Front driveshaft
4	-	LH front drive halfshaft

The front differential converts the 'angle of drive' through 90° and distributes drive, via the front drive halfshafts, to the front wheels.

The front differential for the V8 petrol variants utilise the same output ratio, which differs to that used on the TdV6.

The front differential is mounted on the LH side of the chassis.

46	-	Mounting bush assembly

The casing comprises two halves with machined mating faces. When assembled, the cast iron casing halves are sealed with a thin film of Loctite 5999 sealant and secured together with fourteen bolts. A breather tube is fitted to the casings. This allows a plastic tube to be fitted and routed to a high point in the engine compartment, preventing the ingress of water when the vehicle is wading.

The RH casing is fitted with a drain plug. The front differential unit contains approximately 0.7 litre of oil for a dry fill.

The differential is a conventional design using a hypoid gear layout. This employs a hypoid bevel pinion gear and crown wheel, with the pinion offset above the centre line of the crown wheel. This design allows for a larger pinion gear to be used, which has the advantages of increased gear strength and reduced operating noise.

The front differential is available in two ratios. V8 petrol engine vehicles use a front differential with a final drive ratio of 3.73:1 and TdV6 diesel engine vehicles use a final drive ratio of 3.54:1. Changing the number of teeth between the crown-wheel drive gear and pinion gear changes the ratio.

The differential comprises a pinion shaft and hypoid bevel gear, a crown wheel drive gear with an integral cage, which houses two planet gears. Two sunwheels are also located in the cage and pass the rotational drive to the drive shaft shafts.

The pinion shaft is mounted on two opposed taper roller bearings with a collapsable spacer located between them. The spacer is used to hold the bearings in alignment and also collapses under the pressure applied to the pinion nut. This allows the nut to be tightened to a predetermined torque, which collapses the spacer, setting the correct bearing preload.

The pinion shaft has an externally splined outer end which accepts and locates the input flange, which is retained by the pinion nut. The opposite end of the output flange has an internal spline which provides positive location for the front propeller shaft. The flange has an external O-ring seal, which seals against the front propeller shaft shroud preventing the ingress of dirt and moisture into the splines. An oil seal is pressed into the LH casing and seals the input flange to the differential unit. The pinion shaft has a hypoid bevel gear at its inner end which mates with the crown wheel drive gear.

The crown wheel drive gear is located on the carrier and secured with ten bolts. The carrier is mounted on taper roller bearings located in each casing half. The bearings are press fitted into the casing and a spacer is located on the outside face to set backlash and apply preload to the bearing.

The carrier is fitted with a shaft onto which the two planet gears are mounted. The shaft is secured in the carrier with a roll pin. The sunwheels are located in pockets within the carrier and mesh with the planet gears. Thrust washers are located between the carrier and the sunwheels and hold the sunwheels in mesh with the planet gears. Each sunwheel has a machined, splined, bore to accept the drive shaft. A groove is machined in the bore to locate the snap ring fitted to the drive shaft, providing positive drive shaft location.

Differential Operation

The operating principles of the front and rear differentials are the same. Rotational input from the drive shaft is passed via the input flange to the pinion shaft and pinion gear. The angles of the pinion gear to the crown wheel drive gear moves the rotational direction through 90°.

The transferred rotational motion is now passed to the crown wheel drive gear, which in turn rotates the carrier. The shaft, which is secured to the carrier, also rotates at the same speed as the carrier. The planet gears, which are mounted on the shaft, also rotate with the carrier. In turn, the planet gears transfer their rotational motion to the left and right hand sunwheels, rotating the drive shafts.

When the vehicle is moving in a forward direction, the torque applied through the differential to each sunwheel is equal. In this condition both drive shafts rotate at the same speed. The planet gears do not rotate and effectively lock the sunwheels to the carrier.

If the vehicle is turning, the outer wheel will be forced to rotate faster than the inner wheel by having a greater distance to travel. The differential senses the torque difference between the sunwheels. The planet gears rotate on their axes to allow the outer wheel to rotate faster than the inner one.

SERVICE

The oil used in the front differential is Castrol SAF-XO. The oil contains unique additives, which enhance the differentials operation. No other oil must be used in the front differential.

Front Differential Serviceable Components

- Halfshaft seals
- Needle roller bearing assemblies
- Chassis bush/fixings
- Lubricant.

Front Drive Axle/Differential - Front Drive Axle

Front Drive Axle / Differential - Differential Draining and Filling

General Procedures

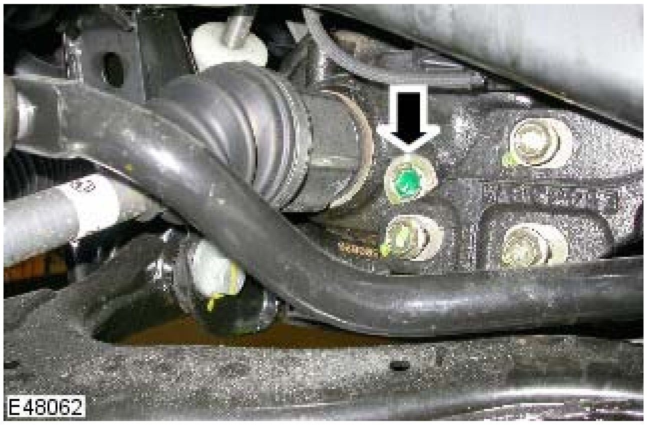
⚠ CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, not to act as a level indicator.

• NOTE: The only way to check the fluid level in the differential is to drain all the fluid out and refill with the correct quantity, shown in the specification section.
For additional information, refer to: Specifications (205-03 Front Drive Axle/Differential, Specifications).

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

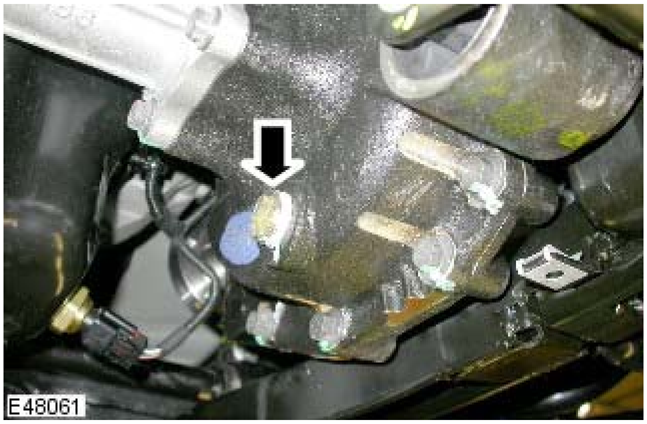
Raise and support the vehicle.

2. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



3. Remove the differential case lubricant filler plug.

- Clean the area around the lubricant filler plug.
- Position container to collect fluid loss.



4. Drain the differential lubricant.

- Clean the area around the drain plug.
- Remove the fluid drain plug.

5. ⚠ CAUTION: There have been 2 different types of fixings used for the drain plug. Note the type and differential serial number, and make sure the correct torque is applied, see below.

Install the lubricant drain plug.

- Clean the drain plug.
- Up to differential serial number 254845: Tighten the hexagonal drive drain plug to 54 Nm (40 lb.ft).
- From differential serial number 254846: Tighten the 3/8'' square drive drain plug to 28 Nm (21 lb.ft).

6. ⚠ CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, not to act as a level indicator.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Specifications (205-03 Front Drive Axle/Differential, Specifications).

7. Install the differential filler plug.

- Tighten the filler plug to 34 Nm (25 lb.ft).

8. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

Removal

CAUTION: The drive pinion seal must only be renewed once.

All vehicles

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Drain the differential lubricant.
   For additional information, refer to: Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

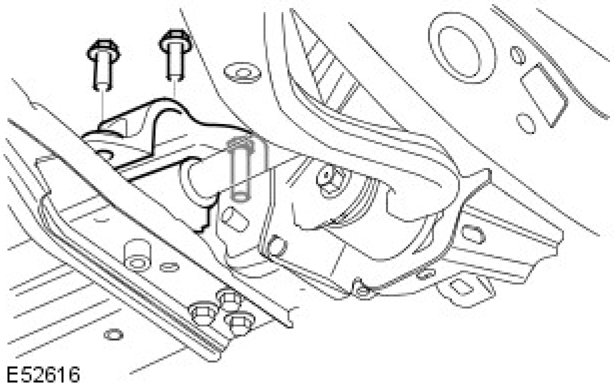
3. Remove the front driveshaft. For additional information, refer to: (205-01 Driveshaft)

   Front Driveshaft - V8 S/C 4.2L Petrol (Removal and Installation),
   Front Driveshaft - V8 4.4L Petrol (Removal and Installation),
   Front Driveshaft - TDV6 2.7L Diesel (Removal and Installation),
   Front Driveshaft - TDV8 3.6L Diesel (Removal and Installation).

Vehicles with Active Stabilization

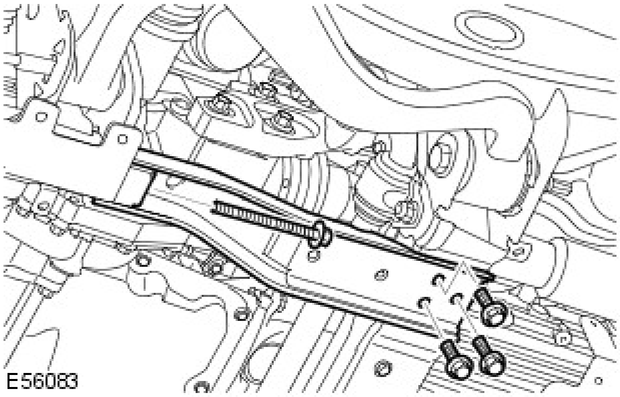
4. Remove the LH stabilizer bar bracket.

   - Remove the 3 bolts.

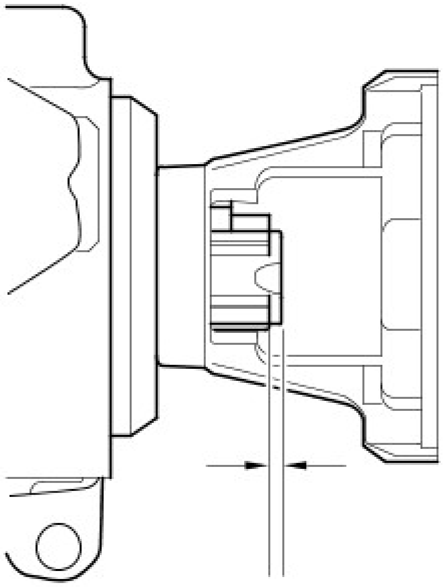


5. Remove the front axle crossmember.

   - Remove the 4 bolts.



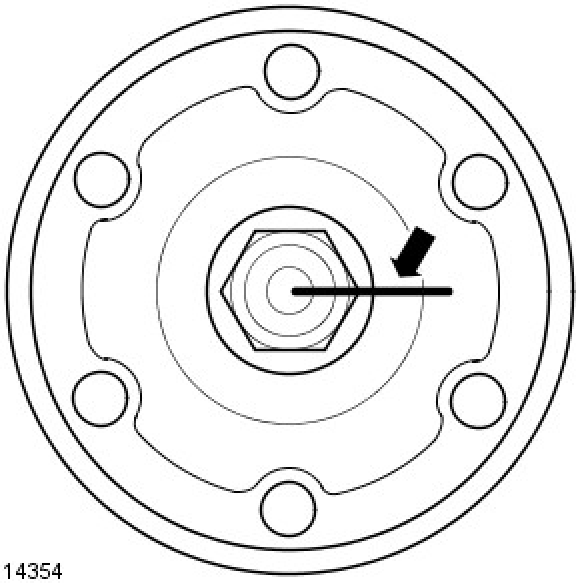
All vehicles



E114355

6. Measure the depth of the pinion nut on the pinion shaft.

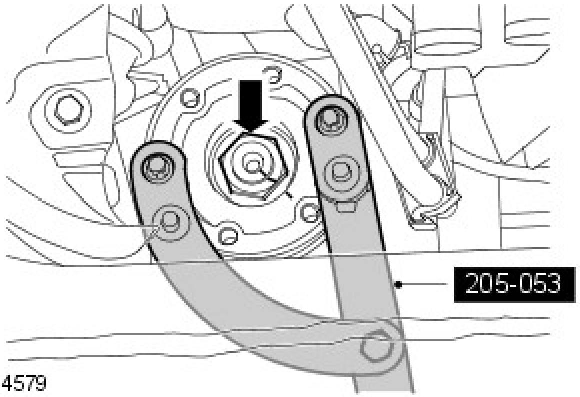
- Note measurement for installation.



E114354

7. ⚠ CAUTION: This step must be carried out to make sure that the drive pinion nut is correctly tightend on assembly.

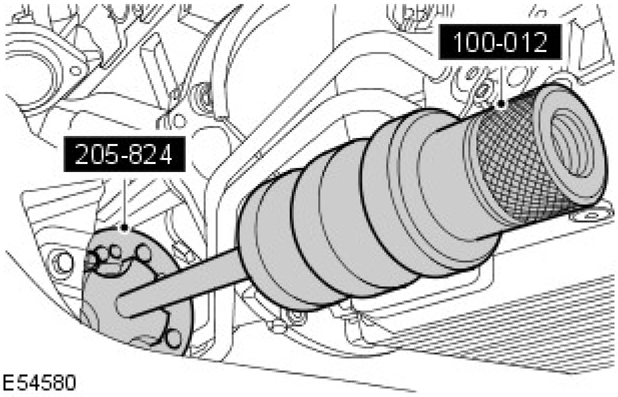
Accurately scribe a line to mark the drive pinion shaft to the drive pinion nut and pinion flange.



E54579

8. Remove the drive pinion flange retaining nut.

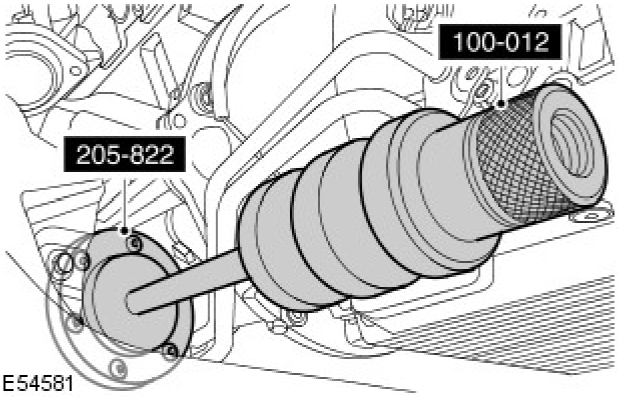
- Using the special tool, counter hold the drive pinion flange.
- Note number of turns for installation.



100-012
205-824
E54580

9. ⚠CAUTION: Make sure only a bolt is used with the special tool, to draw the drive pinion flange off the drive pinion shaft.

Using the special tool, remove the drive pinion flange.



100-012
205-822
E54581

10. Using the special tool, remove the drive pinion seal.

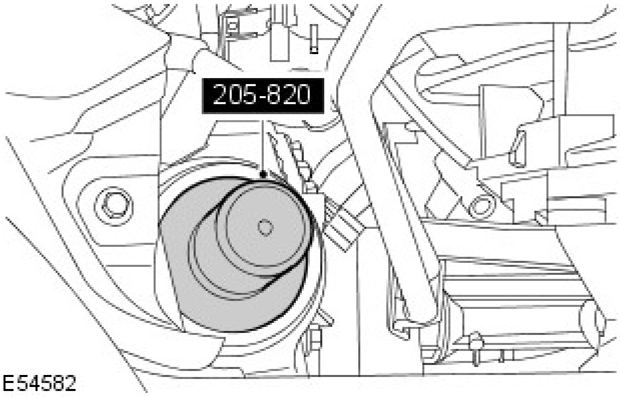
Installation

All vehicles

1. Clean the drive pinion flange.

2. Clean the drive pinion seal mating faces.

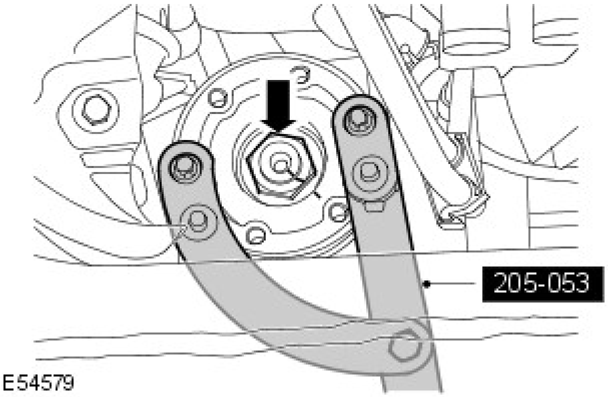
3. Using the special tool, install the new drive pinion seal.



205-820
E54582

4. ⚠CAUTION: Make sure the drive pinion flange scribed marks are aligned.

Install the drive pinion flange.



5. CAUTIONS:

Make sure the mark on the drive pinion nut is never tightened short of the scribed mark on the drive pinion shaft.

Make sure the drive pinion flange has no end float and is free to rotate.

Make sure the scribed mark on the drive pinion nut is no more than a maximum of 5 degrees past the scribed mark on the drive pinion shaft.

Install the drive pinion flange retaining nut.

- Using the special tool, counter hold the drive pinion flange.
- Install nut to previously noted number of turns.
- Measure the depth of the pinion nut on the pinion shaft.

Vehicles with Active Stabilization

6. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

7. Install the stabilizer bar bushing.

- Install the clamp.
- Install the bolts.
- Tighten the bolts to 115 Nm (85 lb.ft).

All vehicles

8. Install the front driveshaft. For additional information, refer to: (205-01 Driveshaft)

Front Driveshaft - V8 S/C 4.2L Petrol (Removal and Installation),
Front Driveshaft - V8 4.4L Petrol (Removal and Installation),
Front Driveshaft - TDV6 2.7L Diesel (Removal and Installation),
Front Driveshaft - TDV8 3.6L Diesel (Removal and Installation).

9. CAUTION: Make sure the correct specification and quanity of oil is used.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

Removal

All vehicles

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

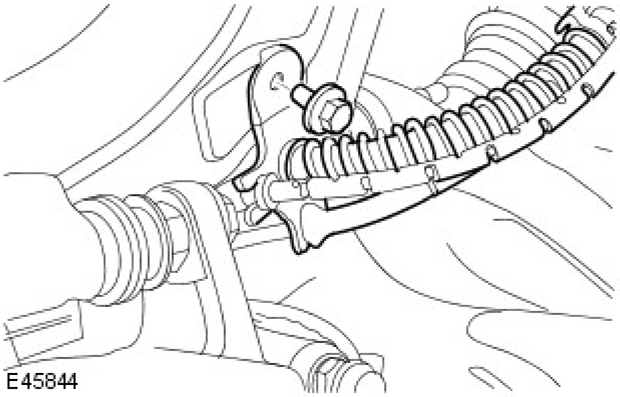
2. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

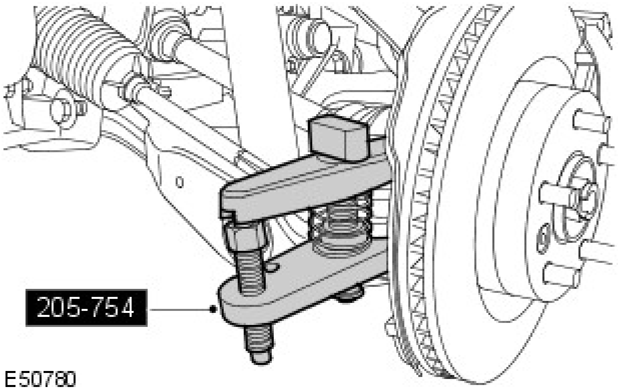
3. Remove the front wheels and tires.

4. Remove the axle tube.
   For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).

5. Release the LH brake hose bracket from the wheel knuckle.

   - Remove the bolt.

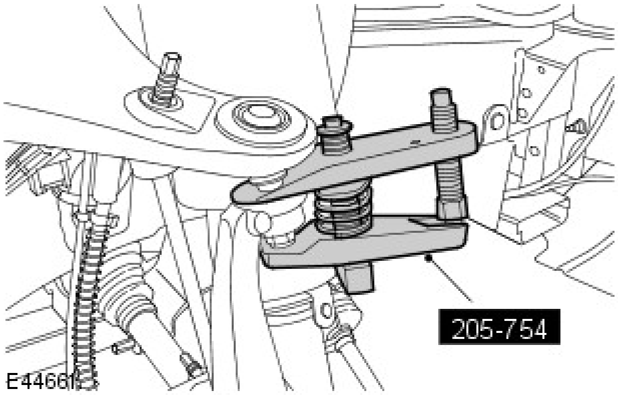




6. CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the LH tie-rod end ball joint from the wheel knuckle.

- Remove and discard the nut.



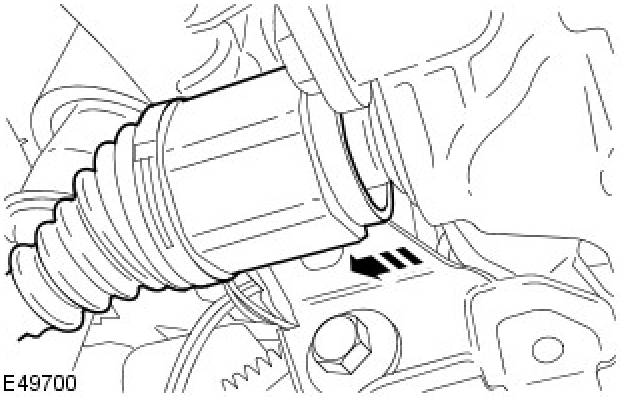
7. CAUTIONS:

Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

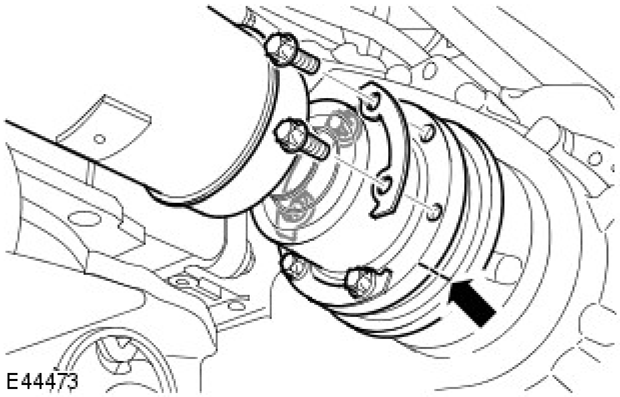
Using the special tool, release the LH upper arm ball joint.

- Remove and discard the nut.



8. Release the LH halfshaft from the axle assembly.

- Remove and discard the snap ring.
- Using a suitable tie strap, support the LH halfshaft.



9. CAUTIONS:

Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

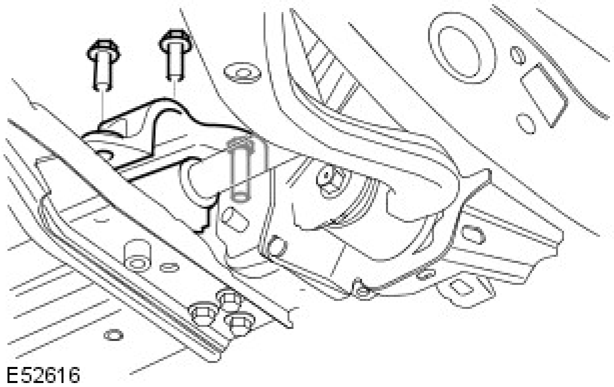
Release the driveshaft from the front axle drive flange.

- Remove the 6 Torx bolts and washers, discard the bolts.
- Using a suitable tie strap, secure the driveshaft end plate.

Vehicles with Active Stabilization

10. Remove the stabilizer bar bushing.

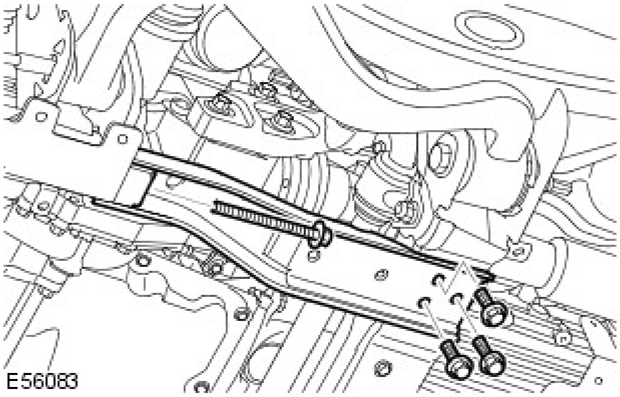
- Remove the 3 bolts.
- Remove the clamp.
- Remove the stabilizer bar bushing.

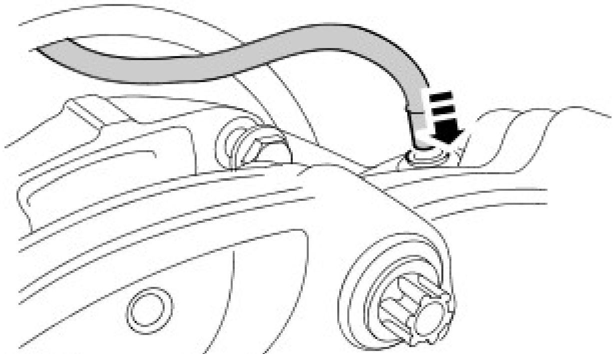


All vehicles

11. Remove the front axle crossmember.

- Remove the 4 bolts.





12. ⚠ CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the breather line.

- Release the clip.

Vehicles built up to VIN 935921

13. NOTE: If a new axle is being installed, a new breather line must also be installed.

Remove and discard the breather line.

- Release from the 3 clips.

14. Remove the engine oil cooler.
For additional information, refer to: Oil Cooler (303-01A Engine - V8 S/C 4.2L Petrol, In-vehicle Repair).

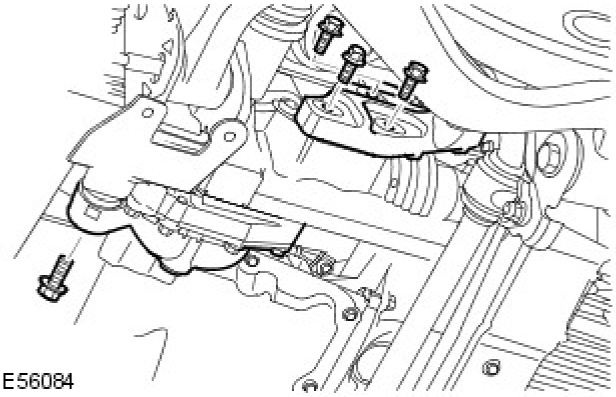
15. Remove the oil cooler support bracket.

- Remove the 3 bolts.

All vehicles

16. Using a transmission jack, support the front axle assembly.

17. With assistance, remove the front axle assembly.



- Remove and discard the 3 axle assembly rear mounting bolts.
- Remove the front axle assembly front mounting bolt.

Installation

Vehicles built up to VIN 935921

1. NOTE: If a new axle is being installed, a new breather line must also be installed.

Install a new breather tube.

- Secure in the clips.

All vehicles

2. Install the front differential case.

- With assistance, raise and manoeuvre the front differential case.
- Connect the breather line.

3. Install the axle tube.
For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).

4. Connect the breather line.

5. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

Vehicles with Active Stabilization

6. Install the stabilizer bar bushing.

- Install the clamp.
- Install the bolts.
- Tighten the bolts to 115 Nm (85 lb.ft).

All vehicles

7. Install the oil cooler support bracket.

- Install the 3 bolts.

8. Install the oil cooler.
For additional information, refer to: Oil Cooler (303-01A Engine - V8 S/C 4.2L Petrol, In-vehicle Repair).

9. NOTE: Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.
- Remove and discard the tie strap.

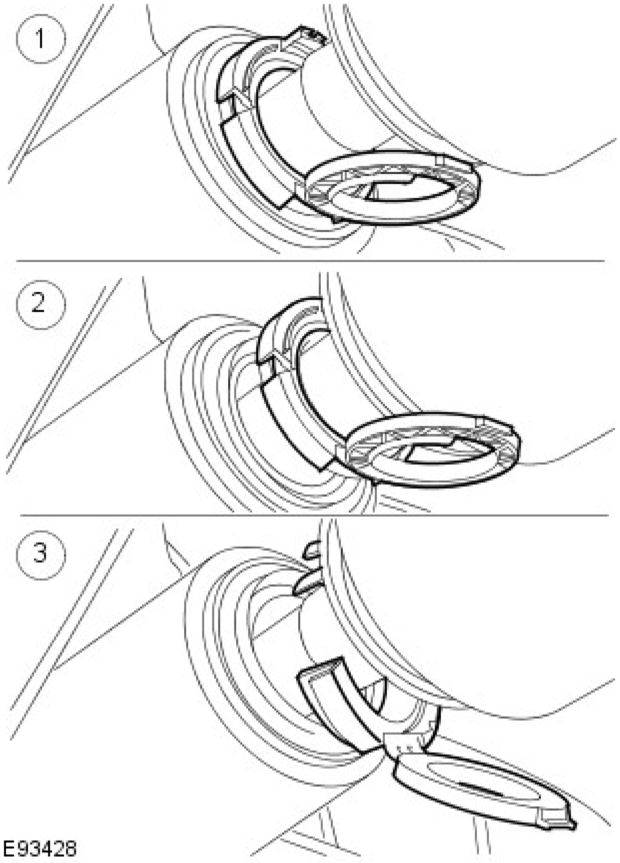
10. Install a new snap ring to the LH halfshaft.

- Remove and discard the tie strap.

11. NOTE: Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

1. Open the halfshaft seal protector and install the halfshaft.
2. Release the halfshaft seal protector from the halfshaft seal.
3. Remove the halfshaft seal protector.
4. Fully install the halfshaft.



12. WARNING: Make sure that a new nut is installed.

Secure the LH upper arm to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

13. WARNING: Make sure that a new nut is installed.

Secure the LH tie-rod end ball joint to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

14. Secure the LH brake hose bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

15. Fill the differential with the correct amount of lubricant.

16. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

17. Connect the battery ground cable.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

Vehicles with Active Stabilization

6. Install the stabilizer bar bushing.

- Install the clamp.
- Install the bolts.
- Tighten the bolts to 115 Nm (85 lb.ft).

All vehicles

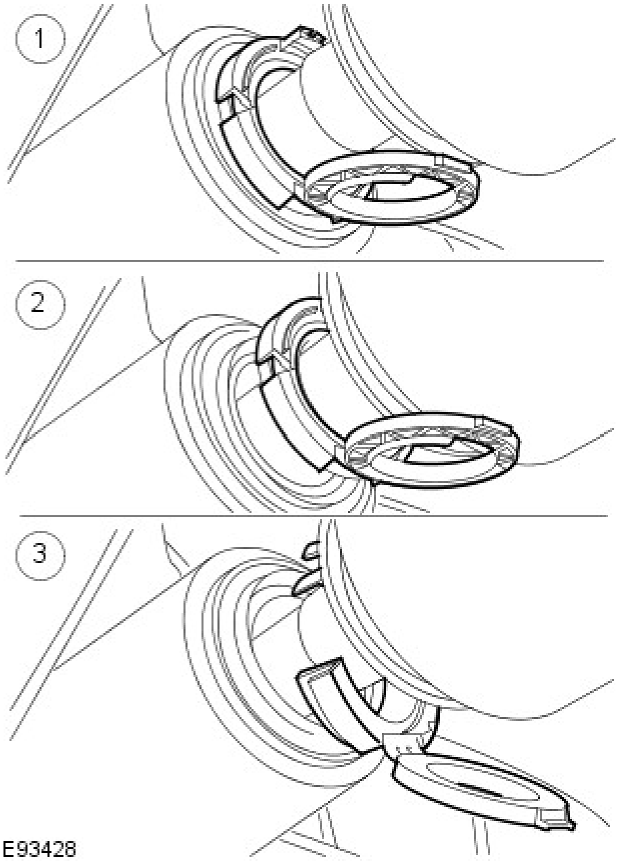
7. NOTE: Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.
- Remove and discard the tie strap.

8. Install a new snap ring to the LH halfshaft.

- Remove and discard the tie strap.



E93428

9. NOTE: Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

1. Open the halfshaft seal protector and install the halfshaft.
2. Release the halfshaft seal protector from the halfshaft seal.
3. Remove the halfshaft seal protector.
4. Fully install the halfshaft.

10. ⚠ WARNING: Make sure that a new nut is installed.

Secure the LH upper arm to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

11. ⚠ WARNING: Make sure that a new nut is installed.

Secure the LH tie-rod end ball joint to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

12. Secure the LH brake hose bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

13. Install the axle tube.
For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).

14. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

15. Connect the battery ground cable.

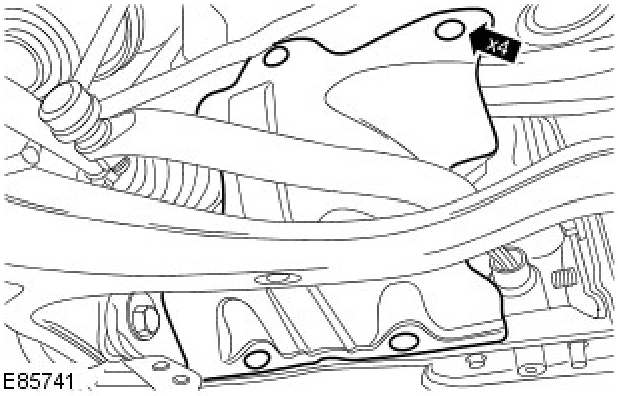
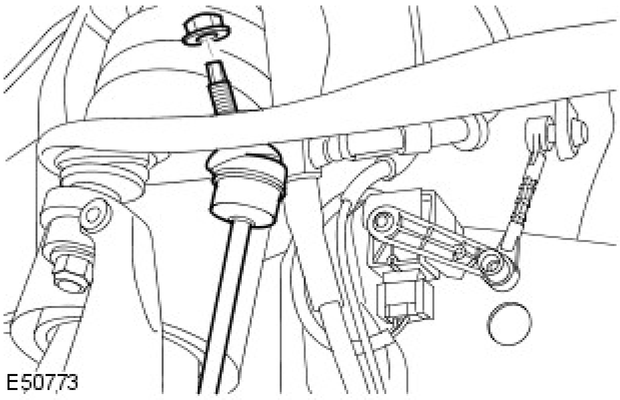
2. Remove the front wheels and tires.

3. Remove the axle tube.
For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).



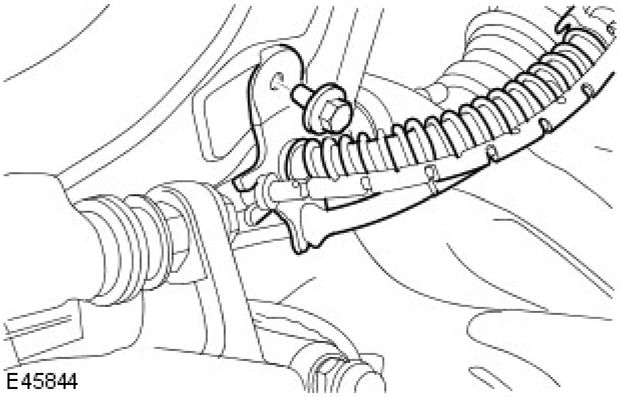
4. Remove the LH splash shield.

- Remove the 4 clips.



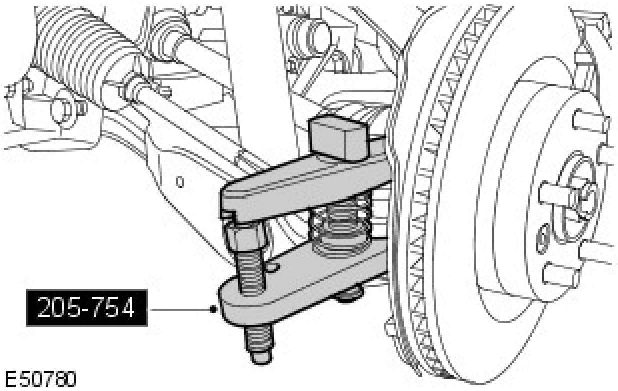
5. Release the LH stabilizer bar link.

- Remove and discard the nut.



6. Release the LH brake hose bracket from the wheel knuckle.

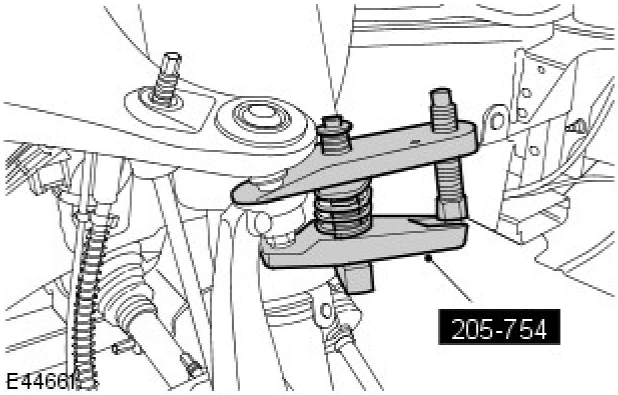
- Remove the bolt.



7. ⚠ CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the LH tie-rod end ball joint from the wheel knuckle.

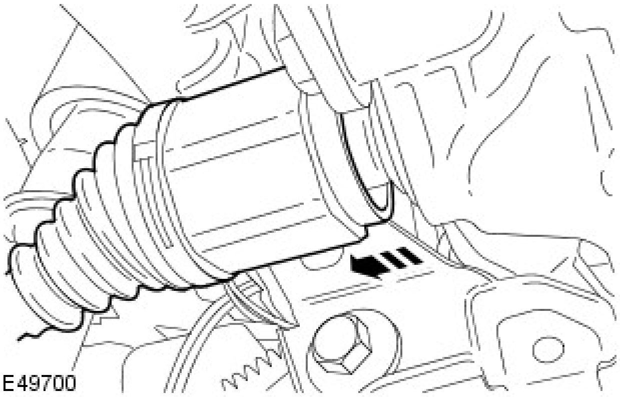
- Remove and discard the nut.



8. ⚠ CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the LH upper arm ball joint.

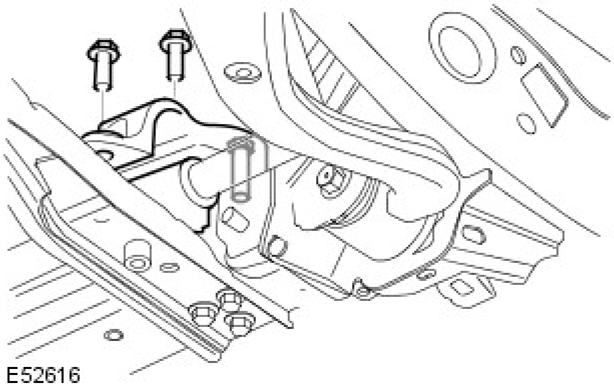
- Remove and discard the nut.



9. Release the LH halfshaft from the axle assembly.

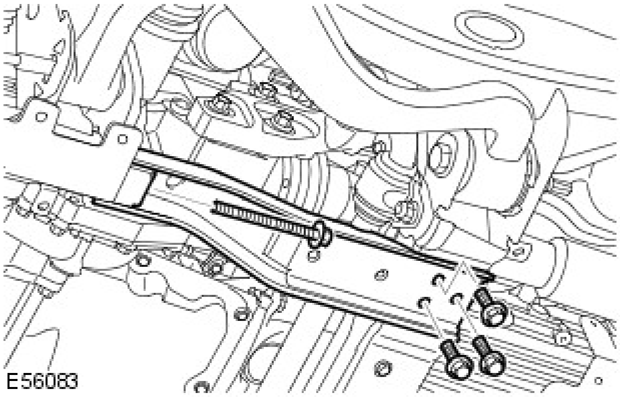
- Remove and discard the snap ring.

10. Remove the front driveshaft.
For additional information, refer to: Front Driveshaft - TDV8 3.6L Diesel (205-01 Driveshaft, Removal and Installation).



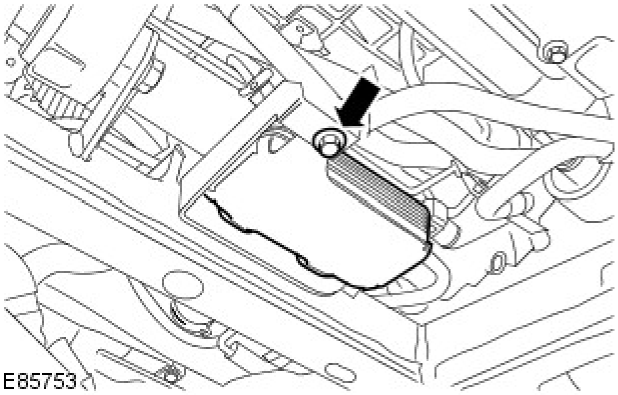
11. Remove the LH stabilizer bar bracket.

- Remove the 3 bolts.



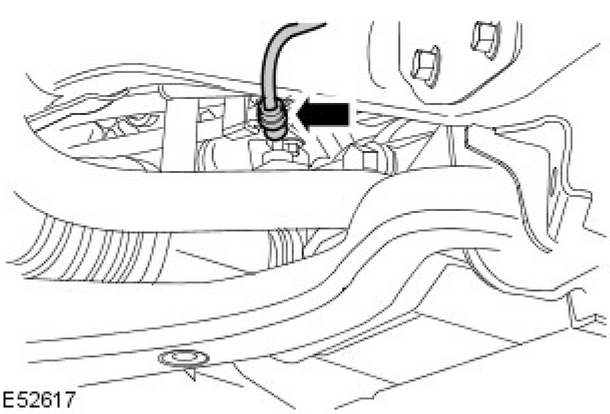
12. Remove the front axle crossmember.

- Remove the 4 bolts.



13. Release the fuel cooler.

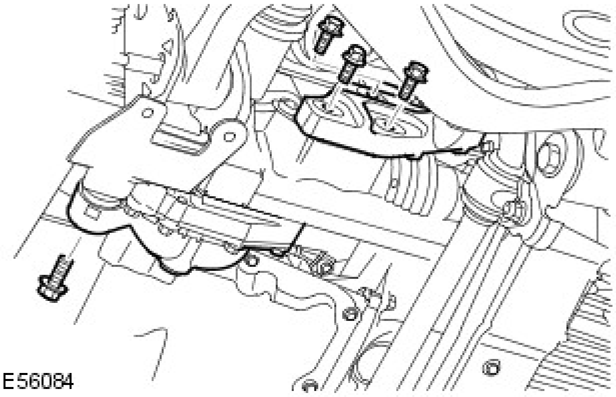
- Remove the bolt.



14. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect the breather line.

15. Using a transmission jack, support the front axle assembly.



16. With assistance, remove the front axle assembly.

- Remove and discard the 3 bolts from the front axle assembly.
- Remove the front axle assembly front mounting bolt.

Installation

1. With assistance, install the front axle assembly.

2. With assistance, align and secure the front axle assembly.

- Tighten the front axle assembly front mounting bolt to 105 Nm (77 lb.ft).
- Tighten the 3 new bolts in the front axle assembly to 80 Nm (59 lb.ft), then a further 60 degrees.

3. NOTE: Remove and discard the blanking caps.

Connect the breather line.

4. Secure the fuel cooler.

- Tighten the bolt to 23 Nm (17 lb.ft).

5. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

6. Install the LH stabilizer bar bracket.

- Tighten the bolts to 115 Nm (85 lb.ft).

7. Install the front driveshaft.
For additional information, refer to: Front Driveshaft - TDV8 3.6L Diesel (205-01 Driveshaft, Removal and Installation).

8. NOTE: Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

- Install a new snap ring.
- Lubricate the seal and the bearing running surfaces with clean axle oil.
- Open the halfshaft oil seal protector.
- Make sure the snap ring is fully engaged and retains the halfshaft.

9. Secure the LH upper arm to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

10. Secure the LH tie-rod end ball joint to the wheel knuckle.

- Install a new nut and tighten to 76 Nm (56 lb.ft).

11. Secure the LH brake hose bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

12. Secure the LH stabilizer bar link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

13. Install the LH splash shield.

- Install the clips.

14. Install the axle tube.
For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).

15. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

- Remove the stabilizer bar bushing.

All vehicles

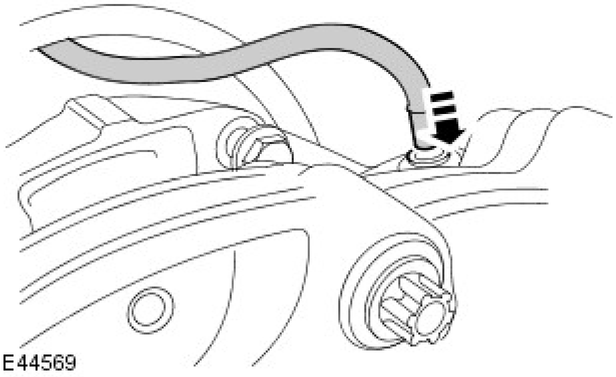
11. Remove the front axle crossmember.

- Remove the 4 bolts.



12. ⚠ CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the breather line.

- Release the clip.

Vehicles built up to VIN 935921

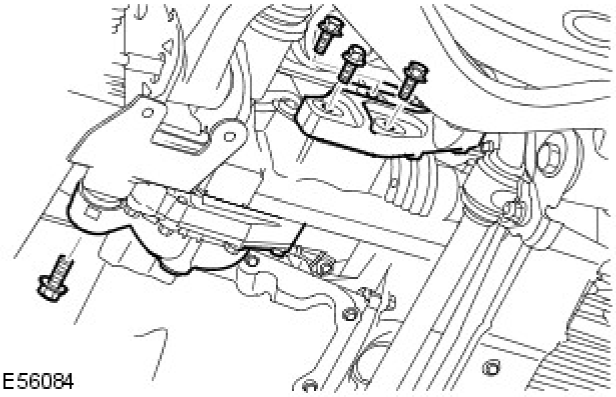
13. NOTE: If a new axle is being installed, a new breather line must also be installed.

Remove and discard the breather line.

- Release from the 3 clips.

All vehicles

14. Using a transmission jack, support the front axle assembly.



15. With assistance, remove the front axle assembly.

- Remove and discard the 3 axle assembly rear mounting bolts.
- Remove the front axle assembly front mounting bolt.

Installation

All vehicles

1. Install the front differential case.

- With assistance, raise and manoeuvre the front differential case.
- Connect the breather line.

2. With assistance, install the front axle assembly.

Vehicles built up to VIN 935921

3. NOTE: If a new axle is being installed, a new breather line must also be installed.

Install a new breather tube.

- Secure in the clips.

All vehicles

4. Connect the breather line.

5. Install the front axle crossmember.

- Tighten the 4 bolts to 115 Nm (85 lb.ft).

Vehicles with Active Stabilization

6. Install the stabilizer bar bushing.

- Install the clamp.
- Install the bolts.
- Tighten the bolts to 115 Nm (85 lb.ft).

All vehicles

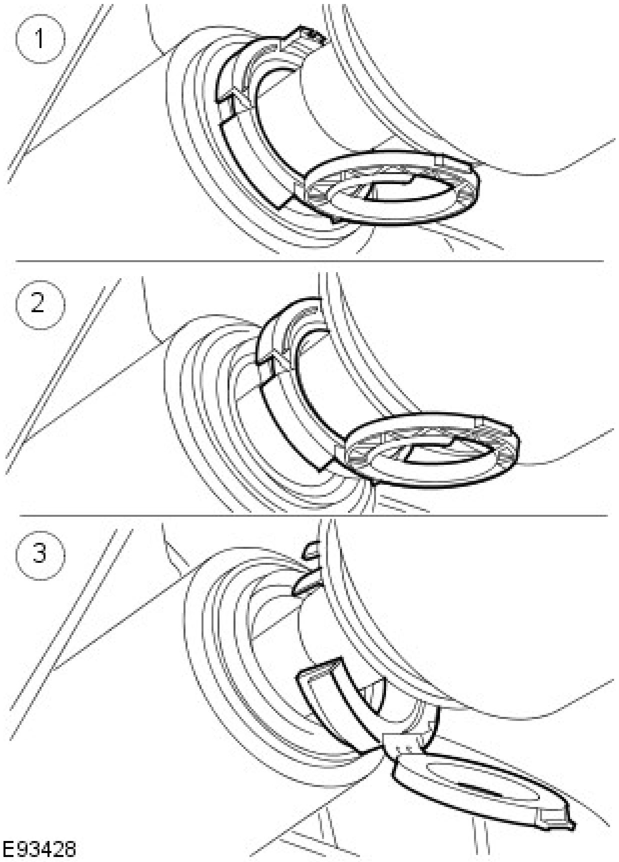
7. NOTE: Make sure that new bolts are installed.

Secure the driveshaft to the front axle drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.
- Remove and discard the tie strap.

8. Install a new snap ring to the LH halfshaft.

- Remove and discard the tie strap.



9. NOTE: Do not fully engage the halfshaft until the oil seal protector has been removed.

Secure the LH halfshaft in the axle assembly.

1. Open the halfshaft seal protector and install the halfshaft.
2. Release the halfshaft seal protector from the halfshaft seal.
3. Remove the halfshaft seal protector.
4. Fully install the halfshaft.

10. ⚠ WARNING: Make sure that a new nut is installed.

Secure the LH upper arm to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

11. ⚠ WARNING: Make sure that a new nut is installed.

Secure the LH tie-rod end ball joint to the wheel knuckle.

- Install a new nut and tighten to 70 Nm (52 lb.ft).

12. Secure the LH brake hose bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

13. Install the axle tube.
For additional information, refer to: Axle Tube (205-03 Front Drive Axle/Differential, In-vehicle Repair).

14. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

15. Connect the battery ground cable.

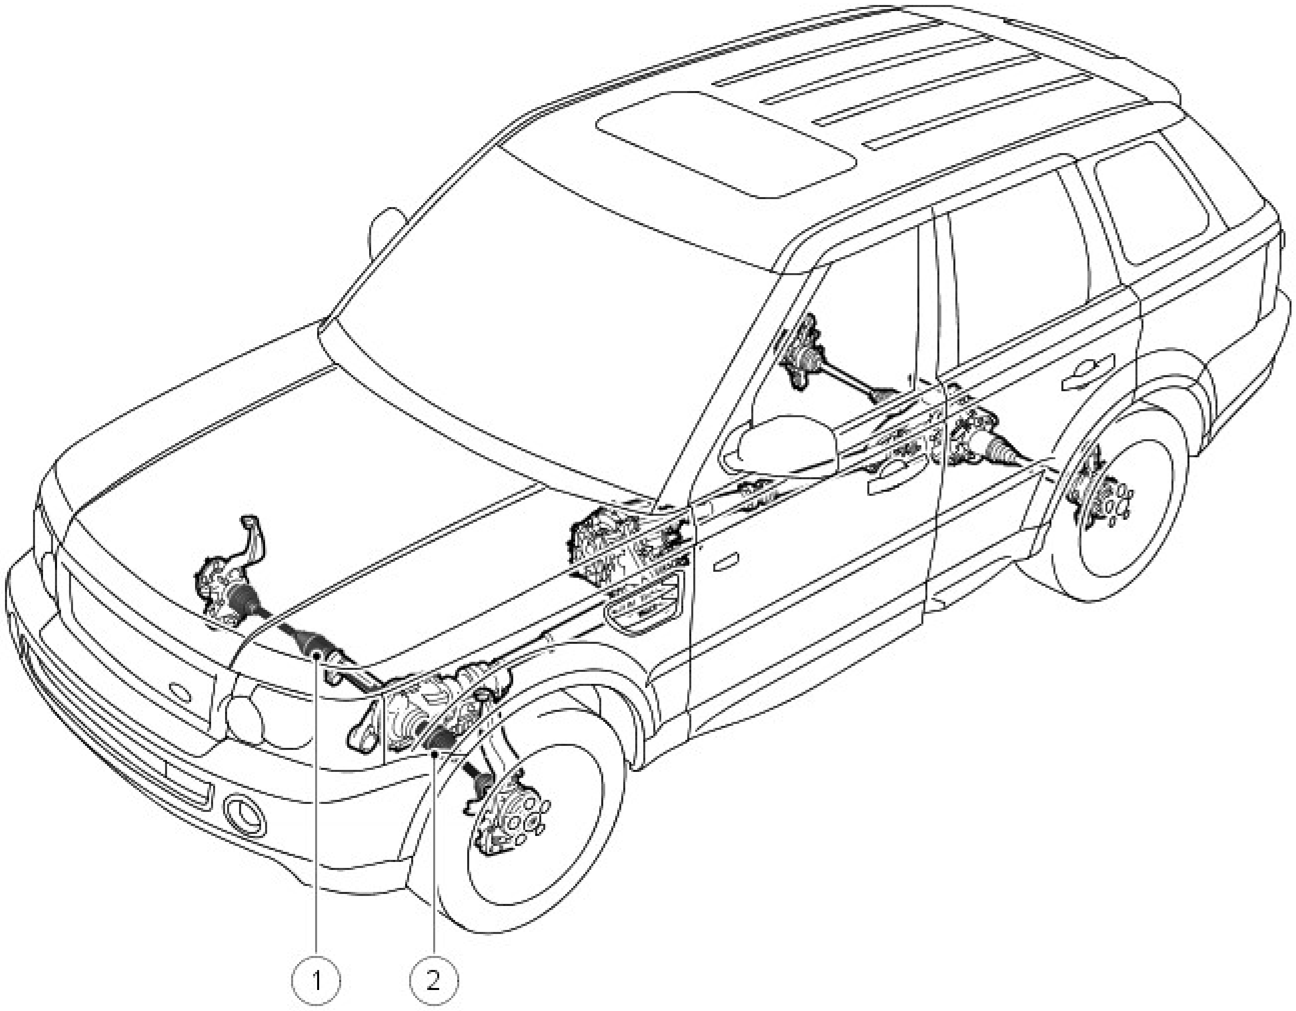
Front Drive Halfshafts - Front Drive Halfshafts

Description and Operation

Front Drive Halfshaft Component Location



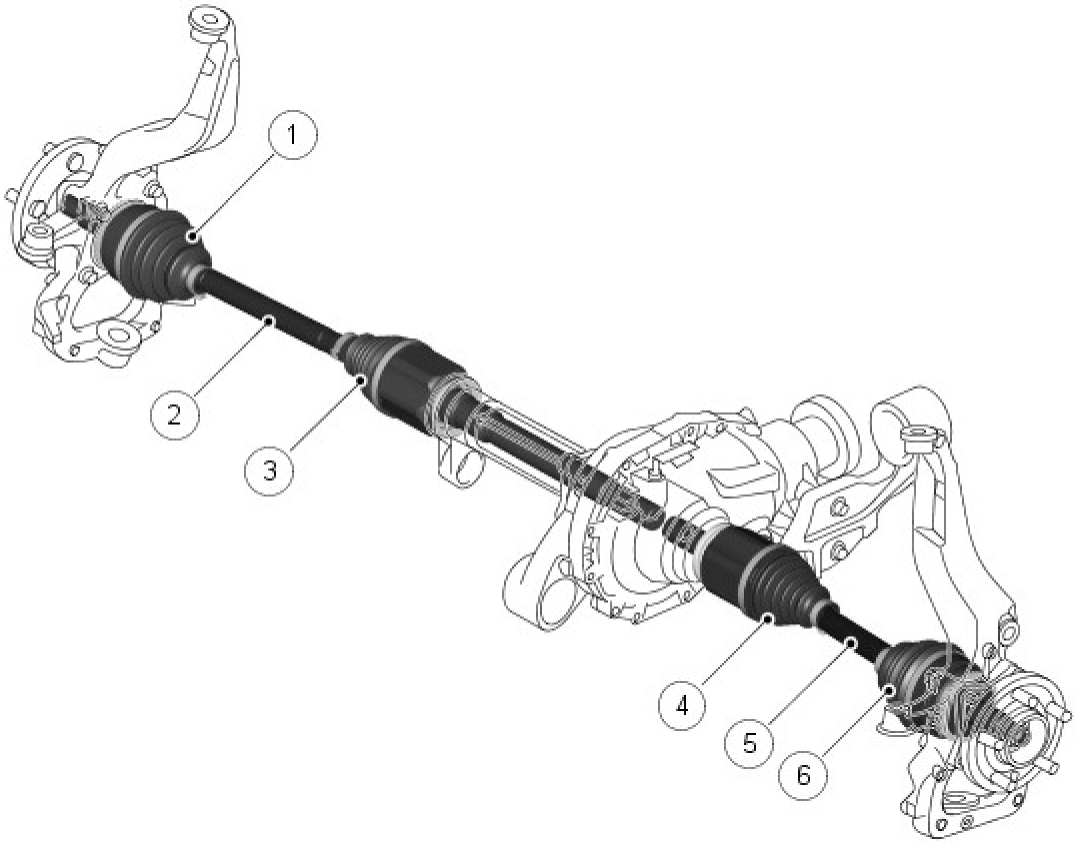
E56495

Item	Part Number	Description
1	-	RH front drive halfshaft
2	-	LH front drive halfshaft

GENERAL

The front drive shafts are handed components with the RH drive shaft being longer than the LH drive shaft. Both shafts are of similar construction with Constant Velocity (CV) joints at each end to allow for steering and suspension movement.

FRONT DRIVE HALFSHAFT ASSEMBLY



Item	Part Number	Description
1	-	RH outer CV joint
2	-	RH front drive halfshaft
3	-	RH inner CV joint
4	-	LH inner CV joint
5	-	LH front drive halfshaft
6	-	LH outer CV joint

The front drive shafts are similar in their construction. The only difference is the lengths of each shaft, the RH drive shaft is a longer shaft with an extended stem.

The outer CV joints have a target wheel on the outer diameter. This is used by the ABS wheel speed sensor for vehicle and wheel speed calculations.

Each drive shaft comprises two CV joints (inner and outer), boots, an outer tube and a solid barshaft, which is retained in the front differential by a circlip (see 'Halfshaft Joint' section for more information on CV joints).

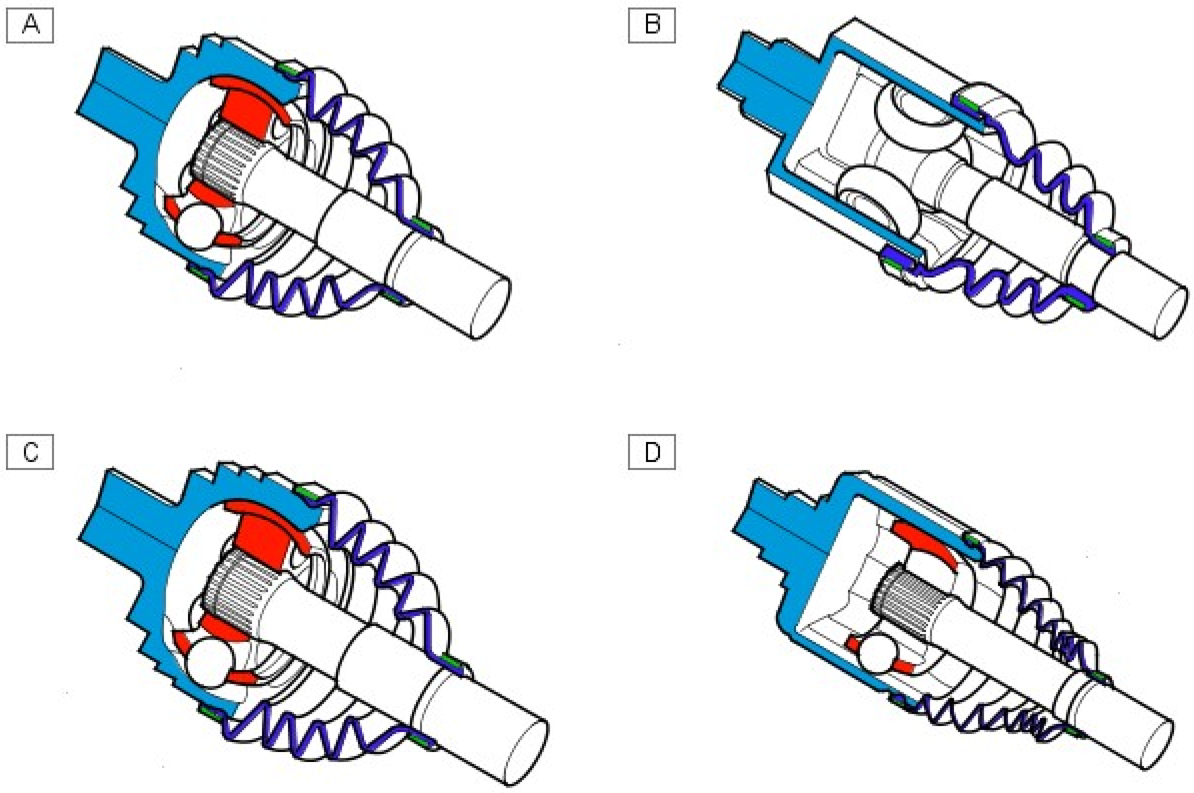
Front Drive Halfshafts - Halfshaft Joint

Description and Operation

Front Drive Halfshaft – Sectional Views



E50637

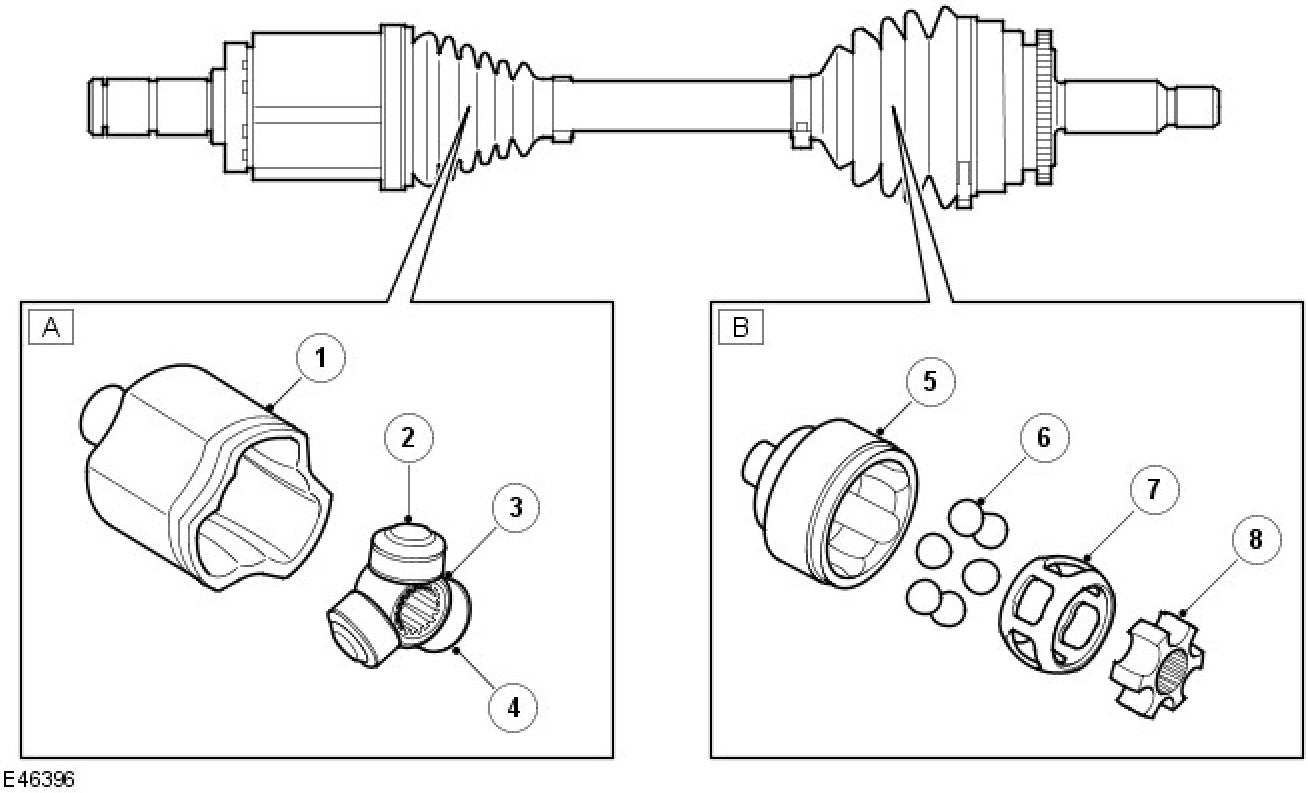
Item	Part Number	Description
A	-	Front outboard halfshaft joint
B	-	Front inboard halfshaft joint
C	-	Rear outboard halfshaft joint
D	-	Rear inboard halfshaft joint

The outboard and rear inboard CV joints are of the Birfield design. This design uses longitudinal, elliptical grooves, which retain six steel balls. A cage further retains the balls. Constant velocity is achieved by the position of the steel balls. If a centre line is drawn through the balls and the driven hub or differential shaft, the two centre lines always bisect each other at the angle of drive. This condition allows the rotational speed of the driven shaft to be passed to the driven hub or differential shaft with no loss of rotational speed regardless of the shaft angle. The CV joints are packed with grease, which is retained in the joint by a synthetic rubber gaiter. The gaiter is retained at each end by a metal clamp, which provides a watertight seal to prevent the ingress of dirt and moisture. The CV joints are retained on their respective shaft or tube by an internal snap ring. The snap rings are located in a groove on each shaft or tube end and locate in a mating groove in the CV joint.

⚠CAUTION: The inner hub is not retained in the joint body on this type of joint. The joint is held together in its unfitted state only by the boot. Pulling on the barshaft can therefore pull the hub out of the joint body. For this reason care must be taken when handling and fitting the front driveshafts.

The shaft is a sliding fit inside the outer tube, which allows for the small length changes, which occur with articulation of the suspension. The shaft is located in a ball cage, which is retained inside the outer tube. The ball cage ensures that the shaft is held rigidly in the outer tube whilst allowing it to freely move in and out of the tube as necessary. A sealing plug is pressed into the outer tube and retains grease around the balls in the cage.

The inner CV joints are similar in design and operation to the outer joints except that the inner joints use rollers rather than balls to transmit the drive.



Item	Part Number	Description
A	-	Inner CV joint
B	-	Outer CV joint
1	-	Tulip outer race
2	-	Trunions (3 of)
3	-	Spider
4	-	Rollers (3 of)
5	-	Outer race
6	-	Steel balls (6 of)
7	-	Cage
8	-	Inner race

The front inboard joint is a 'tripode joint', having three 'feet' or 'podes'. The torque is transmitted from the outer race to the connecting shaft by means of rollers running on needle rollers around the trunions of the tripode spider. The roller tracks of the outer race enable the tripode assembly to move angularly and axially within the joint.

The inner CV joint shaft is splined and mates with splines in the front differential. There is no internal retaining mechanism for this type of joint so care must be taken during service as the shaft and CV joint can separate.

Removal

- CAUTIONS:

⚠ Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

⚠ Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

⚠ Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

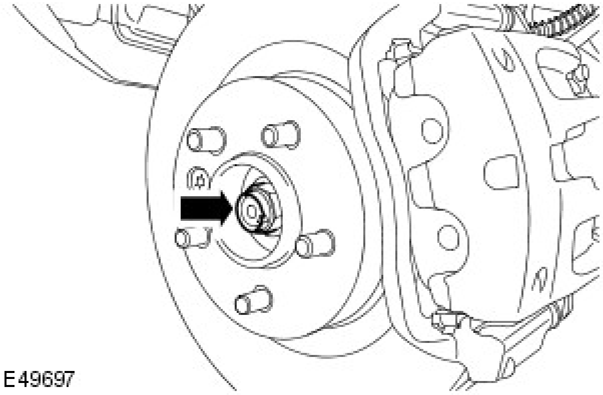
Raise and support the vehicle.

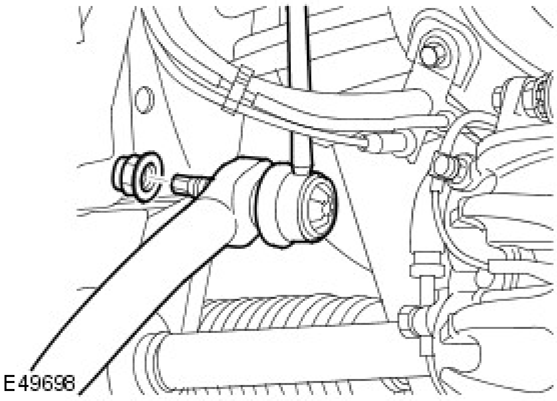
2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

3. Remove the wheel and tire.

4. Remove the halfshaft retaining nut.

- Discard the nut.

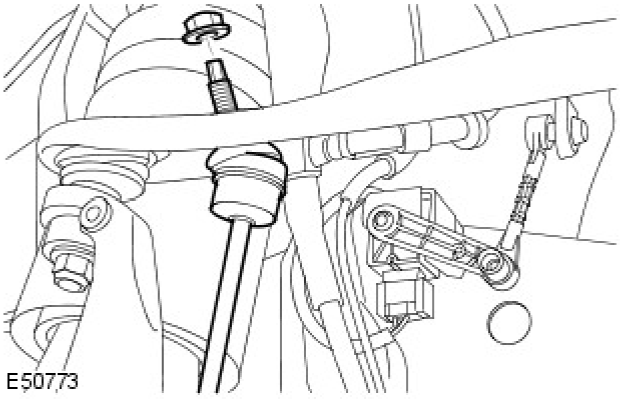




5. ⚠ CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

Disconnect the RH stabilizer bar link.

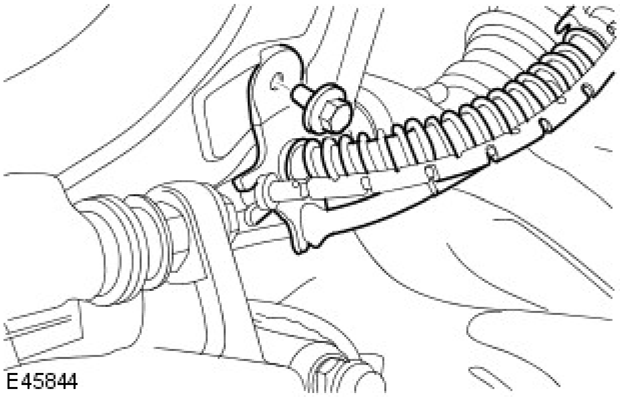
- Remove and discard the nut.



6. ⚠ CAUTION: Use a wrench on the hexagon provided to prevent the ball joint rotating.

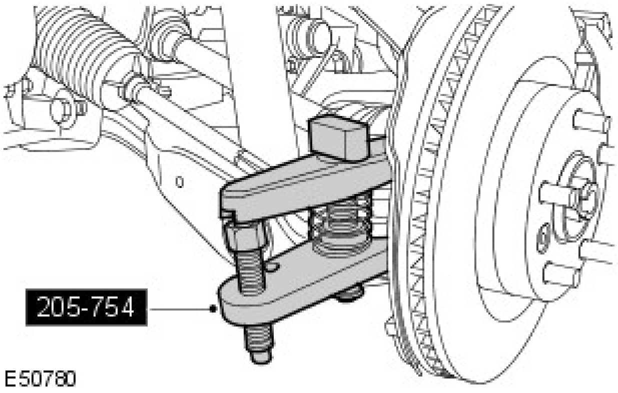
Remove the stabilizer bar link nut.

- Remove and discard the nut.



7. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.



8. Loosen the tie-rod end ball joint retaining nut.

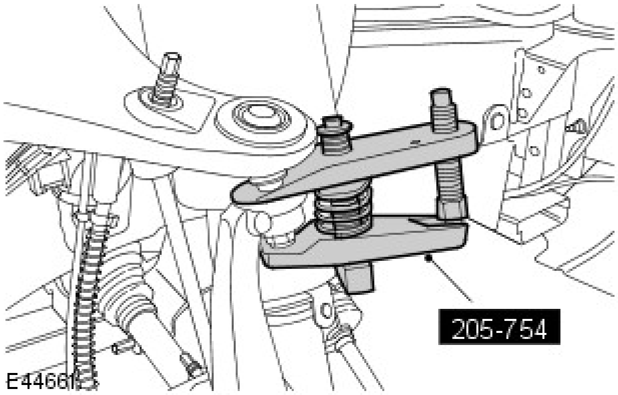
9. ⚠ CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Discard the nut.

10. ⚠ CAUTION: To prevent the wheel knuckle falling outwards and disconnection of the halfshaft inner joint, support the wheel knuckle.

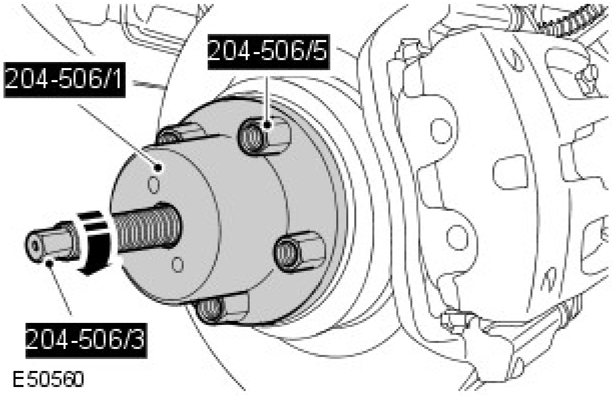
Loosen the upper arm retaining nut.



11. ⚠ CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

Using the special tool, release the upper arm ball joint.

- Remove and discard the retaining nut.



12. CAUTIONS:

⚠ The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

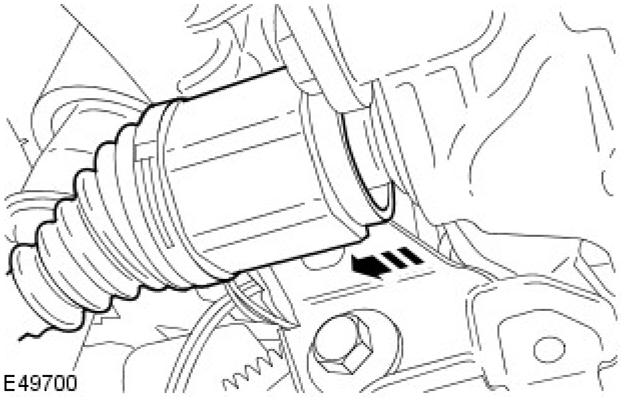
⚠ Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

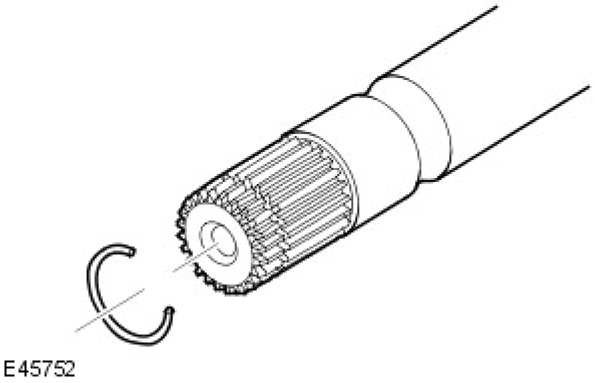
⚠ Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

13. Release the halfshaft from the wheel knuckle.

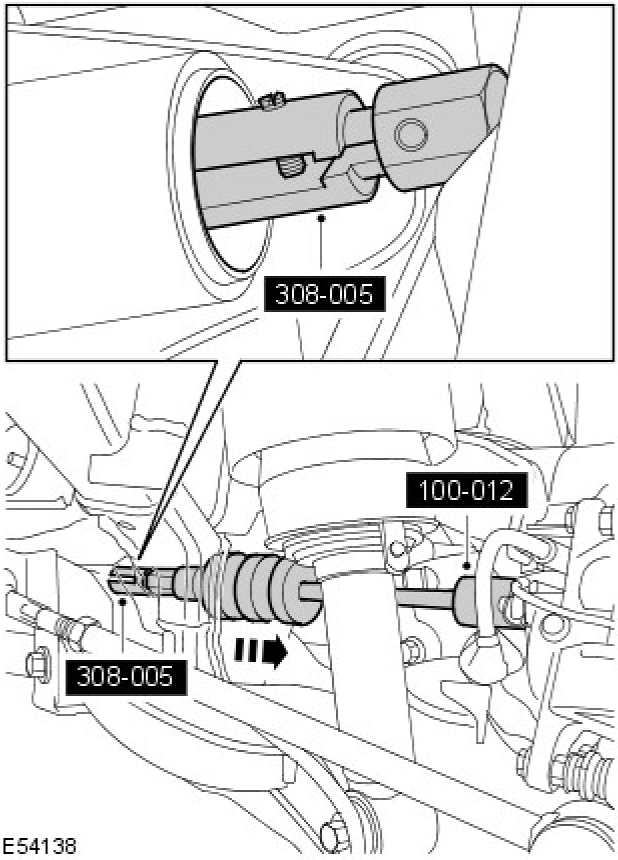
14. Release the halfshaft from the differential housing.





15. Remove the halfshaft.

- Raise the stabilizer bar to allow removal of the halfshaft.
- Remove and discard the snap ring.

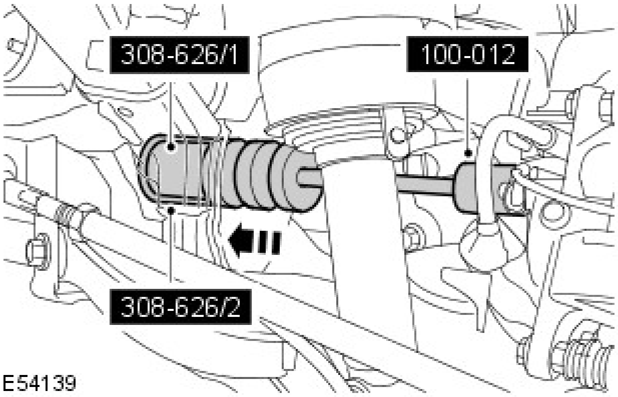


308-005
100-012
308-005
E54138

16. Using the special tools, remove and discard the halfshaft oil seal.

Installation

1. Clean the components.



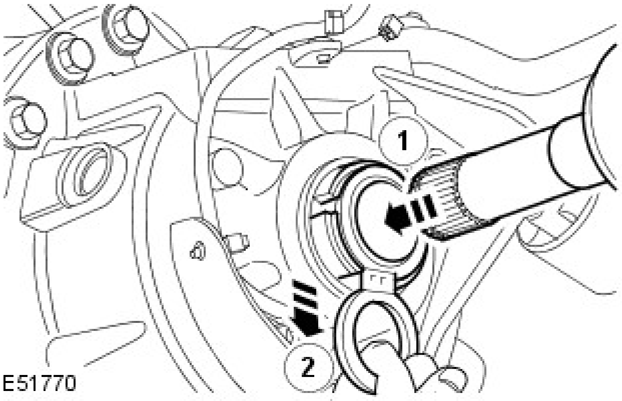
2. Using the special tools, install a new halfshaft oil seal.

- The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

3. NOTE: Do not fully engage the halfshaft until the oil seal protector has been removed.

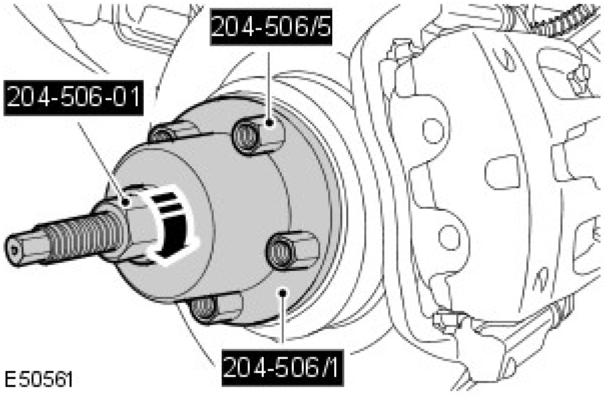
Install the halfshaft.

- Install the snap ring.
- Lubricate the seal and the bearing running surfaces with clean axle oil.
- Make sure the snap ring is fully engaged and retains the halfshaft.
- Open the halfshaft oil seal protector.



4. NOTE: The oil seal protector is designed to break into two pieces.

Remove and discard the halfshaft oil seal protector.



5. ⚠ CAUTION: The lower arm ball joint can be damaged by excessive articulation. The wheel knuckle must be fully supported at all times. Do not allow the wheel knuckle to hang on the lower arm. Failure to follow this instruction will result in damage to vehicle.

Using the special tools, install the halfshaft in the wheel hub.

6. Connect the upper arm and wheel knuckle.

7. Secure the stabilizer bar link.

8. Connect the tie-rod end ball joint.

- Install a new nut and tighten to 70 Nm (52 lb.ft).
- Install a new nut and tighten to 115 Nm (85 lb.ft).

- Install a new nut and tighten to 76 Nm (56 lb.ft).

9. ⚠ CAUTION: Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

10. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

11. Secure the RH stabilizer link.

- Install a new nut and tighten to 115 Nm (85 lb.ft).

12. ⚠ CAUTION: Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 230 Nm (170 lb.ft).

- Stake the nut to the halfshaft.

13. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

14. ⚠ CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Differential Draining and Filling (205-03 Front Drive Axle/Differential, General Procedures).

Front Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot

Removal and Installation

Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

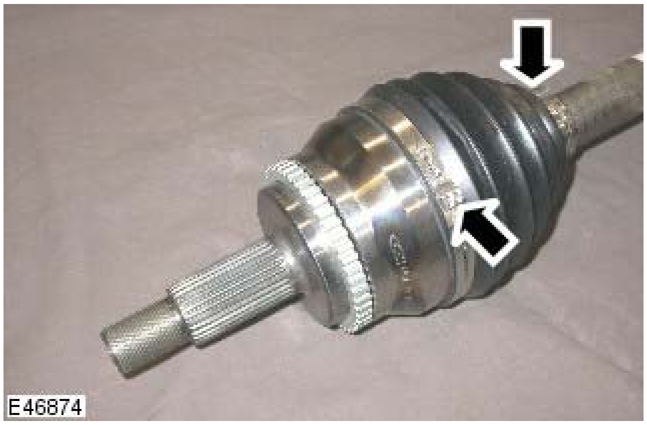
Raise and support the vehicle.

2. Remove the wheel and tire.

3. Remove the halfshaft.
For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).

4. Clamp the halfshaft in a vise.

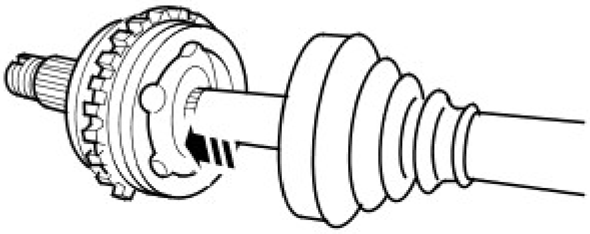
5. Remove and discard the CV joint boot retaining clamps.



6. Slide the CV joint boot along the halfshaft to gain access to the joint.

7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.

- Remove and discard the snap ring.



E46875

8. Remove the outer CV joint boot.

Installation

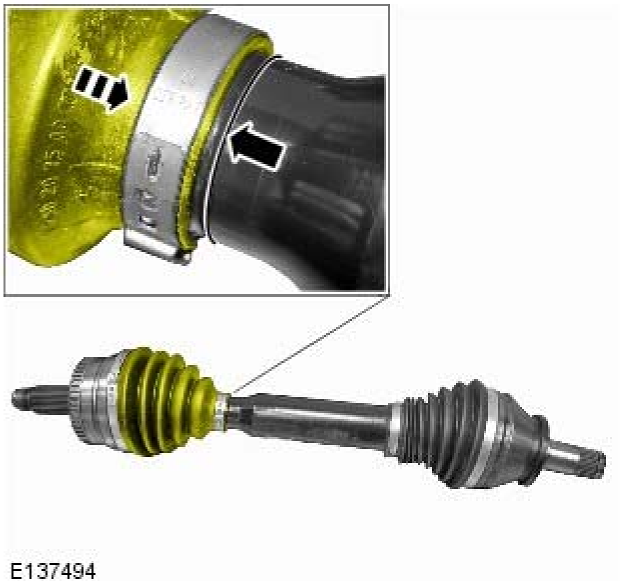
1. Clean the components.

2. Install the CV joint boot.

3. Install the outer CV joint.

4. Pack the CV joint with the grease supplied.

- Install the snap ring.
- Position the CV joint on the halfshaft, press the snap ring into it's groove and push the CV joint fully on to the halfshaft.
- Pull on the CV joint to ensure the snap ring has fully engaged.



5. CAUTIONS:

⚠ Make sure the CV boot is not pushed too far onto the drive shaft and the recess is exposed, failure to follow this instruction may result in damage to the component.

⚠ After the clamps have been secured do not adjust them, failure to follow this instruction may result in damage to the component.

Install the CV joint boot to the CV joint.

- Using a suitable tool, secure the CV joint boot with the new clamps.

6. Install the halfshaft.
For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

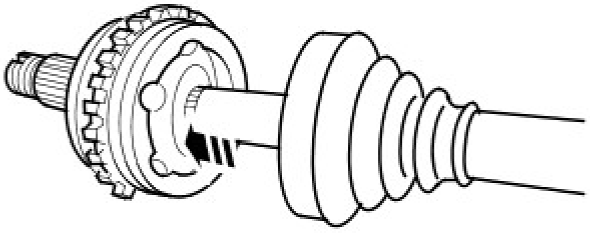
6. Slide the CV joint boot along the halfshaft to gain access to the joint.

7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.

- Remove and discard the snap ring.



E46875

8. Remove the outer CV joint boot.

Installation

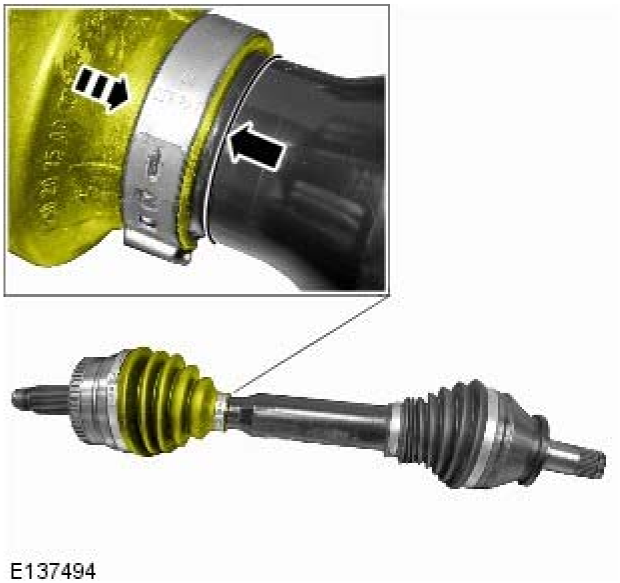
1. Clean the components.

2. Install the CV joint boot.

3. Install the outer CV joint.

4. Pack the CV joint with the grease supplied.

- Install the snap ring.
- Position the CV joint on the halfshaft, press the snap ring into it's groove and push the CV joint fully on to the halfshaft.
- Pull on the CV joint to ensure the snap ring has fully engaged.



5. CAUTIONS:

⚠ Make sure the CV boot is not pushed too far onto the drive shaft and the recess is exposed, failure to follow this instruction may result in damage to the component.

⚠ After the clamps have been secured do not adjust them, failure to follow this instruction may result in damage to the component.

Install the CV joint boot to the CV joint.

- Using a suitable tool, secure the CV joint boot with the new clamps.

6. Install the halfshaft.
For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

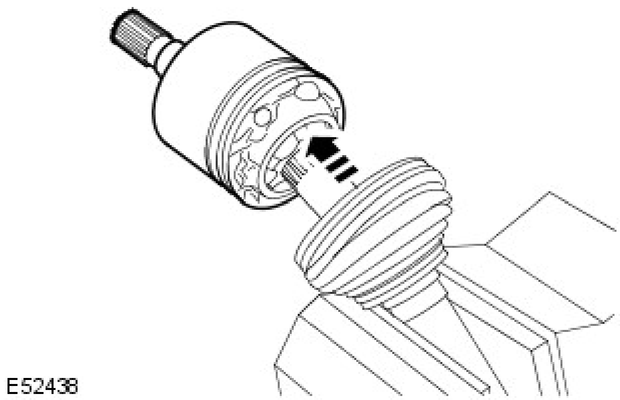
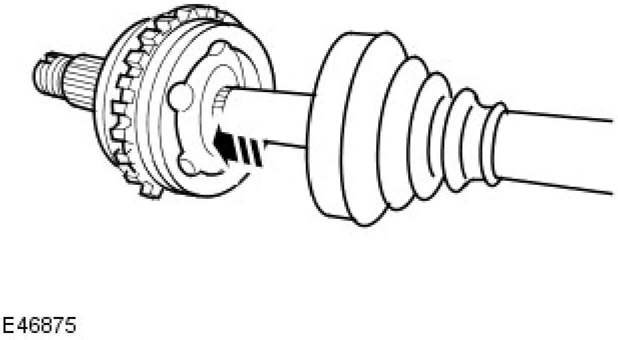
6. Slide the CV joint boot along the halfshaft to gain access to the joint.



7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.

- Remove and discard the snap ring.



8. Remove the inner joint boot.

Installation

1. Clean the components.
2. Install the inner joint boot.
3. Install the inner joint.
    - Install a new snap ring.
    - Position the CV joint on the halfshaft, press the snap ring into it's groove and push the CV joint fully on to the halfshaft.
    - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the joint with the grease supplied.
5. Install the CV joint boot to the CV joint.
    - Secure with the new clamps.
6. Install the halfshaft.
   For additional information, refer to: Front Halfshaft LH (205-04 Front Drive Halfshafts, Removal and Installation).
7. Install the wheel and tire.
    - Tighten the wheel nuts to 140 Nm (103 lb.ft).

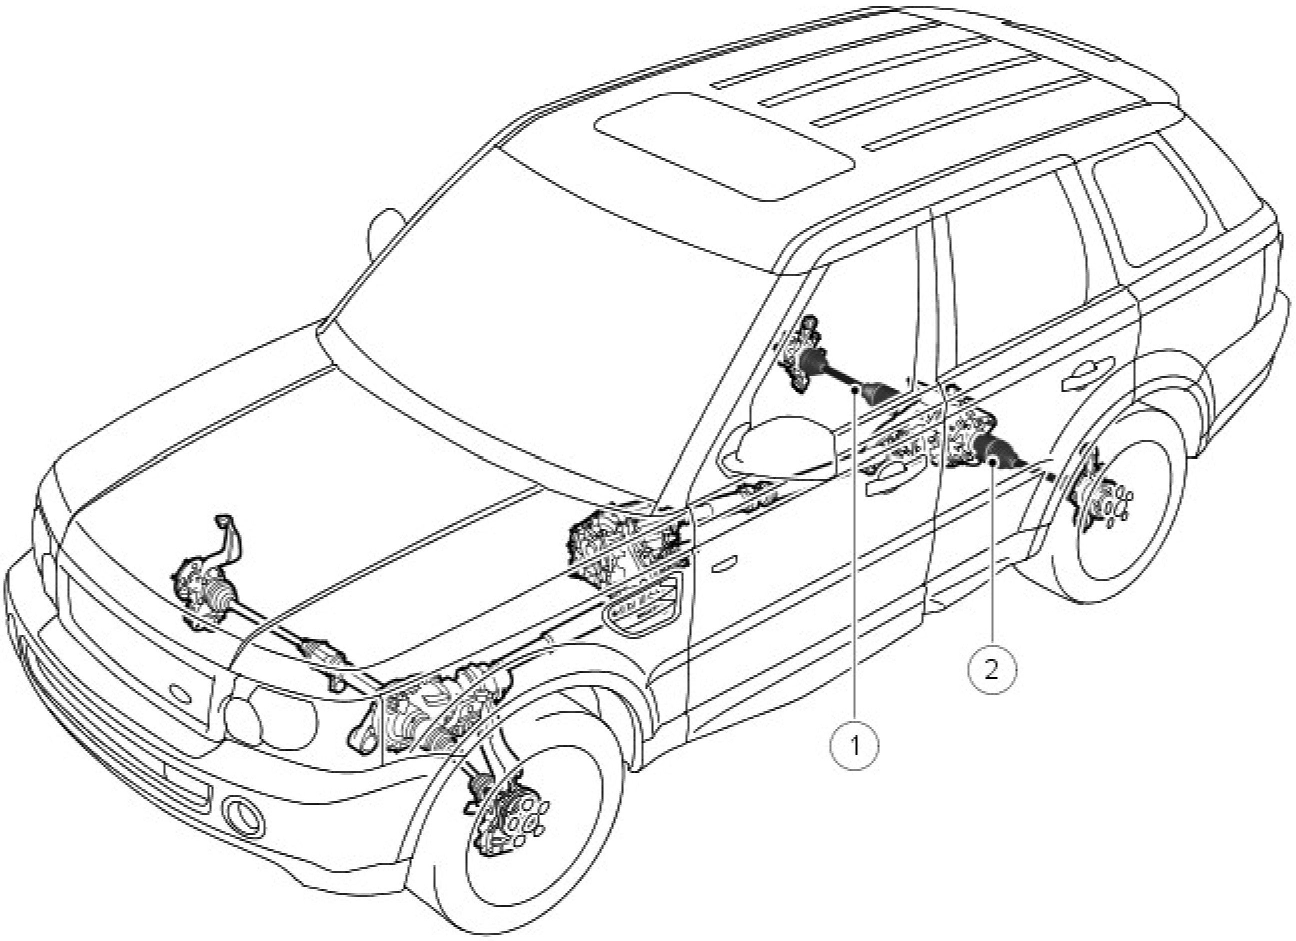
Rear Drive Halfshafts - Rear Drive Halfshafts

Description and Operation

Rear Drive Halfshaft Component Locations



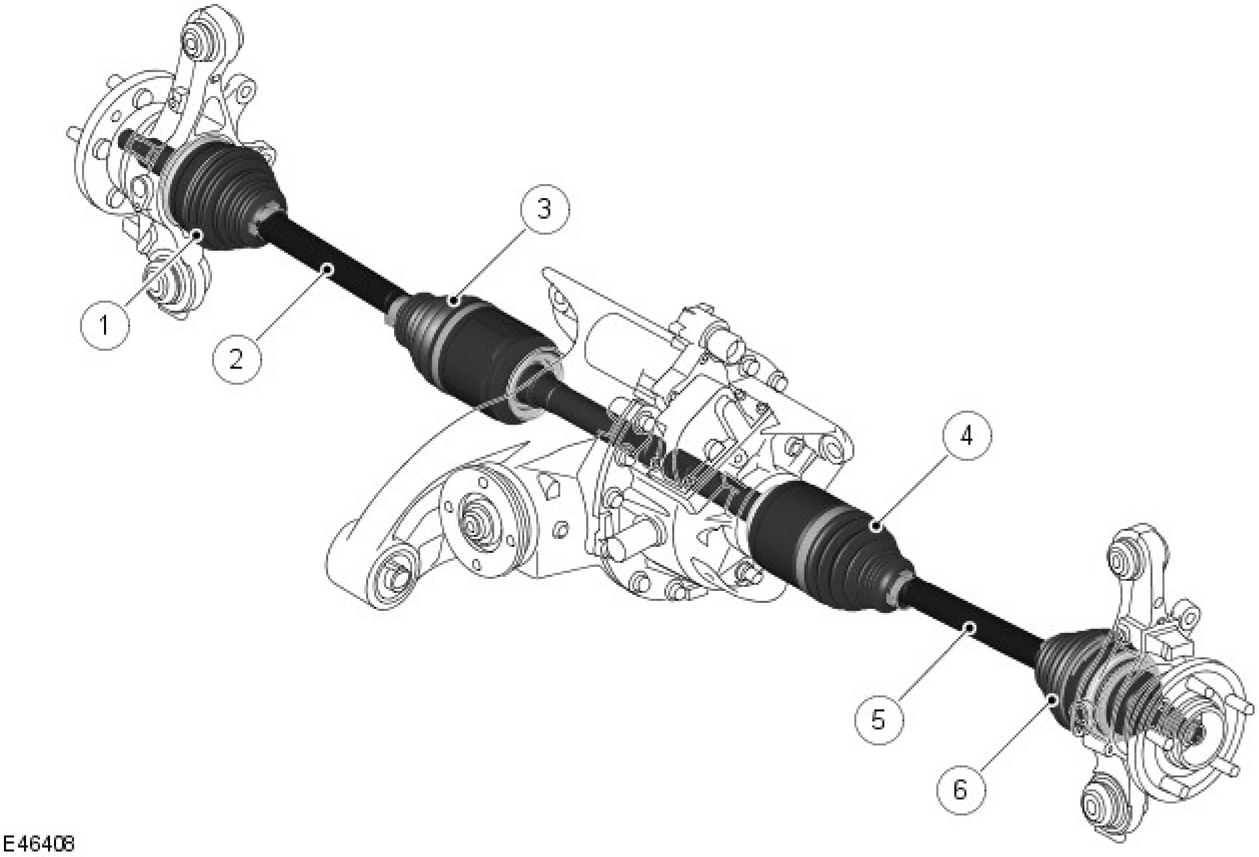
E56496

Item	Part Number	Description
1	-	RH rear drive halfshaft
2	-	LH rear drive halfshaft

GENERAL

The rear drive halfshafts are identical in their construction with a Constant Velocity (CV) joint at each end to allow for suspension movement.

REAR DRIVE SHAFT ASSEMBLY



Item	Part Number	Description
1	-	RH outer CV joint
2	-	RH rear drive halfshaft
3	-	RH inner CV joint
4	-	LH inner CV joint
5	-	LH rear drive halfshaft
6	-	LH outer CV joint

Each outer CV joint has a target wheel on the outer diameter. The ABS wheel speed sensor for vehicle and wheel speed calculations uses this target.

Each rear drive halfshaft comprises two CV joints (inner and outer), boots and a solid barshaft, which is retained in the rear differential by a circlip.

The CV joints used on the rear drive halfshafts share the same design and operating principles as the front drive halfshafts CV joints (see 'Halfshaft Joint' section for more information on CV joints). Peening over the lip of the joint body retains the rear drive halfshaft inner joint hubs.

Rear Drive Halfshafts - Outer Constant Velocity (CV) Joint Boot

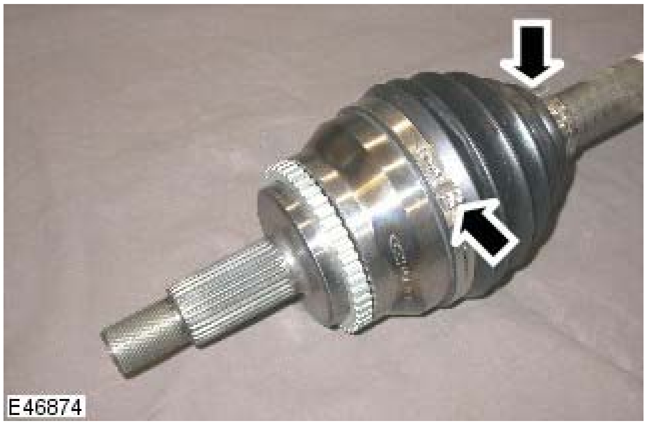
Removal and Installation

Removal

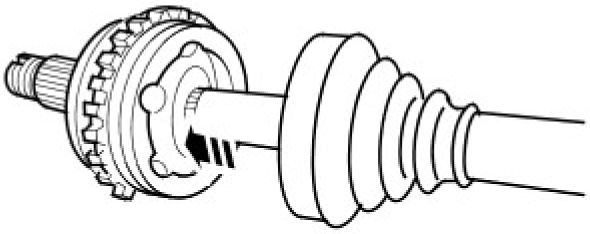
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the wheel and tire.
3. Remove the halfshaft.
   For additional information, refer to: Rear Halfshaft (205-05 Rear Drive Halfshafts, Removal and Installation).
4. Clamp the halfshaft in a vise.
5. Remove and discard the CV joint boot retaining clamps.



6. Slide the CV joint boot along the halfshaft to gain access to the joint.
7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.
   - Remove and discard the snap ring.



E46875

8. Remove the outer CV joint boot.

Installation

1. Clean the components.
2. Install the CV joint boot.
3. Install the outer CV joint.
   - Install the snap ring.
   - Position the CV joint on the halfshaft, press the snap ring into it's groove and push the CV joint fully on to the halfshaft.
   - Pull on the CV joint to ensure the snap ring has fully engaged.
4. Pack the CV joint with the grease supplied.
5. Install the CV joint boot to the CV joint.
   - Secure with the new clamps.
6. Install the halfshaft.

For additional information, refer to: Rear Halfshaft (205-05 Rear Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Removal and Installation

Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

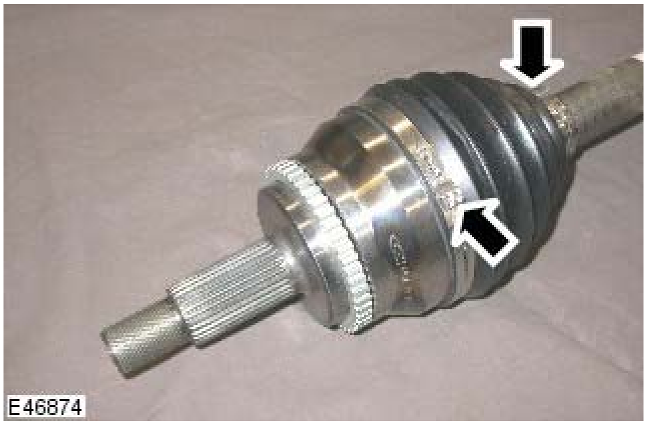
   Raise and support the vehicle.

2. Remove the wheel and tire.

3. Remove the halfshaft.
   For additional information, refer to: Rear Halfshaft (205-05 Rear Drive Halfshafts, Removal and Installation).

4. Clamp the halfshaft in a vise.

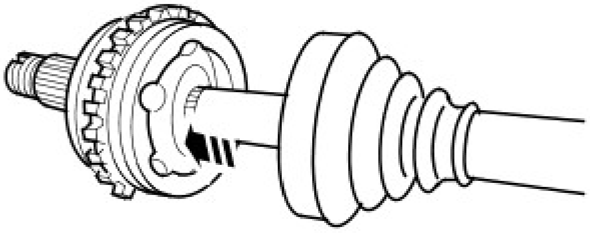
5. Remove and discard the CV joint boot retaining clamps.



6. Slide the CV joint boot along the halfshaft to gain access to the joint.

7. Using a drift against the inner part of the CV joint, remove the CV joint from the halfshaft.

   - Remove and discard the snap ring.



E46875

8. Remove the inner CV joint boot.

Installation

1. Clean the components.

2. Install the inner CV joint boot.

3. Install the inner joint.

   - Install a new snap ring.
   - Position the CV joint on the halfshaft, press the snap ring into it's groove and push the CV joint fully on to the halfshaft.
   - Pull on the CV joint to ensure the snap ring has fully engaged.

4. Pack the joint with the grease supplied.

5. Install the boot to the joint.

   - Secure with the new clamps.

6. Install the halfshaft.

For additional information, refer to: Rear Halfshaft (205-05 Rear Drive Halfshafts, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

 100-012 E54135	Impulse extractor 100-012(LRT-99-004)

	Installer halfshaft oil seal 308-626/1
	Installer/Guide halfshaft oil seal 308-626/2

Removal

- CAUTIONS:

⚠ Do not allow halfshafts to hang unsupported at one end or joint damage will occur.

⚠ Do not store or install halfshafts with joints at maximum articulation or damage may occur to the joint.

⚠ Angularly Adjusted Roller (AAR) joints, used at the inboard end of some halfshafts have no internal retaining mechanism and can separate.

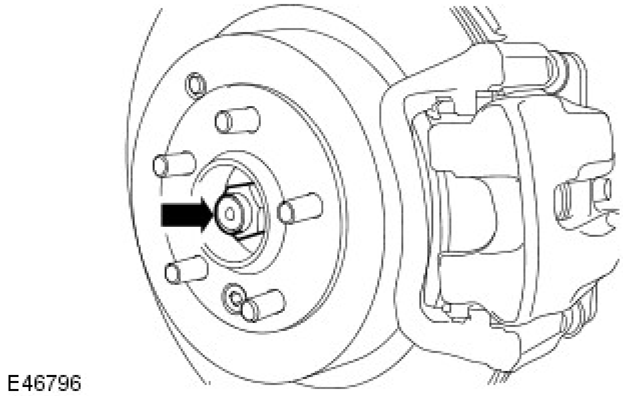
⚠ Do not undo or remove the large protruding hexagon on the differential casing.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Drain the differential lubricant.
For additional information, refer to: Differential Draining and Filling (205-02 Rear Drive Axle/Differential, General Procedures).

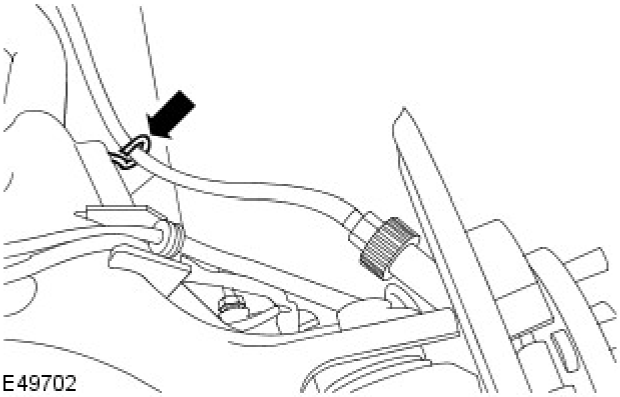
3. Remove the wheel and tire.



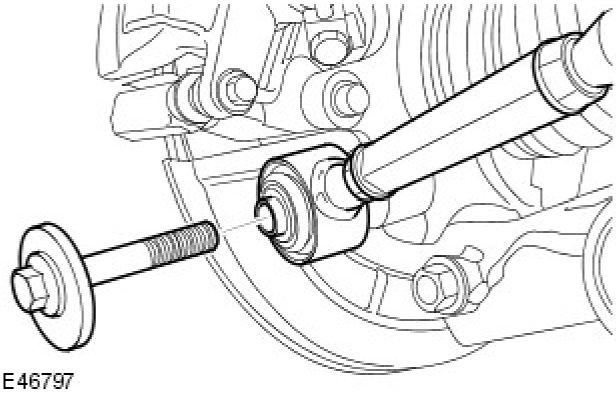
4. Loosen the halfshaft retaining nut.

- Discard the nut.

5. Remove the stabilizer bar link.
For additional information, refer to: Rear Stabilizer Bar Link (204-02 Rear Suspension, Removal and Installation).

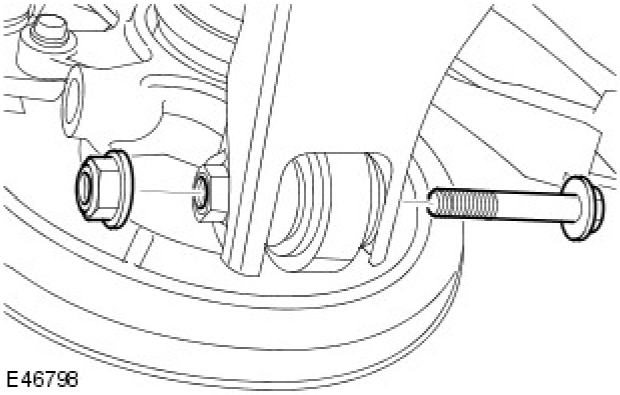


6. Release the parking brake cable from the lower arm.



7. Disconnect the toe link.

- Remove the bolt.

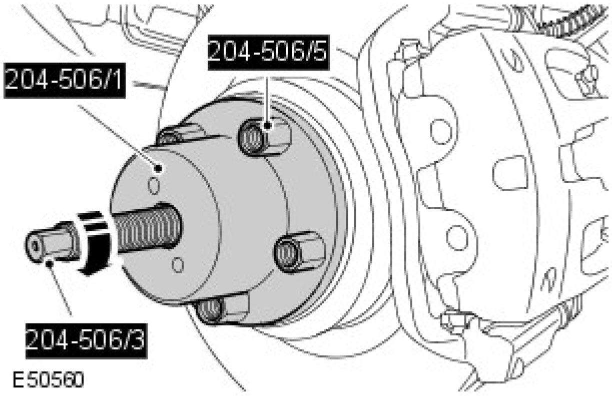


8. Remove and discard the halfshaft retaining nut.

9. ⚠ CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

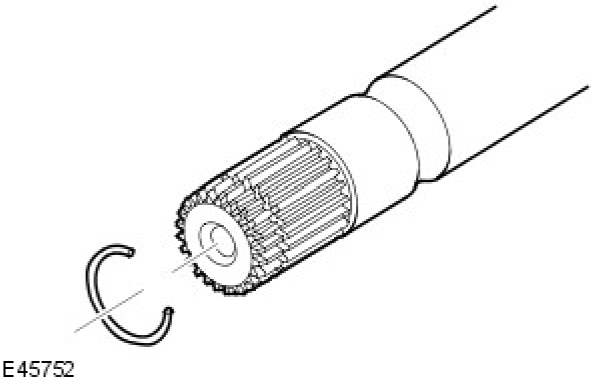
Release the knuckle from the lower arm.

- Remove the bolt.



10. ⚠ CAUTION: Do not use a hammer to detach the halfshaft from the hub assembly, failure to follow this instruction may result in damage to the halfshaft.

Using the special tools, release the halfshaft from the wheel hub.

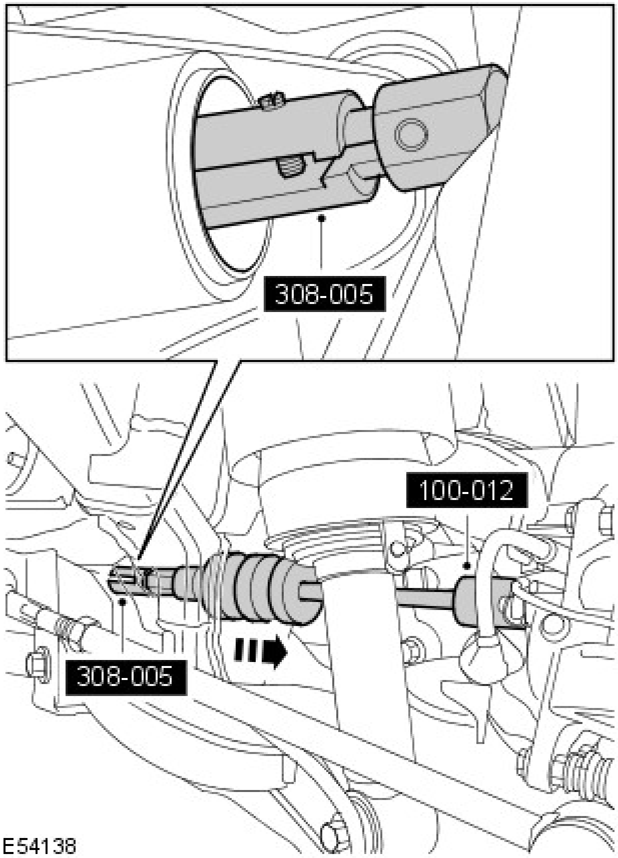


11. Position a container to collect the oil spillage.

12. Release the halfshaft from the differential housing.

13. With assistance, remove the halfshaft.

- Remove and discard the snap ring.

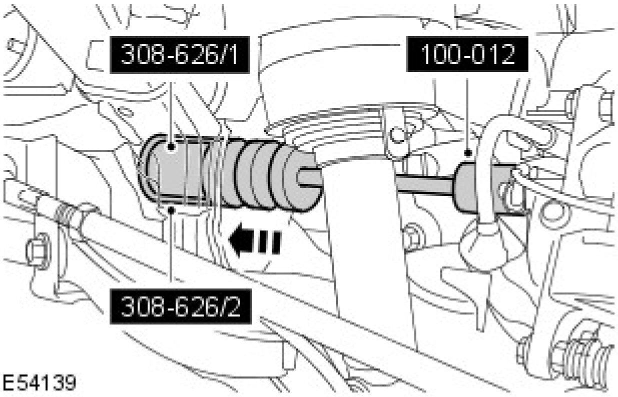


308-005
100-012
308-005
E54138

14. Using the special tools, remove and discard the halfshaft oil seal.

Installation

1. Clean the components.

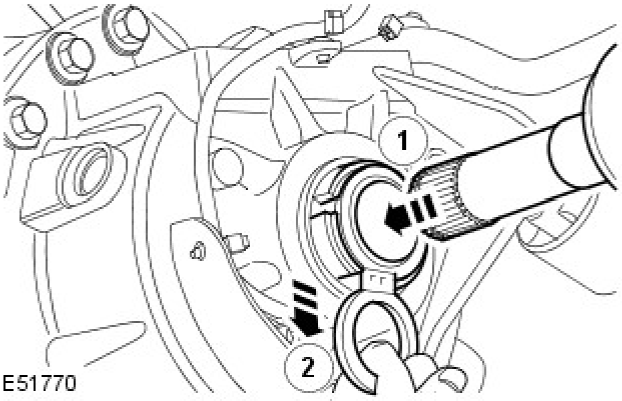


2. Using the special tools, install a new halfshaft oil seal.

- The halfshaft oil seal protector must be left in place, until the halfshaft is fully installed.

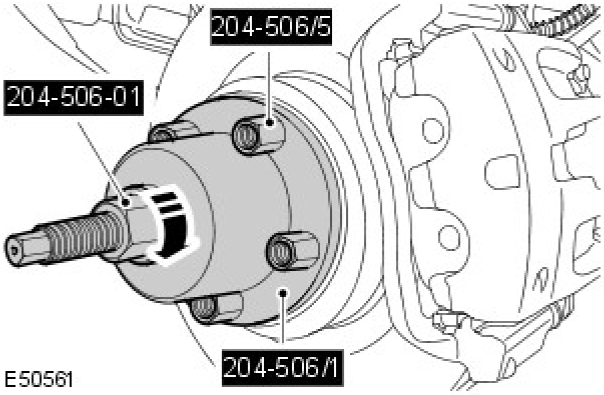
3. With assistance, install the halfshaft.

- Install the snap ring.
- Open the halfshaft oil seal protector.
- Make sure the snap ring is fully engaged and retains the halfshaft.



4. NOTE: The oil seal protector is designed to break into two pieces.

Remove and discard the halfshaft oil seal protector.



5. Using the special tools, install the halfshaft in the wheel hub.

6. CAUTION: Make sure the ball joint seal is not damaged. A damaged seal will lead to the premature failure of the joint.

7. CAUTION: Install the halfshaft nut finger tight.

Install a new halfshaft retaining nut and lightly tighten.

Connect the lower arm to the wheel knuckle.

8. Connect the toe link.

- Tighten to 275 Nm (203 lb.ft).
- Tighten the bolt to 175 Nm (129 lb.ft).
- Tighten the new nut to 275 Nm (203 lb.ft).

9. Secure the parking brake cable to the lower arm.

10. Install the stabilizer bar link.
For additional information, refer to: Rear Stabilizer Bar Link
(204-02 Rear Suspension, Removal and Installation).

11. ⚠ CAUTION: Do not use air tools to install the nut. Failure to follow this instruction may result in damage to the component.

Tighten the new halfshaft retaining nut to 350 Nm (258 lb.ft).

- Stake the nut to the halfshaft.

12. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

13. ⚠ CAUTION: Do not fill the differential with lubricant up to the filler plug. The filler plug is only used to fill the differential with lubricant, and not to act as a level indicator.

Fill the differential with the correct amount of lubricant.
For additional information, refer to: Differential Draining and Filling
(205-02 Rear Drive Axle/Differential, General Procedures).

Brake System - General Information -

Brake Hydraulic Fluid

Item	Specification
* Recommended hydraulic fluid	SHELL DONAX YB DOT4 ESL FLUID

⚠ CAUTION: * If the above fluid is not available, use a low viscosity DOT 4 brake fluid meeting ISO 4925 Class 6 and Land Rover LRES22BF03 requirements.

General Specification

Item	Specification
Footbrake type:	
Vehicles without Brembo Brakes	Hydraulic, servo assisted, self-adjusting with front/rear split hydraulic system, twin piston sliding calipers to the front and single piston sliding calipers to the rear
Vehicles with Brembo Brakes	Hydraulic, servo assisted, self-adjusting with front/rear split hydraulic system, opposed four piston calipers to the front and single piston sliding calipers to the rear
Parking brake type	Twin shoe (leading/trailing) operating on rear wheels and controlled from electric park brake actuator via twin cables

Sealant

Application	Land Rover Part Number
Brake vacuum pump - 2.7 Litre engine	8510302

Brake System - General Information - Brake System

Diagnosis and Testing

Principle of Operation

The brake system is a fairly straightforward design requiring no specialized techniques for diagnosis.

For information on the description and operation of the system, refer to the relevant section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
    - If a road test is necessary make sure the vehicle is safe to do so.
2. **2.** Visually inspect for obvious mechanical faults.

Visual inspection

Mechanical
• Brake pad(s) condition and installation • Brake caliper(s) condition and installation • Brake disc(s) condition and installation • Parking brake disc(s)/parking brake drum(s) condition and installation • Parking brake shoes condition and installation • Parking brake cable(s) condition and installation • Brake booster condition and installation • Brake booster vacuum hose condition and installation • Brake master cylinder condition and installation • Hydraulic control unit (HCU) • Brake fluid leaks • Brake warning indicator

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart.
    - For a list of diagnostic trouble codes (DTCs) referring to the anti-lock brake system, refer to section 206-09 - Traction Control in the workshop manual.
    - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible causes	Action
Brake noise	• Debris • Brake pads • Brake disc(s)	Refer to the relevant section of the workshop manual.
Brake vibration	• Suspension components • Brake disc(s)	Refer to the relevant section of the workshop manual.
Excessive brake pedal travel/brake pedal spongy	• Brake pads • Air in the brake system • Brake master cylinder • Brake fluid leak (see visual inspection)	Worn pads may make the pedal travel excessive, new pads may make the pedal spongy. Check after bedding in the pads. Check the pedal travel. If the pedal "pumps-up", suspect air in the system. Check for a cause for air ingress, rectify as necessary. If the pedal sinks to the floor when held under pressure when there are no external leaks, suspect a master cylinder fault. Refer to the relevant section of the workshop manual.
Excessive brake pedal effort/brake pedal hard	• Brake pipe(s) • Brake caliper slide(s) • Brake caliper piston(s) • Brake vacuum	Check for damaged brake pipes. Check the brake calipers. Check the brake vacuum pipe for air leaks, rectify as necessary. Check the brake vacuum pump operation. Refer to the relevant section of the workshop manual. Check the brake booster.

Symptom	Possible causes	Action
	pipe ● Brake vacuum pump ● Brake booster	
Low foot brake efficiency/brakes pulling/sticking/binding	● Brake pipe(s) ● Pads ● Brake caliper piston(s) ● Brake caliper slide(s) ● Brake disc(s)	Check the vehicle for damaged brake pipes. Inspect the brake pads. Check the brake calipers. Check the brake discs. Refer to the relevant section of the workshop manual.
Parking brake will not engage or release	● Parking brake cables ● Parking brake shoes ● Parking brake adjusters ● Rear brake disc(s)/parking brake drum(s) ● Parking brake actuator malfunction	Check the parking brake cable(s) for operation/condition. Check that the cable end connector(s) are correctly installed to the operating lever(s). Inspect the parking brake shoes for wear. Check the parking brake shoes for correct adjustment. Check the rear brake disc(s)/parking brake drum(s). Check the parking brake actuator for damage and/or excessive noise in normal operation. Refer to the relevant section of the workshop manual.
Low parking brake efficiency/parking brake sticking/binding		
Brake warning indicator staying illuminated	● Brake reservoir fluid level ● Brake pads ● Brake pad wear sensor leads ● Brake fluid level sensor	Check the brake fluid level, top up if required. Inspect the brake pads. Check the brake pad sensor circuit. Refer to the electrical guides. Check the function of the brake fluid level sensor. Refer to the relevant section of the workshop manual.

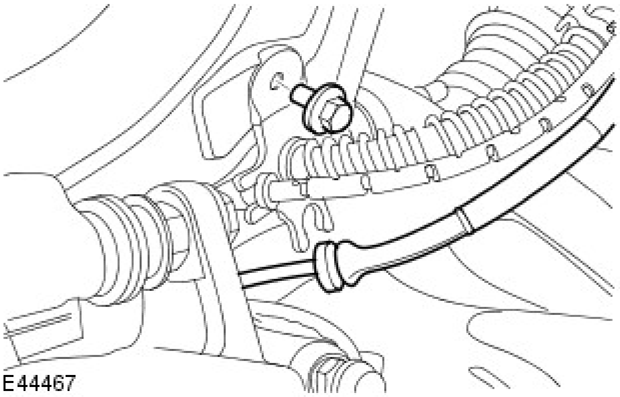
Brake System - General Information - Front Brake Disc Runout CheckVehicles With: Standard Brakes

General Procedures

Special Tool(s)	
	Dial indicator gauge holding fixture 100-053 (LRT-99-503)

⚠CAUTION: Brake discs must be renewed in pairs, unless one disc requires changing before 1000 miles (1500 kilometers) from new.

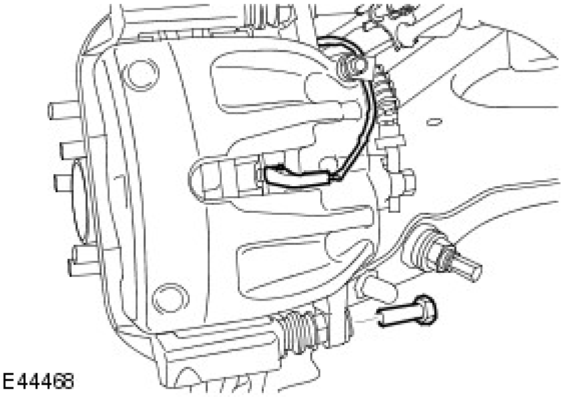


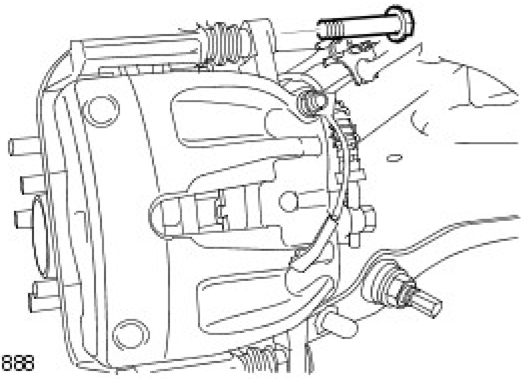
1. Release the brake hose bracket from the wheel knuckle.
   - Remove the bolt.

2. ⚠CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

   LH side only: Disconnect the brake pad wear indicator sensor.

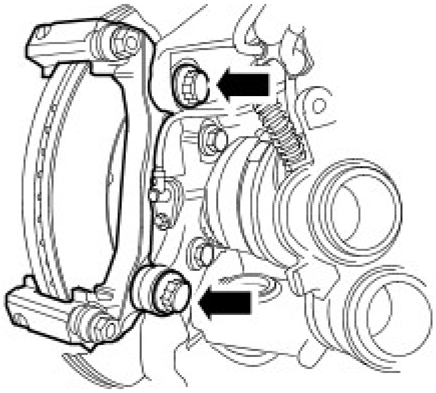
3. Remove the brake caliper lower bolt.





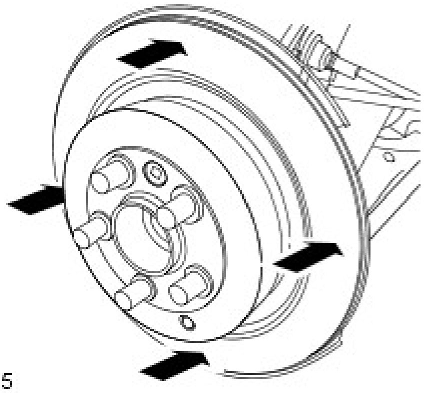
4. Remove the brake caliper upper bolt.

5. Tie the brake caliper housing aside.



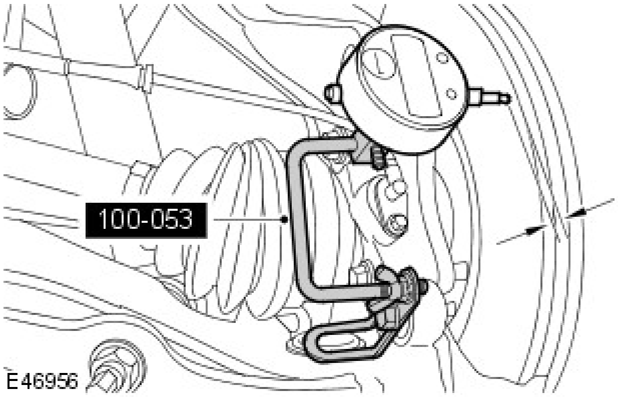
6. Remove the brake caliper anchor plate.

- Remove the 2 bolts.



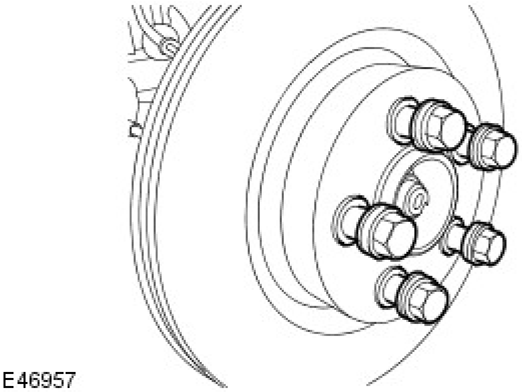
7. Measure the brake disc thickness at four points around the brake disc.

- Renew the brake disc if the thickness is less than the service limit, or if the maximum thickness variation is exceeded. Brake disc thickness, NEW = 30 mm, Service limit = 27 mm.



8. Using the special tool, install a dial indicator gauge to the brake caliper lower mounting.

- Position the dial indicator gauge plunger 5 mm in from the outer edge of the brake disc.



9. Install the wheel nuts.

- Install spacer washers under the wheel nuts.
- Tighten the wheel nuts to 140 Nm (103 lb.ft).

10. Rotate the brake disc one revolution to measure the brake disc run-out.

- Brake disc run-out must not exceed 0.05 mm.

11. If the brake disc run-out is outside the limit. Remove the brake disc.

12. Make sure the brake disc and hub mating surfaces are clean.

13. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

14. Install the wheel nuts.

- Install spacer washers under the wheel nuts.
- Tighten the wheel nuts to 140 Nm (103 lb.ft).

15. Rotate the brake disc one revolution to measure the brake disc run-out.

- Brake disc run-out must not exceed 0.05 mm.

16. If the brake disc run-out is still outside the limit, install a new brake disc and/or hub.

17. Remove the dial indicator gauge and the special tool.

18. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the caliper housing and anchor plate using brake cleaning fluid.

19. Install the anchor plate.

- Tighten the bolts to 275 Nm (203 lb.ft).

20. Install the brake caliper housing and fit the top bolt.

- Tighten the bolt to 32 Nm (24 lb.ft).

21. Install the brake pads.

- Install the two clips.

22. Rotate the brake caliper downwards.

- Tighten the bolt to 32 Nm (24 lb.ft).

23. Connect the brake pad wear indicator sensor.

24. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

25. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

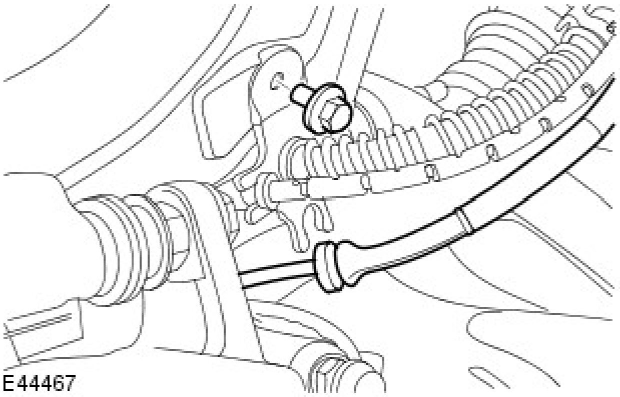
Brake System - General Information - Front Brake Disc Runout CheckVehicles With: High Performance Brakes

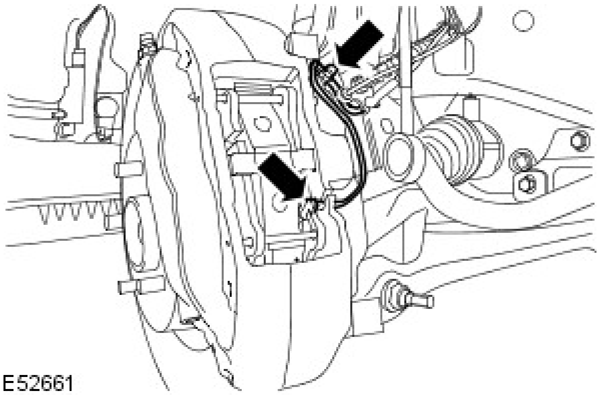
General Procedures

Special Tool(s)	
	Dial indicator gauge holding fixture 100-053 (LRT-99-503)



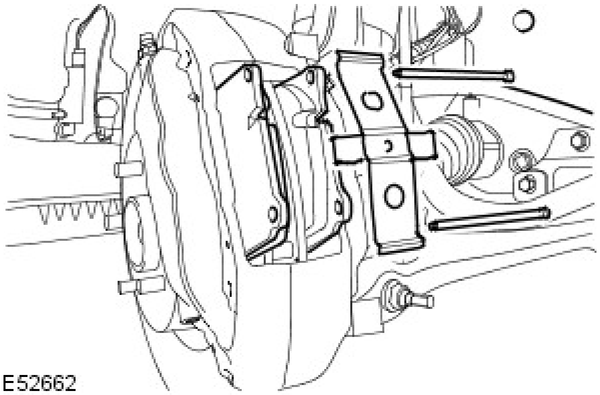
1. Release the brake hose bracket from the wheel knuckle.

- Remove the bolt.



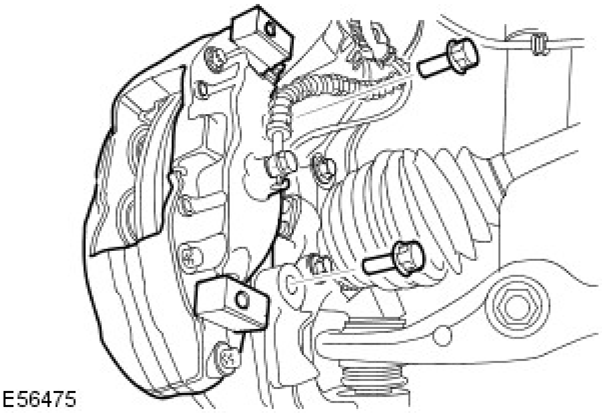
2. LH side only: Disconnect the brake pad wear indicator sensor.

- Release the lead from the clips.



3. Remove the brake pads.

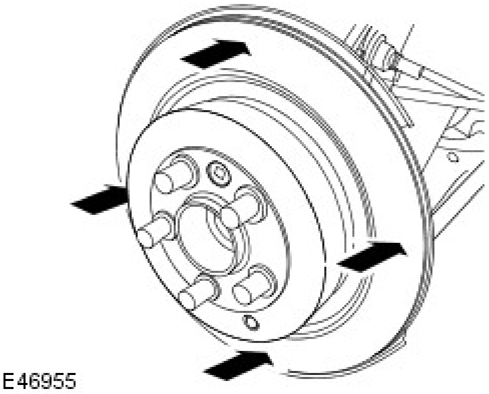
- Remove the 2 retaining pins.
- Remove the anti-rattle spring.
- Withdraw the brake pads.



E56475

4. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

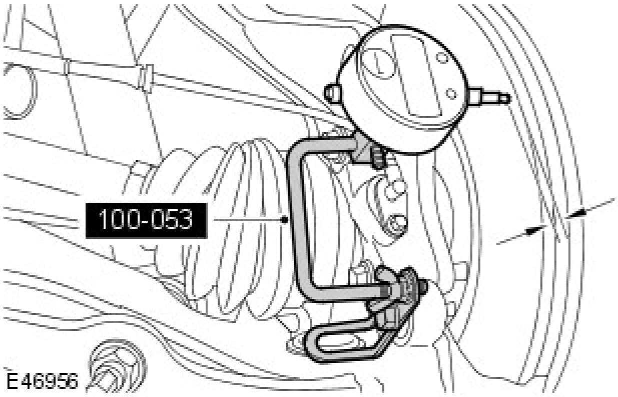
Release the brake caliper and tie aside.



E46955

5. Measure the brake disc thickness at 4 points around the brake disc.

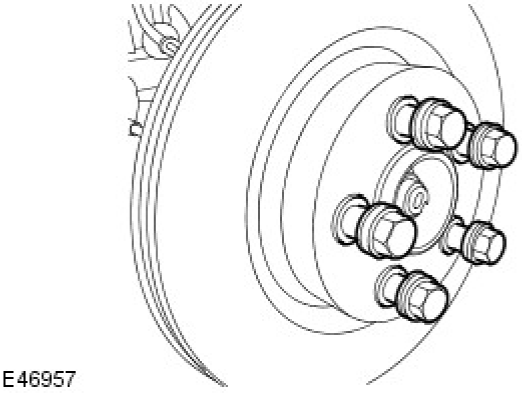
- Renew the brake disc if the thickness is less than the service limit, or if the maximum thickness variation is exceeded. Brake disc thickness, NEW = 30 mm, Service limit = 27 mm.



E46956

6. Using the special tool, install a dial indicator gauge to the brake caliper lower mounting.

- Position the dial indicator gauge plunger 5 mm in from the outer edge of the brake disc.



E46957

7. Install the wheel nuts.

- Install spacer washers under the wheel nuts.
- Tighten the wheel nuts to 140 Nm (103 lb.ft).

8. Rotate the brake disc one revolution to measure the brake disc run-out.

- Brake disc run-out must not exceed 0.05 mm.

9. If the brake disc run-out is outside the limit. Remove the brake disc.

10. Make sure the brake disc and hub mating surfaces are clean.

11. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

12. Install the wheel nuts.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).
- Install spacer washers under the wheel nuts.

13. Rotate the brake disc one revolution to measure the brake disc run-out.

- Brake disc run-out must not exceed 0.05 mm.

14. If the brake disc run-out is still outside the limit, install a new brake disc and/or hub.

15. Remove the dial indicator gauge and the special tool.

16. Secure the brake caliper to the wheel knuckle.

- Tighten the bolts to 275 Nm (203 lb.ft).

17. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 23 Nm (17 lb.ft).

18. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the components.

19. Inspect the caliper piston seals for damage.

20. Position a bleed jar containing a small quantity of approved brake fluid. Connect the bleed tube to the bleed screw and loosen the screw.

21. Press the pistons into the caliper housing.

- Tighten the bleed screw to 19 Nm (14 lb.ft).

22. Repeat the above process for the other 2 pistons.

23. Disconnect the bleed tube and remove the jar.

24. Install the brake pads.

- Position the anti-rattle spring.
- Install the pins, making sure the pin collets are fully engaged in the caliper.

25. LH side only: Connect the brake pad wear indicator sensor.

- Secure the lead in the clips.

26. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

27. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Brake System - General Information - Rear Brake Disc Runout Check

General Procedures

Special Tool(s)	
	Dial indicator gauge holding fixture 100-053 (LRT-99-503)

• NOTE: If the parking brake shoes or the brake discs have been removed for access to other components then DO NOT carry out the bedding in procedure.

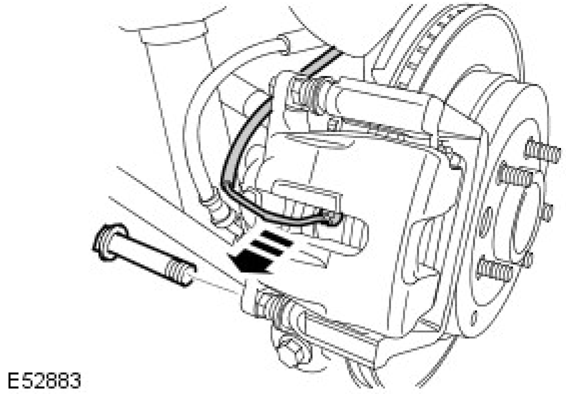
1. CAUTION: Do not turn the ignition on when the parking brake service mode has been set, this will result in the parking brake being released from the service mode.

Enter the parking brake into the service mode.

- Turn the ignition key to position II.
- Apply, and hold, the footbrake.
- Apply, and hold, the parking brake switch to the RELEASE position.
- Turn the ignition key to position '0' and remove the key.
- Release the footbrake.
- Release the parking brake switch.

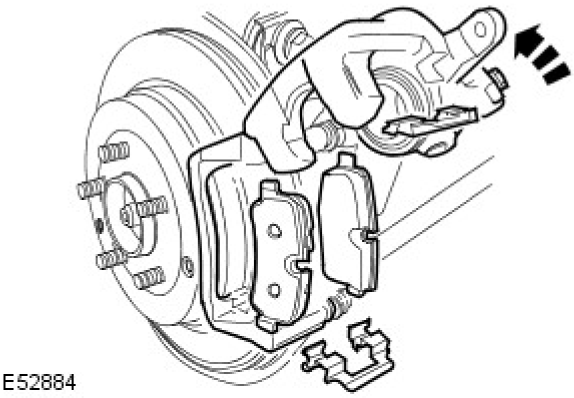
2. CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

RH side only: Disconnect the brake pad wear indicator sensor.



E52883

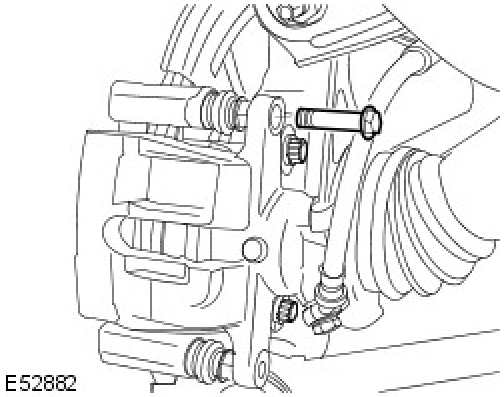
3. Remove the brake caliper lower bolt.



E52884

4. Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the two clips.



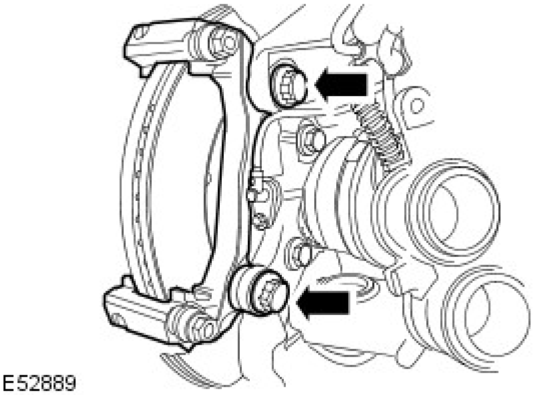
E52882

5. Remove the brake caliper upper bolt.

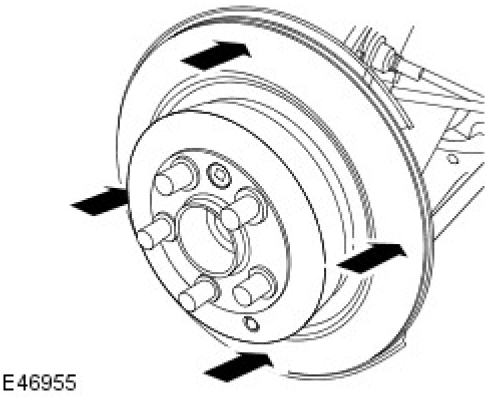
6. ⚠CAUTION: Do not allow the brake caliper to hang on the brake hose.

Tie the brake caliper housing aside.

7. Remove the brake caliper anchor plate.

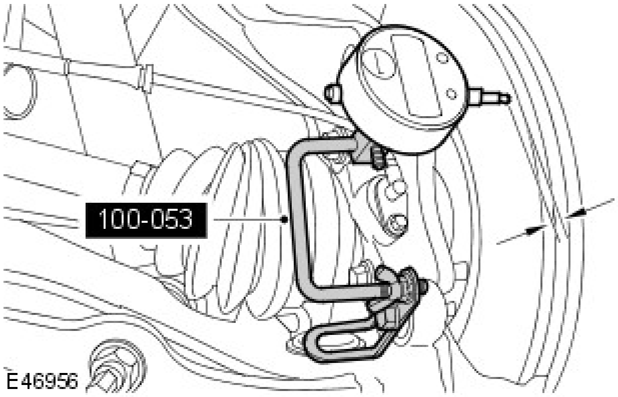


E52889



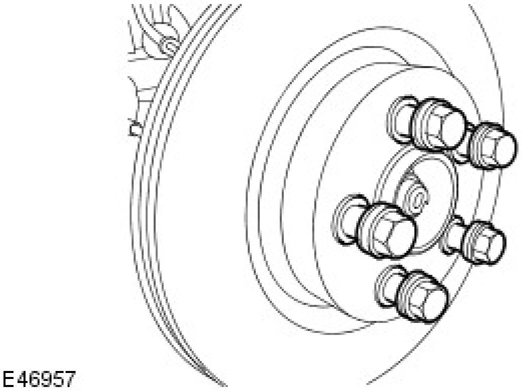
8. Measure the brake disc thickness at four points around the brake disc.

- Renew the brake disc if the thickness is less than the service limit, or if the maximum thickness variation is exceeded. Brake disc thickness, NEW = 20 mm, Service limit = 17 mm.



9. Using the special tool, install a dial indicator gauge to the brake caliper lower mounting.

- Position the dial indicator gauge plunger 5 mm in from the outer edge of the brake disc.



10. Install the wheel nuts.

- Install spacer washers under the wheel nuts.
- Tighten the wheel nuts to 140 Nm (103 lb.ft).

11. Rotate the brake disc one revolution to measure the brake disc run-out.

- Brake disc run-out must not exceed 0.09 mm.

12. If the brake disc run-out is outside the limit. Remove the brake disc.

13. Make sure the brake disc and hub mating surfaces are clean.

14. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

15. Install the wheel nuts.

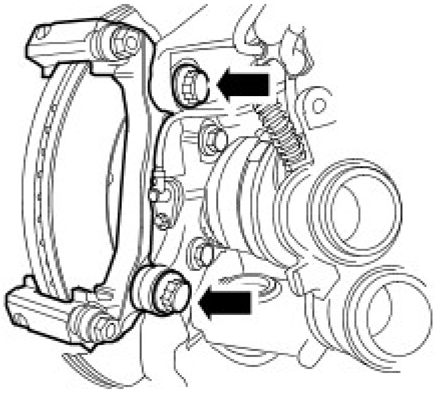
- Install spacer washers under the wheel nuts.
- Tighten the wheel nuts to 140 Nm (103 lb.ft).

16. Rotate the brake disc one revolution to measure the brake disc run-out.

- Brake disc run-out must not exceed 0.09 mm.

17. If the brake disc run-out is still outside the limit, install a new brake disc and/or hub.

18. Remove the dial indicator gauge and the special tool.



E52889

19. Install the anchor plate.

- Tighten the bolts to 115 Nm (85 lb.ft).

20. Install the brake caliper housing and fit the top bolt.

- Tighten the bolt to 32 Nm (24 lb.ft).

21. Install the brake pads.

- Install the 2 clips.
- Install the two clips.

22. Rotate the brake caliper downwards.

- Tighten the bolt to 32 Nm (24 lb.ft).

23. Connect the brake pad wear indicator sensor.

24. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Brake System - General Information - Brake System BleedingVehicles With: Standard Brakes

General Procedures

WARNING: If any components upstream of the Hydraulic Control Unit (HCU), including the HCU itself are replaced, the brake system must be bled using the procedure on T4. This will ensure that all air is expelled from the new component(s).

• NOTE: Bleeding of the brake system can be carried out using the procedures given on T4, or by using the procedure below. The following procedure covers bleeding the brake system if components downstream of the HCU have been replaced.

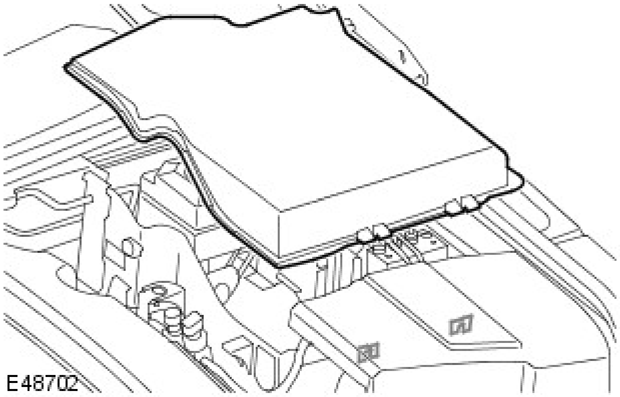
• NOTE: Where only the primary or secondary brake circuits have been disturbed in isolation, it should only be necessary to bleed that circuit. Partial bleeding of the hydraulic system is only permissible if a brake tube or hose has been disconnected with only minimal loss of fluid.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Check that all the brake line connections are tight and that there are no signs of leaks. If any leak of brake fluid is observed, investigate and rectify the cause of the leak before bleeding the brakes.

3. Pump the brake pedal until the brake vacuum assistance is exhausted.



E48702

4. Remove the plenum chamber panel.

- Release the 2 clips.

5. WARNING: Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

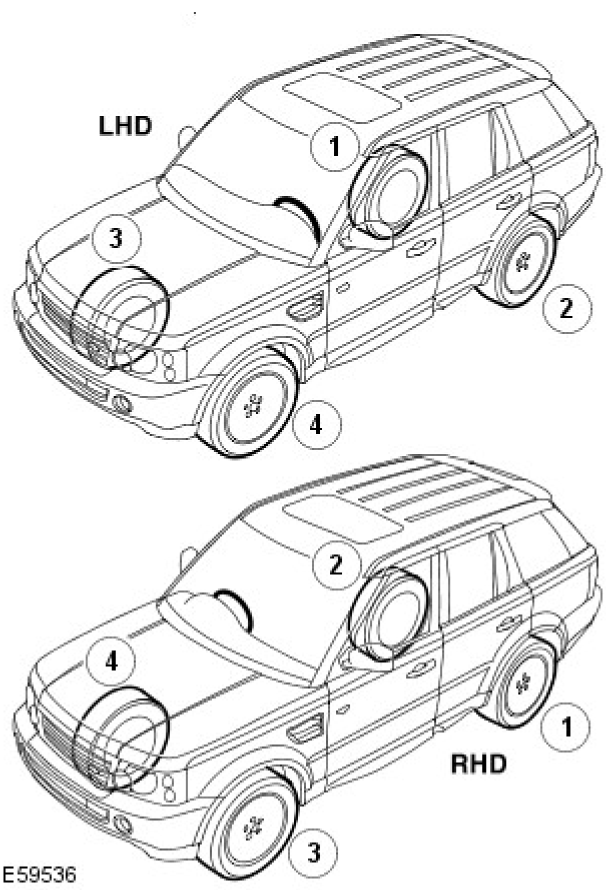
CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Remove the brake fluid reservoir cap.

- Disconnect the brake fluid reservoir electrical connector.

6. Fill the brake fluid reservoir to the MAX mark.

7. Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.



8. ⚠ WARNING: Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Starting at the brake caliper furthest away from the brake master cylinder, loosen the bleed screw by one-half to three-quarters of a turn.

9. ⚠ CAUTION: The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With the aid of an assistant, depress the brake pedal steadily through its full stroke and allow to return to the rest position. Repeat the procedure until a flow of clean, air-free fluid is being pumped into the bleed jar.

10. When a flow of clean, air-free fluid is being pumped into the bleed jar, depress and hold the brake pedal.

11. ⚠ CAUTION: Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw to 10 Nm (7 lb.ft).

12. Fill the brake fluid reservoir to the MAX mark.

13. Repeat the brake bleeding procedure for each brake caliper, following the above sequence.

14. Fill the brake fluid reservoir to the MAX mark.

15. Apply the brakes and check for leaks.

16. Install the brake fluid reservoir cap.

- Connect the brake fluid reservoir electrical connector.

17. Install the plenum chamber panel.

- Secure the clips.

Published: 11-May-2011

9. CAUTION: The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

With the aid of an assistant, depress the brake pedal steadily through its full stroke and allow to return to the rest position. Repeat the procedure until a flow of clean, air-free fluid is being pumped into the bleed jar.

10. When a flow of clean, air-free fluid is being pumped into the bleed jar, depress and hold the brake pedal.

11. CAUTION: Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw to 10 Nm (7 lb.ft).

12. Fill the brake fluid reservoir to the MAX mark.

13. Repeat the brake bleeding procedure for the remaining rear brake caliper.

- Tighten the bleed screw to 10 Nm (7 lb.ft).

14. WARNING: Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each front brake caliper, following the above sequence.

- If access is restricted to the front caliper outer bleed screws, rotate the road wheels to gain access.
- Tighten the front brake caliper bleed screws to 19 Nm (14 lb.ft).

15. Fill the brake fluid reservoir to the MAX mark.

16. Apply the brakes and check for leaks.

17. Install the brake fluid reservoir cap.

- Connect the brake fluid reservoir electrical connector.

18. Install the plenum chamber panel.

- Secure the clips.

Brake System - General Information - Brake System Pressure BleedingVehicles With: Standard Brakes

General Procedures

⚠WARNING: If any components upstream of the Hydraulic Control Unit (HCU), including the HCU itself are replaced, the brake system must be bled using the procedure on T4, to ensure that all the air is expelled from the new component(s).

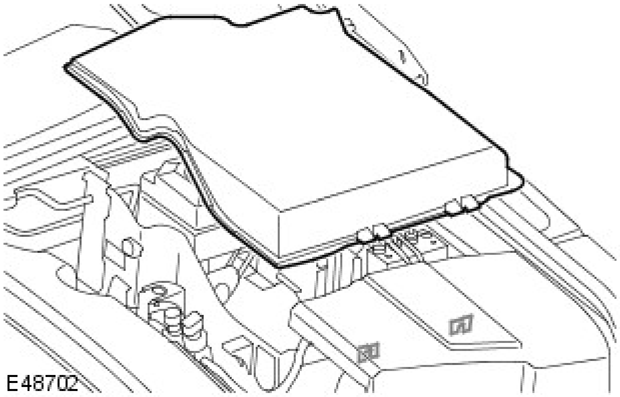
- NOTE: The following procedure covers bleeding the complete system. Where only the primary or secondary brake circuits have been disturbed in isolation, it should only be necessary to bleed that circuit. Partial bleeding of the hydraulic system is only permissible if a brake tube or hose has been disconnected with only minimal loss of fluid.

1. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Check that all the brake line connections are tight and that there are no signs of leaks.
For additional information, refer to: Specifications (206-00, Specifications).

3. Release the 3 clips and remove the cover.



4. ⚠WARNING: Do not allow dirt or foreign liquids to enter the reservoir. Use only new brake fluid of the correct specification from airtight containers. Do not mix brands of brake fluid as they may not be compatible.

⚠CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Fill the brake fluid reservoir to the MAX mark.

5. Install the bleed tube to the brake caliper bleed screw and immerse the free end of the bleed tube in a bleed jar containing a small quantity of approved brake fluid.

6. Starting at the brake caliper furthest away from the brake master cylinder, loosen the bleed screw by one-half turn.

7. ⚠CAUTION: The brake fluid reservoir must remain full with new, clean brake fluid at all times during bleeding.

Depress the brake pedal steadily through its full stroke and allow to return to the rest position. Repeat the procedure until a flow of clean, air-free fluid is being pumped into the bleed jar.

8. ⚠CAUTION: Make sure the bleed screw cap is installed after bleeding. This will prevent corrosion to the bleed screw.

With the brake pedal fully depressed, tighten the bleed screw to 10 Nm (7 lb.ft).

9. Fill the brake fluid reservoir to the MAX mark.

10. ⚠ WARNING: Braking efficiency may be seriously impaired if an incorrect bleed sequence is used.

Repeat the brake bleeding procedure for each brake caliper.

11. Using T4, bleed the braking system.

12. Apply the brakes and check for leaks.

13. Install the cover.

Front Disc Brake -

Item	**Specification**
Disc type	Ventilated
Disc diameter:	
V6 Diesel engine vehicles without Brembo brakes	320 mm (12.6 in)
V8 Petrol engine vehicles without Brembo brakes	340 mm (13.5 in)
Vehicles with Brembo brakes	360 mm (14.1 in)
Disc thickness:	
New	30.0 mm (1.18 in)
Service limit	27.0 mm (1.063 in)
Maximum disc run-out - disc installed	0.05 mm (0.002 in)
Vehicles without Brembo brakes:	
Caliper type	Sliding pin, twin piston
Piston diameter	48.0 mm (1.9 in)
Pad minimum thickness	3.0 mm (0.12 in)
Vehicles with Brembo brakes:	
Caliper type	Fixed, opposing four piston
Piston diameter	46 mm (1.8 in)
Pad minimum thickness	3.0 mm (0.12 in)
Brake pad wear warning lead:	
Location	Front left hand brake pad
Activates at	75% of pad life utilised

GENERAL

The front brakes on all models feature ventilated brake discs, with different diameter brake discs for each model. The 4.4L and 2.7L diesel models feature twin piston sliding calipers. Although similar in appearance, the sliding calipers on 4.4L and 2.7L diesel are not interchangeable. On 4.2L models, 4 piston, opposed piston Brembo calipers are installed. The dust shields are common on 4.4L and 2.7L diesel models, and unique on 4.2L models.

Two steel damper weights are installed on the inboard side of the Brembo calipers to reduce noise, vibration and harshness (NVH).

On all models the brake caliper is attached to the rear of the front knuckle. The brake pads are made from an asbestos free material. The inboard brake pad of the left front brake incorporates a wear sensor.

With the sliding calipers, when hydraulic pressure is supplied to the caliper, the pistons extend and force the inner pad against the brake disc. The caliper body reacts and slides on the guide pins to bring the outer pad into contact with the brake disc.

With the Brembo calipers, when hydraulic pressure is supplied to the caliper, the two pairs of opposed pistons extend in the caliper. The two pistons in each side of the caliper force their related brake pads against the brake disc.

The front brake pad wear sensor is connected in series with the rear brake pad wear sensor, between the instrument cluster and ground. When a brake pad incorporating a brake pad wear sensor is approximately 75% worn, the brake pad wear sensor goes open circuit. When the instrument cluster detects the open circuit, it illuminates the amber light emitting diode (LED) in the brake warning indicator, displays an appropriate warning in the message center and sounds a warning chime.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

At the beginning of each ignition cycle, the instrument cluster performs a bulb check on the brake warning indicator: the indicator is illuminated amber for 1.5 seconds, red for 1.5 seconds, then goes off.

Diagnosis and Testing

Overview

The front disc brake system is a fairly straightforward design requiring no specialized techniques for diagnosis.

For information on the description and operation of the system:
REFER to: Front Disc Brake (206-03 Front Disc Brake, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer concern.
    - ○ If a road test is necessary make sure the vehicle is safe to do so.
2. **2.** Visually inspect for obvious mechanical faults.

Visual inspection

Mechanical
- Brake caliper(s) condition and fitment - Brake pad(s) condition and fitment - Brake disc(s) condition and fitment - Fluid leaks

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the symptom chart.

Symptom Chart

Symptom	Possible causes	Action
Brake noise	- Debris - Brake pads - Brake discs	Inspect for debris, remove as necessary. Check for excessive brake pad wear. Check for brake disc damage. REFER to: Brake Pads - Vehicles Without: Brembo Brakes (206-03 Front Disc Brake, Removal and Installation) / Brake Pads - Vehicles With: Brembo Brakes (206-03 Front Disc Brake, Removal and Installation).
Brake vibration	- Suspension components - Brake discs	Check for worn or damaged suspension components. REFER to: Front Suspension (204-01 Front Suspension, Diagnosis and Testing). Check for brake disc distortion or runout. REFER to: Front Brake Disc Runout Check - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures) / Front Brake Disc Runout Check - Vehicles With: High Performance Brakes (206-00 Brake System - General Information, General Procedures).

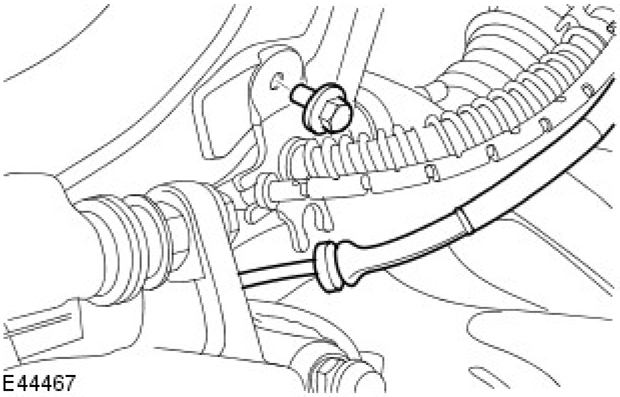
Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

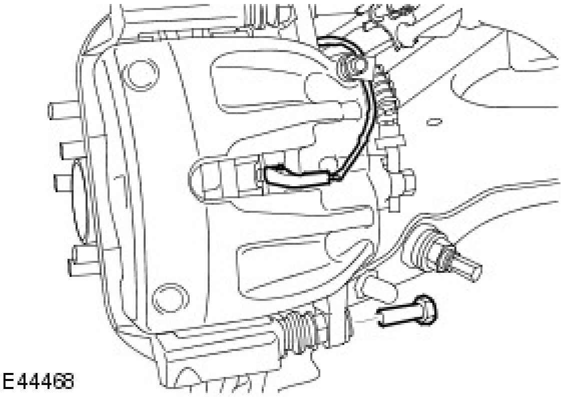
2. Remove the wheel and tire.
3. Release the brake hose bracket from the wheel knuckle.
   - Remove the bolt.



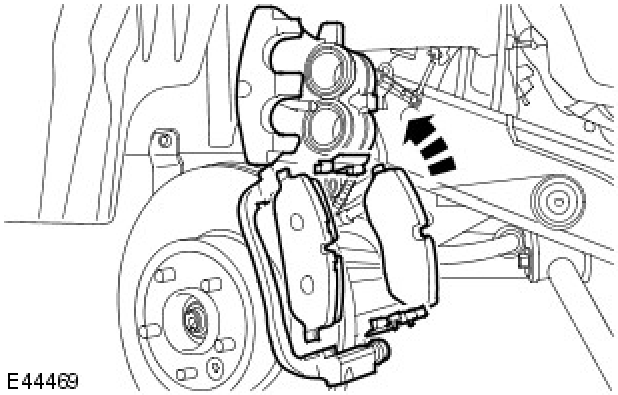
4. ⚠ CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

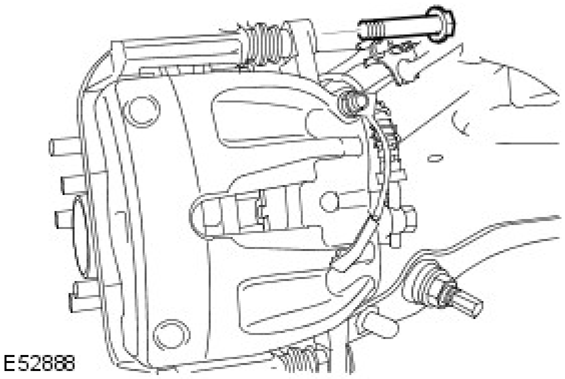
   LH side only: Disconnect the brake pad wear indicator sensor.

5. Remove the brake caliper lower bolt.



6. Remove the brake pads.
   - Rotate the brake caliper upwards.
   - Remove the two clips.





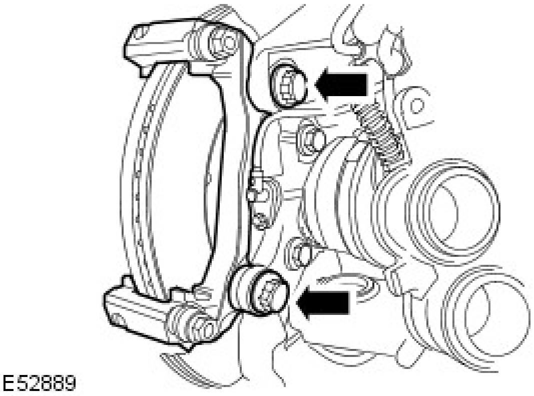
7. Remove the brake caliper upper bolt.

8. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

Tie the brake caliper housing aside.

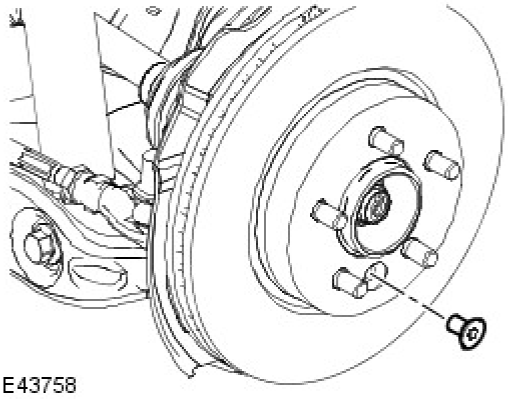
9. Remove the brake caliper anchor plate.

- Remove the 2 bolts.



10. Remove the brake disc.

- Remove the Torx screw.



Installation

1. Make sure the brake disc and hub mating surfaces are clean.

2. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

3. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the caliper housing and anchor plate using brake cleaning fluid.

4. Install the anchor plate.

- Tighten the bolts to 275 Nm (203 lb.ft).

5. Install the brake caliper housing and fit the top bolt.

- Tighten the bolt to 35 Nm (26 lb.ft).

6. Install the brake pads.

- Install the two clips.

7. Rotate the brake caliper downwards.

- Tighten the bolt to 35 Nm (26 lb.ft).

8. Connect the brake pad wear indicator sensor.

9. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 22 Nm (16 lb.ft).

10. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

11. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Removal and Installation

Removal

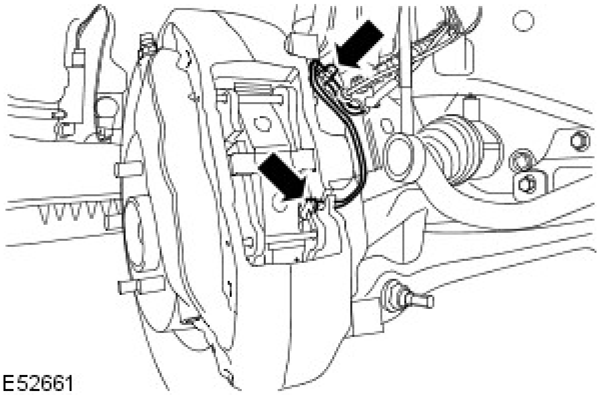
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the wheel and tire.

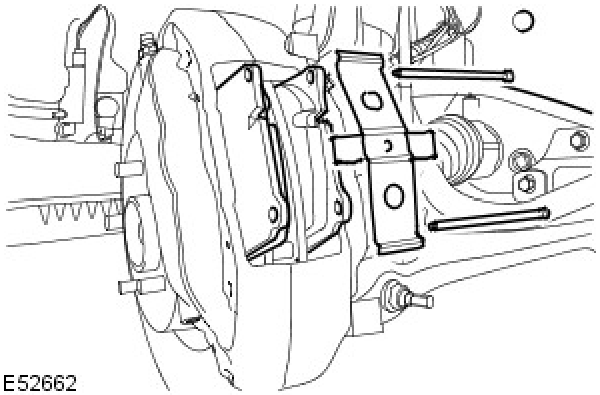
3. LH side only: Disconnect the brake pad wear indicator sensor.

- Release the lead from the clips.



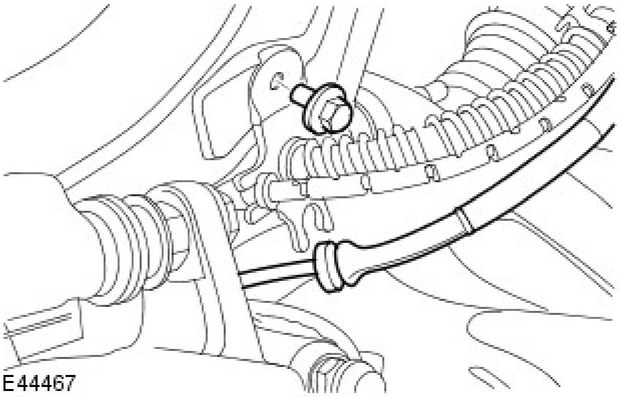
4. Remove the brake pads.

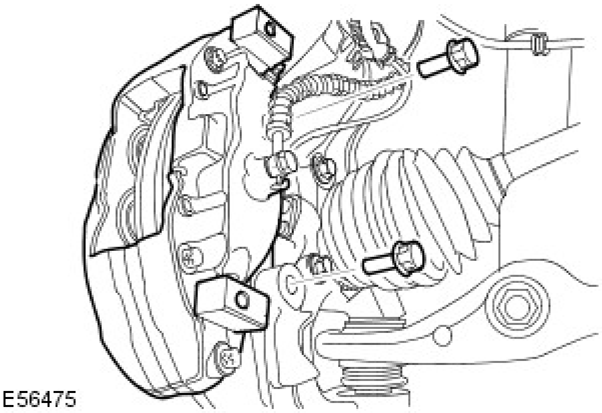
- Remove the 2 retaining pins.
- Remove the anti-rattle spring.
- Withdraw the brake pads.



5. Release the brake hose bracket from the wheel knuckle.

- Remove the retaining bolt.

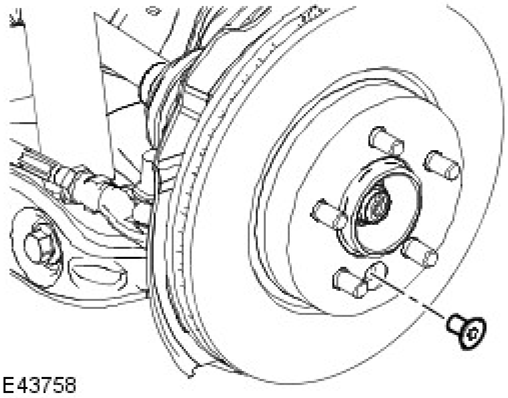




6. ⚠CAUTION: Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper from the wheel knuckle.

- Remove the 2 retaining bolts.
- Tie the brake caliper aside.



7. Remove the brake disc.

- Remove the Torx screw.

Installation

1. Make sure the brake disc and hub mating surfaces are clean.

2. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

3. Secure the brake caliper to the wheel knuckle.

- Tighten the bolts to 275 Nm (203 lb.ft).

4. Secure the brake hose retaining bracket to the wheel knuckle.

- Tighten the bolt to 23 Nm (17 lb.ft).

5. ⚠WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the components.

6. Inspect the caliper piston seals for damage.

7. Position a bleed jar containing a small quantity of approved brake fluid. Connect the bleed tube to the bleed screw and loosen the screw.

8. Press the pistons into the caliper housing.

- Tighten the bleed screw to 19 Nm (14 lb.ft).

9. Repeat the above process for the other 2 pistons.

10. Disconnect the bleed tube and remove the jar.

11. Install the brake pads.

- Position the anti-rattle spring.
- Install the pins, making sure the pin collets are fully engaged in the caliper.

12. LH side only: Connect the brake pad wear indicator sensor.

- Secure the lead in the clips.

13. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

14. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Removal and Installation

Removal

- WARNINGS:

⚠ Brake pads must be renewed in axle sets only, otherwise braking efficiency may be impaired.

⚠ If the brake pad wear warning light has been activated, the pad wear sensor must be replaced.

- NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

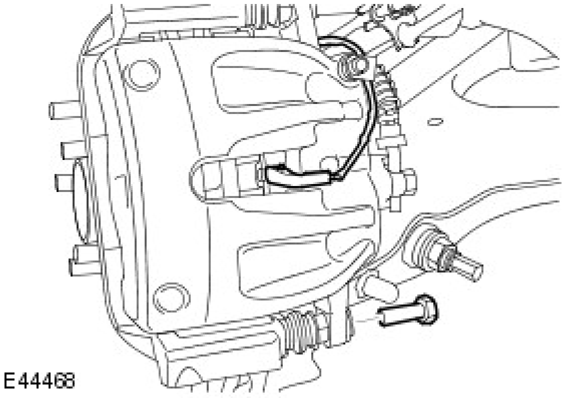
Raise and support the vehicle.

2. Remove the wheel and tires.

3. ⚠ CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

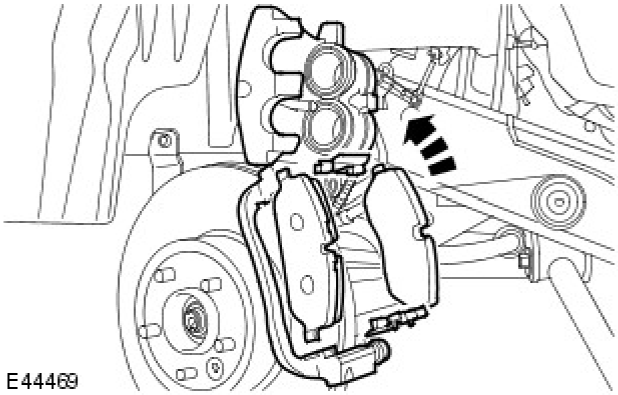
LH side only: Disconnect the brake pad wear indicator sensor.

4. Remove the brake caliper lower bolt.



5. Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the 2 clips.



6. Repeat the above 2 steps for the other side.

Installation

1. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the caliper housing and anchor plate using brake cleaning fluid.

2. Inspect the caliper piston and slide pin seals for damage.

3. CAUTIONS:

⚠ The brake caliper should move freely on both slide pins.

⚠ If necessary, renew the components.

Check the slide pins for correct operation.

4. ⚠ CAUTION: Check the brake fluid reservoir level before pushing the piston back, failure to follow this instruction may result in damage to the vehicle.

• NOTE: As the piston is pushed back into the caliper housing, the brake fluid level in the reservoir will rise. Do not allow the reservoir to overflow.

Press the pistons into the caliper housing.

5. NOTE: Make sure the brake pads are installed in the correct orientation.

Install the brake pads.

- Install the 2 clips.
- Apply a suitable amount of the supplied grease to the mating faces of the brake pads and brake calipers.

6. Rotate the brake caliper downwards.

- Tighten the bolt to 35 Nm (26 lb.ft).

7. Repeat the above procedure for the other side.

8. LH side front: Connect the brake pad wear indicator wiring harness electrical connection.

9. Install the wheel and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

10. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top up with brake fluid if necessary.

GENERAL

The rear brakes each consist of a single piston brake caliper, a ventilated brake disc and a dust shield (integrated as part of the parking brake). The 4.2L and 4.4L models feature a different caliper and a larger diameter brake disc than 2.7L diesel models. The dust shield and parking brake are common on all models.

The brake caliper is attached to the rear of the rear knuckle. The brake pads are made from an asbestos free material. The inboard brake pad of the right rear brake incorporates a wear sensor.

When hydraulic pressure is supplied to the caliper, the piston extends and forces the inner pad against the disc. The caliper body reacts and slides on the guide pins to bring the outer pad into contact with the disc.

The rear brake pad wear sensor is connected in series with the front brake pad wear sensor, between the instrument cluster and ground. When a brake pad incorporating a brake pad wear sensor is approximately 75% worn, the brake pad wear sensor goes open circuit. When the instrument cluster detects the open circuit, it illuminates the amber light emitting diode (LED) in the brake warning indicator, displays an appropriate warning in the message center and sounds a warning chime.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

At the beginning of each ignition cycle, the instrument cluster performs a bulb check on the brake warning indicator: the indicator is illuminated amber for 1.5 seconds, then red for 1.5 seconds.

Diagnosis and Testing

Overview

The rear disc brake system is a fairly straightforward design requiring no specialized techniques for diagnosis.

For information on the description and operation of the system:
REFER to: Rear Disc Brake (206-04 Rear Disc Brake, Description and Operation).

Inspection and Verification

1. **1.** Verify the customer concern.
    - ○ If a road test is necessary make sure the vehicle is safe to do so.
2. **2.** Visually inspect for obvious mechanical faults.

Visual inspection

Mechanical
● Brake caliper(s) condition and fitment ● Brake pad(s) condition and fitment ● Brake disc(s) condition and fitment ● Fluid leaks

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the symptom chart.

Symptom Chart

Symptom	Possible causes	Action
Brake noise	● Debris ● Brake pads ● Brake discs	Inspect for debris, remove as necessary. Check for excessive brake pad wear. Check for brake disc damage. REFER to: Brake Pads (206-04 Rear Disc Brake, Removal and Installation).
Brake vibration	● Suspension components ● Brake discs	Check for worn or damaged suspension components. REFER to: Rear Suspension (204-02 Rear Suspension, Diagnosis and Testing). Check for brake disc distortion or runout. REFER to: Rear Brake Disc Runout Check (206-00 Brake System - General Information, General Procedures).

Rear Disc Brake - Brake Disc

Removal and Installation

Removal

• NOTE: If the parking brake shoes or the brake discs have been removed for access to other components then DO NOT carry out the bedding in procedure.

1. CAUTION: Do not turn the ignition on when the parking brake service mode has been set, this will result in the parking brake being released from the service mode.

Enter the parking brake into the service mode.

- Turn the ignition key to position II.
- Apply, and hold, the footbrake.
- Apply, and hold, the parking brake switch to the RELEASE position.
- Turn the ignition key to position '0' and remove the key.
- Release the footbrake.
- Release the parking brake switch.

2. Isolate the parking brake electrical circuit.

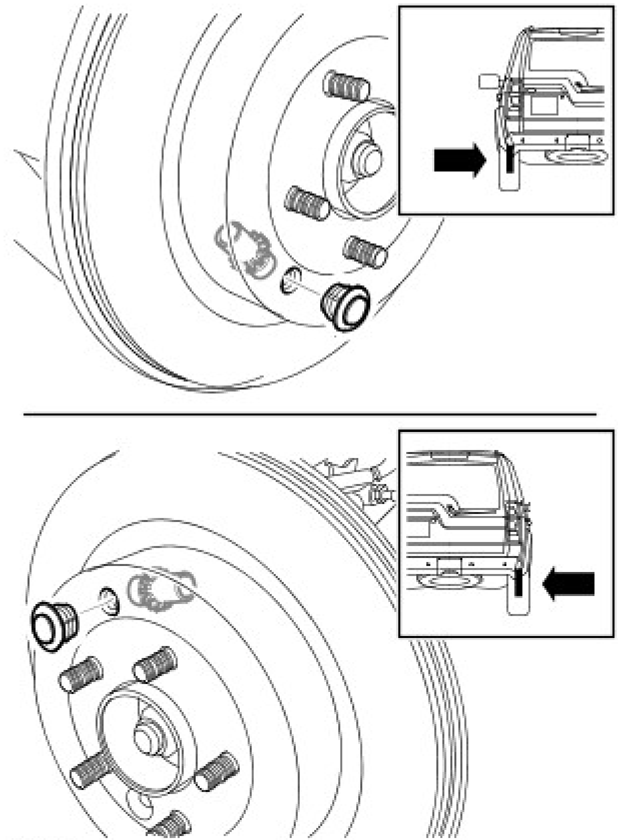
- Remove fuse number 8 from the BJB.

3. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheel and tire.

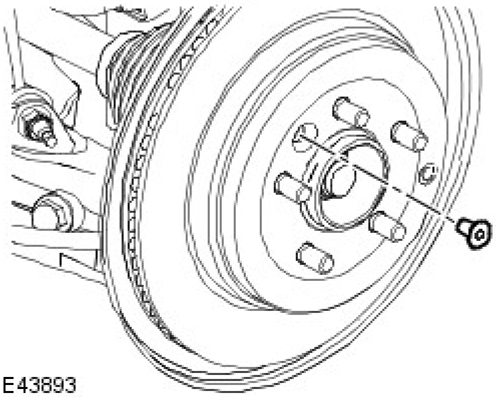
5. Remove the brake caliper anchor plate.
For additional information, refer to: Brake Caliper Anchor Plate (206-04 Rear Disc Brake, Removal and Installation).



E48748

6. Release the parking brake shoe adjustment.

- Remove the plug from the access hole in the brake disc.
- Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.
- Install the access plug.



E43893

7. Remove the brake disc.

- Remove the Torx screw.

Installation

1. Make sure the brake disc and hub mating surfaces are clean.

2. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

3. Install the brake caliper anchor plate.
For additional information, refer to: Brake Caliper Anchor Plate (206-04 Rear Disc Brake, Removal and Installation).

4. Adjust the parking brake.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

5. Install fuse number 8 into the BJB.

6. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Rear Disc Brake - Brake Pads

Removal and Installation

Removal

- WARNINGS:

⚠ Brake pads must be renewed in axle sets only, otherwise braking efficiency may be impaired.

⚠ If the brake pad wear warning light has been activated, the pad wear sensor must be replaced.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

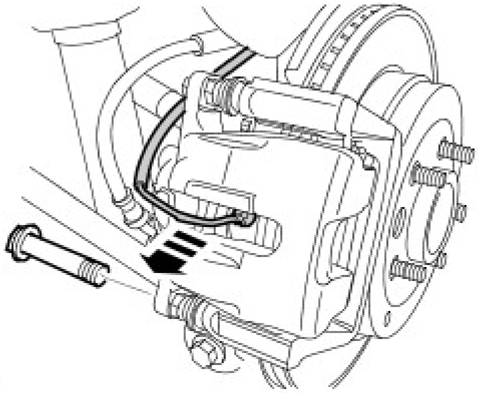
Raise and support the vehicle.

2. Remove the wheel and tire.

3. ⚠ CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

RH side only: Disconnect the brake pad wear indicator sensor.

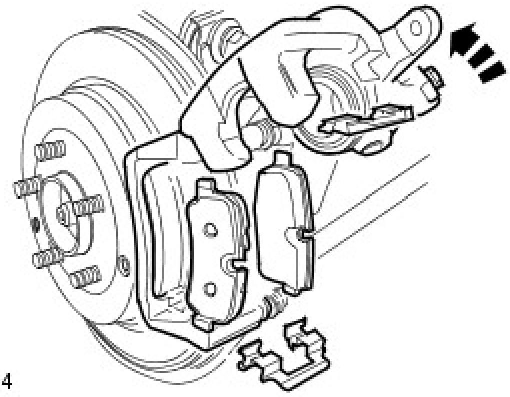
4. Remove the brake caliper lower bolt.



E52883

5. Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the 2 clips.



E52884

Installation

1. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the brake caliper housing and anchor plate using brake cleaning fluid.

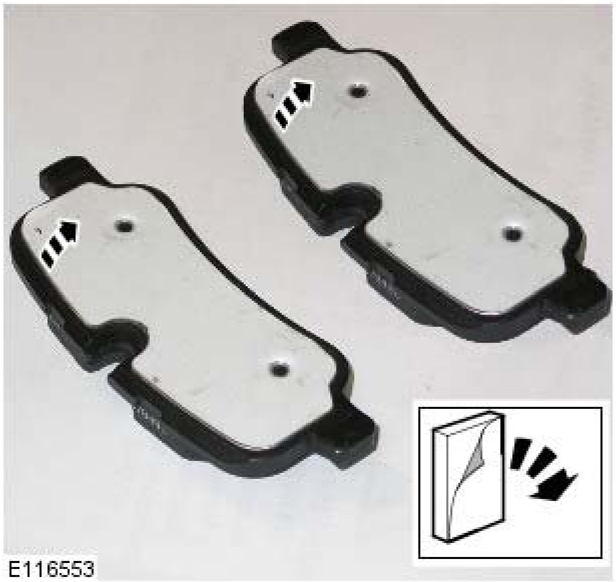
2. Inspect the caliper piston and slide pin seals for damage.

3. Position a bleed jar containing a small quantity of approved brake fluid. Connect the bleed tube to the bleed screw and loosen the screw.

4. Press the piston into the caliper housing.

- Tighten the bleed screw to 14 Nm (10 lb.ft).

5. Disconnect the bleed tube and remove the jar.



6. ⚠ CAUTION: If equipped, the adhesive strips covering the outer brake pads must be removed before installation. Failure to follow this instruction may result in damage to the vehicle.

If equipped, remove the adhesive strips from the 2 outer brake pads.

7. Install the brake pads.

- Install the 2 clips.

8. Rotate the brake caliper downwards.

- Tighten the bolt to 32 Nm (24 lb.ft).

9. Connect the brake pad wear indicator sensor.

10. Repeat the above procedure for the other side.

11. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

12. Depress the brake pedal several times, check the fluid level in the brake fluid reservoir and top-up with brake fluid if necessary.

Rear Disc Brake - Brake Caliper

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

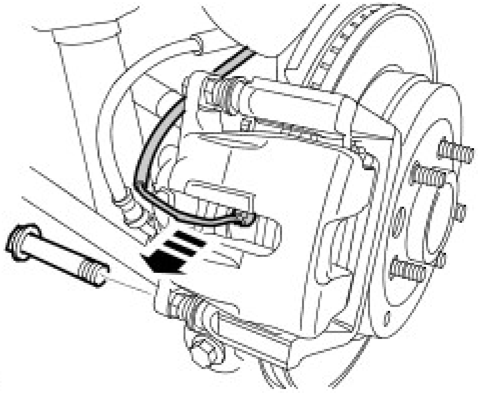
Raise and support the vehicle.

2. Remove the wheel and tire.

3. ⚠ CAUTION: The brake pad wear indicator sensor is easily damaged. Do not use a lever to remove the sensor. Use fingers only.

RH side only: Disconnect the brake pad wear indicator sensor.

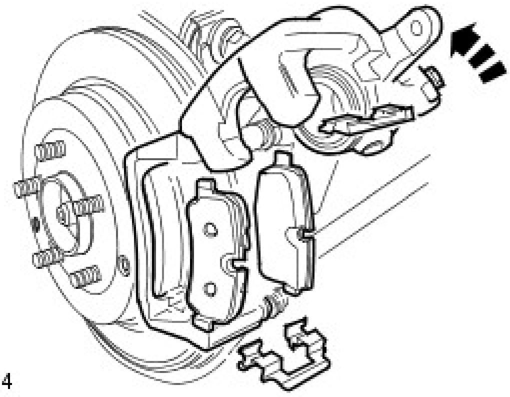
4. Remove the brake caliper lower bolt.



E52883

5. Remove the brake pads.

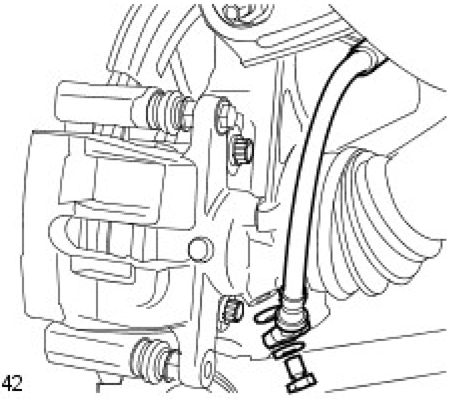
- Rotate the brake caliper upwards.
- Remove the 2 clips.



E52884

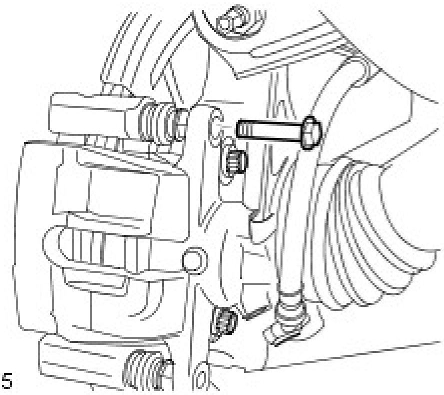
6. Disconnect the brake hose from the brake caliper.

- Remove the union.
- Remove and discard the two sealing washers.
- Install blanking caps to the exposed ports.



E52942

7. Remove the brake caliper upper bolt.



E52885

8. Remove the brake caliper housing.

Installation

1. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the caliper housing and anchor plate using brake cleaning fluid.

2. Install the brake caliper.

3. Install the brake caliper upper bolt.

- Tighten the bolt to 35 Nm (26 lb.ft).

4. Connect the brake hose to the brake caliper.

- Remove the blanking caps from the ports.
- Install new sealing washers.
- Tighten the brake hose union to 28 Nm (21 lb.ft).

5. Install the brake pads.

- Install the two clips.

6. Rotate the brake caliper downwards.

- Tighten the bolt to 35 Nm (26 lb.ft).

7. Connect the brake pad wear indicator sensor.

8. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

9. Bleed the brake system.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures).

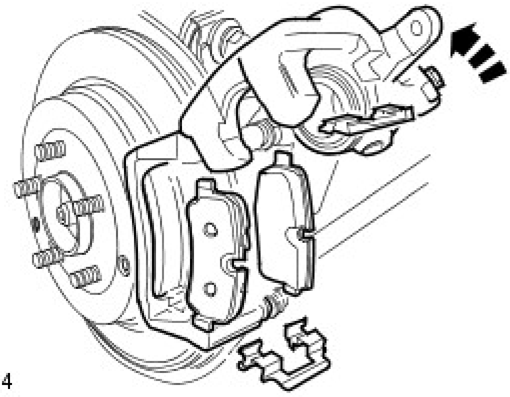
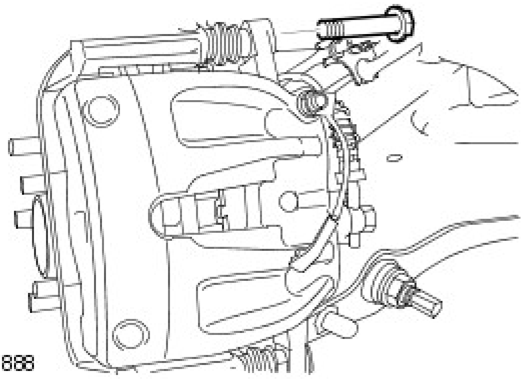
5. Remove the brake pads.

- Rotate the brake caliper upwards.
- Remove the two clips.



E52884

6. Remove the brake caliper upper bolt.

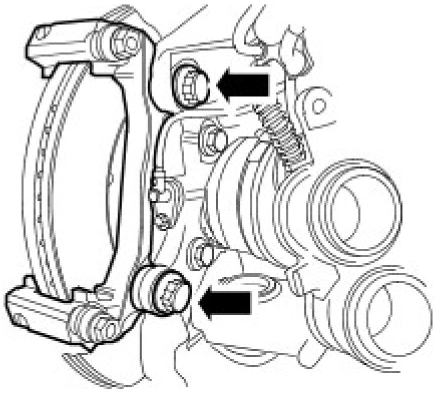


E52888

7. ⚠CAUTION: Do not allow the brake caliper to hang on the brake hose.

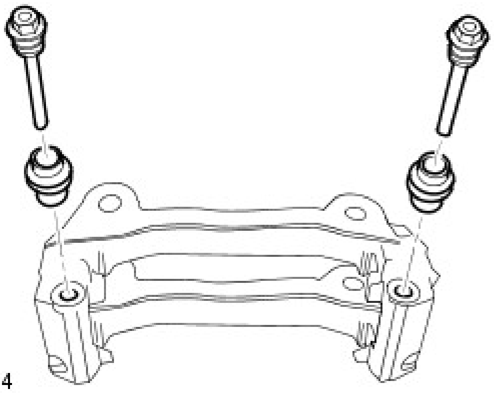
Tie the brake caliper housing aside.

8. Remove the brake caliper anchor plate.



E52889

9. Remove the guide pins and seals.



E53724

Installation

1. ⚠WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the caliper housing and anchor plate using brake cleaning fluid.

2. Clean and lubricate the guide pins.

3. Install the guide pins.

4. Install the anchor plate.

- Tighten the bolts to 115 Nm (85 lb.ft).

5. Install the brake caliper housing and fit the top bolt.

- Tighten the bolt to 35 Nm (26 lb.ft).

6. Install the brake pads.

- Install the 2 clips.

7. Rotate the brake caliper downwards.

- Tighten the bolt to 35 Nm (26 lb.ft).

8. Connect the brake pad wear indicator sensor.

9. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

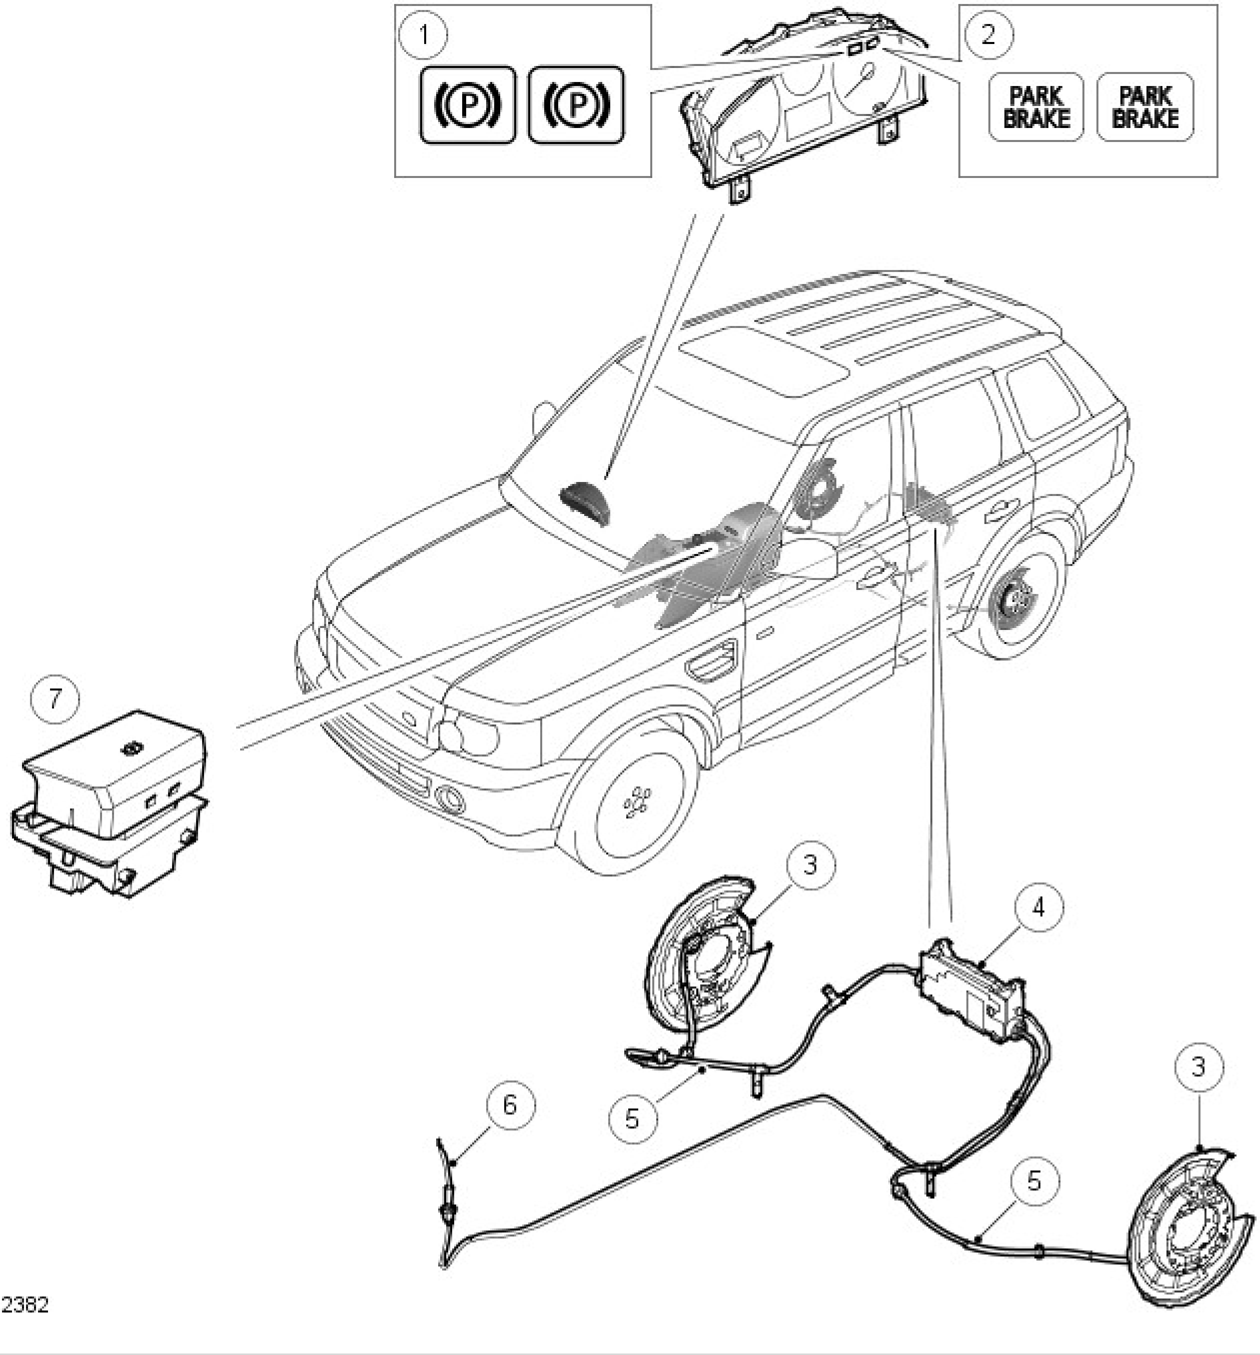
Parking Brake and Actuation - Parking Brake

Description and Operation

COMPONENT LOCATIONS



Item	Part Number	Description
1	-	Parking brake indicators (all except NAS (north America specification))
2	-	Parking brake indicators (NAS only)
3	-	Drum brake
4	-	Parking brake module
5	-	Parking brake cable
6	-	Emergency release cable
7	-	Parking brake switch

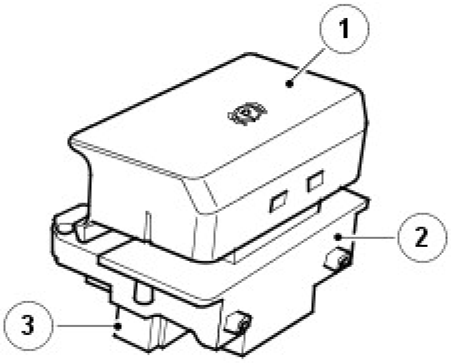
GENERAL

The parking brake is an electrically actuated system that operates drum brakes integrated into the rear brake discs. The parking brake system consists of:

- A parking brake switch.
- Left and right drum brakes.
- Left and right brake cables.
- An emergency release cable.
- Two parking brake indicators.
- A parking brake module.

The parking brake is operated by the parking brake module, which adjusts the tension of the brake cables to apply and release the drum brakes. Operation of the parking brake module is initiated by the parking brake switch.

PARKING BRAKE SWITCH



E52383

Item	Part Number	Description
1	-	Operating handle
2	-	Switch body
3	-	Electrical connector

The parking brake switch is used by the driver to apply and release the parking brake, and is installed in the center console adjacent to the gear lever.

Slots on the sides of the parking brake switch engage with the top panel of the center console, and a screw secures the parking brake switch in position. An electrical connector on the back of the switch provides the interface with the vehicle wiring. A brake symbol on the switch illuminates when the exterior lamps are selected on.

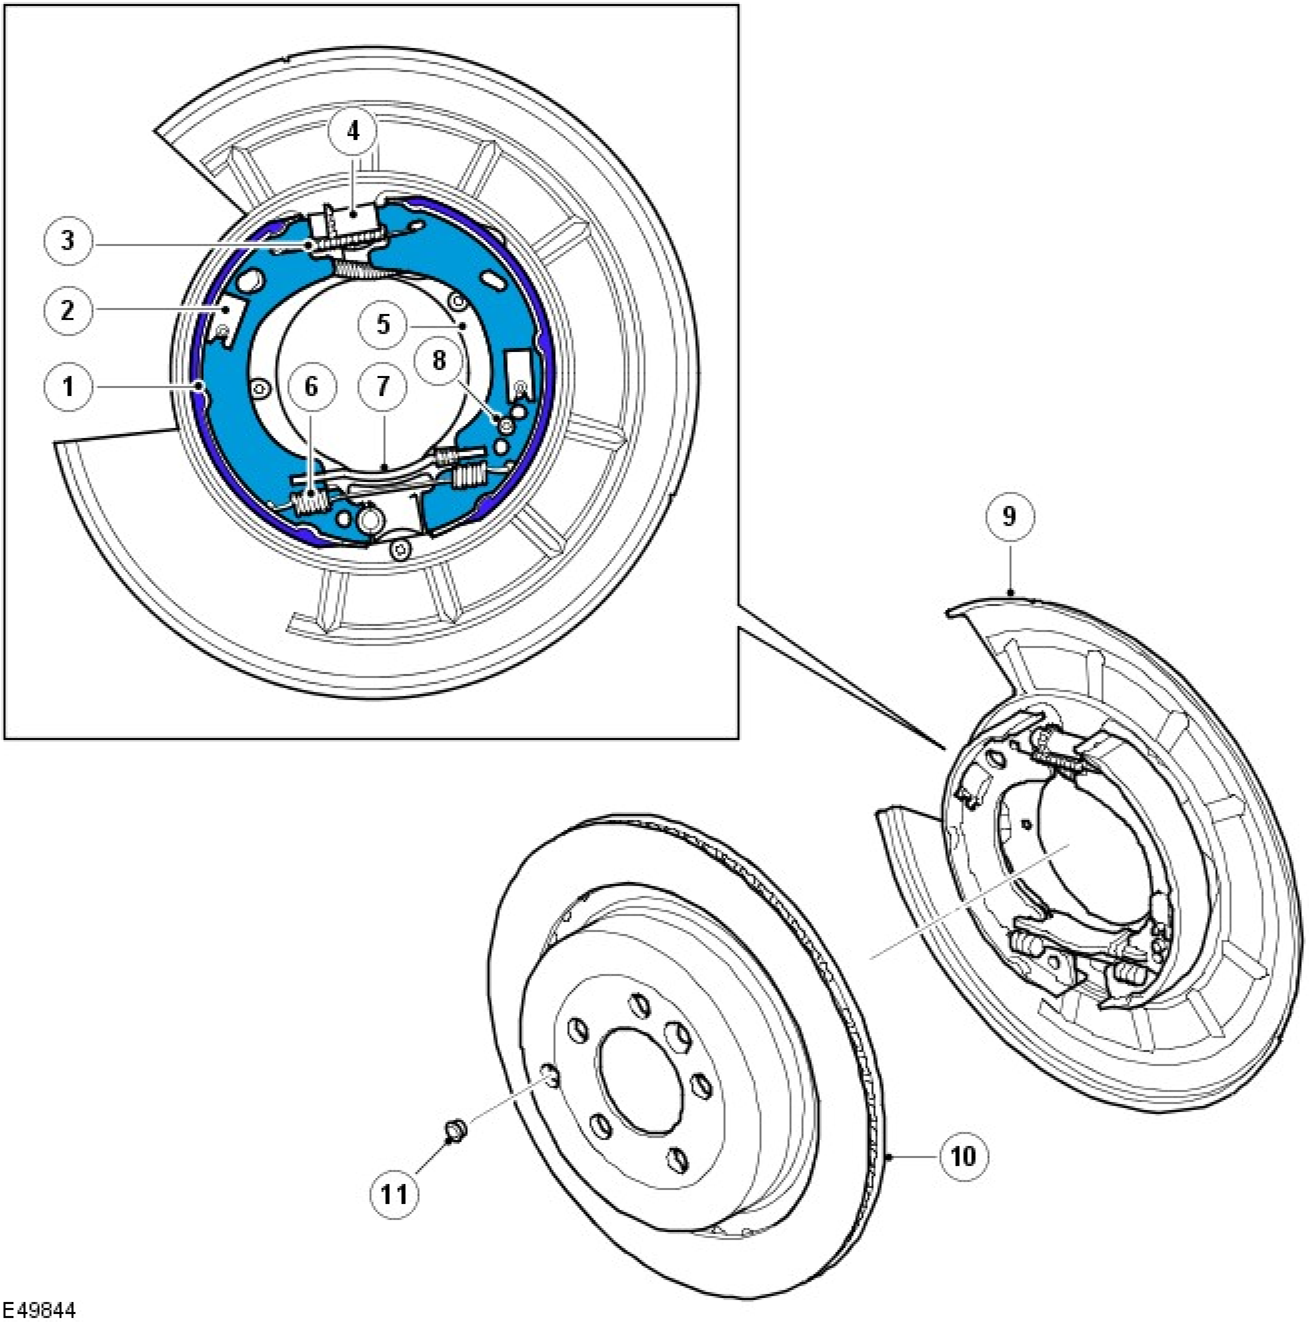
There are three states for the parking brake switch:

- Apply request, when the handle of the parking brake switch is pulled up.
- Release request, when the handle of the parking brake switch is pushed down.
- Idle, when the handle of the parking brake switch is in the central or rest position.

Microswitches, incorporated into the parking brake switch, are activated by the handle of the parking brake switch. To determine the operating state of the parking brake switch, the parking brake module scans the circuits containing the microswitches.

DRUM BRAKES

• NOTE: right-hand (RH) brake shown, left-hand (LH) brake similar



E49844

Item	Part Number	Description
1	-	Brake shoe
2	-	Shoe locating pin and clip
3	-	Adjuster spring
4	-	Toothed wheel adjuster
5	-	Backplate
6	-	Return spring
7	-	Cross strut
8	-	Wedge adjuster screw
9	-	Dust shield
10	-	Rear brake disc
11	-	Adjuster access plug

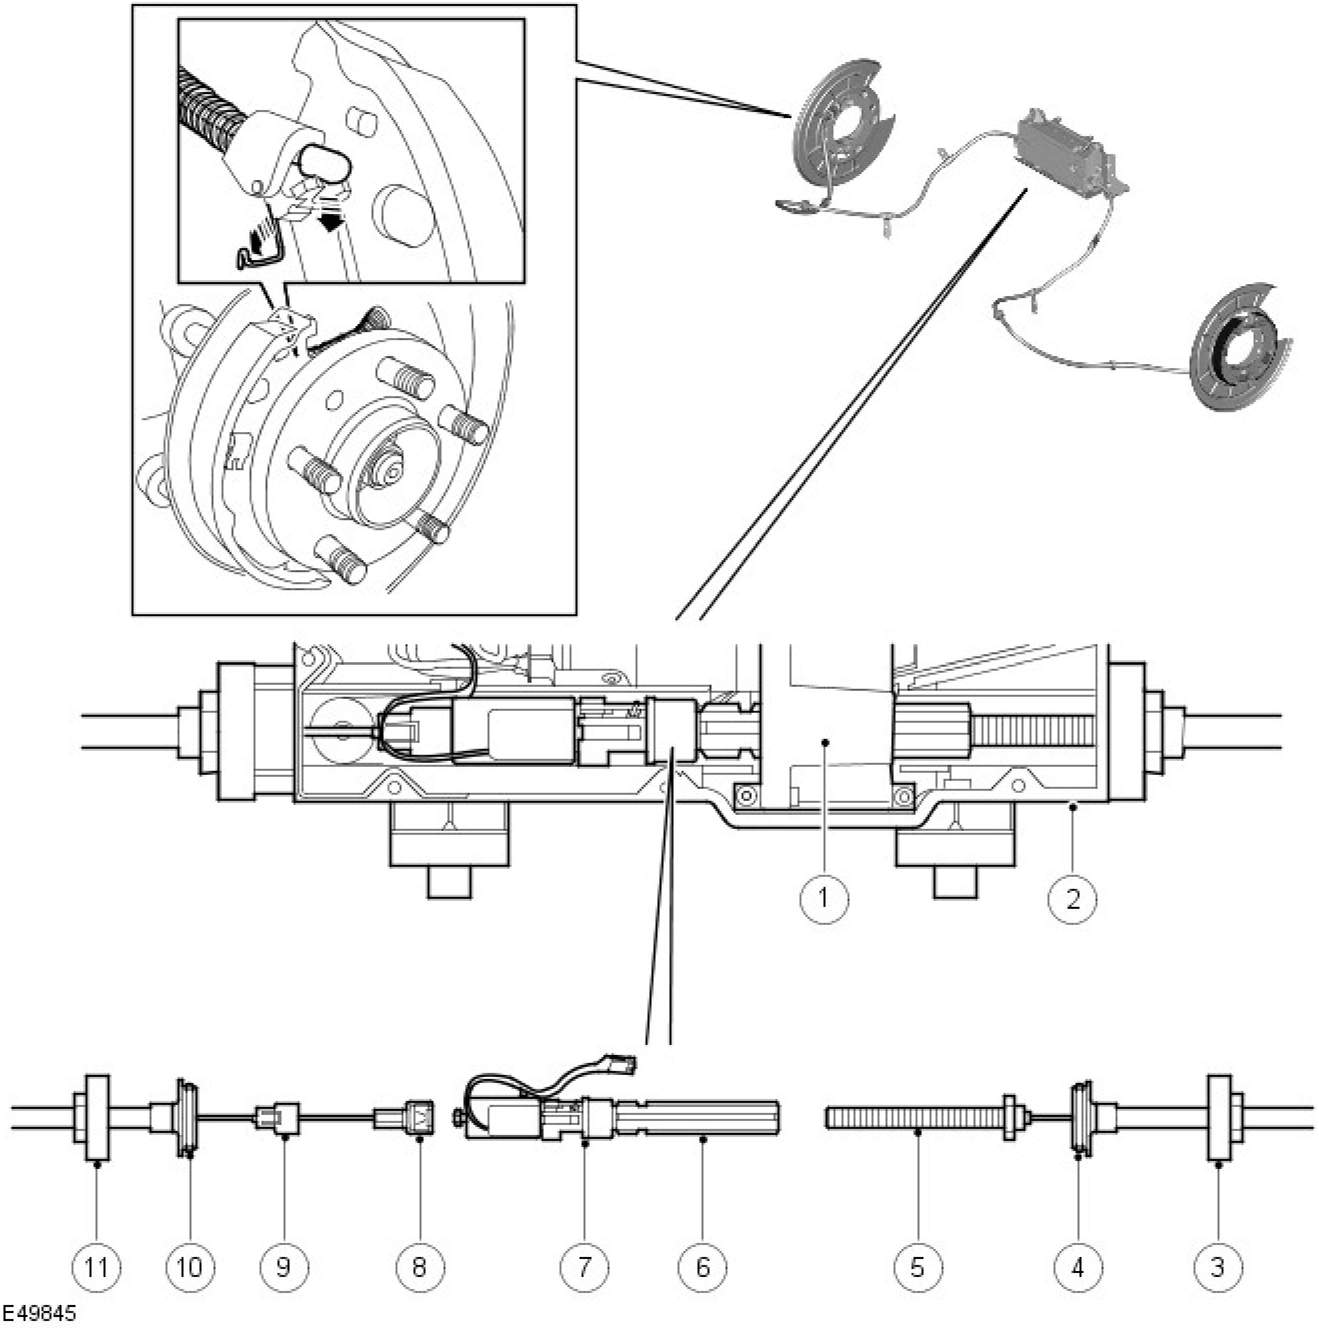
⚠ WARNING: Prior to removing a brake disc from a vehicle, power should be disconnected from the parking brake module. Operation of the parking brake switch while a brake disc is removed can cause the actuating mechanism in the parking brake module to seize. In addition, the parking brake may not switch off until 20 minutes after key-off; automatic re-apply cannot be eliminated until this period has expired.

Each drum brake consists of a pair of brake shoes installed on a backplate attached to the rear hub carrier. The brake shoes operate on the drum integrated into the rear brake disc. The orientation of the brake shoes differ by 180° between the LH and RH brakes.

When the parking brake module tensions the brake cables, the movement is transmitted to an operating lever on one of the brake shoes. The operating lever pivots against a cross strut, which forces the brake shoes apart and into contact with the drum in the rear brake disc. Brake shoe to drum clearance is set with two manual adjusters, which are accessed through a hole in the brake disc. One of the adjusters is a conventional toothed wheel adjuster. The second adjuster is a wedge adjuster operated by an Allen screw.

After replacement of the brake shoes or brake discs, a bedding in procedure must be performed to ensure the drum brakes operate satisfactorily.
For additional information, refer to: Parking Brake Shoes Bedding-In (206-05 Parking Brake and Actuation, General Procedures).

BRAKE CABLES



Item	Part Number	Description
1	-	Gearbox
2	-	Parking brake module housing

3	-	Cable nut
4	-	Sealing collar
5	-	Threaded connector
6	-	Spline shaft
7	-	Force sensor
8	-	Shoe
9	-	Locking cover
10	-	Sealing collar
11	-	Cable nut

WARNING: Prior to disconnecting a brake cable, power should be disconnected from the parking brake module. Operation of the parking brake switch while a brake cable is disconnected can cause the actuating mechanism in the parking brake module to seize. In addition, the parking brake may not switch off until 20 minutes after key-off; automatic re-apply cannot be eliminated until this period has expired.

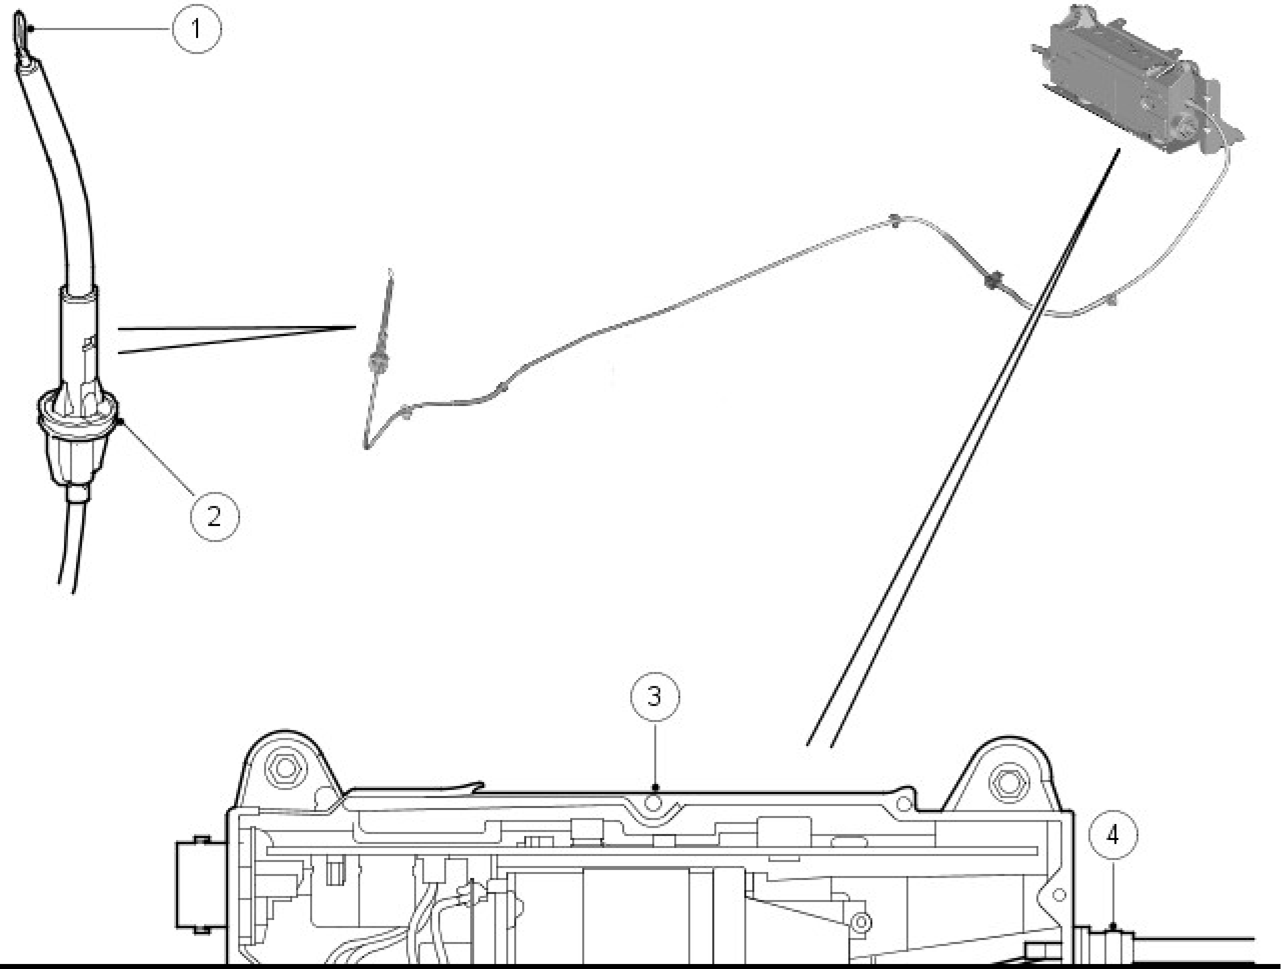
The brake cables consist of Bowden cables installed between the parking brake module and the drum brakes. Nuts, on the ends of the outer cables, secure the brake cables to the parking brake module and the backplate of the related drum brake. In each drum brake, the inner cable is located in the guide spring and connected to the brake shoe operating lever by a nipple on the end of the cable. In the parking brake module, the two inner cables are joined together via the force sensor and the spline shaft.

The inner cable of the RH brake cable is connected to a nipple on the force sensor by a 'shoe' on the end of the cable; a locking cover keeps the shoe engaged with the nipple.

The inner cable of the LH brake cable is connected to the spline shaft by a threaded connector (LH thread); a squared flange at the end of the threaded connector locates in the housing of the parking brake module, to prevent the threaded connector from turning with the spline shaft.

When the spline shaft turns, the threaded connector of the LH brake cable is screwed into or out of the spline shaft, which changes the effective length of the inner cables and operates the drum brakes. The ability of the spline shaft to move axially in the gearbox equalizes the load applied by the inner cables to the two drum brakes.

EMERGENCY RELEASE CABLE



[redacted]

Item	Part Number	Description
1	-	Pull ring
2	-	Quick release fitting
3	-	Parking brake module
4	-	Sealing collar
5	-	Spring
6	-	Inner cable
7	-	Nipple
8	-	Pulley wheel

The emergency release cable allows the parking brake to be mechanically released if:

- The parking brake cannot be electrically released because of a system fault.
- The battery is disconnected or battery voltage decreases below 7.5 volts while the parking brake is applied, so that the parking brake cannot be electrically released.

The parking brake is mechanically released by disconnecting the force sensor from the spline shaft in the parking brake module. During normal operation, the force sensor and the spline shaft are locked together by a lever operated pawl on the end of the spline shaft, which engages with a spigot on the force sensor.

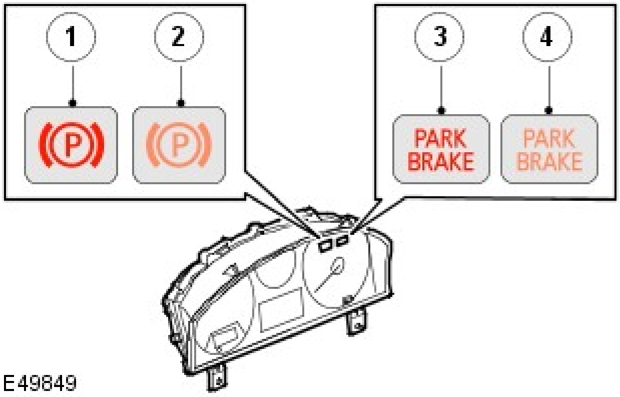
The emergency release cable is a Bowden cable installed between the parking brake module and the center console. The emergency release cable is held in clips along the underside of the vehicle and enters the passenger compartment below the center console through an aperture in the transmission tunnel. A quick release fitting seals the emergency release cable in the aperture. At the parking brake module, a sealing collar on the outer cable is a push fit in the housing of the parking brake module.

In the center console, a pull ring is installed on the end of the inner cable. The pull ring is designed to fit the hook on the end of the jack handle which, in combination with a screwdriver shaft, can be used to pull on the cable. The pull ring can be accessed by removing a circular panel in the bottom of the center console cupholders, on left-hand drive (LHD) vehicles, or by removing the parking brake switch on right-hand drive (RHD) vehicles.

The pull required to release the latch is approximately 200 N (45 lbf). When the pull ring of the emergency release cable is released, the spring in the parking brake module retracts the inner cable and the nipple moves away from the pawl operating lever.

After the emergency release cable has been used to release the parking brake, the next time an apply selection is made with the parking brake switch, the parking brake module automatically runs through a latching procedure to reconnect the spline shaft with the force sensor. The parking brake module turns the spline shaft so that it moves towards the force sensor. The pawl of the spline shaft then re-engages with the spigot of the force sensor. A second apply selection with the parking brake switch is required to apply the parking brake.

PARKING BRAKE INDICATORS



Item	Part Number	Description
1	-	Red warning indicator (all except NAS)
2	-	Amber warning indicator (all except NAS)
3	-	Red warning indicator (NAS only)
4	-	Amber warning indicator (NAS only)

The parking brake has two warning indicators, one amber and one red, located in the speedometer of the instrument cluster.

Amber Parking Brake Warning Indicator

The amber parking brake warning indicator is continuously illuminated if there is a parking brake system fault. Operation of the indicator is controlled by a high speed controller area network (CAN) bus signal from the parking brake module to the instrument cluster.

Red Parking Brake Warning Indicator

When the parking brake is applied, the red parking brake warning indicator is continuously illuminated while the ignition is on and for 3 minutes after the ignition is switched off. If the system is unable to comply with an apply or release request, due to a system fault, the indicator flashes.

When the ignition is on and the indicator is not flashing, operation is controlled by a high speed CAN bus signal from the parking brake module to the instrument cluster. When the ignition is off or when the indicator is flashing, operation is controlled by a hardwired signal from the parking brake module to the instrument cluster.

Messages Center

When there is a fault condition, illumination of the warning indicators is accompanied by a text message displayed in the message center.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

PARKING BRAKE MODULE

The parking brake module monitors external and internal inputs and adjusts the tension of the brake cables to operate the drum brakes and provide the required parking brake function.

The parking brake module is installed on a support bracket attached to the front of the spare wheel carrier. Two rubber mounts, installed on lugs on the underside of the parking brake module, locate in holes in the support bracket. The top corners of the parking brake module are secured to the support bracket with rubber mounts and flanged nuts.

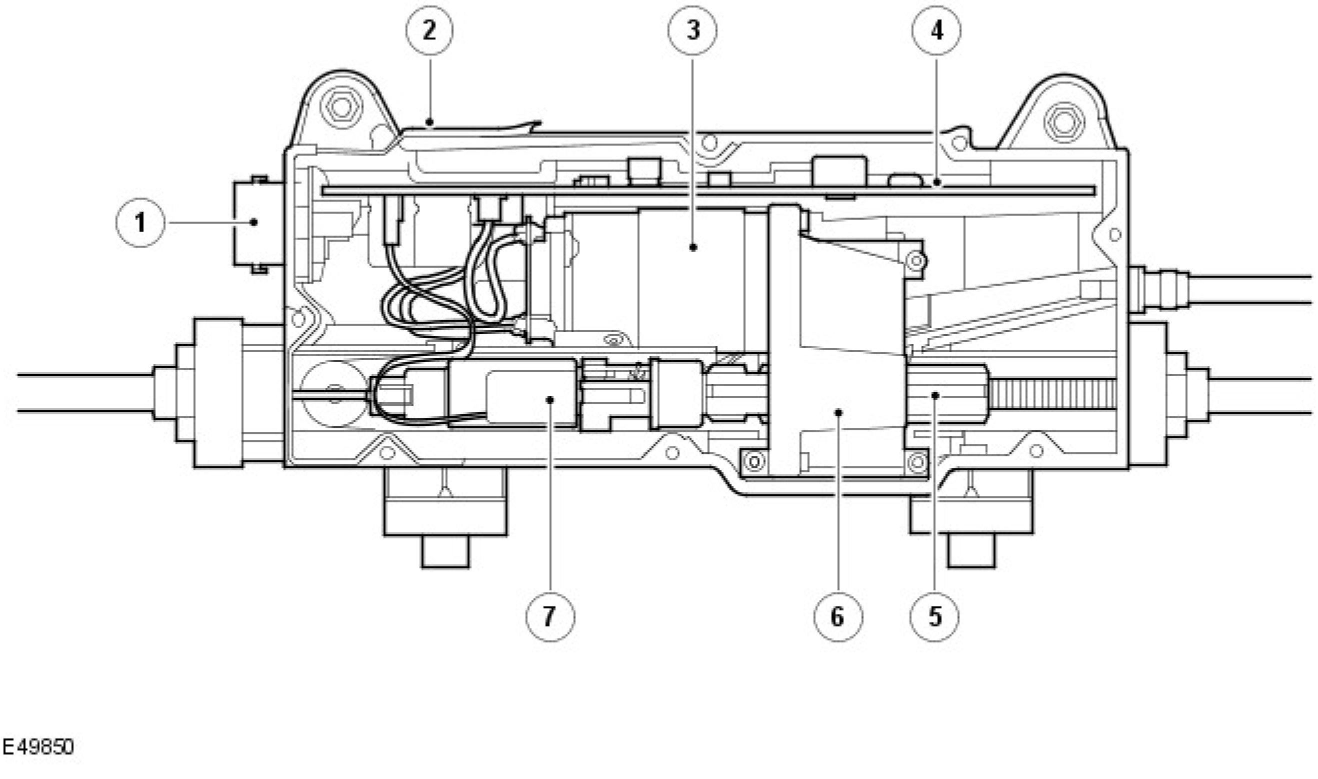
The main components of the parking brake module are:

- A PCB (printed circuit board) incorporating the ASIC (application specific integrated circuit) for control of the parking brake.
- An electric motor.
- A gearbox.
- A spline shaft.
- A force sensor.

The spline shaft and the force sensor are connected together by a latch on the end of the spline shaft. The spline shaft rotates on the latch and moves axially in the gearbox. The latch and the force sensor slide in a channel in the body of the parking brake module.

To apply or release the drum brakes, the parking brake module runs the electric motor, which drives the gearbox. The gearbox turns the spline shaft to increase or decrease the tension in the brake cables. The parking brake module monitors the load exerted by the brake cables using the input from the force sensor.

Interior of Parking Brake Module



Item	Part Number	Description
1	-	Electrical connector
2	-	Housing
3	-	Electric motor
4	-	PCB
5	-	Spline shaft
6	-	Gearbox
7	-	Force sensor

Inputs and Outputs

A 32 pin electrical connector on the RH side of the parking brake module provides the interface between the PCB and the vehicle wiring.

The parking brake module is powered by two permanent battery power feeds from the battery junction box (BJB). Two further connections with the central junction box (CJB) provide battery voltage signals when the key is in the ignition switch (key in) and when the ignition switch is in position II (ignition). Other hardwired inputs include those from the parking brake switch.

In addition to the hardwired connections, the parking brake module is connected to the high speed CAN bus to enable communication with other vehicle systems.

H4	Battery power supply	Input

PARKING BRAKE OPERATION

The parking brake can be applied at any time provided sufficient battery power is available. For the parking brake to be released, various pre-conditions are required. The parking brake has manual and automatic actuating modes, to cater for different operating circumstances, as detailed in the following table:

Actuating Modes

Mode	Pre-Conditions	Driver Action
Static apply	Vehicle speed less than 2.5 km/h (1.6 mph).	Pull up parking brake switch.
Static release	1. Vehicle speed less than 2.5 km/h (1.6 mph). 2. Engine running. **OR** Ignition switch in position II and brake pedal or accelerator pedal pressed.	Press down parking brake switch.
Dynamic apply	Vehicle speed more than 2.5 km/h (1.6 mph).	Pull up parking brake switch as required.

Mode	Pre-Conditions	Driver Action
Dynamic release	Vehicle speed more than 2.5 km/h (1.6 mph).	Release (to neutral position) or press down parking brake switch.
DAR (drive away release)	1. Ignition switch in position II. 2. Transmission in gear 1, 2 or R (with high range selected) or 1, 2, 3 or R (with low range selected). 3. Accelerator pedal pressed more than 5%.	None. Parking brake released automatically on drive away.

Operating Voltages

Actuation of the parking brake (apply or release) is only started if the power supply to the parking brake module is within 9 to 18 volts. At any voltage in this range, the parking brake module is able to tighten the brake cables to the maximum, to fully apply the parking brake, although at voltages between 9 and 10.5 volts the actuation time may exceed 1.0 second.

During a parking brake actuation:

- If the power supply to the parking brake module decreases to less than 8.3 volts, the parking brake module continues the actuation, but stores a related fault code. If the ignition is on, the parking brake module also signals the instrument cluster to illuminate the amber parking brake warning indicator and flash the red parking brake warning indicator. On the instrument cluster, a message advising there is a parking brake fault is shown in the message center. The warning indications are discontinued if the power supply voltage increases to 8.3 volts or more.
- If the power supply voltage decreases to less than 7.5 volts, the parking brake module discontinues the actuation. Actuation is automatically resumed if the power supply voltage subsequently increases to 7.5 volts or more and the parking brake switch request is still valid.
- If the power supply voltage decreases below 6.5 volts, the parking brake function is disabled for the remainder of the ignition cycle.
- If the power supply voltage increases to more than 18.0 volts, the parking brake module immediately disables the parking brake function and stores a related fault code. If the ignition is on, the parking brake module also signals the instrument cluster to illuminate the amber parking brake warning indicator and flash the red parking brake warning indicator. On the instrument cluster, a message advising that the parking brake has a fault and is not functioning is shown in the message center. The parking brake function remains disabled until the power supply voltage is within 9 to 18 volts again. When the power supply voltage is within 9 to 18 volts again, the warning indications are cancelled and actuation is automatically resumed if the parking brake module is in a dynamic mode of operation with a valid parking brake switch request.

• NOTE: The instrument cluster shuts down below 8 volts, so warning indications and messages are not displayed below 8 volts. CAN transmission stops if battery voltage drops below 7.0 volts and re-starts when voltage goes above 7.5 volts.

Sleep Mode

To reduce quiescent drain on the vehicle battery, the parking brake module incorporates a sleep mode. The parking brake module enters the sleep mode, provided the ignition is off and there are no signals from the wheel speed sensors, when one of the following occurs:

- 20 minutes elapse after the last actuation of the parking brake.
- If no actuation occurred, 20 minutes elapse after the ignition is switched off.

The parking brake module wakes up from the sleep mode when one of the following occurs:

- An apply or release request is made with the parking brake switch.
- The ignition is turned on.

The parking brake module wakes up within 500 ms. The high speed CAN bus is activated within 200 ms maximum.

When the parking brake module is woken with a release request from the parking brake switch, the parking brake module ignores the request but illuminates the red brake warning indicator. The parking brake module extinguishes the red brake warning indicator and goes back to sleep immediately the switch is released to the neutral position.

When the parking brake module is woken with an apply request from the parking brake switch, if the parking brake is already applied the parking brake module ignores the request but illuminates the red brake warning indicator. The parking brake module extinguishes the red brake warning indicator and goes back to sleep immediately the switch is released to the neutral position. If the parking brake is in the released condition when the apply request is made, the parking brake module illuminates the red brake warning indicator and applies the parking brake. The parking brake module extinguishes the red brake warning indicator and goes back to sleep 3 minutes after the apply activation, or immediately after the switch is released to the neutral position, whichever occurs last.

Dynamic Apply

In the dynamic apply mode, if the vehicle speed is more than 10 km/h (6.25 mph) when the parking brake switch is selected to apply, the parking brake module requests the anti-lock brake system (ABS) module to activate the disc brakes on all four wheels. When the vehicle comes to a standstill, the parking brake module statically applies the parking brake. Once the static load is achieved, the hydraulic pressure is removed. If the parking brake switch is released to the neutral position, or pressed down to the release position, during dynamic apply, braking is cancelled.

The ABS module monitors the deceleration rate using the wheel speed sensor signals, and adjusts the hydraulic pressure to the disc brakes as required to achieve the required rate. All of the anti-lock control - traction control system brake functions remain enabled in the dynamic apply mode.

The parking brake module incorporates two fallback functions for the dynamic apply mode:

- Fallback 1 is invoked if vehicle speed is between 2.5 km/h (1.25 mph) and V_{max} when the parking brake switch is selected to apply and the ABS module is unable to fulfil a hydraulic request. When fallback 1 is invoked, the parking brake module decelerates the vehicle using only the parking brake. The parking brake module monitors the deceleration rate using the wheel speed information from the ABS module, and adjusts the tension of the brake cables to achieve the required rate. During deceleration the parking brake module also uses the wheel speed inputs from the ABS module to operate an anti-lock function for the rear wheels. When vehicle speed decreases to 2.5 km/h (1.25 mph) the parking brake module changes to the static apply mode.
- Fallback 2 is invoked if there is a loss of communication between the parking brake module and the ABS module or the CAN bus has failed. When fallback 2 is invoked, the parking brake module decelerates the vehicle using only the parking brake. The parking brake module tightens the brake cables under the control of the driver, no anti-lock function is available.

While dynamic apply is active, including fallback 1 and fallback 2, the parking brake module also outputs high speed CAN bus signals to:

- The ABS module, to apply the stoplamps.
- The instrument cluster, to sound an intermittent warning buzzer, at 0.5 second on, 1.0 second off.
- The instrument cluster, to illuminate the red parking brake warning indicator. The indicator is permanently illuminated except in fallback 2, when it flashes.

DAR Pre-arming

The DAR pre-arming function operates when the transfer box is in high range to reduce the parking brake release time during DAR and to provide a smooth take-off. DAR pre-arming is invoked when:

- The ignition switch is in position II.
- The transmission is in gear 1, 2 or R.
- The vehicle is stationary.
- No failsafe tighten actuation has occurred.

Automatic Load Adjustment

While the ignition is on, the parking brake module constantly monitors the input from the force sensor. If the tension of the brake cables goes outside the limits for a given operating mode, the parking brake module automatically restores the tension within limits.

Failsafe Tighten. If, during DAR pre-arming, the vehicle moves, then the maximum cable force is reinstated for the remainder of that ignition cycle.

Automatic Apply. While the parking brake is applied, if the tension of the brake cables decreases by a prescribed amount from the initial setting, the parking brake module automatically restores the tension to the initial setting.

Automatic Release. While the parking brake is released, if the tension of the brake cables increase to a prescribed amount, the parking brake module automatically reduces the tension to zero.

Parking Brake Switch Monitoring

The parking brake module monitors for the following types of fault in the parking brake switch system:

- Short circuits between a pull-down transistor in the parking brake module and battery voltage.
- Broken wires and microswitches.
- Plausibility.

If a fault is detected, the parking brake module stores a related fault code.

The parking brake switch has a degree of in-built redundancy. If a single microswitch fault is detected the parking brake module can still determine the operating state of the parking brake switch. Short circuits or multiple failures cause the parking brake module to disable the parking brake switch for the remainder of the ignition cycle. The parking brake module also disables the parking brake switch if a plausibility fault occurs. However, since plausibility faults are usually caused by incomplete operation of the parking brake switch, the parking brake switch is re-enabled if the parking brake module subsequently establishes a plausible operating state.

If a single microswitch fault is detected, the parking brake module signals the instrument cluster to illuminate the amber parking brake warning indicator. The parking brake module also signals the instrument cluster to display a message advising there is a parking brake fault. During an apply actuation, the parking brake module also signals the instrument cluster to flash the red parking brake warning indicator.

For all other fault types, the parking brake module signals the instrument cluster to illuminate the amber parking brake warning indicator and to display a message advising the parking brake has a fault and is not functioning. If it makes an apply actuation, the parking brake module signals the instrument cluster to flash the red parking brake warning indicator for the remainder of the ignition cycle.

On the next ignition cycle, the warning indicators and the messages are only activated if the fault is still present, although the fault code is retained by the parking brake module until cleared by T4.

Parking Brake and Actuation - Parking Brake

Diagnosis and Testing

Overview

Please note this is a sealed unit and no attempt must be made to open the actuator as it will invalidate the warranty claim.

For information on the operation of the system, refer to the relevant section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Parking brake cable(s) condition and installation ● Parking brake shoes condition and installation ● Parking brake drums (integrated into rear brake discs) ● Parking brake actuator module condition and installation	● Parking brake indicators ● Fuses - Fuse box - engine compartment - fuse 11E - Fuse box - engine compartment - fuse 8E - Fuse box - passenger compartment - fuse 40P - Fuse box - passenger compartment - fuse 41P ● Wiring harness/electrical connectors - Check for bent/corroded pins ● Controller area network (CAN) circuits ● Parking brake switch ● Parking brake actuator module

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart or DTC index.
   - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Parking brake will not engage or release	● Parking brake cables fouled, trapped or damaged ● Parking brake cables incorrectly routed or fixed ● Parking brake shoes, linings worn/contaminated ● Parking brake drums (integrated into rear brake discs) ● Parking brake shoes incorrectly adjusted following replacement ● Parking brake actuator module malfunction	Check the parking brake cables for fouling, trapping or damage. Check the cables for correct routing. Check that the cable end fitting connector(s) are correctly installed to the operating lever(s). Inspect the parking brake shoes and drums for condition/wear/contamination. Check the parking brake shoes for correct adjustment. REFER to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures). Check the operation of the parking brake actuator module, check for damage and/or excessive noise during operation. Check for parking brake actuator module DTCs.
Low parking brake efficiency/parking brake sticking/binding		

DTC Index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: Intermittent faults may cause DTCs to be logged, however some DTCs may be cleared during an ignition off, ignition on cycle. Carry out a road test (if safe to do so), check the functionality of the system and retrieve any DTCs **before** turning the ignition off.

Brake Bedding Mode

Bedding mode is a special mode available in the parking brake module (PBM) that disables the stability assist system (ABS) and allows the parking brake to provide the braking force rather than the conventional braking system whilst the vehicle is moving at a velocity of >3kph. This mode is entered via a series of brake pedal presses and switch applications, full details on this procedure is available in the relevant section of the workshop manual. If brake bedding mode is entered accidentally by the driver the RED warning lamp will flash in the Instrument Pack, the module will return to normal operational mode when the ignition has been cycled. This DTC (C110468) is intended to highlight the fact that although the RED lamp was illuminated there was no fault present in the control module.

• NOTE: Where reference is made to a drive cycle test, refer to the descriptions at the end of the table.

DTC	Description	Possible causes	Action
C110468	Brake Bedding Mode	- Event information - Brake bedding mode has been entered	This is not a fault. This is where the parking brake bedding-in mode has been activated. For information on how the bedding-in mode is activated and deactivated, REFER to: Parking Brake Shoes Bedding-In (206-05 Parking Brake and Actuation, General Procedures).
C1A0000	Control Module	- Parking brake actuator module fault	Clear DTCs, complete drive cycle 1 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A0016	Control Module	- Battery voltage below 8.3V at parking brake actuator module - Charging system under charging - Parking brake actuator module supply circuit short circuit to ground - Parking brake actuator module supply circuit open circuit - Parking brake actuator module ground circuit short circuit to power - Parking brake actuator module ground circuit open circuit	Check the charging system, charging voltage and battery condition. Check the parking brake actuator power and ground circuits. Refer to the electrical guides. Clear DTCs, complete drive cycle 3 to test for normal operation, refer to the relevant drive cycle shown below this table.
C1A0017	Control Module	- Vehicle started using a booster pack - Battery voltage at parking brake actuator module has been greater than 17V - Charging system over charging - Parking brake actuator module supply circuit short circuit to power	Check the charging system and charging voltage. Check the parking brake actuator power circuits. Refer to the electrical guides. Clear DTCs, complete drive cycle 3 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A004B	Control module	• NOTE: This is not a fault. - Parking brake actuator module temperature protection invoked, typically due to over-use where there have been more than 15 apply and release cycles continuously	If the red parking brake warning indicator flashes the fault is the result of short term protection (message displayed). Allow the parking brake to cool for 60 seconds and retest for functionality. If the parking brake does not apply, check for other DTCs. Rectify as necessary. Clear DTCs, complete drive cycle 3 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A4001	Longitudinal Acceleration Sensor	• NOTE: The longitudinal acceleration sensor is part of the parking brake actuator module - Longitudinal acceleration sensor	Clear DTCs and check if the fault reoccurs when the vehicle is stationary. Refer to the warranty policy and procedures manual if a module is suspect. Clear DTCs, complete drive cycle 1 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		fault	
C1A4002	Longitudinal Acceleration Sensor	• NOTE: The longitudinal acceleration sensor is part of the parking brake actuator module - Longitudinal acceleration sensor plausibility failure	Clear DTCs and check if the fault reoccurs when the vehicle is stationary. Calibrate the longitudinal acceleration sensor. To calibrate the sensor make sure the vehicle is on a level surface and run the calibration routine from the configuration menu of the approved diagnostic system. If calibration was not successful check that the parking brake actuator module is correctly installed. Refer to the warranty policy and procedures manual if a module is suspect. Clear DTCs, complete drive cycle 2 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A4054	Longitudinal Acceleration Sensor	• NOTE: The longitudinal acceleration sensor is part of the parking brake actuator module - Longitudinal acceleration sensor not calibrated	Clear DTCs and calibrate the longitudinal acceleration sensor. To calibrate the sensor make sure the vehicle is on a level surface and run the calibration routine from the configuration menu of the approved diagnostic system. Retest for functionality. Clear DTCs, complete drive cycle 1 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A4101	Clutch Pedal Sensor	- Clutch pedal sensor electrical error	Refer to the electrical guides and check the electrical circuit between the PBM and clutch position sensor, repair/renew as necessary.
C1A4102	Clutch Pedal Sensor	- Clutch pedal sensor circuit error	Refer to the electrical guides and check the electrical circuit between the PBM and clutch position sensor, repair/renew as necessary.
C1A4300	Motor Supply	• NOTE: The electric motor is part of the parking brake actuator module - Brake cables loose/broken/damaged - Brake shoes worn/damaged - Electric motor jammed	Check that the brake cables are connected correctly and are not loose/damaged. If the cables need to be re-connected use the approved diagnostic system to drive the cables to the "mount" position so that maximum cable length is available. Check the parking brake shoes adjustment and condition, REFER to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures) / Brake Disc (206-04 Rear Disc Brake, Removal and Installation) / Parking Brake Shoes (206-05 Parking Brake and Actuation, Removal and Installation). If the parking brake actuator module is stuck, re-cycle the ignition. If the parking brake actuator module cannot be operated from the switch then use the approved diagnostic system to drive the parking brake actuator module using the 'unjam' application in the set-up and configuration menu. Retest for functionality. Refer to the warranty policy and procedures manual if a module is suspect. Clear DTCs, complete drive cycle 1 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect.
C1A4301	Motor Supply	• NOTE: The electric motor is part of the parking brake actuator module - Internal motor circuit fault	Clear DTCs, complete drive cycle 3 to test for normal operation, refer to the relevant drive cycle shown below this table. Refer to the warranty policy and procedures manual if a module is suspect. Refer to the warranty policy and procedures manual if a module is suspect.
C1A4662	Mismatch Between Motor Drive Current and Resultant Force	- Parking brake cables fouled, trapped or damaged - Parking brake shoes, linings worn - Parking brake shoes incorrectly adjusted following replacement - Parking brake actuator module circuit short circuit to ground, short circuit to power, high resistance - Parking brake actuator module fault	Check the parking brake cables for fouling, trapping or damage. Check the parking brake shoes for correct adjustment, REFER to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures). Inspect the parking brake shoes for excessive wear. REFER to: Brake Disc (206-04 Rear Disc Brake, Removal and Installation) / Parking Brake Shoes (206-05 Parking Brake and Actuation, Removal and Installation). Check the parking brake actuator module circuits. Refer to the electrical guides. Clear the DTC and retest. If the problem persists, renew the control module. Refer to the warranty policy and procedures manual if a module is suspect.

Drive Cycle 1 Description

- Ignition On
- Make sure that no parking brake activation (diagnostic command or switch input) is attempted for a minimum of 3 seconds
- Retest for functionality

Drive Cycle 2 Description

- Ignition On
- Drive vehicle at a constant speed of 20KPH (13MPH) or slightly above in 2nd gear
- At a constant speed of 20KPH (13MPH) or slightly above apply the parking brake via the parking brake switch
- Press the brake pedal

Drive Cycle 3 Description

- Ignition On
- Make sure that the vehicle is stationary and that the parking brake is released
- Pull the parking brake switch to the apply position and hold in this position until the parking brake motor has stopped (this may take up to 5 seconds)
- Release the parking brake switch to the idle position, leave in the idle position for 2 seconds
- Push the parking brake switch to the release position (while pressing the brake pedal) and keep in this position until the parking brake motor has stopped (this may take up to 5 seconds)
- Release the parking brake switch to the idle position

Parking Brake and Actuation - Parking Brake Shoe and Lining Adjustment

General Procedures

• NOTE: This procedure must be carried out if, new parking brake shoes are fitted, new rear brake discs are fitted or if the vehicle has been mud wading (not water) for more than 50 miles.

1. Check the parking brake for correct operation.

2. CAUTIONS:

When the vehicle is in the mounting position a red flashing light may appear on the instrument cluster. This indicates that the parking brake actuator is in the mounting position. It does not indicate a vehicle fault.

The warning lamp on the instrument cluster will flash whilst the parking brake is being driven into the mounting position.

Using the Land Rover approved diagnostic system, drive the parking brake to the mounting position.

3. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

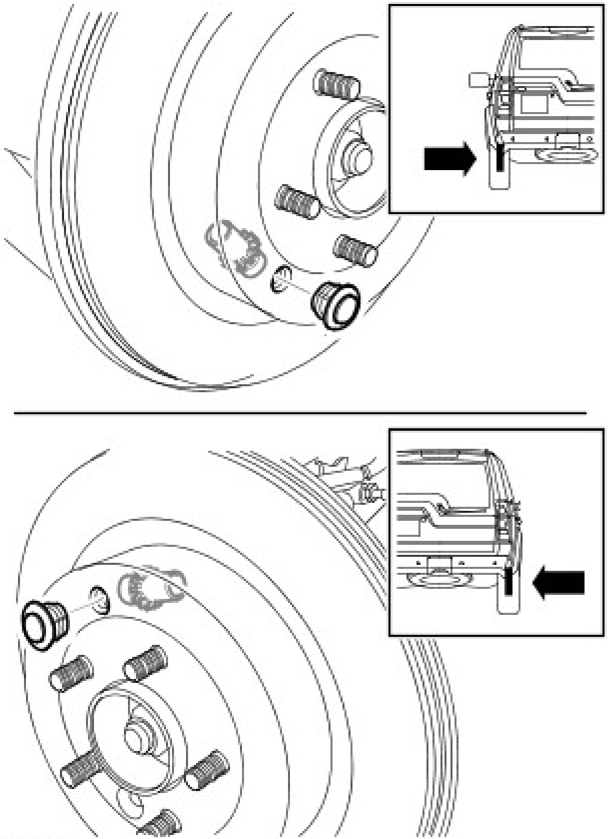
Raise and support the vehicle.

4. Remove the wheels and tires.

5. NOTE: Align the access hole with the indicators located on the back plate.

Locate the parking brake shoe adjuster.

- Remove the access plug.
- Rotate the brake disc.

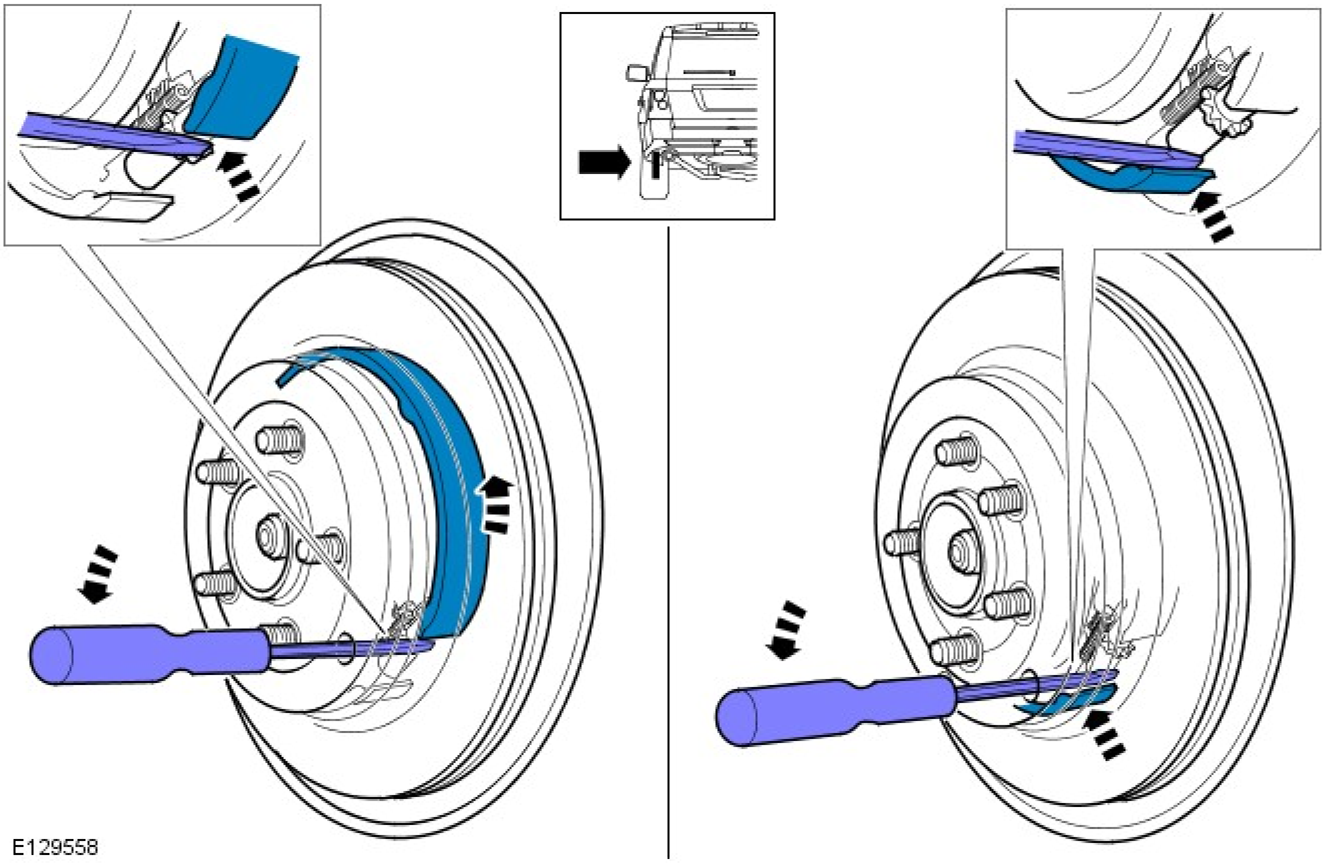


E48748

6. CAUTION: Failure to follow this step may cause damage to the parking brake system. Failure to displace the parking brake shoes, as shown, will result in incorrect clearance when carrying out the adjustment step.

- NOTE: The movement of the parking brake shoe will be small and may not be felt when levering.
- NOTE: LH shown.

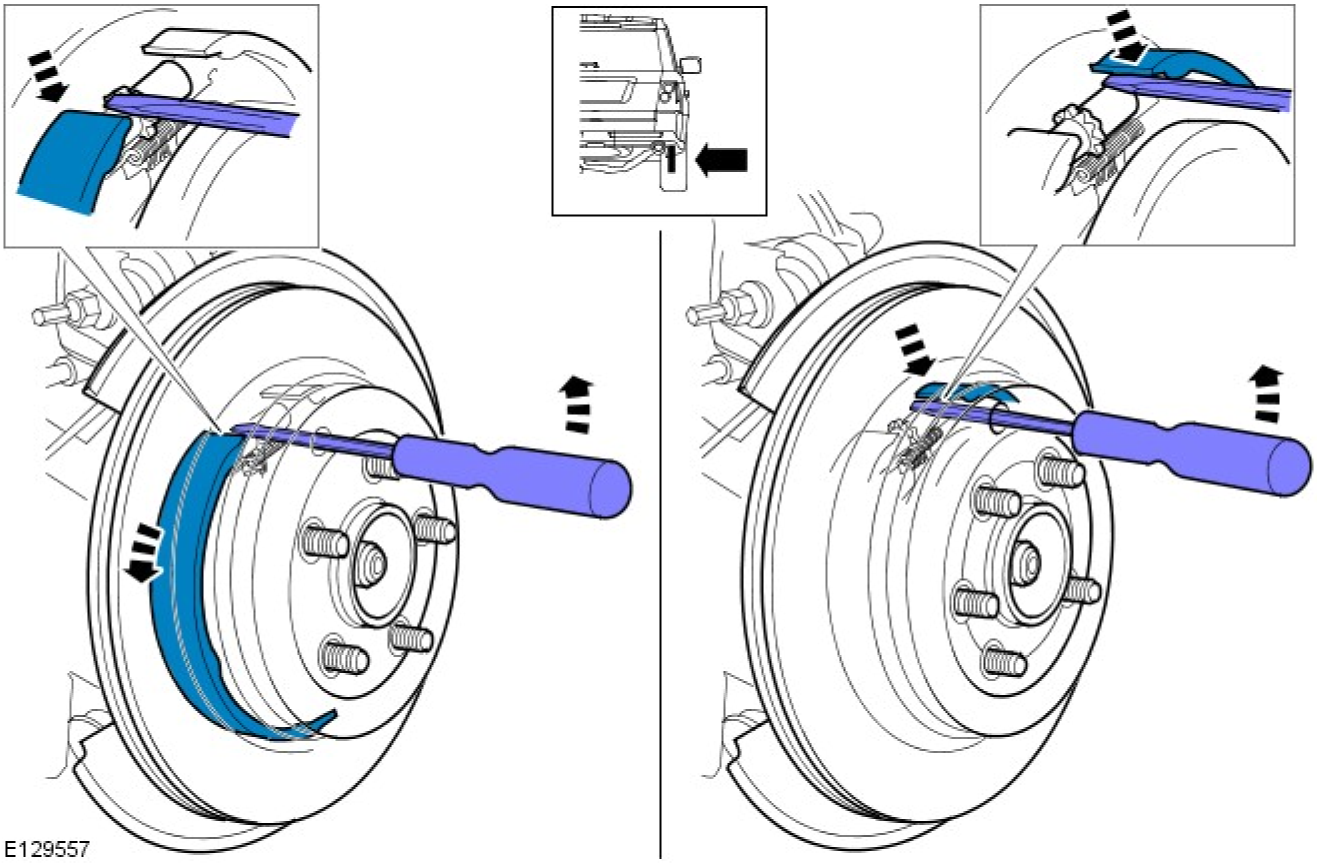
Using a flat blade screwdriver, lever the brake shoes as indicated.



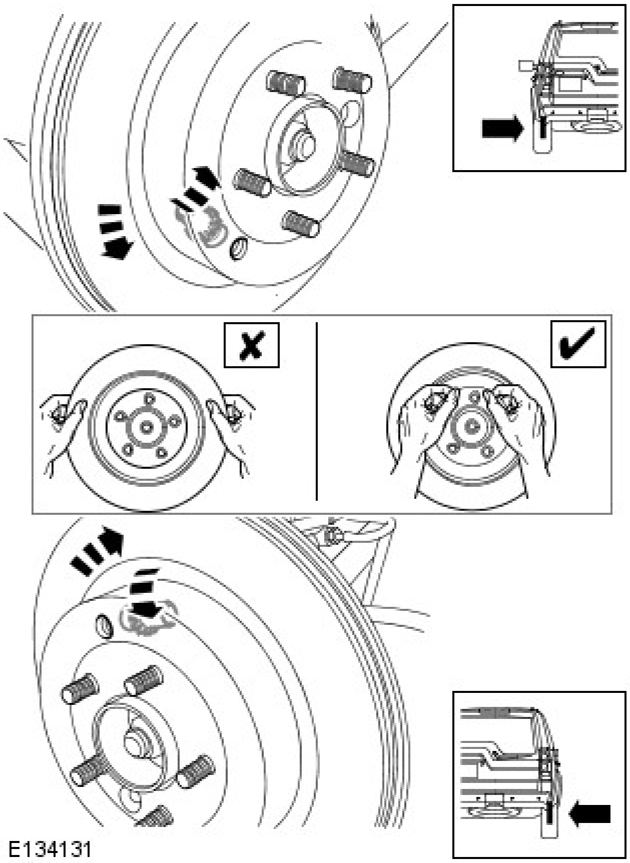
7. ⚠ CAUTION: Failure to follow this step may cause damage to the parking brake system. Failure to displace the parking brake shoes, as shown, will result in incorrect clearance when carrying out the adjustment step.

- NOTE: The movement of the parking brake shoe will be small and may not be felt when levering.
- NOTE: RH Shown.

Using a flat blade screwdriver, lever the brake shoes as indicated.



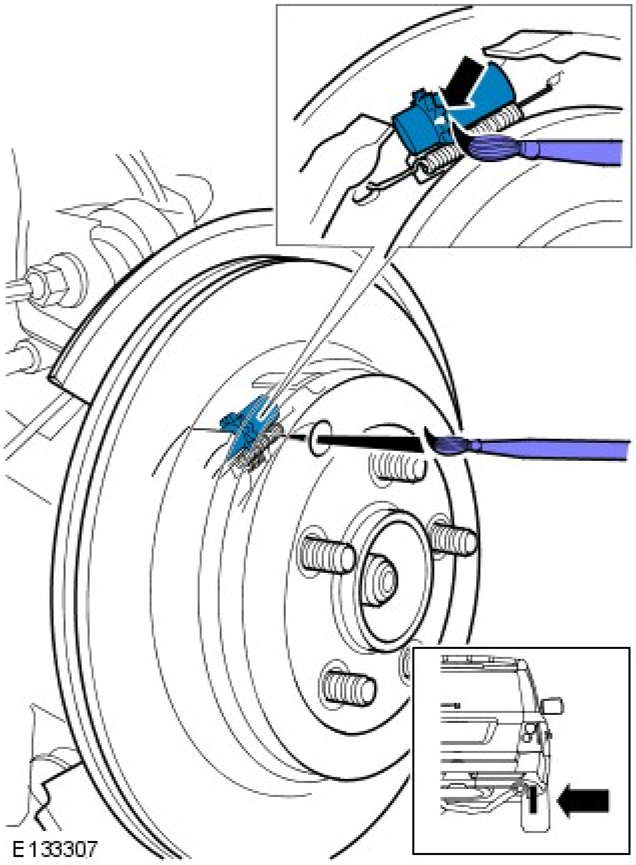
E129557



E134131

8. CAUTION: Do dot apply excessive force on the brake shoe adjuster. Failure to follow this instruction may result in damage to the parking brake system

Using a flat bladed screwdriver rotate the brake shoe adjuster to extend it until the brake disc is locked hand tight.

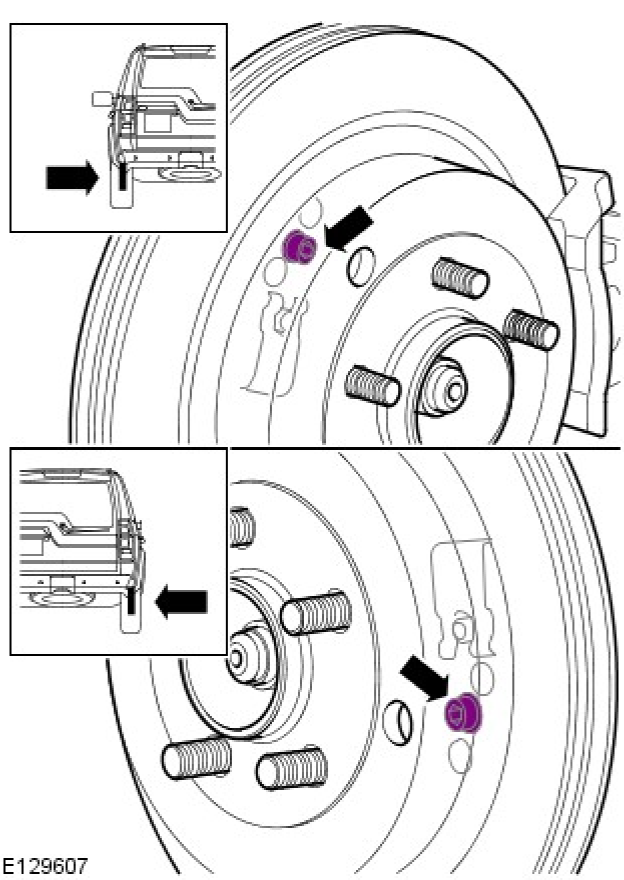


9. ⚠CAUTION: The following steps sets the running clearance for the parking brake shoes, failure to adhere to the paint marking process may cause damage to the park brake system when the adjustment steps are carried out.

Using suitable marker, mark the position of the brake shoe adjuster.

10. ⚠CAUTION: The parking brake adjuster must be rotated back EXACTLY one full revolution. Failure to follow this instruction may result in damage to the parking brake system.

Rotate the adjuster back one revolution until paint mark is visible.



E129607

11. ⚠ CAUTION: The wedge adjuster must be correctly seated to make sure the parking brake cable is correctly adjusted. Failure to follow this instruction may result in damage to the parking brake system.

Loosen the wedge adjuster Allen screw half a turn.

- Tap the brake disc lightly with a soft faced mallet, around the parking brake shoe location within the brake disc.
- Tighten the wedge adjuster Allen screw to 6 Nm (5 lb.ft).
- Install the access plug.

12. Repeat the above procedure for the other side.

13. Take the vehicle out of the mounting position by operating the parking brake twice.

14. ⚠ CAUTION: If the parking brake shoes or the brake discs have been removed for access to other components then DO NOT carry out this procedure.

Carry out the parking brake shoe bedding-in procedure.
For additional information, refer to: Parking Brake Shoes Bedding-In (206-05 Parking Brake and Actuation, General Procedures).

Published: 11-May-2011

Parking Brake and Actuation - Parking Brake Shoes Bedding-In

General Procedures

- NOTE: This procedure must be carried out if, new parking brake shoes are fitted, new rear brake discs are fitted or if the vehicle has been mud wading (not water) for more than 50 miles.

1. Carry out the parking brake shoe bedding-in procedure.

2. NOTE: The electronic parking brake 'Service Bedding-in Procedure mode' will be active for the remainder of the igntion cycle, or until the vehicle speed exceeds 31 mph (50 kph). If the procedure needs to be re-entered, the entry actions must be repeated.

To enter 'Service Bedding-in Procedure' mode.

- Start and run the engine.
- Apply the footbrake 3 times within 10 seconds and hold applied after the 3rd application.
- Apply the electronic parking brake switch 4 times, followed by 3 release applications within 10 seconds.

3. Once the Service Bedding-in procedure mode has been entered, the electronic parking brake linings can be bedded-in by conducting 10 repeated stops from 30 - 35 kph (19 - 22 mph), followed by a 500 metre (547 yard) interval between each stop to allow the brakes to cool, using the electronic parking brake control switch.

- The electronic parking brake brake force will be increased up to the dynamic maximum so long as the switch is held in the applied position.
- If the switch is released to either the NEUTRAL or OFF positions, the electronic parking brake will be released.
- The electronic parking brake MUST be allowed to cool between applications, either by driving at 19 mph (30 kph) for 500 metres (547 yards) or remaining stationary for 1 minute between each application.

Parking Brake and Actuation - Parking Brake Cable LH

Removal and Installation

Removal

CAUTION: To avoid accidental operation of the parking brake, and possible damage to the parking brake actuator, remove Fusible link 8, located in the engine compartment fuse box before commencing work.

• NOTE: If the parking brake system has completed less than 50,000 cycles it is permissible to replace the parking brake cables. If over 50,000 cycles have been completed, then the cables can only replaced as part of the parking brake actuator and cable assembly. The parking brake cycle count can be checked using using the Land Rover approved diagnostic system, (ON/OFF = 1 cycle). If a cable breaks or becomes detached whilst the vehicle is being driven, a 'parking brake actuator unjaming procedure' may be required using the Land Rover approved diagnostic system.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.

2. Isolate the parking brake electrical circuit.

- Remove fuse number 8 from the BJB.

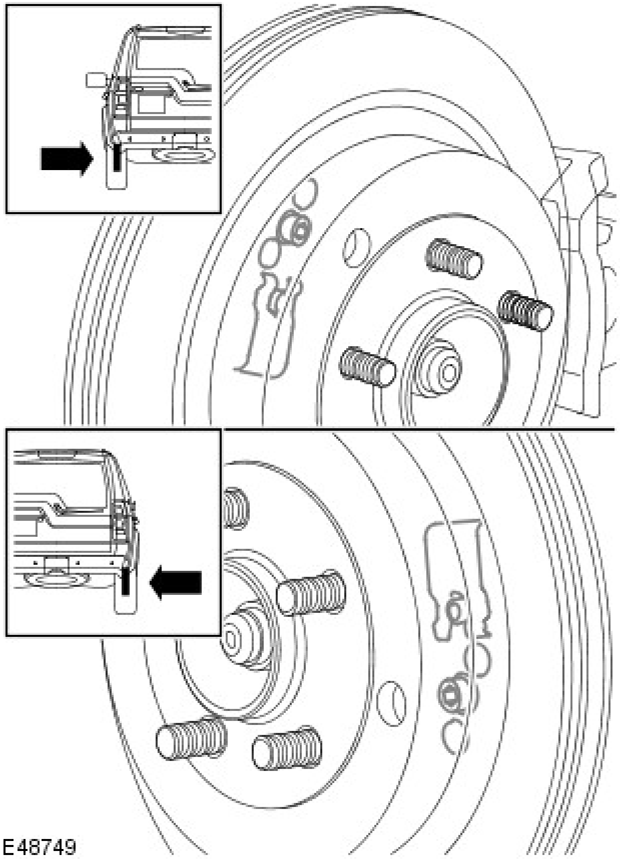
3. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

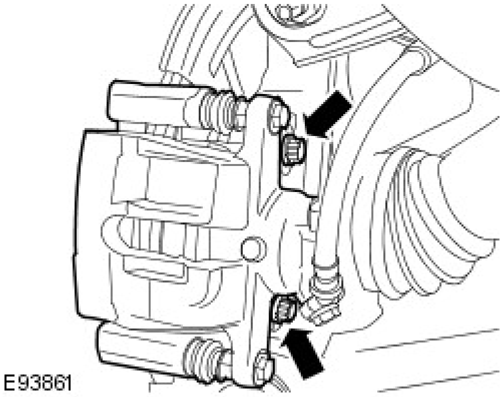
Raise and support the vehicle.

4. Remove both rear wheels and tires.

5. Release the parking brake shoe adjustment.

- Loosen the screw.



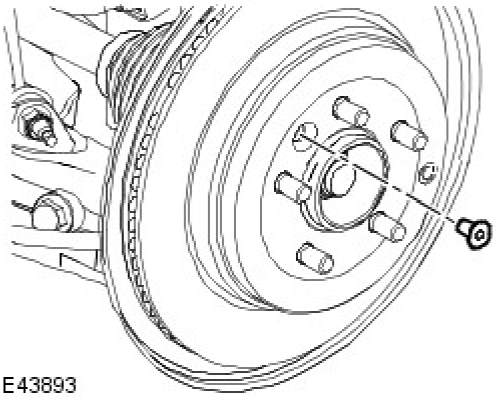


E93861

6. ⚠CAUTION: Do not allow the brake caliper to hang on the brake hose.

Reposition the LH rear brake caliper.

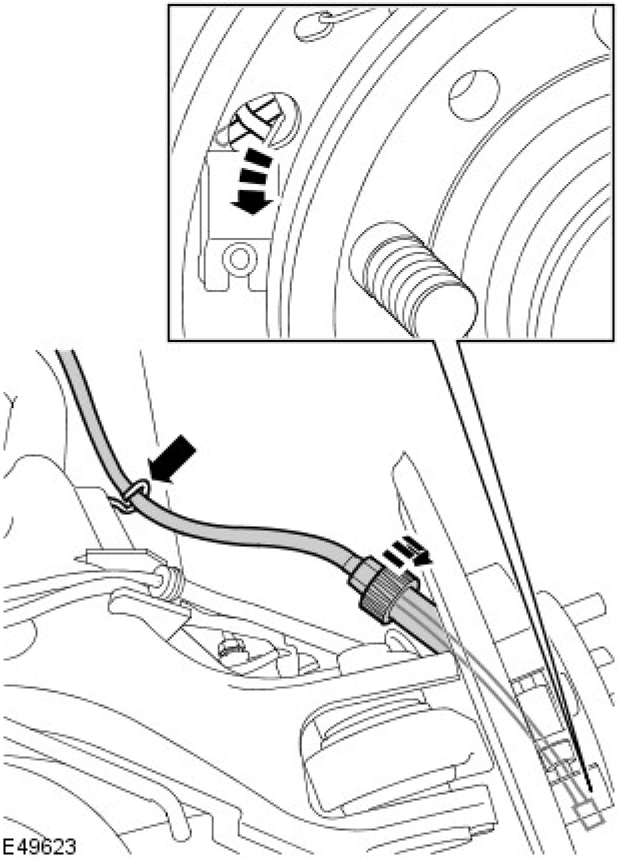
- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.



E43893

7. Remove the LH rear brake disc.

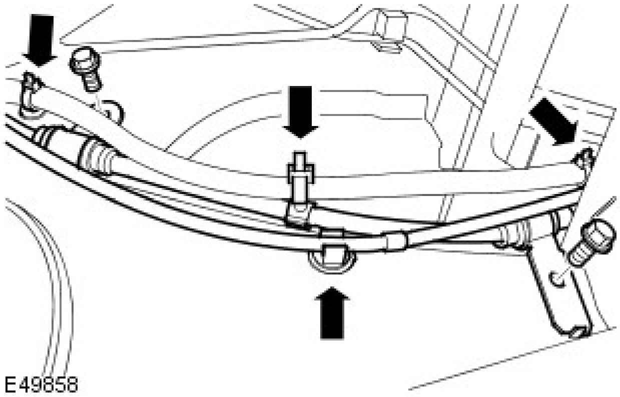
- Remove the screw.



E49623

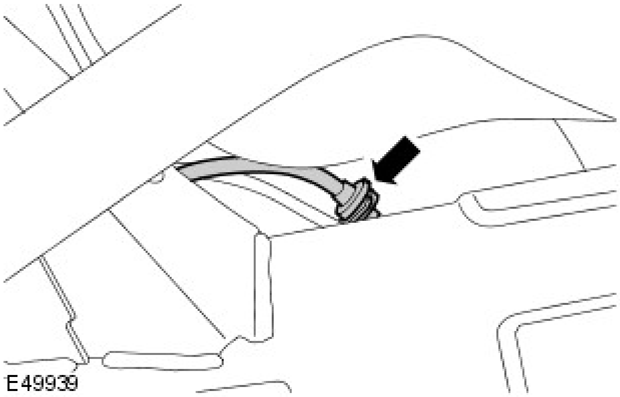
8. Disconnect parking brake cable from the wheel hub.

- Fully loosen the nut.
- Release the cable from the lower arm.
- Disconnect the inner cable from the brake shoe.

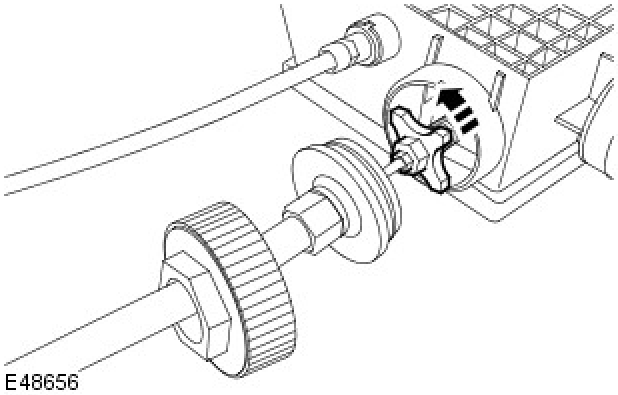


9. Release the LH parking brake cable.

- Remove the 2 bolts.
- Release the 3 wiring harness clips.
- Release the cable from the clip on the chassis.



10. Release the LH parking brake cable.



11. Remove the LH parking brake cable.

- Release the retaining nut.
- Release and remove the cable.

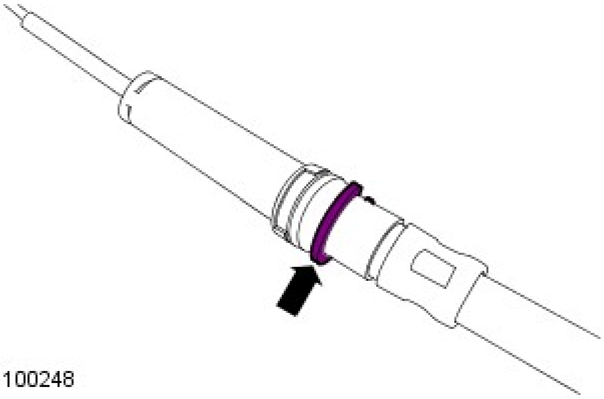
Installation

1. Install the LH parking brake cable.

- LH cable: Screw the cable in 5 complete turns.
- Tighten the retaining nut.

2. Locate and secure the LH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the wiring harness.
- Secure the cable grommet to the integrated body frame bracket.



E100248

3. NOTE: Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cable to the wheel hub.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

4. ⚠ CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the LH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

5. Secure the LH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

6. NOTE: The adjustment procedure must be carried out in full.

Adjust the parking brake shoes.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

7. Install the rear wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

8. Install fuse number 8 into the BJB.

Published: 11-May-2011

Parking Brake and Actuation - Parking Brake Cable RH

Removal and Installation

Removal

⚠CAUTION: To avoid accidental operation of the parking brake, and possible damage to the parking brake actuator, remove Fusible link 8, located in the engine compartment fuse box before commencing work.

• NOTE: If the parking brake system has completed less than 50,000 cycles it is permissible to replace the parking brake cables. If over 50,000 cycles have been completed, then the cables can only replaced as part of the parking brake actuator and cable assembly. The parking brake cycle count can be checked using using the Land Rover approved diagnostic system, (ON/OFF = 1 cycle). If a cable breaks or becomes detached whilst the vehicle is being driven, a 'parking brake actuator unjaming procedure' may be required using the Land Rover approved diagnostic system.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.

2. Isolate the parking brake electrical circuit.

- Remove fuse number 8 from the BJB.

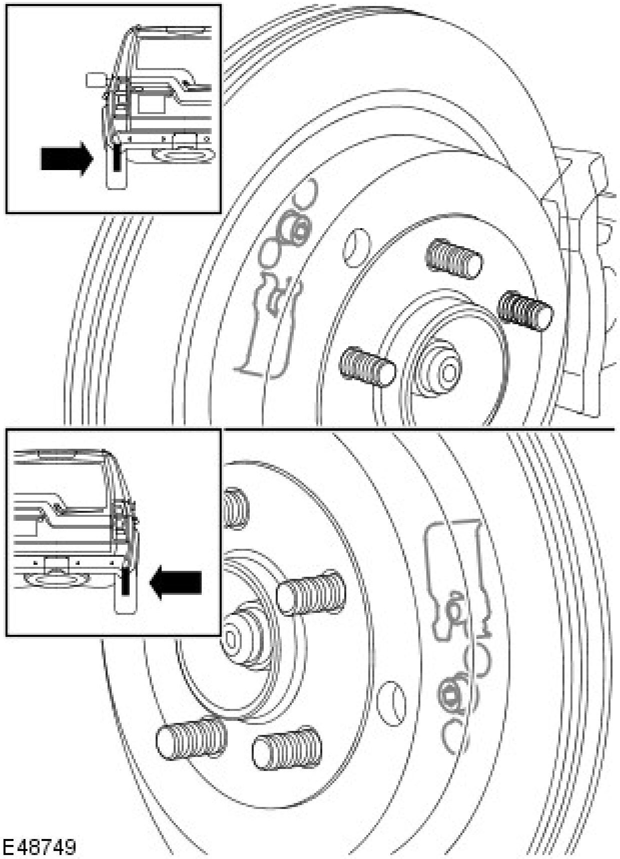
3. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

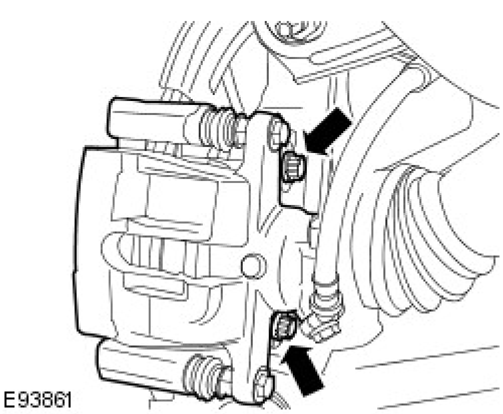
Raise and support the vehicle.

4. Remove the wheels and tires.

5. Release the parking brake shoe adjustment.

- Loosen the screw.

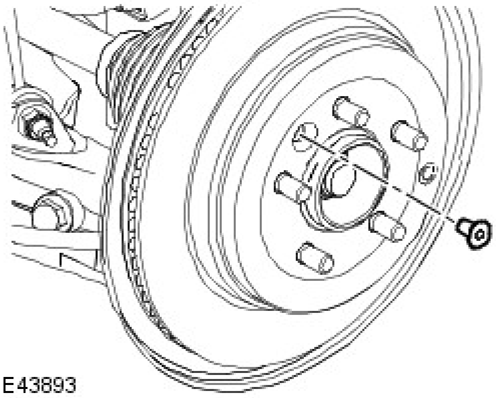




6. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

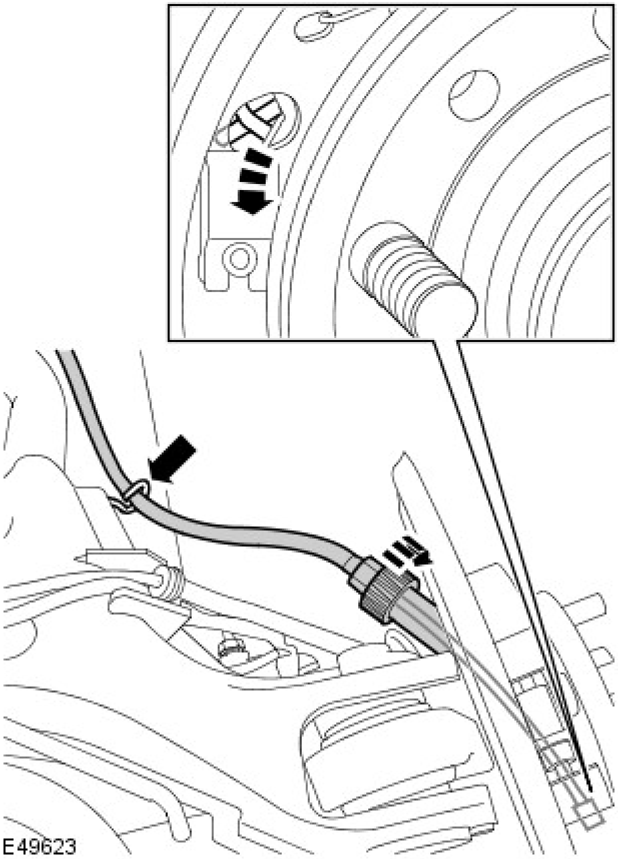
Reposition the RH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.



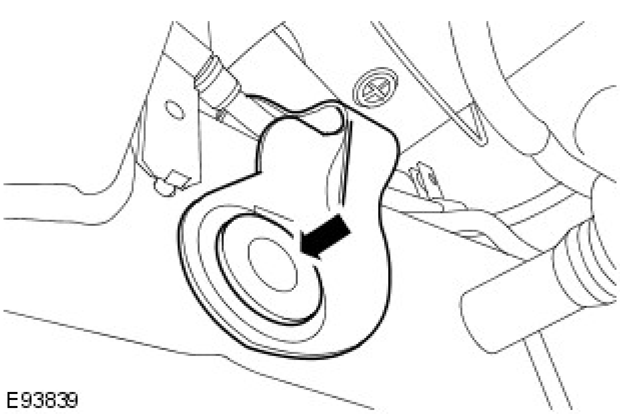
7. Remove the RH rear brake disc.

- Remove the screw.



8. Disconnect parking brake cable from the wheel hub.

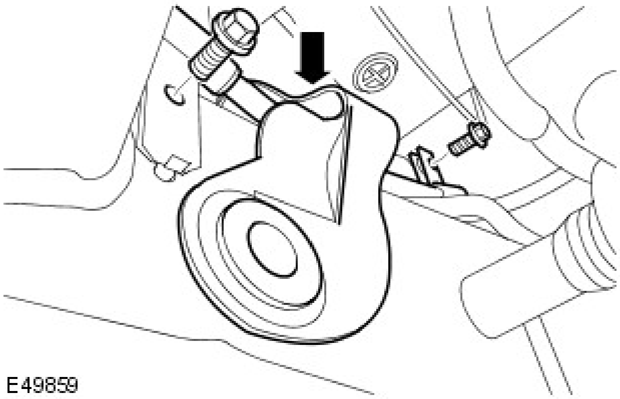
- Fully loosen the nut.
- Release the cable from the lower arm.
- Disconnect the inner cable from the brake shoe.



9. ⚠ CAUTION: The fuel tank breather line bracket can be easily damaged when releasing it from the chassis.

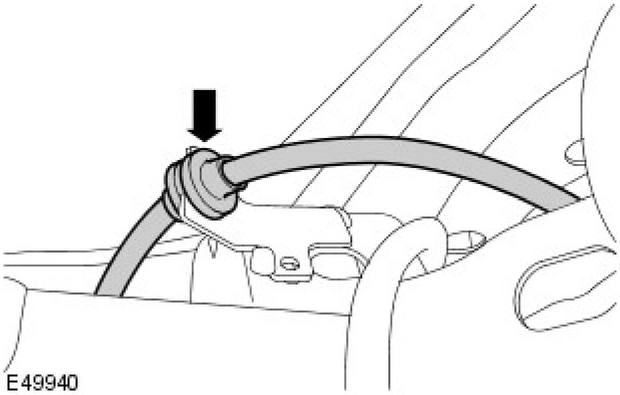
Release the fuel tank breather line bracket.

- Remove the plastic insert.

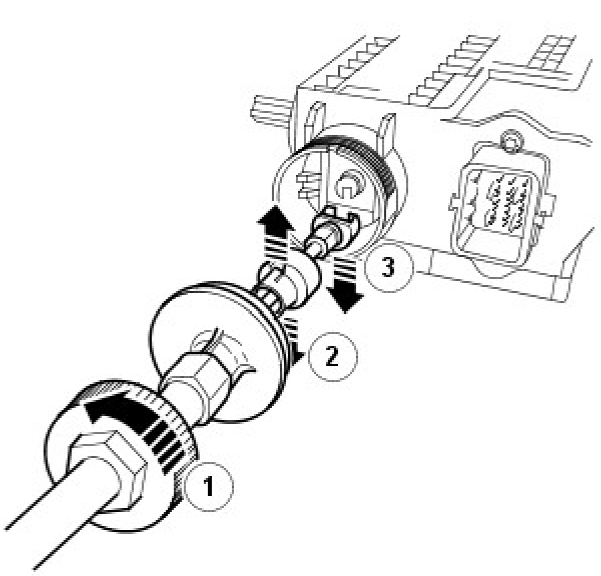


10. Release the RH parking brake cable.

- Remove the 2 bolts.
- Release the parking brake cable from the 2 pipe clips.
- Release the cable from the clip on the chassis.



11. Release the RH parking brake cable.



E61820

12. CAUTION: Make sure that no dirt or moisture enters the actuator during cable replacement.

Remove the RH parking brake cable.

- Release the retaining nut.
- Release the cable retaining clip.
- Release and remove the cable.

Installation

1. Install the RH parking brake cable.

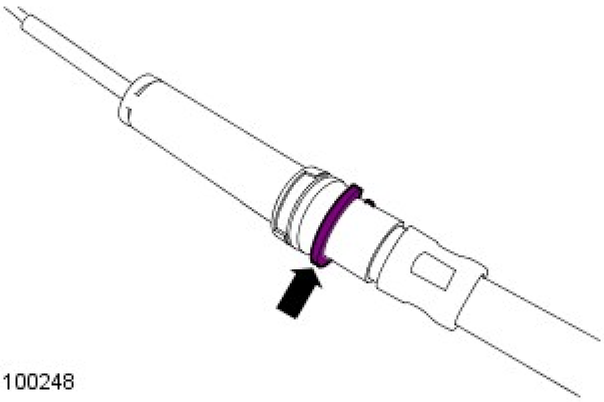
- Install the cable.
- Install the cable retaining clip.
- Tighten the retaining nut.

2. Secure the fuel tank breather line bracket.

- Install the plastic insert.

3. Locate and secure the RH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the parking brake cable to the 2 pipe clips.
- Secure the cable grommet to the integrated body frame bracket.



E100248

4. NOTE: Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cable to the wheel hub.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

5. CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the RH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

6. Secure the RH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

7. NOTE: The adjustment procedure must be carried out in full.

Adjust the parking brake shoes.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

8. Install the rear wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

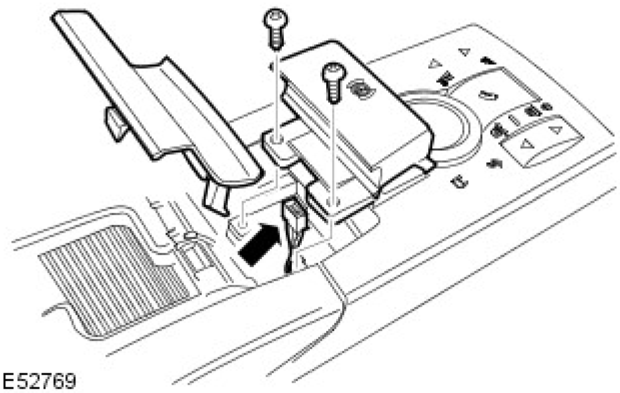
9. Install fuse number 8 into the BJB.

Published: 11-May-2011

Parking Brake and Actuation - Parking Brake Switch

Removal and Installation

Removal



1. Remove the parking brake switch.
   - Remove the screw cover.
   - Remove the 2 screws.
   - Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.

Parking Brake and Actuation - Parking Brake ActuatorV8 4.4L Petrol/V8 S/C 4.2L Petrol

Removal and Installation

Removal

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.

2. Isolate the parking brake electrical circuit.

- Remove fuse number 8 from the BJB.

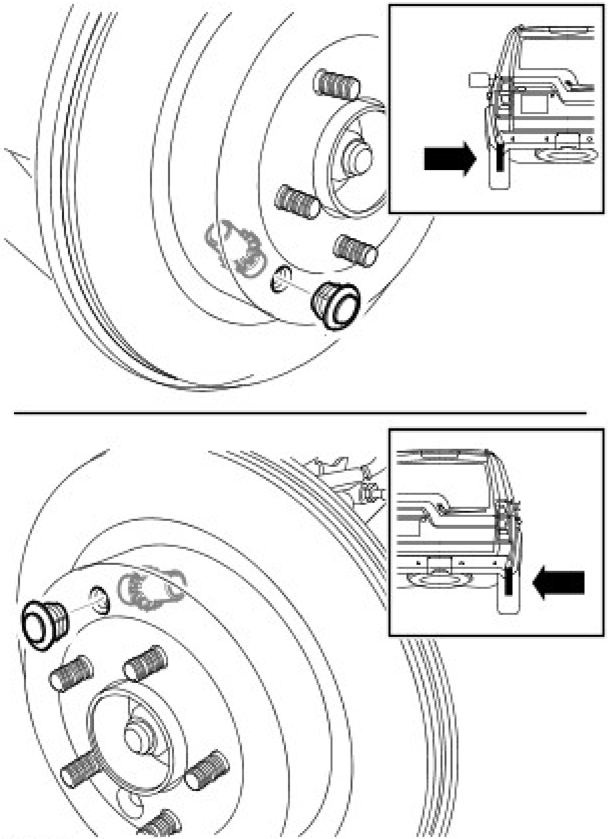
3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

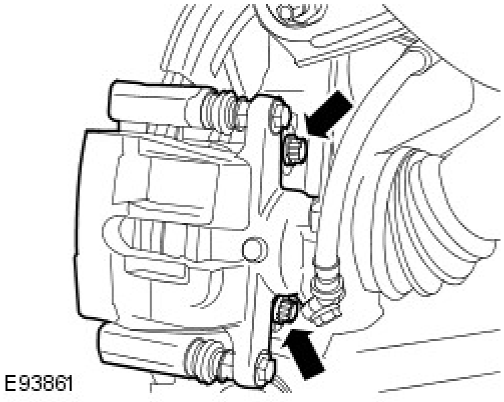
Raise and support the vehicle.

4. Remove the rear wheels and tires.

5. Release the parking brake shoe adjustment.

- Remove the plug from the access hole in the brake disc.
- Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.

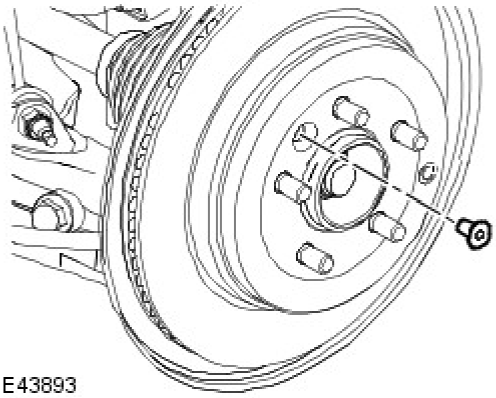




6. ⚠CAUTION: Do not allow the brake caliper to hang on the brake hose.

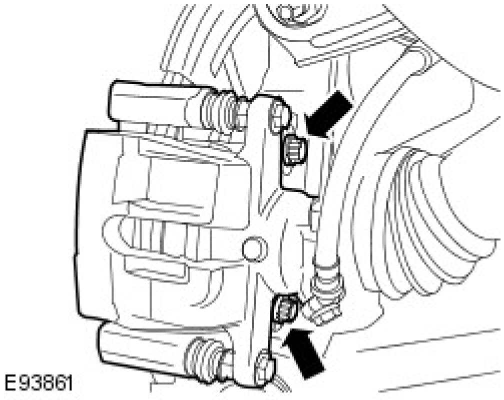
Reposition the RH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.



7. Remove the RH rear brake disc.

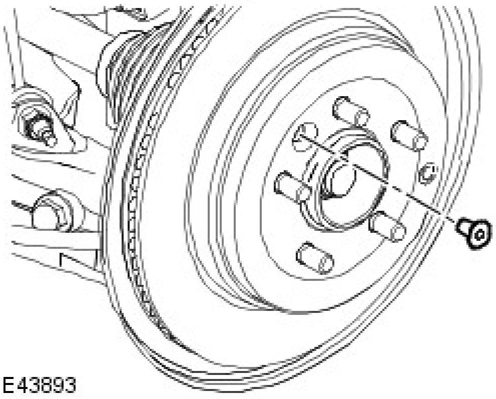
- Remove the screw.



8. ⚠CAUTION: Do not allow the brake caliper to hang on the brake hose.

Reposition the LH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.

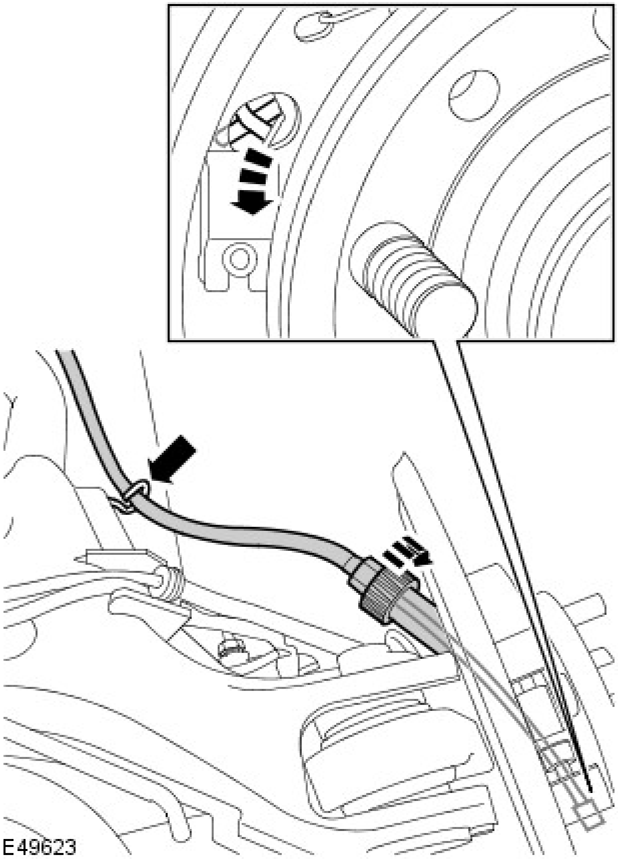


9. Remove the LH rear brake disc.

- Remove the screw.

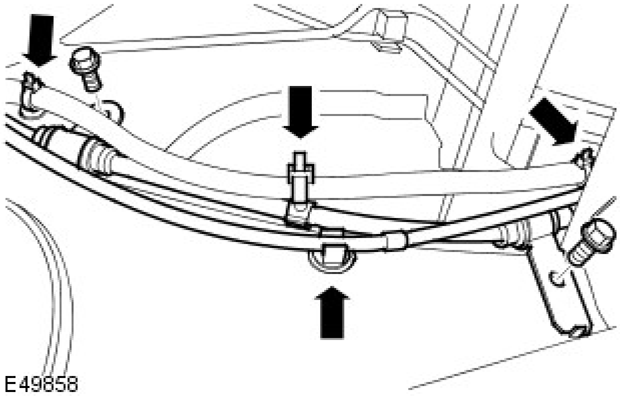
10. Disconnect both parking brake cables from the wheel hubs.

- Fully loosen the nut.
- Release the cable from the lower arm.
- Disconnect the inner cable from the brake shoe.

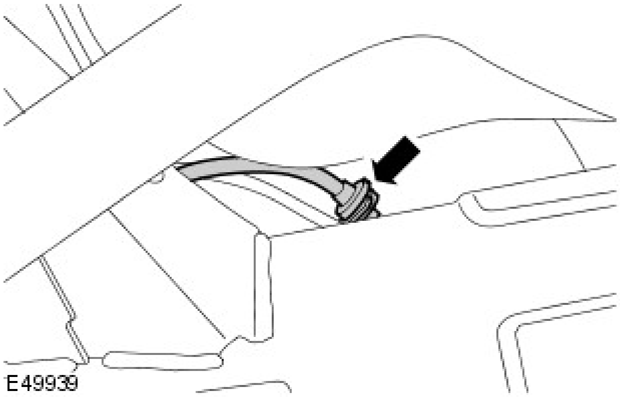


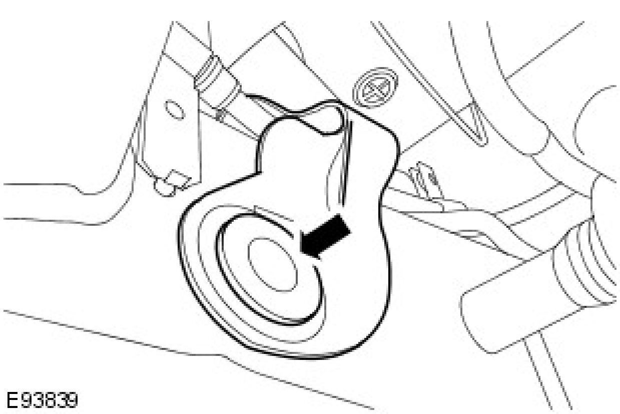
11. Release the LH parking brake cable.

- Remove the 2 bolts.
- Release the 3 wiring harness clips.
- Release the cable from the clip on the chassis.



12. Release the LH parking brake cable.

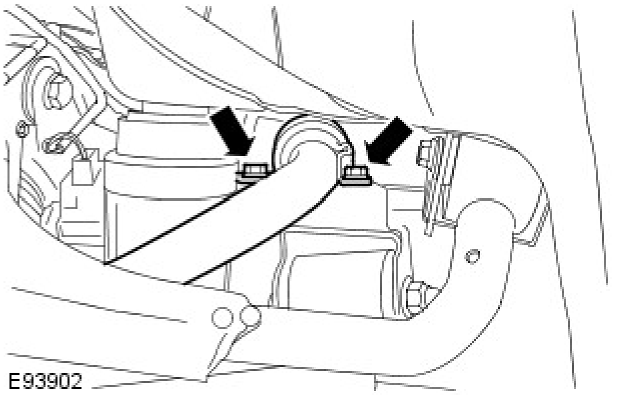




13. ⚠ CAUTION: The fuel tank breather line bracket can be easily damaged when releasing it from the chassis.

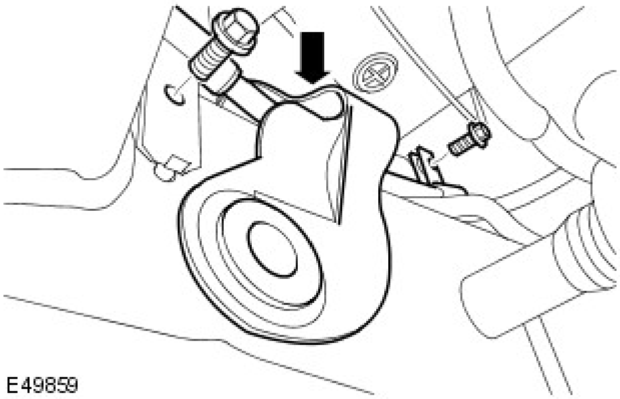
Release the fuel tank breather line bracket.

- Remove the plastic insert.



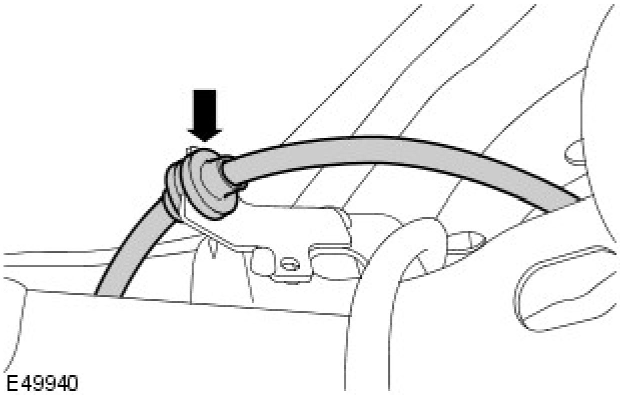
14. Raise the RH side of the rear stabilizer bar.

- Loosen the 2 bolts.

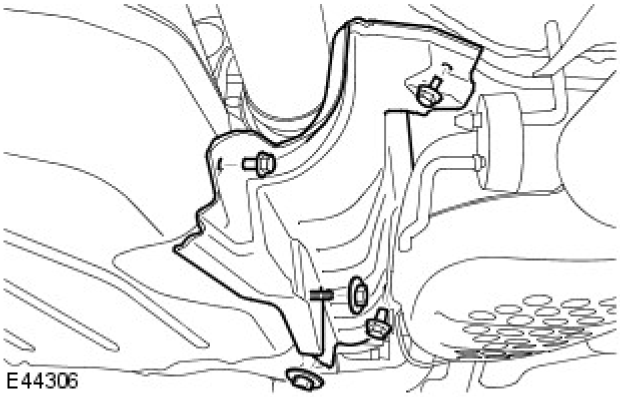


15. Release the RH parking brake cable.

- Remove the 2 bolts.
- Release the parking brake cable from the 2 pipe clips.
- Release the cable from the clip on the chassis.

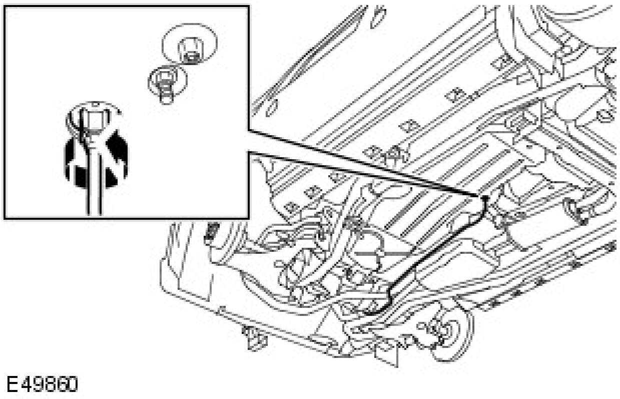


16. Release the RH parking brake cable.



17. Remove the fuel tank heat shield.

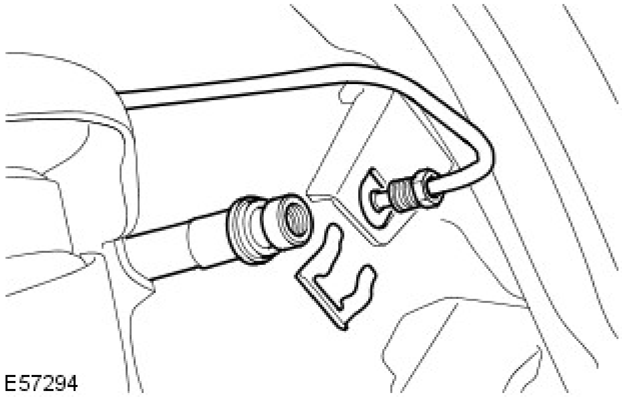
- Remove the 3 bolts and 2 nuts.



18. ⚠ CAUTION: Inspect the parking brake emergency release cable to body seal and replace if damaged.

• NOTE: Note the fitted position of the parking brake emergency release cable to body seal.

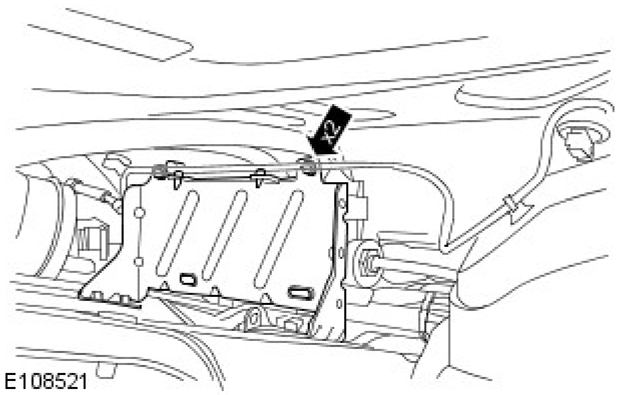
Release the parking brake emergency release cable.



19. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

RH side rear: Disconnect the brake line.

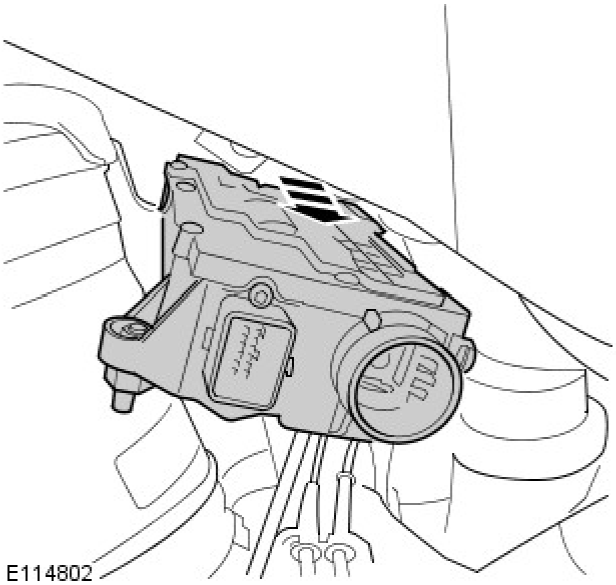
- Position an absorbent cloth to collect fluid spillage.
- Disconnect the line union.
- Remove the clip.



20. NOTE: Note the routing of the parking brake emergency release cable.

Displace the parking brake actuator and cable assembly.

- Disconnect the electrical connector.
- Remove the 2 nuts.



21. NOTE: Brake cable shown removed for clarity.

Remove the parking brake actuator and cable assembly.

- Withdraw from the RH rear wheel arch aperture.

Installation

1. NOTE: Note the routing of the parking brake emergency release cable.

Install the parking brake actuator and cable assembly.

- Install the 2 nuts.
- Connect the electrical connector.

2. NOTE: Remove and discard the blanking caps.

RH side rear: Connect the brake line.

- Clean the component mating faces.
- Secure the clip.
- Tighten the brake line union to 16 Nm (12 lb.ft).

3. ⚠ CAUTION: Make sure the parking brake emergency release cable to body seal is installed correctly.

Locate and secure the parking brake emergency release cable.

4. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

5. Secure the fuel tank breather line bracket.

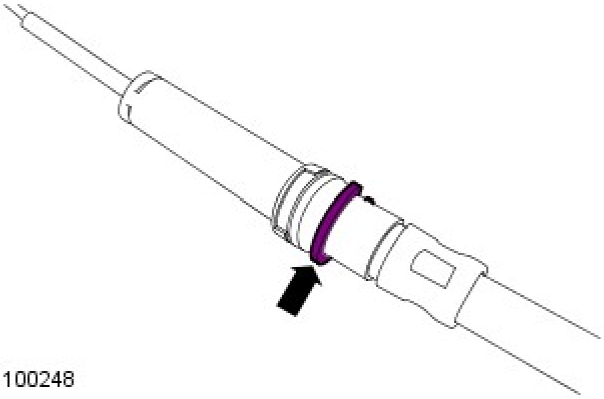
- Install the plastic insert.

6. Locate and secure the RH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the parking brake cable to the 2 pipe clips.
- Secure the cable grommet to the integrated body frame bracket.

7. Locate and secure the LH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the wiring harness.
- Secure the cable grommet to the integrated body frame bracket.



E100248

8. NOTE: Make sure that the brake cable circlip is positioned as shown.

Connect the parking brake cables to the wheel hubs.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

9. ⚠ CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the LH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

10. Secure the LH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

11. ⚠ CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the RH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

12. Secure the RH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

13. Adjust the parking brake shoes.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

14. Bleed the brake system.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures).

15. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

16. Install fuse number 8 into the BJB.

17. Using the Land Rover approved diagnostic system, calibrate the parking brake actuator on an even surface.

18. Apply and release hand brake to confirm operation.

Published: 11-May-2011

Parking Brake and Actuation - Parking Brake Shoes

Removal and Installation

Removal

• NOTE: If the parking brake shoes or the brake discs have been removed for access to other components then DO NOT carry out the bedding in procedure.

1. Using the Land Rover approved diagnostic system, drive the parking brake to the mounting position.

2. Isolate the parking brake electrical circuit.

- Remove fuse number 8 from the BJB.

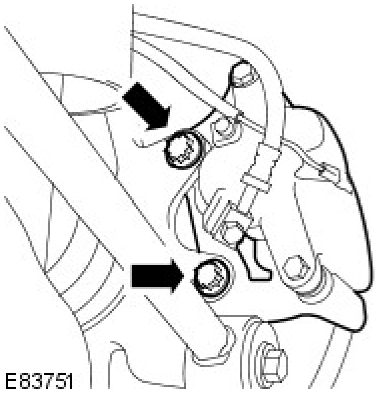
3. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the wheels and tires.

5. Release the brake caliper.

- Remove the brake caliper anchor bolts.

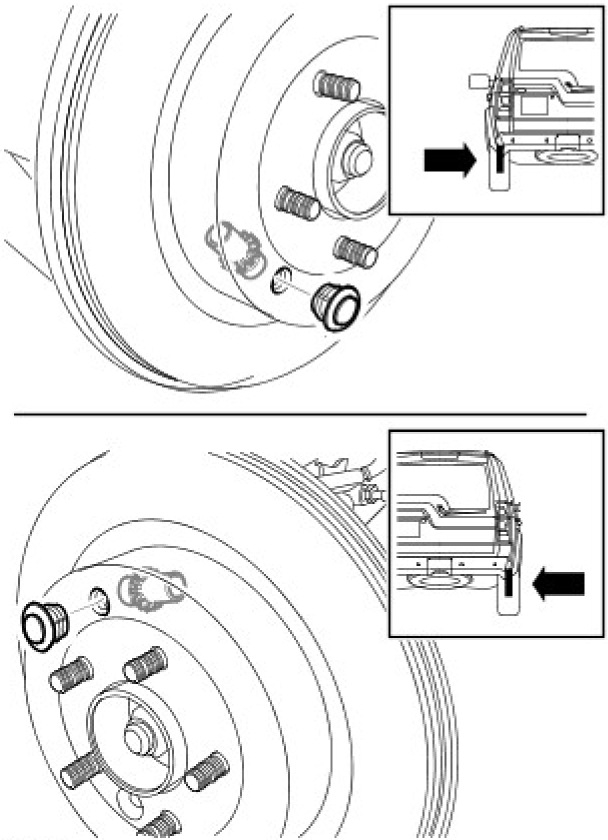


6. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

Tie the brake caliper aside.

7. Release the park brake shoe adjustment.

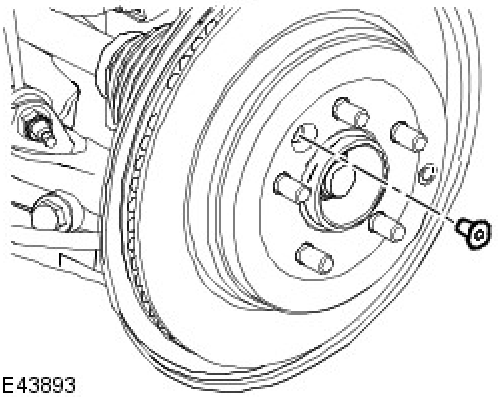
- Remove the plug from the access hole in the brake disc.
- Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.



E48748

8. Remove the brake disc.

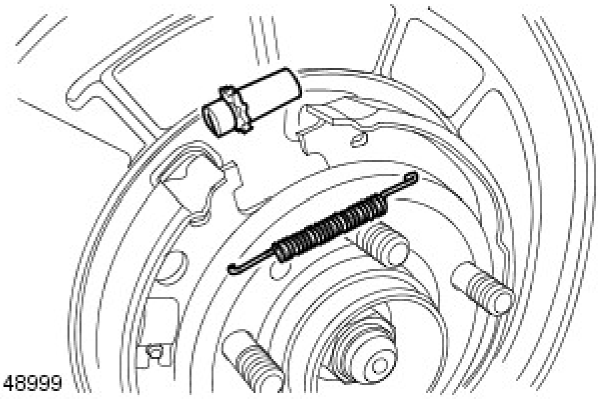
- Remove the Torx screw.



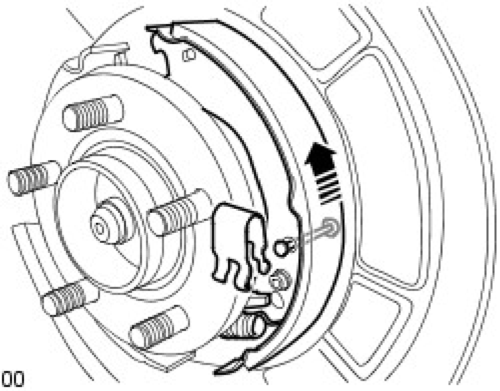
E43893

9. Remove the adjuster and return spring.

- Release the the parking brake shoe adjuster to the minimum adjustment.



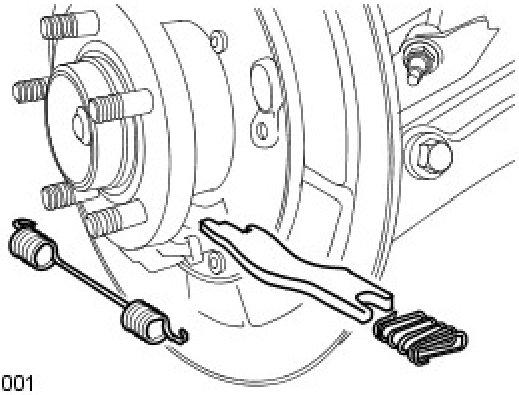
E48999



E49000

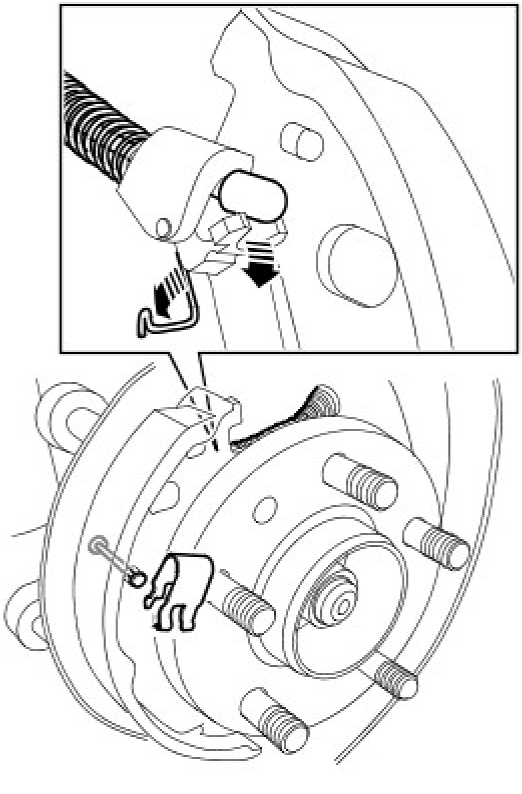
10. Remove the primary brake shoe.

- Remove the hold-down spring and retaining pin.
- Pivot the shoe to release it from the spreader plate and return spring.



E49001

11. Remove the spreader plate and spring.
12. Remove the return spring.



E49002

13. Remove the secondary brake shoe.

- Remove the hold-down spring and retaining pin.
- Disconnect the parking brake cable retaining spring from the brake shoe lever.
- Release the parking brake cable.

14. Repeat the above procedure for the other side.

Installation

1. ⚠ WARNING: Do not use compressed air to clean brake components. Dust from friction materials can be harmful if inhaled.

Clean the backing plate and apply grease to the brake shoe contacts.

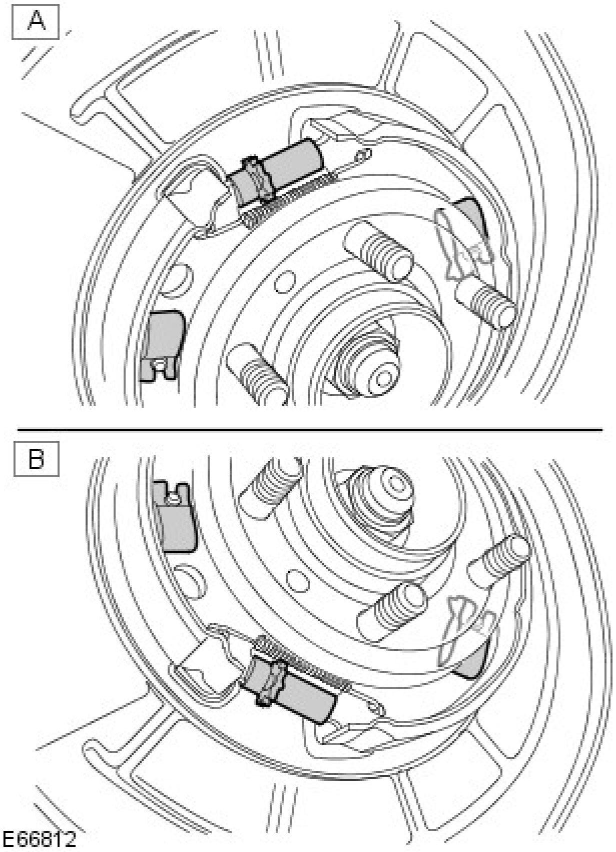
2. Clean the adjuster and set it to its minimum extension.

3. CAUTIONS:

⚠ Make sure the brake shoe spring is not over stretched.

⚠ Make sure the closed end of the retaining clip is installed facing the brake shoe adjuster. Failure to follow this instruction may result in damage to the vehicle.

⚠ Illustration 'A' is the LH side and 'B' is the RH side.

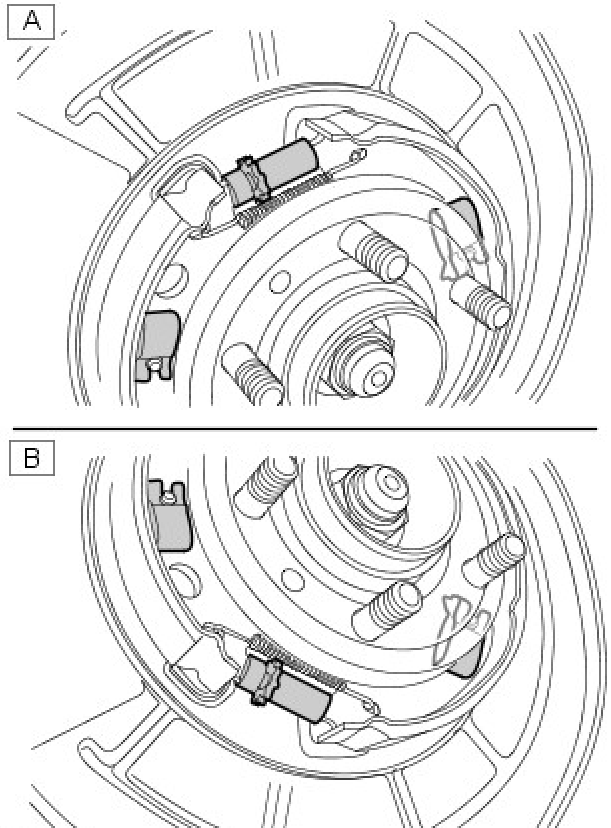


Install the secondary brake shoe.

- Connect the parking brake cable.
- Connect the parking brake cable retaining spring to the brake shoe lever, making sure the spring is not twisted.
- Install the hold-down spring and retaining pin.

4. Install the spreader plate and the spring.

- Using a tie strap, tie back the spreader plate spring.



E66812

5. WARNING: Make sure the return spring and the adjuster spring are correctly installed to the primary shoe.

• CAUTIONS:

Make sure the brake shoe spring is not over stretched.

Make sure the closed end of the retaining clip is installed facing the brake shoe adjuster. Failure to follow this instruction may result in damage to the vehicle.

Illustration 'A' is the LH side and 'B' is the RH side.

Install the primary brake shoe.

- Install the return spring.
- Connect the primary brake shoe to the return spring.
- Locate the primary brake shoe to the spreader plate.
- Install the hold-down spring and retaining pin.

6. CAUTION: Make sure the brake shoe spring is not over stretched.

Install the brake shoe adjuster and the retaining spring.

7. Remove and discard the spreader plate spring tie strap.

8. Make sure the brake disc and hub mating surfaces are clean.

9. Install the brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

10. Install the brake caliper.

- Tighten the bolts to 115 Nm (85 lb.ft).

11. Repeat the above procedure for the other side.

12. Adjust the parking brake.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

13. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

14. Install fuse number 8 into the BJB.

Published: 11-May-2011

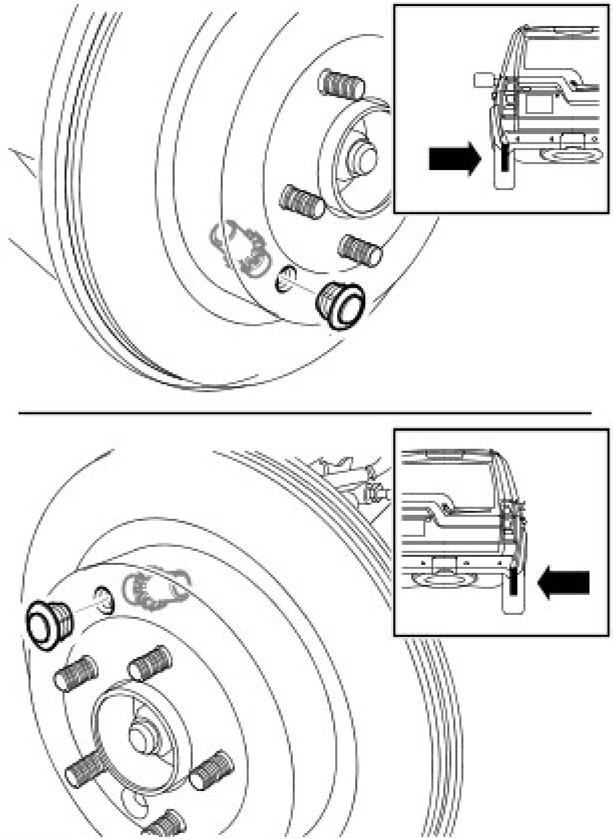
Parking Brake and Actuation - Parking Brake ActuatorTDV8 3.6L Diesel/TDV6 2.7L Diesel

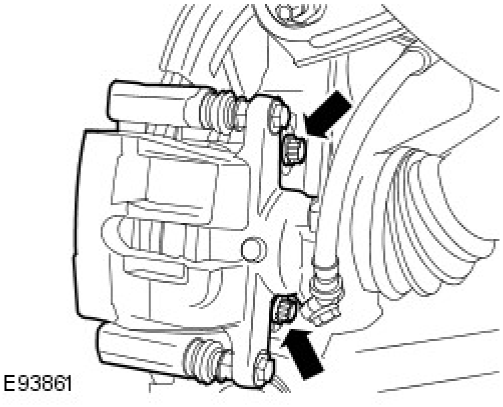
Removal and Installation

Removal

1. Using the Land Rover approved diagnostic system, drive the parking brake to the 'mounting position'.
2. Isolate the parking brake electrical circuit.
   - Remove fuse number 8 from the BJB.
3. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.
4. Remove the rear wheels and tires.
5. Release the parking brake shoe adjustment.
   - Remove the plug from the access hole in the brake disc.
   - Using a suitable tool, rotate the brake shoe adjuster to release the adjustment.

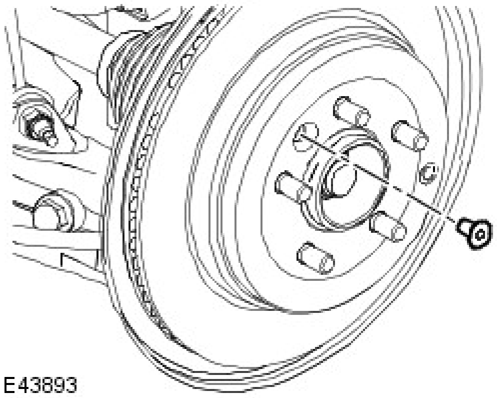




6. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

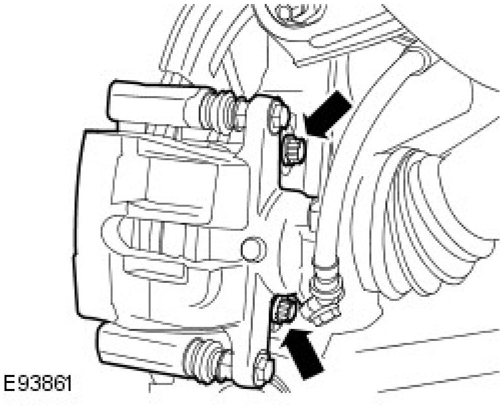
Reposition the RH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.



7. Remove the RH rear brake disc.

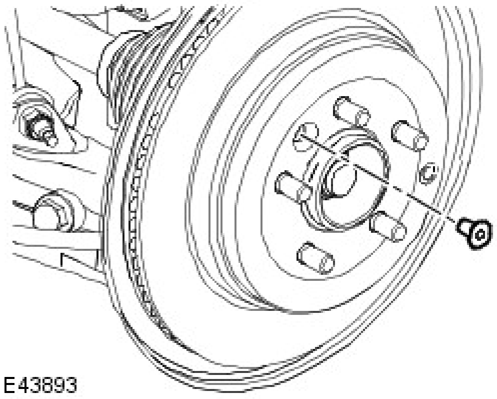
- Remove the screw.



8. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

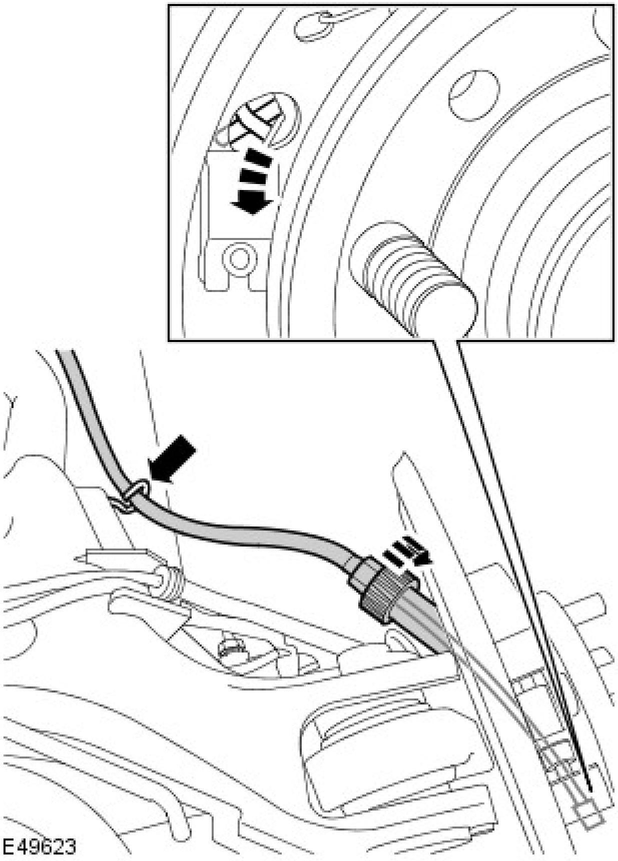
Reposition the LH rear brake caliper.

- Remove the 2 bolts.
- Using a suitable tie strap, support the brake caliper.



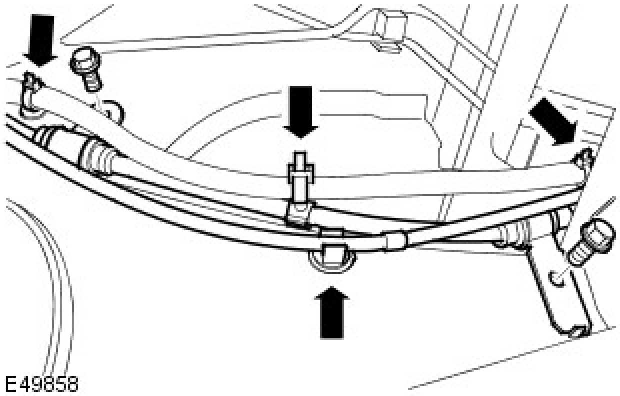
9. Remove the LH rear brake disc.

- Remove the screw.



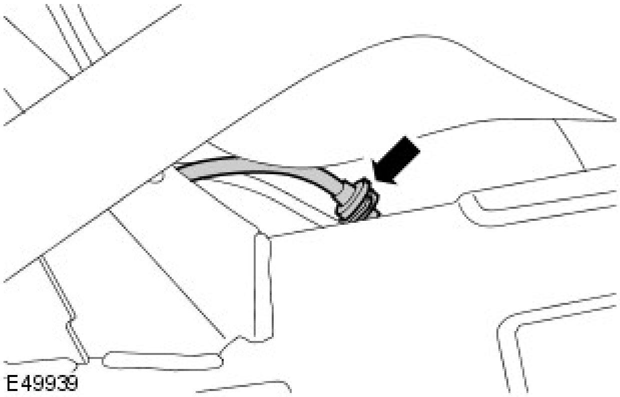
10. Disconnect both parking brake cables from the wheel hubs.

- Fully loosen the nut.
- Release the cable from the lower arm.
- Disconnect the inner cable from the brake shoe.



11. Release the LH parking brake cable.

- Remove the 2 bolts.
- Release the 3 wiring harness clips.
- Release the cable from the clip on the chassis.

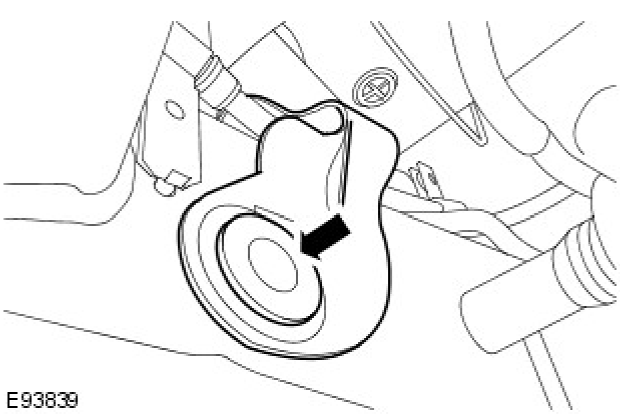


12. Release the LH parking brake cable.

13. ⚠ CAUTION: The fuel tank breather line bracket can be easily damaged when releasing it from the chassis.

Release the fuel tank breather line bracket.

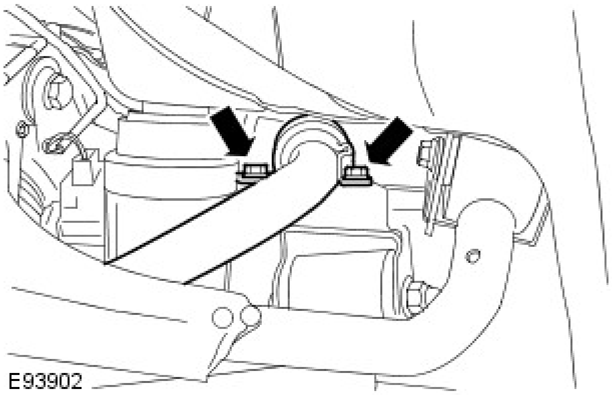
- Remove the plastic insert.



E93839

14. Raise the RH side of the rear stabilizer bar.

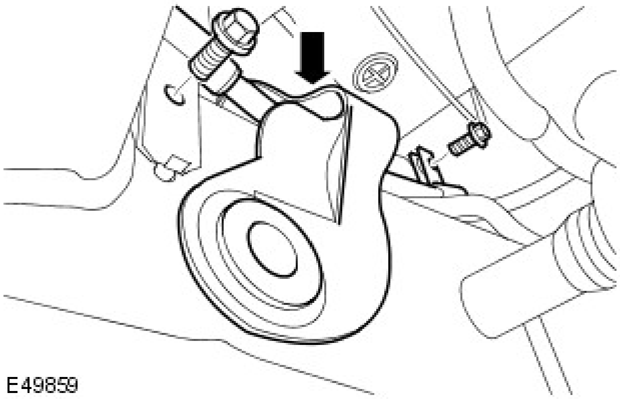
- Loosen the 2 bolts.



E93902

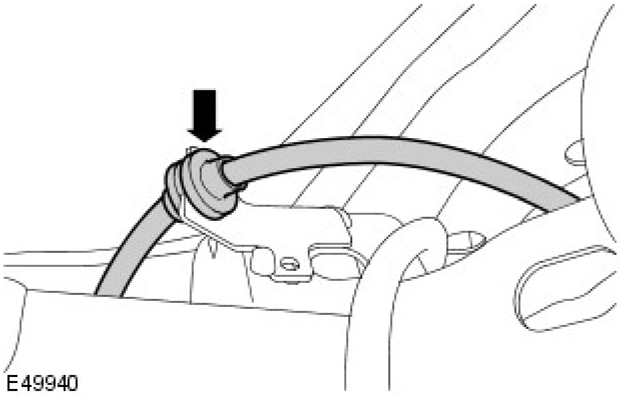
15. Release the RH parking brake cable.

- Remove the 2 bolts.
- Release the parking brake cable from the 2 pipe clips.
- Release the cable from the clip on the chassis.

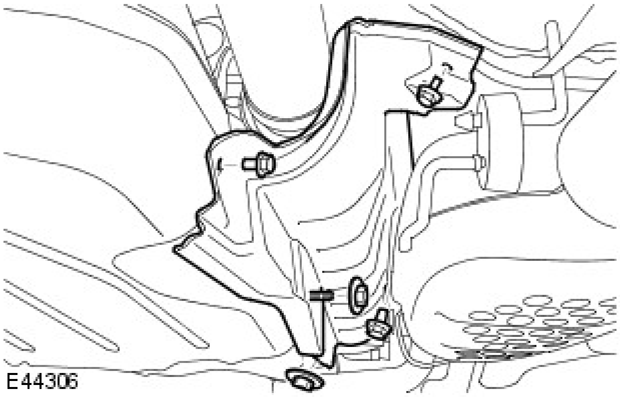


E49859

16. Release the RH parking brake cable.



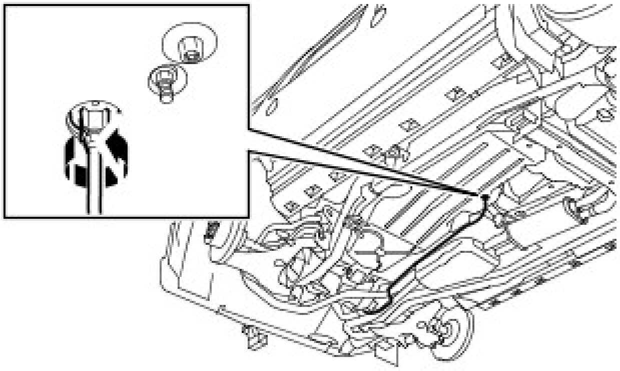
E49940



E44306

17. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

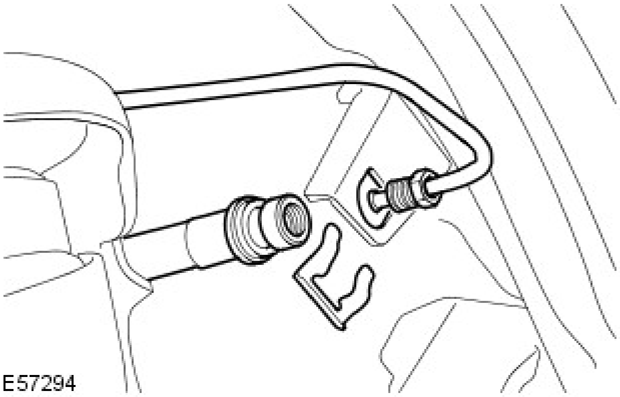


E49860

18. CAUTION: Inspect the parking brake emergency release cable to body seal and replace if damaged.

• NOTE: Note the fitted position of the parking brake emergency release cable to body seal.

Release the parking brake emergency release cable.

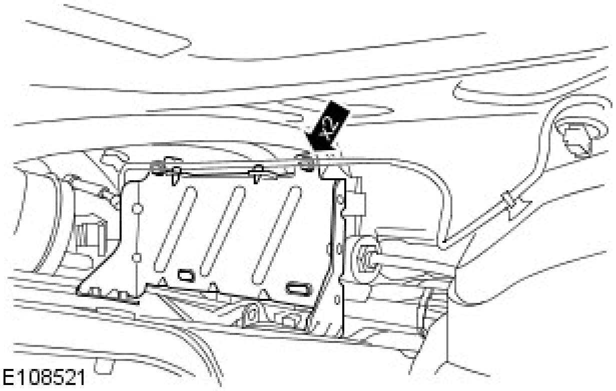


E57294

19. CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

RH side rear: Disconnect the brake line.

- Position an absorbent cloth to collect fluid spillage.
- Disconnect the line union.
- Remove the clip.



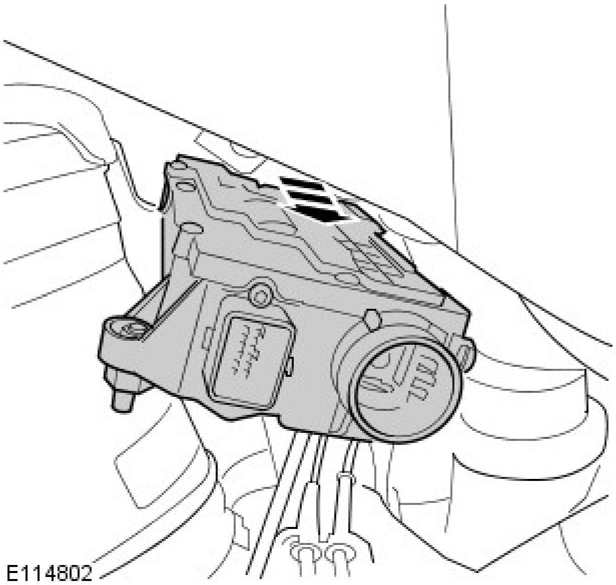
E108521

20. NOTE: Note the routing of the parking brake emergency release cable.

Displace the parking brake actuator and cable assembly.

- Disconnect the electrical connector.
- Remove the 2 nuts.

21. NOTE: Brake cable shown removed for clarity.



Remove the parking brake actuator and cable assembly.

- Withdraw from the RH rear wheel arch aperture.

Installation

1. NOTE: Note the routing of the parking brake emergency release cable.

Install the parking brake actuator and cable assembly.

- Install the 2 nuts.
- Connect the electrical connector.

2. NOTE: Remove and discard the blanking caps.

RH side rear: Connect the brake line.

- Clean the component mating faces.
- Secure the clip.
- Tighten the brake line union to 16 Nm (12 lb.ft).

3. ⚠ CAUTION: Make sure the parking brake emergency release cable to body seal is installed correctly.

Locate and secure the parking brake emergency release cable.

4. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

5. Secure the fuel tank breather line bracket.

- Install the plastic insert.

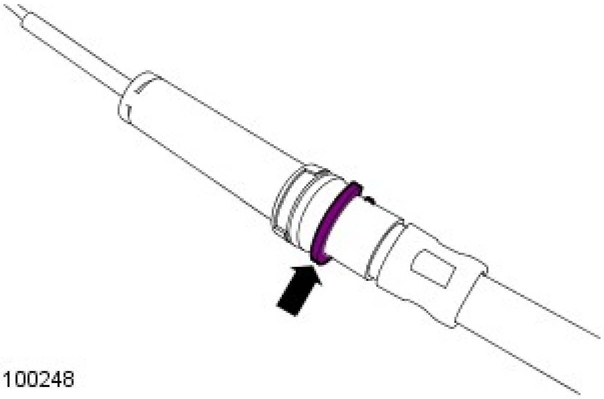
6. Locate and secure the RH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the parking brake cable to the 2 pipe clips.
- Secure the cable grommet to the integrated body frame bracket.

7. Locate and secure the LH parking brake cable.

- Tighten the bolts to 22 Nm (16 lb.ft).
- Secure the wiring harness.
- Secure the cable grommet to the integrated body frame bracket.

8. NOTE: Make sure that the brake cable circlip is positioned as shown.



E100248

Connect the parking brake cables to the wheel hubs.

- Connect the cable to the brake shoe lever.
- Locate the cable to the backplate.
- Tighten the nut to 8 Nm (6 lb.ft).

9. ⚠ CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the LH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

10. Secure the LH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

11. ⚠ CAUTION: Make sure that the component is clean, free of foreign material and lubricant.

Install the RH rear brake disc.

- Tighten the Torx screw to 35 Nm (26 lb.ft).

12. Secure the RH rear brake caliper.

- Remove and discard the tie strap.
- Tighten the bolts to 115 Nm (85 lb.ft).

13. Adjust the parking brake shoes.
For additional information, refer to: Parking Brake Shoe and Lining Adjustment (206-05 Parking Brake and Actuation, General Procedures).

14. Bleed the brake system.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures).

15. Install the wheels and tires.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

16. Install fuse number 8 into the BJB.

17. Using the Land Rover approved diagnostic system, calibrate the parking brake actuator on an even surface.

18. Apply and release hand brake to confirm operation.

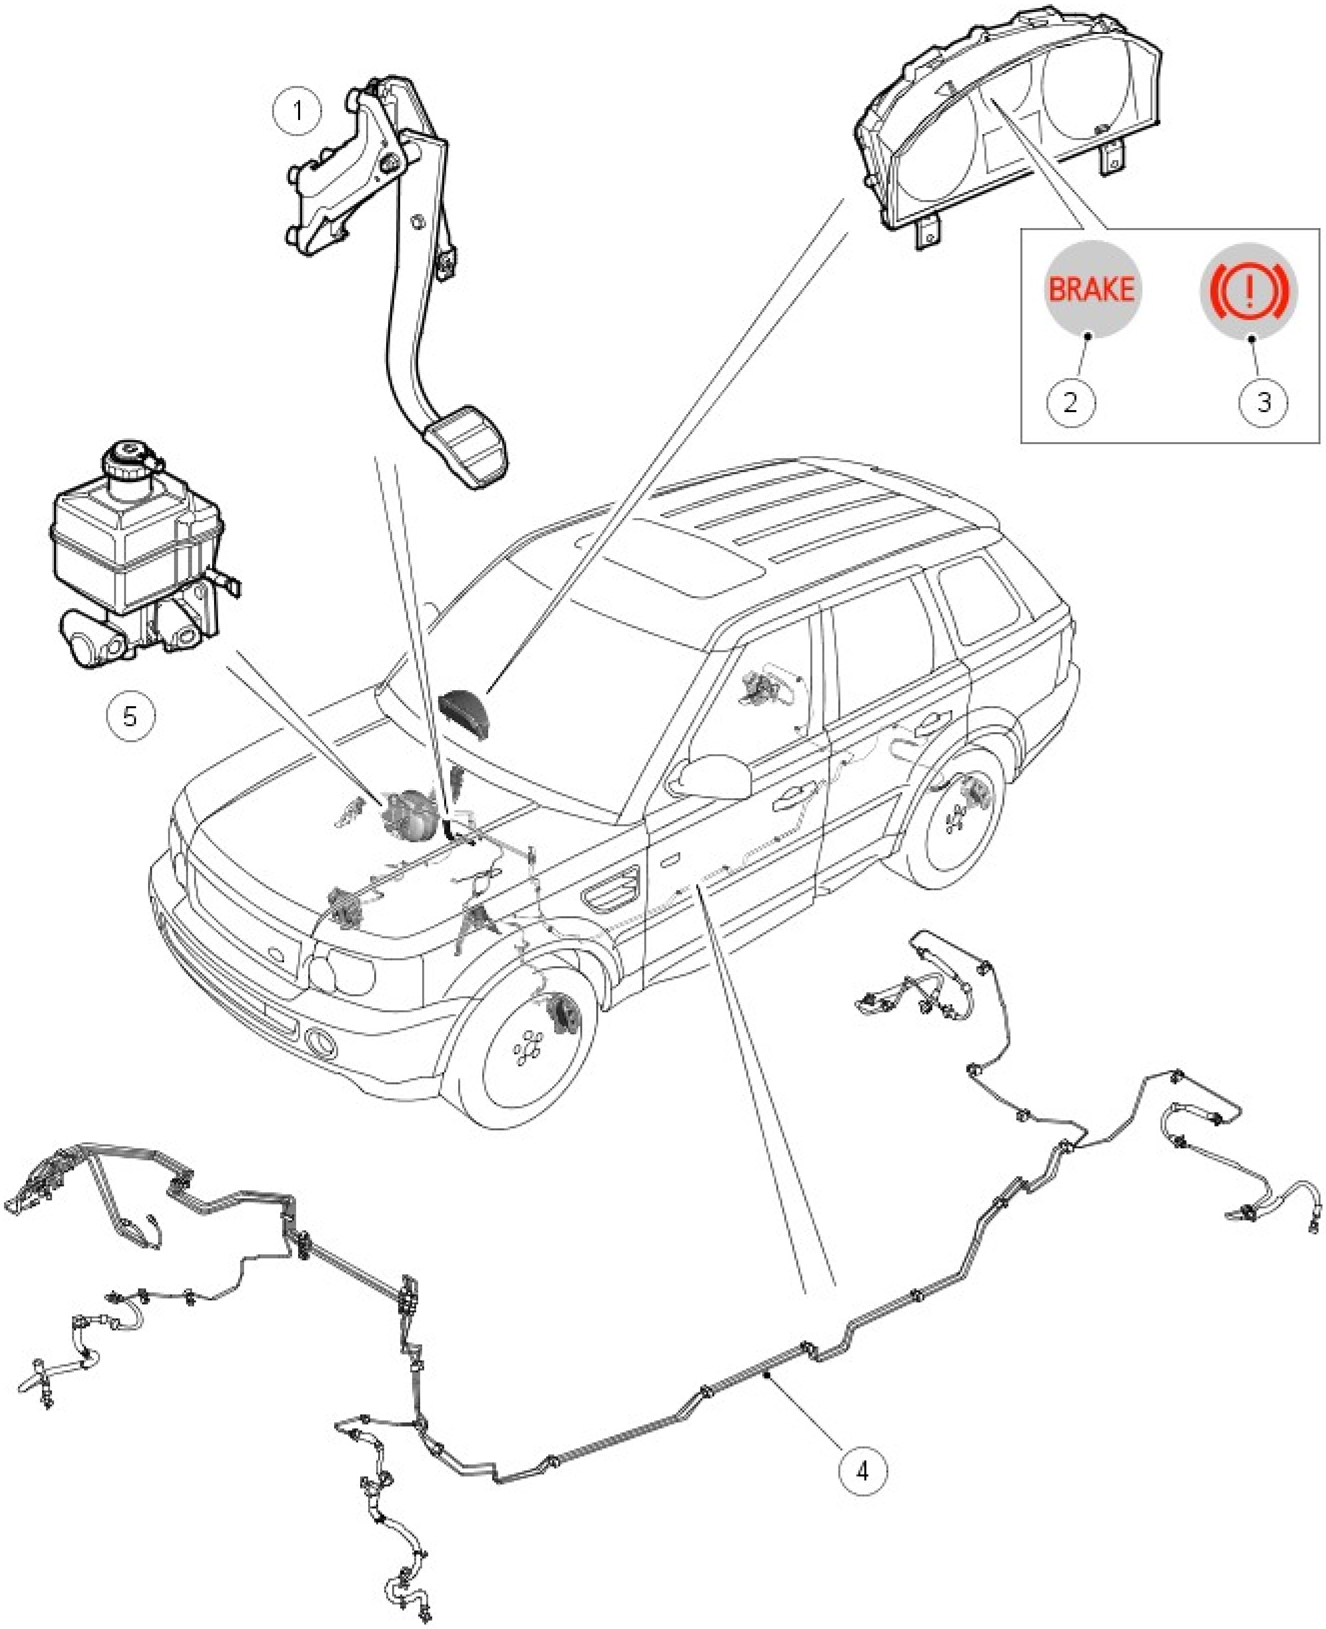
Hydraulic Brake Actuation - Hydraulic Brake Actuation

Description and Operation

COMPONENT LOCATIONS

- NOTE: right-hand drive (RHD) shown, left-hand drive (LHD) similar



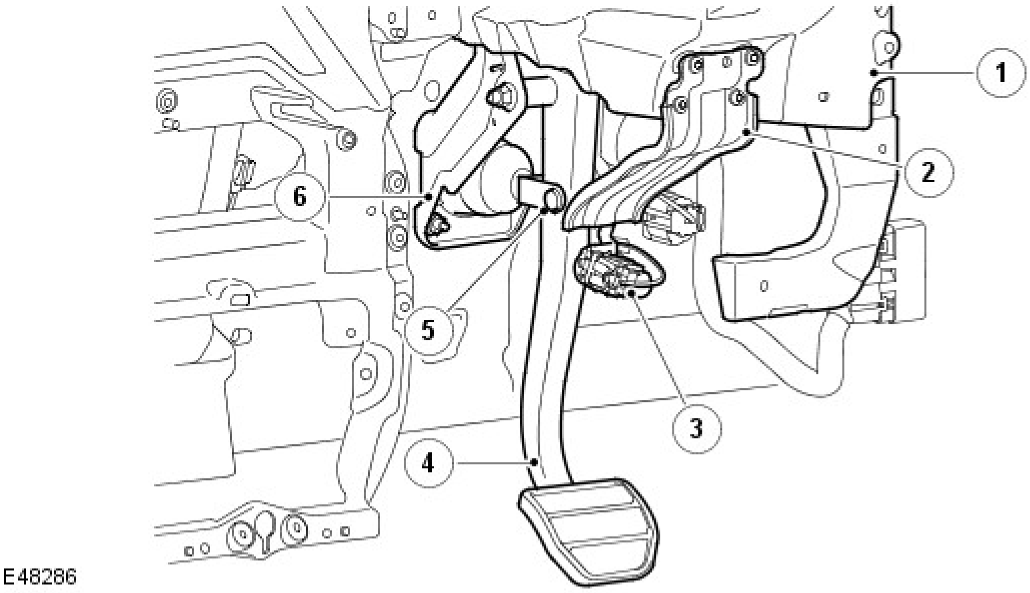
E52213

Item	Part Number	Description
1	-	Brake pedal
2	-	Brake warning indicator NAS (north American specification)
3	-	Brake warning indicator (all except NAS)
4	-	Brake pipes and hoses
5	-	Brake master cylinder and reservoir

GENERAL

Hydraulic brake actuation consists of the brake pedal, the brake master cylinder and the hydraulic pipes and hoses.

BRAKE PEDAL



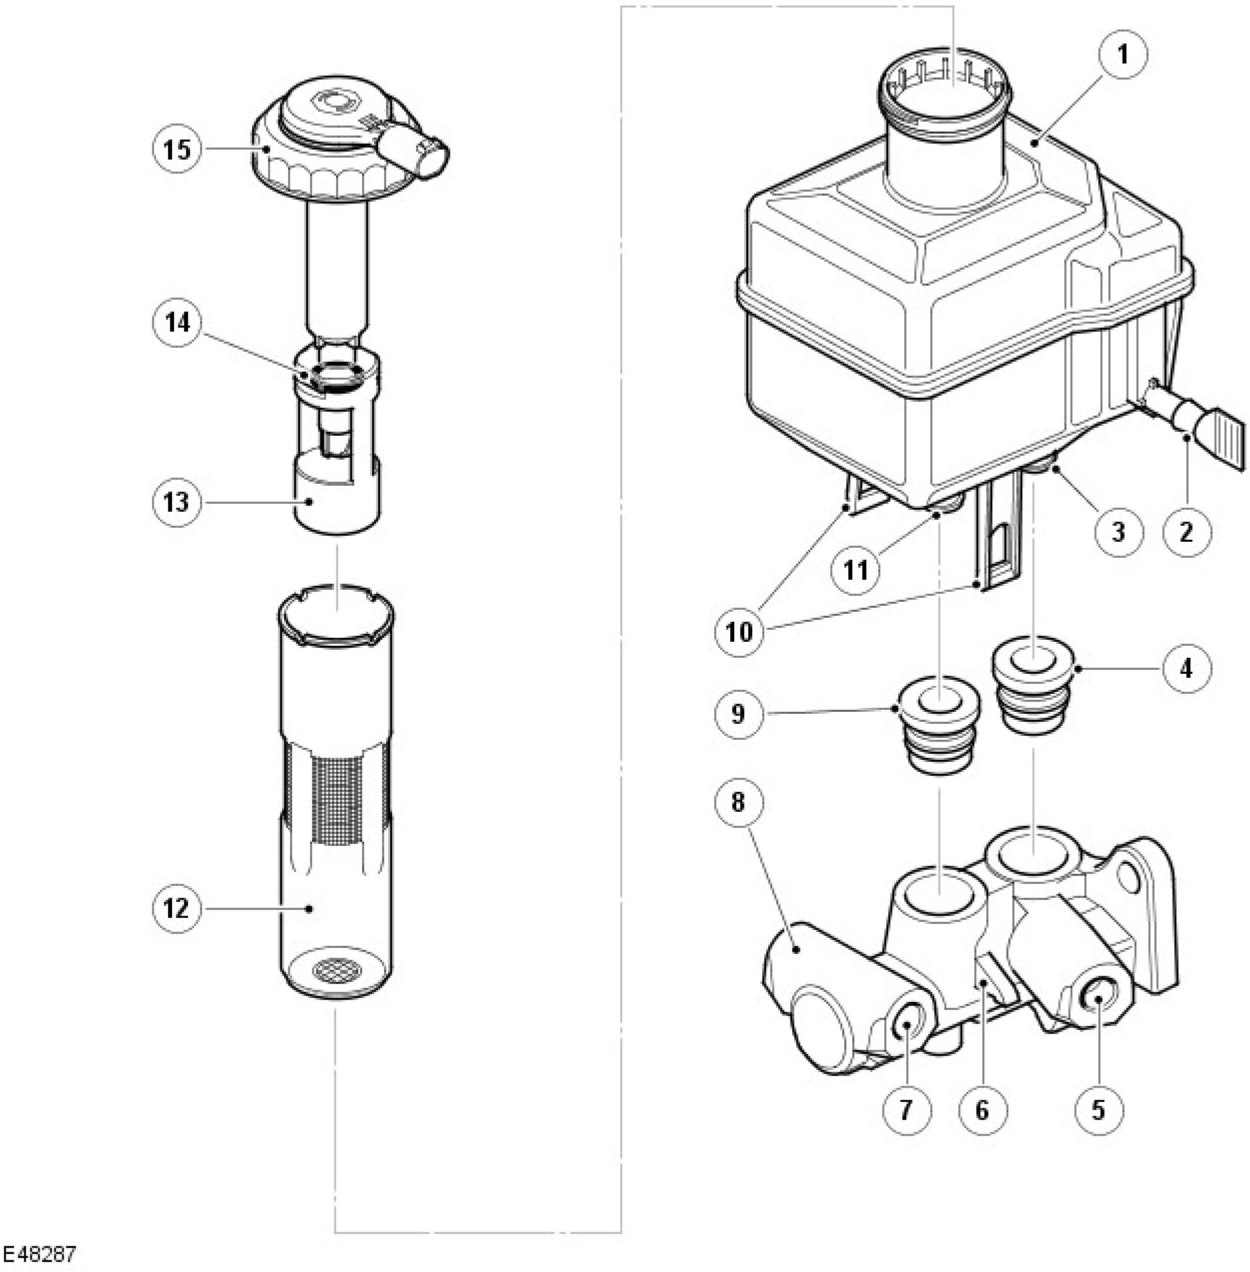
Item	Part Number	Description
1	-	In-vehicle cross beam
2	-	Brake pedal buffer
3	-	Stoplamp switch
4	-	Brake pedal
5	-	Clevis pin and clip
6	-	Brake pedal bracket

The brake pedal is mounted in a bracket attached to the rear side of the engine bulkhead. A clevis pin and clip connect the brake pedal to the push rod of the brake booster. A brake pedal buffer is installed on the in-vehicle cross beam to restrain rearward movement of the brake pedal in an accident.

The stoplamp switch is mounted in the brake pedal bracket and operated by the brake pedal.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

BRAKE MASTER CYLINDER AND RESERVOIR

- NOTE: RHD version shown, LHD version similar



Item	Part Number	Description
1	-	Reservoir
2	-	Clutch outlet spigot and sealing cap (reference, not used)
3	-	Primary outlet spigot
4	-	Reservoir to master cylinder seal, primary inlet
5	-	Primary outlet port
6	-	Reservoir securing lug
7	-	Secondary outlet port
8	-	Cylinder housing

10	-	Reservoir securing straps
11	-	Secondary outlet spigot
12	-	Filter
13	-	Float
14	-	Magnet
15	-	Reservoir cap and level switch

The brake master cylinder and reservoir is attached to the front of the brake booster, on the driver side of the engine compartment.

Master Cylinder

The brake master cylinder consists of a cylinder housing containing two pistons in tandem. The rear piston produces pressure for the primary circuit and the front piston produces pressure for the secondary circuit. The pistons incorporate center valves with a high flow rate to ensure there is always sufficient fluid available at the hydraulic control unit for stability control operations.

When the brake pedal is pressed, the front push rod in the brake booster pushes the primary piston along the bore of the cylinder housing. This produces pressure in the primary pressure chamber which, in conjunction with the primary spring, overcomes the secondary spring and simultaneously moves the secondary piston along the bore. The initial movement of the pistons, away from the piston stops, closes the primary and secondary center valves. Further movement of the pistons then pressurizes the fluid in the primary and secondary pressure chambers, and thus the brake circuits. The fluid in the chambers behind the pistons is unaffected by the movement of the pistons and can flow unrestricted through the feed holes between the chambers and the reservoir.

When the brake pedal is released, the primary and secondary springs push the pistons back down the bore of the cylinder housing. As the pistons contact the piston stops, the primary and secondary center valves open, which allows fluid to circulate unrestricted between the two hydraulic circuits and the reservoir, through the center valves, the chambers behind the pistons and the cylinder housing inlets.

Should a failure occur in one of the brake circuits, the remaining brake circuit will still operate effectively, although brake pedal travel and vehicle braking distances will increase.

Reservoir

The reservoir is installed on top of the master cylinder to provide a supply of brake fluid for the primary and secondary circuits of the brake system.

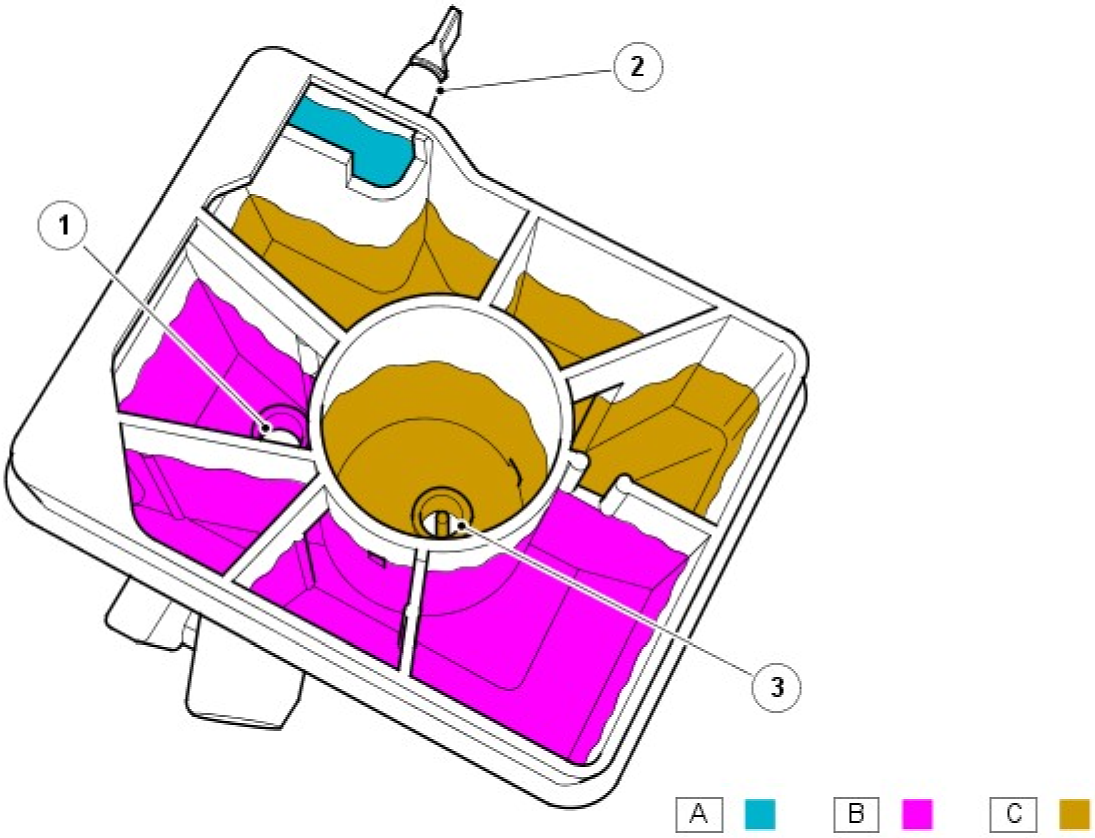
Two straps, integrated onto the sides of the reservoir, engage with lugs on the master cylinder to secure the reservoir in position. Two outlet spigots on the underside of the reservoir locate in seals installed in the inlet ports of the master cylinder. An outlet port is incorporated into the left side of the reservoir for use on vehicles with a clutch.

The reservoir is internally divided to isolate the circuits from each other at low fluid levels, and so prevent a leak in one circuit from disabling the other circuit(s). The dividing walls support a central well and divide the area around the well into a further eight separate compartments. The well forms an extension of the filler neck and contains the filter and the fluid level switch.

The well and the surrounding compartments are interconnected by slots in the dividing walls. The slots are positioned such that when the reservoir is full, fluid can move between the well and all of the surrounding compartments, but at low fluid levels the interior forms separate reservoirs for each circuit. The following figure shows the separate reservoirs for each circuit and the amount retained in each reservoir if there is a leak from one of the other circuits.

Reservoir Interior

- NOTE: A = Clutch reservoir (reference, not used); B = Primary circuit reservoir; C = Secondary circuit reservoir



E54600

Item	Part Number	Description
1	-	Primary outlet
2	-	Clutch outlet (reference, not used)
3	-	Secondary outlet

The filler neck of the reservoir is sealed with a cap incorporating the level switch. The level switch is operated by a magnet, which is installed in the float on the bottom of the switch. The switch reacts to the influence of the magnetic field surrounding the magnet.

When the reservoir is full, the float rests against the bottom of the switch and holds the level switch open. When the fluid level decreases, the float moves down and the switch closes to connect a ground to the instrument cluster. When the ground is made, the instrument cluster illuminates the red light emitting diode (LED) in the brake warning indicator. The instrument cluster also display an appropriate warning in the message center.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

At the beginning of each ignition cycle, the instrument cluster performs a bulb check on the brake warning indicator; the indicator is illuminated amber for 1.5 seconds, then red for 1.5 seconds.

The instrument cluster broadcasts the status of the brake fluid level, on the high speed controller area network (CAN) bus, to the anti-lock brake system (ABS) module.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

BRAKE PIPES AND HOSES

The brake pipes and hoses connect the master cylinder to the wheel brakes via the hydraulic control unit. The pipes are arranged to provide a front and rear split braking system. The brakes on the front axle are operated by the primary system; the brakes on the rear axle are operated by the secondary system.

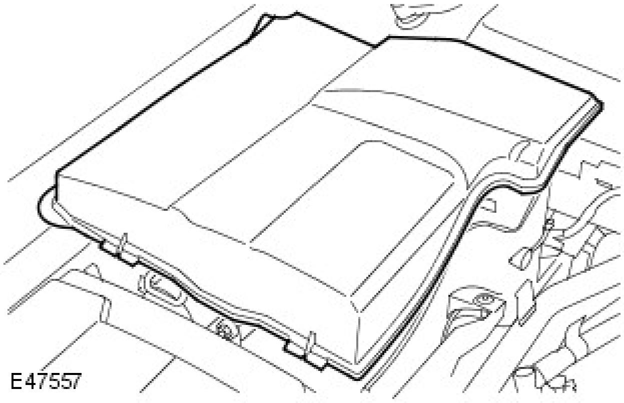
Hydraulic Brake Actuation - Brake Fluid Reservoir

Removal and Installation

Removal

⚠ CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.



1. Remove the cover.

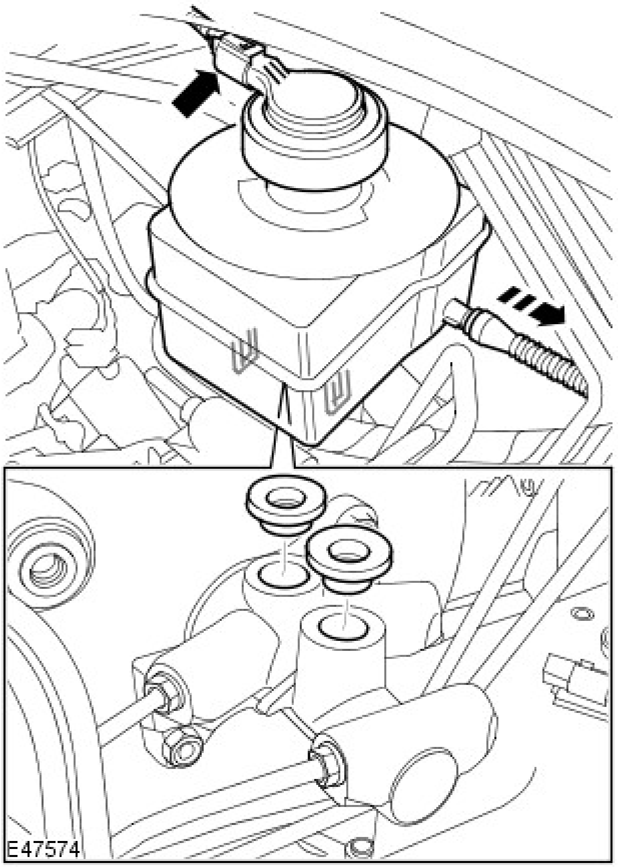
2. Position an absorbent cloth to collect fluid spillage.

3. Disconnect the low brake fluid warning indicator switch electrical connector.

4. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Remove the brake fluid reservoir.

- Release the 2 clips.
- Remove and discard 2 brake fluid reservoir seals.



Installation

1. Clean the components.

2. Install the brake fluid reservoir.

- Install new brake fluid reservoir seals.

3. Connect the low brake fluid warning indicator switch electrical connector.

4. Bleed the brake system using T4.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures) /

Removal and Installation

Removal

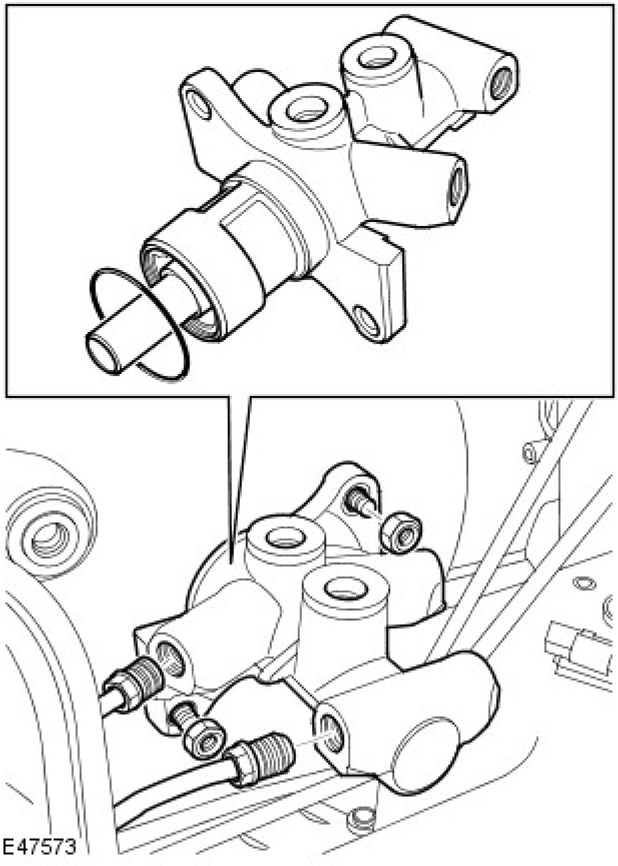
1. Remove the brake fluid reservoir.
For additional information, refer to: Brake Fluid Reservoir (206-06 Hydraulic Brake Actuation, Removal and Installation).

2. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the brake master cylinder brake tubes.

3. Remove the brake master cylinder.

- Remove the 2 nuts.
- Remove and discard the O-ring seal.



Installation

1. Install the brake master cylinder.

- Install a new O-ring seal.
- Tighten the nuts to 26 Nm (19 lb.ft).

2. Connect the brake tubes.

- Tighten the brake tube unions to 18 Nm (13 lb.ft).

3. Install the brake fluid reservoir.
For additional information, refer to: Brake Fluid Reservoir (206-06 Hydraulic Brake Actuation, Removal and Installation).

2	-	Brake booster
3	-	Vacuum pipe connection to brake booster (includes check valve)
4	-	Vacuum pipe connection to vacuum pump
5	-	Vacuum pipes

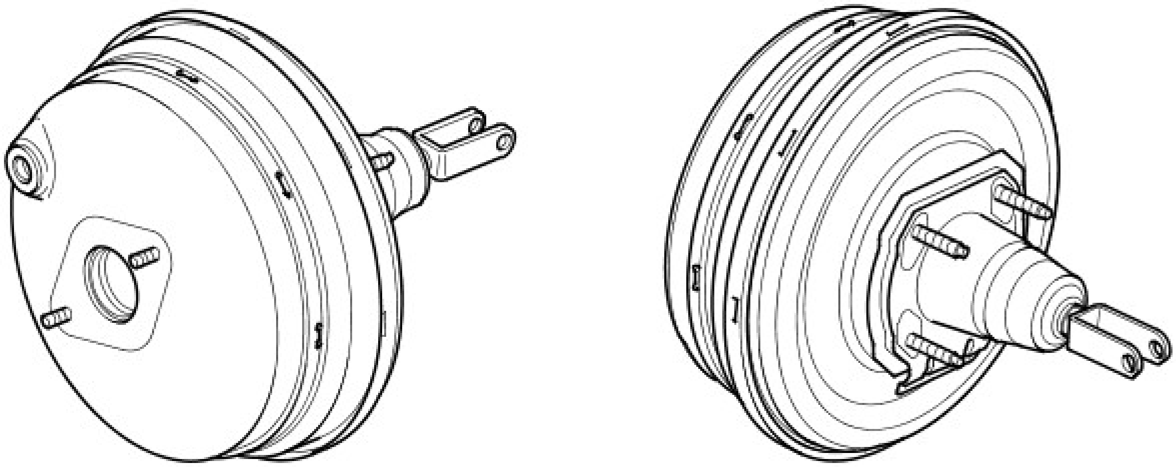
GENERAL

Power assistance for the brakes is provided by a vacuum operated brake booster. On petrol models, the vacuum is produced by the intake manifold and an electric vacuum pump. On diesel models, the vacuum is produced by an engine driven vacuum pump.

VACUUM PIPES

Plastic vacuum pipes connect the brake booster to the vacuum source. Check valves are incorporated into the vacuum pipes. On petrol models there are two in-line check valves, to maintain the vacuum in the brake booster when the throttle is open and the vacuum pump is not running, and prevent fuel vapor entering the brake booster. On diesel models there is a single check valve integrated into the vacuum pipe connection with the brake booster, to maintain the vacuum in the brake booster when the vacuum pump is operating at less than the optimum.

BRAKE BOOSTER

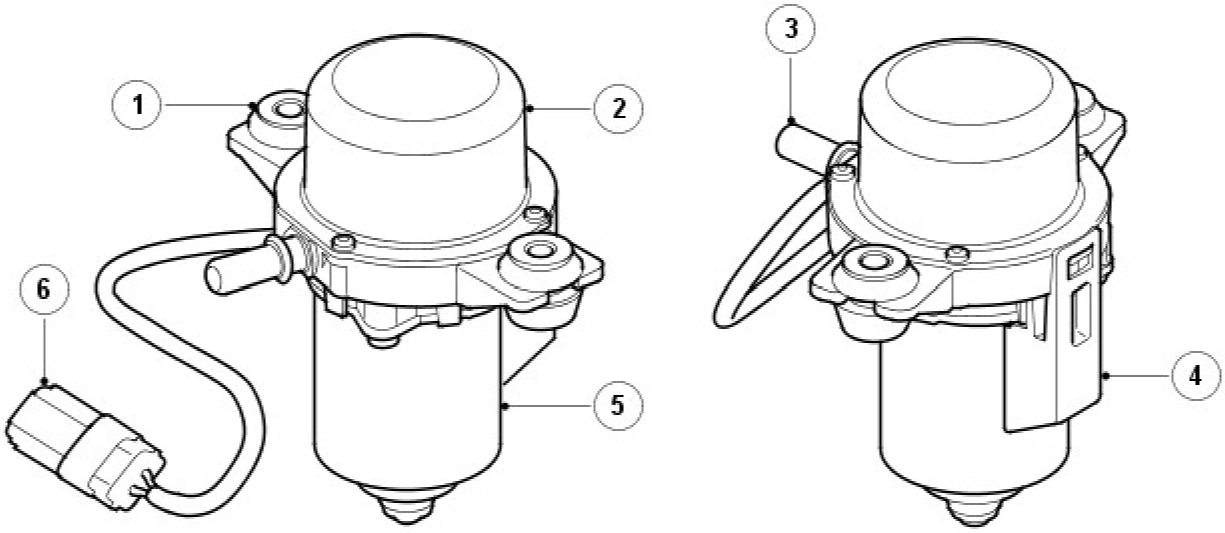


E49905

The brake booster is installed in the driver side of the engine compartment, on the engine bulkhead.

The brake booster is a dual diaphragm unit with a boost ratio of 7.0 : 1 on 4.4L and 2.7L Diesel models and 8.0 : 1 on 4.2L models. The input push rod is connected to the brake pedal. The output push rod locates in the primary piston of the brake master cylinder. A vacuum pipe, connected to the front face of the housing, connects the brake booster to the intake manifold and electric vacuum pump (petrol models) or the engine driven vacuum pump (diesel models).

VACUUM PUMP (4.2L AND 4.4L)



E49906

Item	Part Number	Description
1	-	Anti-vibration mount
2	-	Pump cover
3	-	Vacuum pump inlet
4	-	Rubber shroud for exhaust port
5	-	Motor cover
6	-	Electrical connector

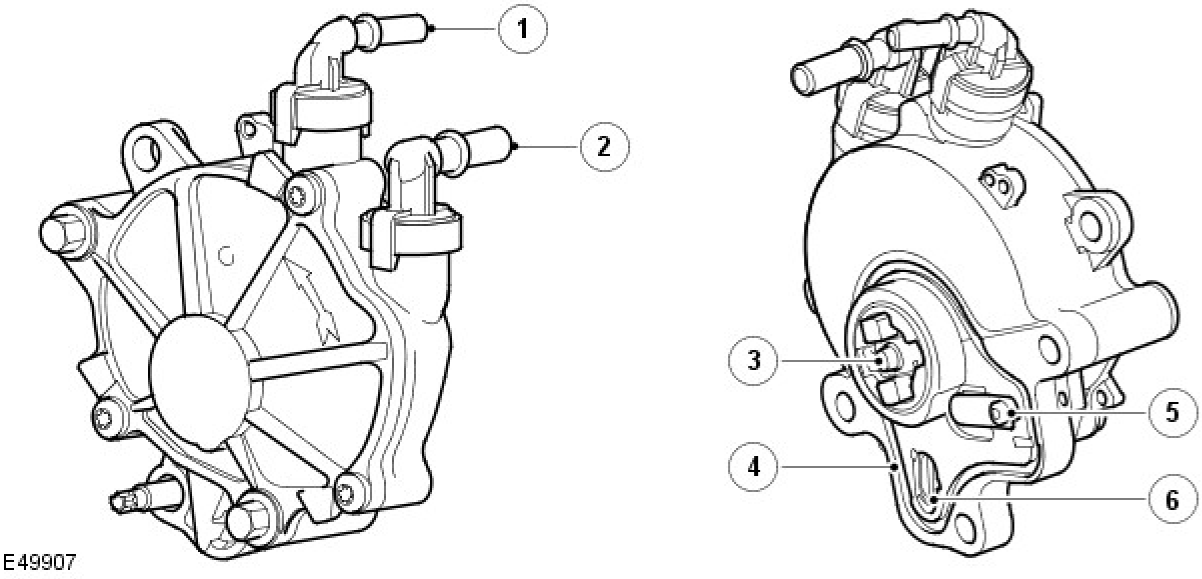
On petrol models the electric vacuum pump supplements the main vacuum supply from the engine manifold.

The vacuum pump is installed on a mounting bracket in the front left corner of the engine compartment. Two anti-vibration mounts on the vacuum pump are located on studs on the mounting bracket and secured with nuts.

The vacuum pump consists of a radial vane pump driven by an electric motor. The rotor and vanes of the pump are made from a self-lubricating carbon based material. A stub pipe is installed in the inlet of the pump to provide a connection point for the vacuum pipe from the brake booster. A second stub pipe, which is covered by a rubber shroud, is installed in the outlet from the pump.

Operation of the vacuum pump is controlled by the engine control module (ECM), which uses the brake vacuum pump relay in the battery junction box (BJB) to switch power to the vacuum pump. The ECM controls the time for which the vacuum pump is switched on and has in-built safeguards to protect the pump from overuse, e.g. continuous running is not allowed so a minimum delay time is specified between applications.

VACUUM PUMP (2.7L DIESEL)



Item	Part Number	Description
1	-	Vacuum connection (not used)
2	-	Vacuum connection for brake booster
3	-	Drive dog
4	-	Seal
5	-	Oil inlet port
6	-	Oil return/air vent

A vacuum pump is installed on diesel models as the air inlet system does not produce sufficient vacuum for satisfactory operation of the brake booster.

The vacuum pump is a radial vane pump which is attached to the rear of the right-hand (RH) cylinder head and driven at half engine speed by the exhaust camshaft. The vacuum pipe from the brake booster connects to an elbow on the rim of the vacuum pump.

The vacuum pump is lubricated and cooled by engine oil supplied to a port in the front face of the vacuum pump from a gallery in the cylinder head. The oil return is through a vent in the front face of the pump into a drain cavity in the cylinder head. Air extracted from the brake booster is vented into the drain cavity with the returning engine oil.

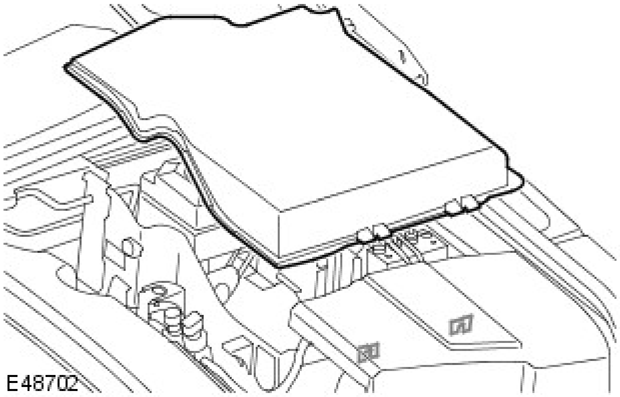
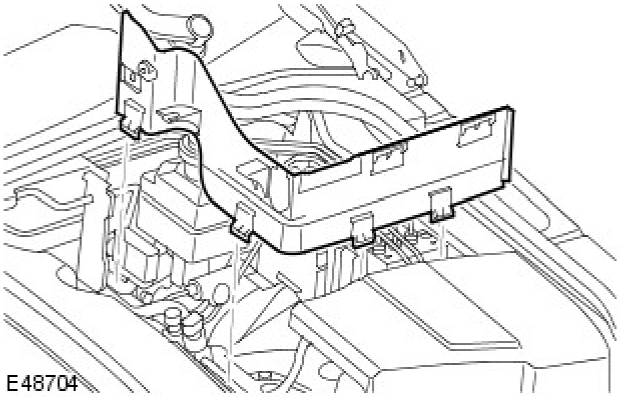
Removal and Installation

Removal

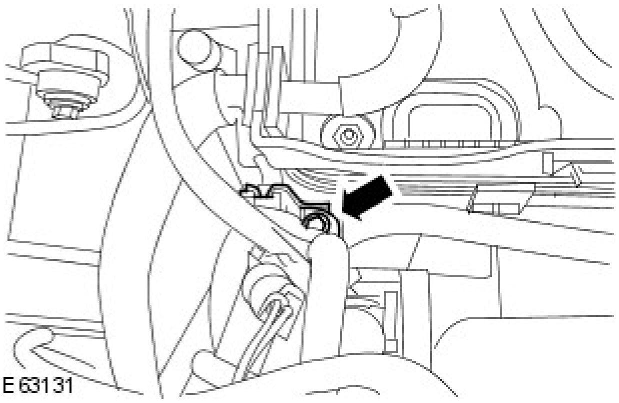
1. Pump the brake pedal until the brake vacuum assistance is exhausted.



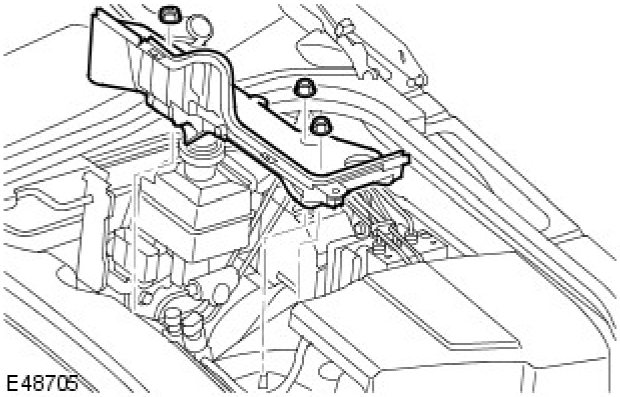
2. Remove the auxiliary battery cover.
   - Release the 2 clips.



3. If installed, remove the auxiliary battery.
4. Remove the auxiliary battery compartment side wall.
   - Release the four clips.

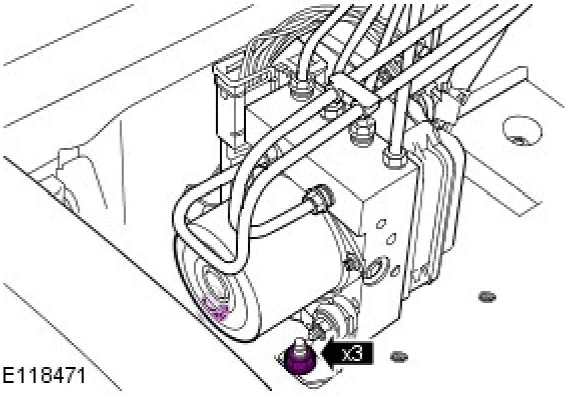


5. Release the Air Conditioning (A/C) pipes.
   - Remove the retaining screw.



6. Remove the auxiliary battery tray.

- Remove the 3 bolts.



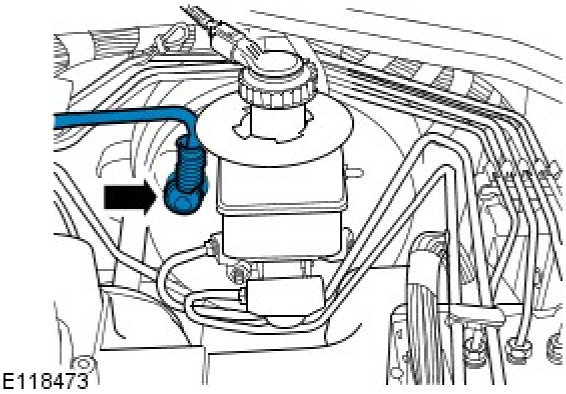
7. Release the Anti-lock Brake System (ABS) module.

- Remove the 3 nuts.
- Release the brake tubes from the clip.

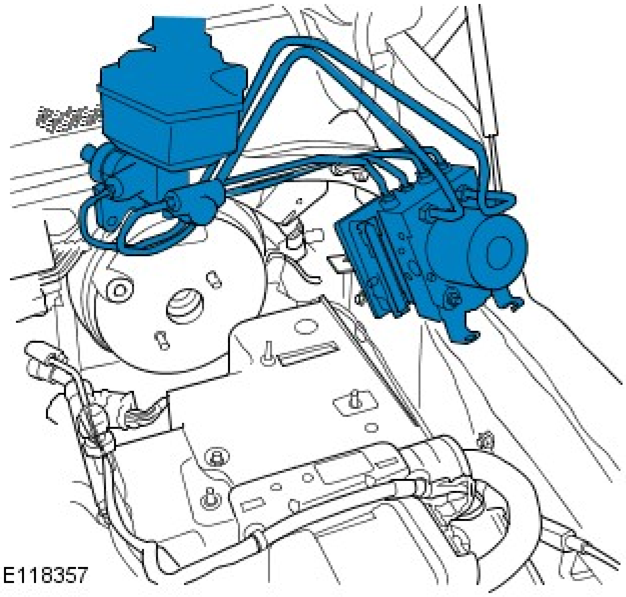
8. Disconnect the low brake fluid warning indicator switch electrical connector.

9. ⚠ CAUTION: Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

Position an absorbent cloth to collect fluid spillage.



10. Disconnect the brake booster vacuum hose from the brake booster.



E118357

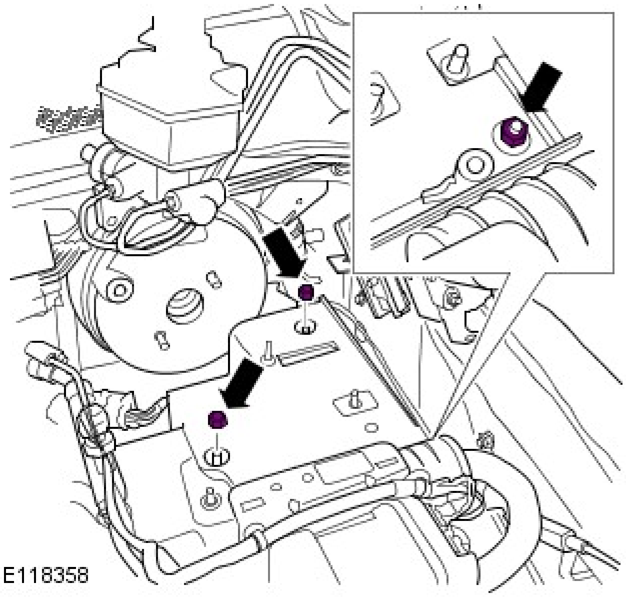
11. CAUTIONS:

⚠ Make sure that excessive force is not used. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure the wings and trim panels are covered and protected, failure to follow this instruction may result in damage to the vehicle.

Displace the master cylinder.

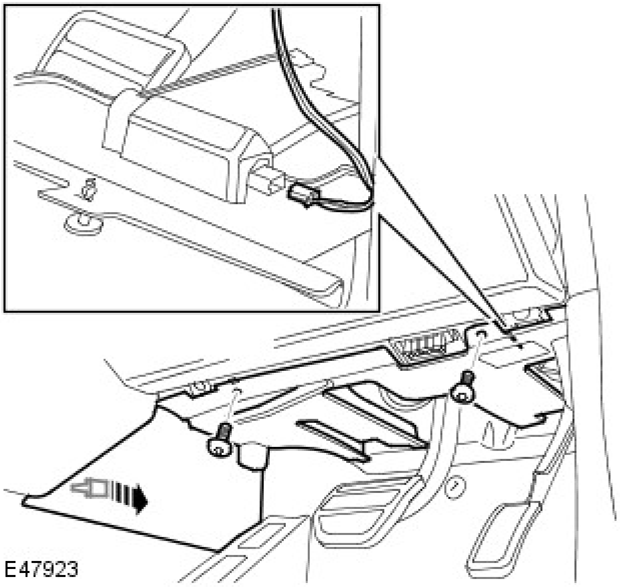
- Remove the 2 nuts.



E118358

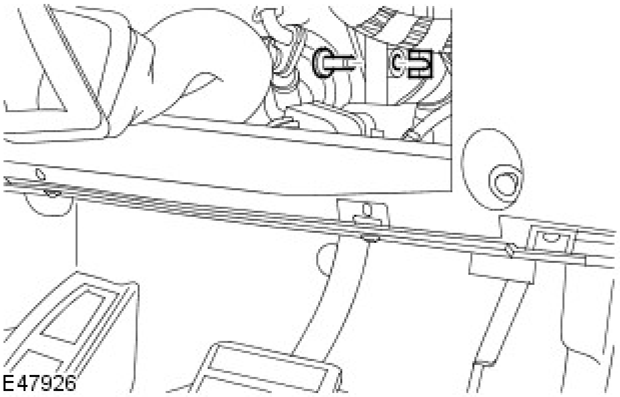
12. Remove the outer plenum base.

- Remove the 3 nuts.



13. Remove the driver side closing trim panel.

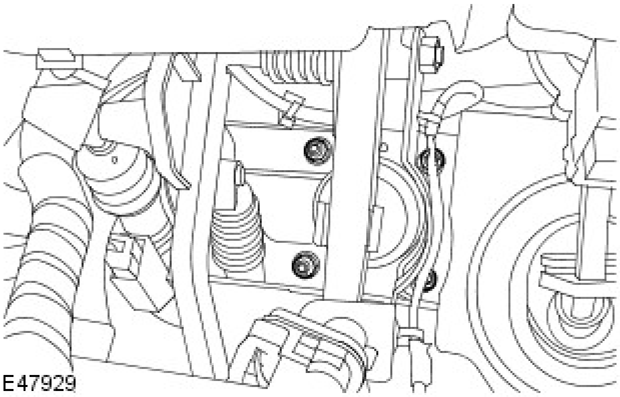
- Release the clip.
- Remove the 2 screws.
- Disconnect the electrical connector.



14. NOTE: The cover is shown removed for clarity.

Remove the brake booster push rod clevis pin.

- Remove the retaining clip.



15. Remove the brake booster.

- Remove the 4 nuts.

Installation

1. Install the brake booster.

- Tighten the nuts to 23 Nm (17 lb.ft).

2. Install the brake booster push rod clevis pin.

- Install the retaining clip.

3. Install the closing trim panel.

- Connect the electrical connector.
- Secure the clip.
- Tighten the screws.

4. Connect the brake booster vacuum hose.

5. Install the outer plenum base.

- Carefully lift the anti-lock brake system modulator for access.
- Install the 3 nuts.

6. ⚠ CAUTION: Make sure the master cylinder is correctly aligned. Failure to make sure the master cylinder is correctly aligned to the brake booster actuation rod may cause component damage or poor brake performance.

Install the brake master cylinder.

- Tighten the nuts to 26 Nm (19 lb.ft).

7. Secure the anti-lock brake system modulator.

- Install the 3 nuts.
- Secure the brake tubes to the clip.

8. Connect the low brake fluid warning indicator switch electrical connector.

9. Install the auxiliary battery tray.

- Install the 3 bolts.

10. Install the auxiliary battery compartment side wall.

- Secure with the four retaining clips.

11. Secure the A/C pipes.

- Install the retaining screw.

12. If installed, install the auxiliary battery.

13. Start engine and check the brake booster operation.

Power Brake Actuation - Brake Vacuum PumpTDV8 3.6L Diesel

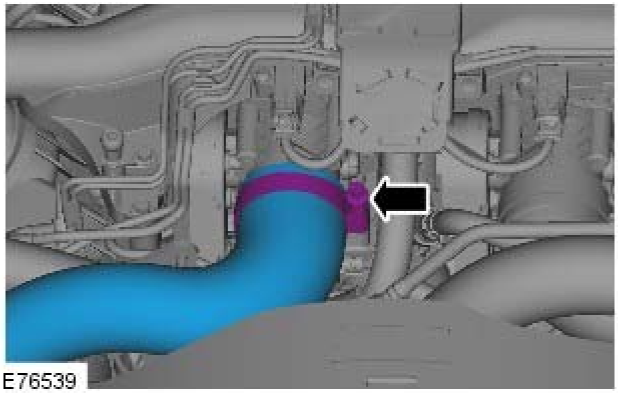
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

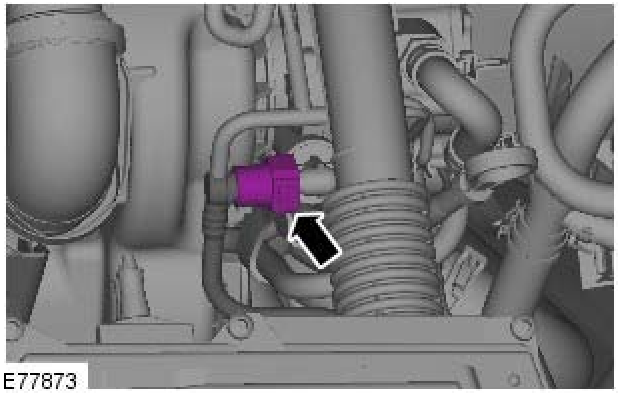
2. Remove the air cleaner assembly.

3. Remove the charge air cooler RH outlet hose.

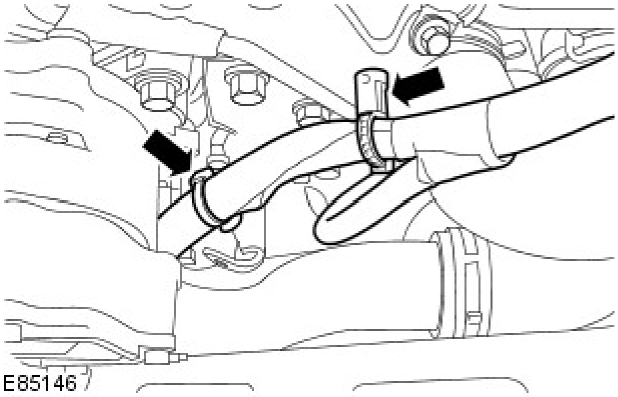


- Release the 2 clips.

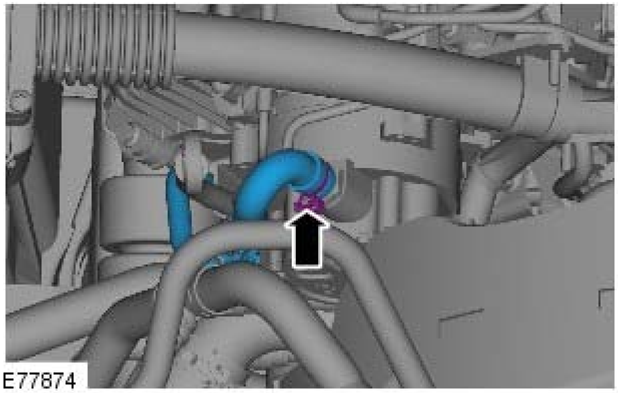
4. Disconnect the brake booster vacuum line from the brake vacuum pump.



5. Release the engine wiring harness.

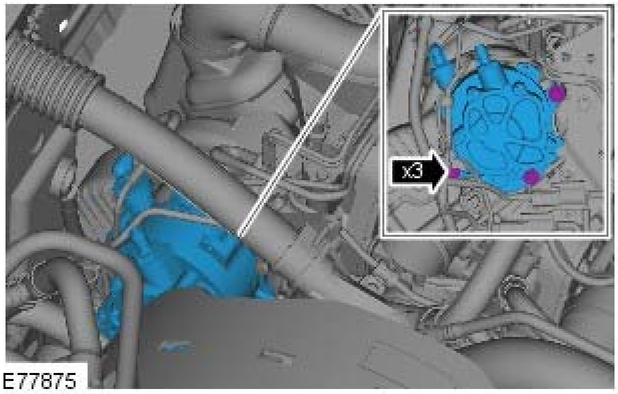


- Release the 2 clips.



6. Disconnect the engine oil pick-up hose.

- Release the clip.



7. Remove the brake vacuum pump.

- Remove the nut.
- Remove the stud.
- Remove the 2 bolts.
- Remove and discard the gasket.

Installation

1. ⚠ CAUTION: Make sure that the mating faces are clean and free of foreign material.

Install the brake vacuum pump.

- Install a new gasket.
- Tighten the stud to 10 Nm (7 lb.ft).
- Tighten the nut to 23 Nm (17 lb.ft).
- Tighten the bolts to 23 Nm (17 lb.ft).

2. Connect the engine oil pick-up hose.

- Secure with the clip.

3. Secure the engine wiring harness.

- Secure the clips.

4. Connect the brake booster vacuum line to the brake vacuum pump.

5. Install the charge air cooler RH outlet hose.

- Secure with the clips.

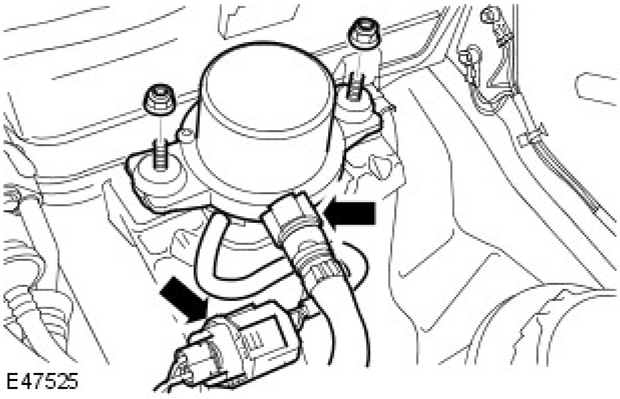
6. Install the air cleaner assembly.

7. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Power Brake Actuation - Brake Vacuum PumpV8 4.4L Petrol/V8 S/C 4.2L Petrol

Removal and Installation

Removal

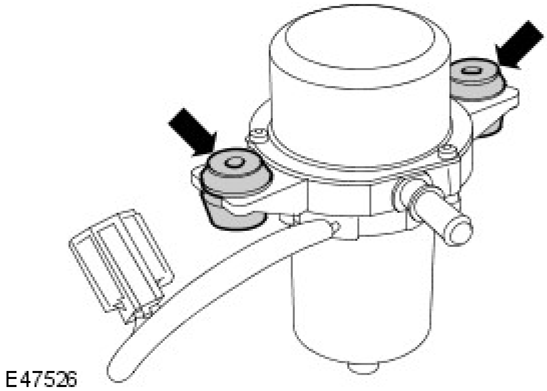


E47525

1. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Remove the brake vacuum pump.

- Release and disconnect the electrical connector.
- Disconnect the vacuum line.
- Remove the 2 nuts.



E47526

2. NOTE: Do not disassemble further if the component is removed for access only.

Remove the 2 rubber insulators.

Installation

1. To install, reverse the removal procedure.

- Tighten the nuts to 5 Nm (4 lb.ft).

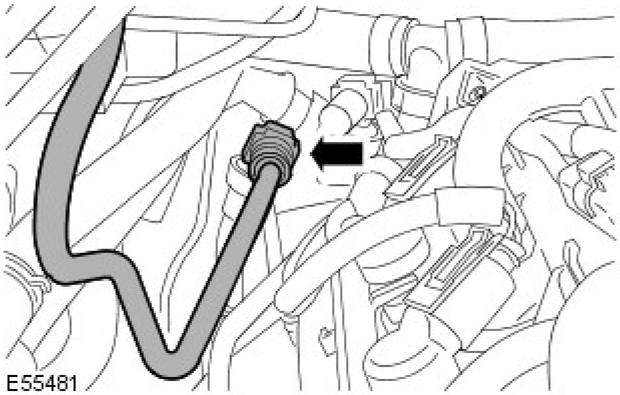
Power Brake Actuation - Brake Vacuum PumpTDV6 2.7L Diesel

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).



E55481

3. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Disconnect the brake booster vacuum line from the brake vacuum pump.

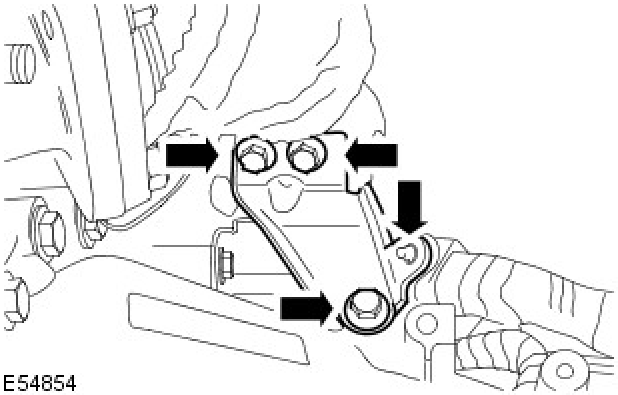
4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the exhaust system. For additional information, refer to: (309-00C Exhaust System - TDV6 2.7L Diesel)

Exhaust System - Vehicles Without: Diesel Particulate Filter (DPF) (Removal and Installation),
Exhaust System - Vehicles With: Diesel Particulate Filter (DPF) (Removal and Installation).

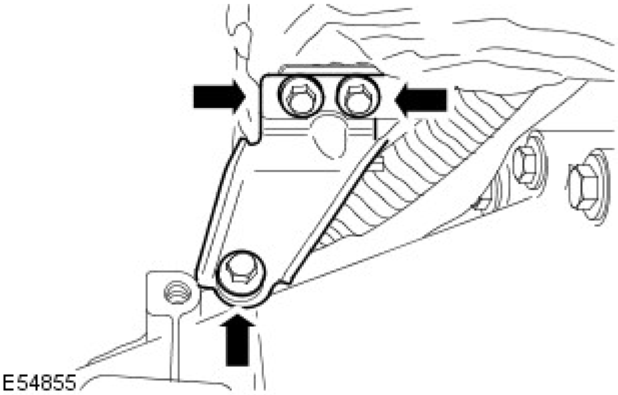
6. Lower the rear of the transmission for access.



E54854

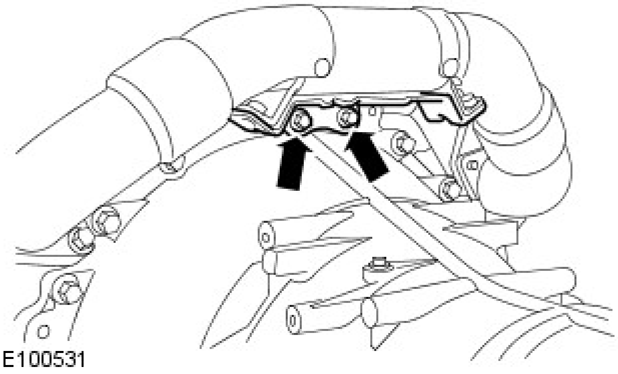
7. Remove the exhaust cross-over pipe LH support bracket.

- Release the wiring harness.
- Remove the 3 bolts.



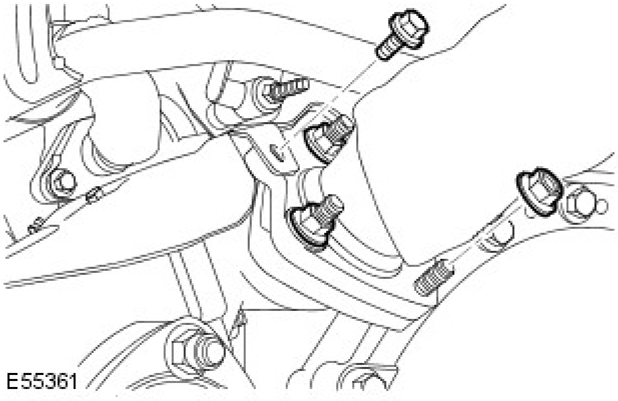
8. Remove the exhaust cross-over pipe RH support bracket.

- Remove the 3 bolts.



9. Remove the exhaust cross-over pipe center support bracket.

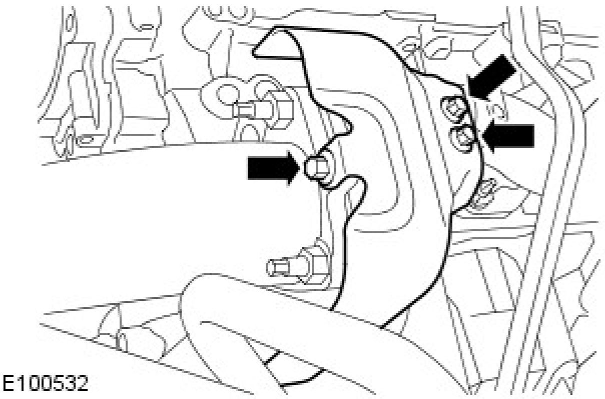
- Remove the 2 bolts.



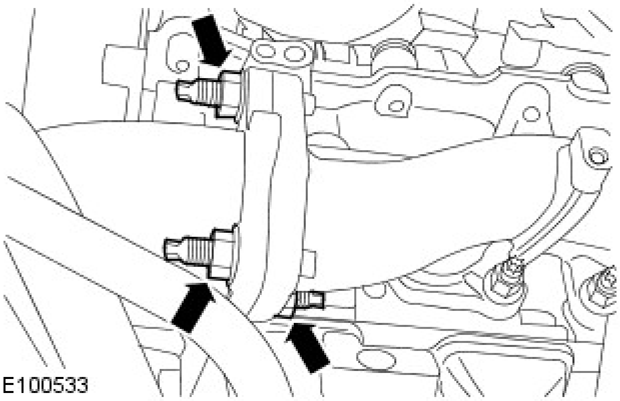
10. ⚠ CAUTION: Take care when handling the cross-over pipe as damage to the insulating material may occur.

Release the exhaust cross-over pipe from the turbocharger.

- Remove the turbocharger heat shield bolt.
- Remove and discard the 3 nuts.

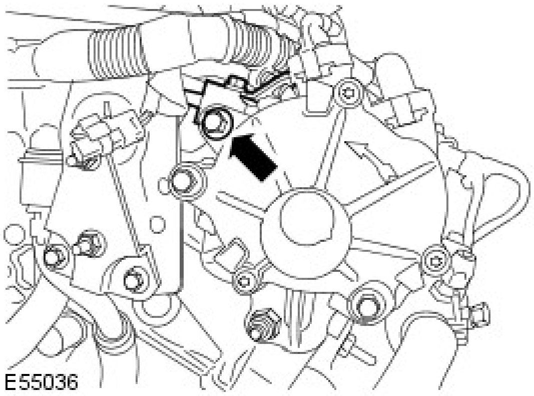


11. Remove the RH exhaust manifold heat shield.



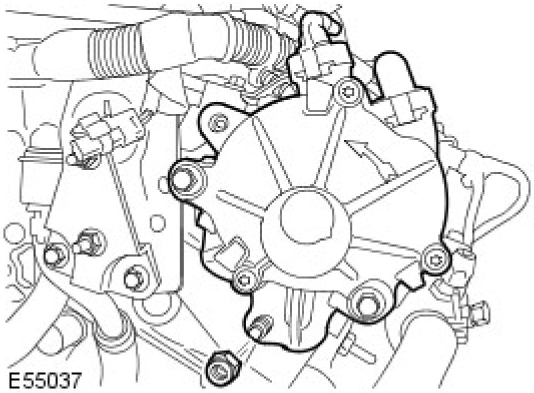
12. Remove the exhaust cross-over pipe.

- Remove and discard the 3 nuts.
- Remove and discard the 2 gaskets.

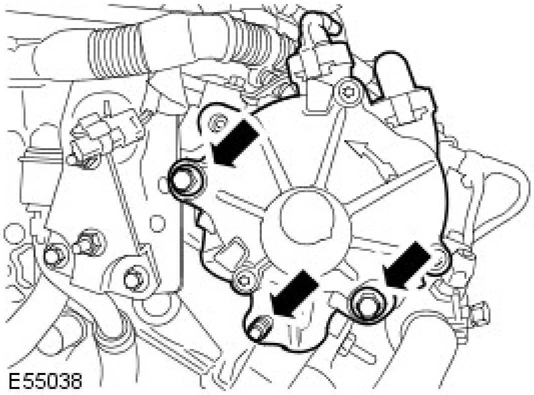


13. Release the high-pressure fuel supply line.

- Remove the bolt.



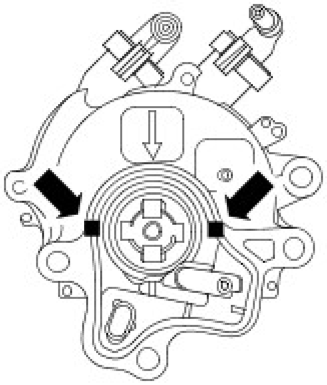
14. Remove the brake vacuum pump nut.



15. Remove the brake vacuum pump.

- Remove the stud.
- Remove the 2 bolts.

Installation



E56076

1. ⚠ CAUTION: Extreme care is required during assembly so that the sealant is not smeared. If the sealant is smeared, the mating faces must be cleaned and new sealant must be applied.

   Apply sealant to the two places shown.

   - Make sure the vacuum pump seal is clean and dry.
   - Make sure that the dogs on the vacuum pump are aligned with the camshaft.
   - Apply a 2mm square of Loctite 518 sealant in the 2 places shown.
   - Install the brake vacuum pump immediately after applying the sealant.
   - The brake vacuum pump should be fitted directly to the engine without smearing the sealant.

2. Install the brake vacuum pump.
   - Install the 2 bolts.
   - Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the brake vacuum pump stud.
   - Tighten to 13 Nm (10 lb.ft).

4. Install the brake vacuum pump nut.
   - Tighten to 13 Nm (10 lb.ft).

5. Secure the high-pressure fuel supply line.
   - Tighten the bolt to 10 Nm (7 lb.ft).

6. Install 3 new exhaust manifold studs.
   - Tighten the 3 studs to 13 Nm (10 lb. ft).

7. Install 3 new turbocharger studs.
   - Tighten the 3 studs to 13 Nm (10 lb. ft).

8. ⚠ CAUTION: Take care when handling the cross-over pipe as damage to the insulating material may occur.

   Install the exhaust cross-over pipe.

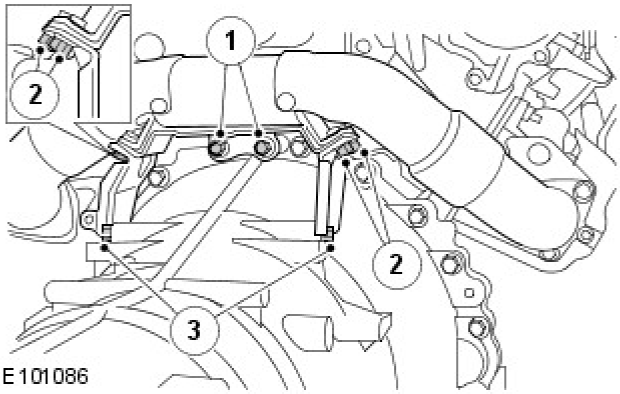
   - Clean the component mating faces.
   - Install 2 new gaskets.
   - Install 6 new nuts
   - Tighten the 6 nuts to 24 Nm (18 lb. ft).

9. Install the exhaust cross-over pipe center support bracket.
   - Loosely install the 2 bolts.

10. Install the exhaust cross-over pipe RH support bracket.
    - Loosely install the 3 bolts.

11. Install the exhaust cross-over pipe LH support bracket.

- Loosely install the 3 bolts.



12. Tighten the exhaust cross-over pipe mounting bracket bolts in the following sequence.

- Tighten the 2 bolts marked 1 to 10 Nm (7 lb.ft).
- Undo the 2 bolts by 90 degrees.
- Tighten the 2 bolts marked 3 to 10 Nm (7 lb.ft).
- Undo the 2 bolts by 90 degrees.
- Tighten the 4 bolts marked 2 to 25 Nm (18 lb.ft).
- Tighten the 2 bolts marked 1 to 25 Nm (18 lb.ft).
- Tighten the 2 bolts marked 3 to 25 Nm (18 lb.ft).
- Attach the wiring harness.

13. Install the RH exhaust manifold heat shield.

- Tighten the 3 bolts to 10 Nm (7 lb.ft).

14. Install the turbocharger heat shield.

- Tighten the bolt to 10 Nm (7 lb.ft).

15. Install the exhaust system. For additional information, refer to: (309-00C Exhaust System - TDV6 2.7L Diesel)

Exhaust System - Vehicles Without: Diesel Particulate Filter (DPF) (Removal and Installation),
Exhaust System - Vehicles With: Diesel Particulate Filter (DPF) (Removal and Installation).

16. CAUTION: Always plug any open connections to prevent contamination.

Connect the brake booster vacuum line to the brake vacuum pump.

17. Install the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

18. Connect the battery ground cable.

GENERAL

The anti-lock control - traction control system is based on the 4 channel Bosch 8.0 system and provides the following brake functions:

- ARM (active roll mitigation).
- ABS.
- CBC (corner brake control).
- DSC.
- electronic brake force distribution (EBD).
- ETC (electronic traction control).
- emergency brake assist (EBA).
- EDC (engine drag-torque control).
- HDC.

The system consists of the following components:

- A DSC switch.
- An HDC switch.
- An HDC relay.
- A stoplamp switch.
- Four wheel speed sensors.
- A yaw rate and lateral acceleration sensor.
- A steering angle sensor.
- Four warning indicators.
- A HCU with attached ABS module.

DSC SWITCH

The DSC switch allows the DSC function to be selected off. Although Land Rover recommend that DSC is selected on for all normal driving conditions, it may be beneficial to de-select DSC, to maximize traction, under the following conditions:

- If the vehicle needs to be rocked out of a hollow or a soft surface.
- Driving on loose surfaces or with snow chains.
- Driving in deep sand, snow or mud.
- On tracks with deep longitudinal ruts.

The DSC switch is a non-latching switch installed in the center switch pack on the instrument panel. Pressing the DSC switch connects an ignition power feed to the ABS module. With the first press of the DSC switch, the ABS module disables the DSC functions. When the DSC switch is pressed again, the ABS module re-enables the DSC functions. The DSC switch must be pressed for a minimum of 0.3 second for the ABS module to react. The DSC function is re-enabled at the beginning of each ignition cycle.

The status of the DSC switch selection is shown by the DSC warning indicator. The DSC warning indicator is off while DSC is selected on, and continuously illuminated while DSC is selected off.

A DSC switch request to disable DSC is ignored if the air suspension system has failed, or is in off-road height at speeds above 60 km/h (37.5 mph).

To guard against incorrect operation or a broken switch, if the input from the DSC switch is held high for more than one minute, a failure is stored in the ABS module.

Even if DSC is deselected, driving maneuvers with extreme yaw or lateral acceleration may trigger DSC activity to assist vehicle stability.

HDC SWITCH

The HDC switch controls the selection of the HDC function.

The HDC switch is a non-latching switch installed on the center console, to the rear of the gear shift lever. Pressing and releasing the HDC switch momentarily connects an ignition power feed to the ABS module. With the first press and release of the HDC switch, the ABS module enables operation of the HDC function. When the HDC switch is pressed and released again, the ABS module disables operation of the HDC function.

To guard against incorrect operation or a broken switch, if the switch is pressed for more than 10 seconds no change of state occurs. If the input from the HDC switch is held high for more than one minute, a failure is stored in the ABS module.

HDC RELAY

The HDC relay is used to illuminate the stoplamps when the brakes are activated:

- During HDC operation.
- During dynamic application of the parking brake.
  For additional information, refer to: Parking Brake (206-05 Parking Brake and Actuation, Description and Operation).
- By the adaptive speed control system. For additional information, refer to:
  Speed Control (310-03B Speed Control - V8 4.4L Petrol, Description and Operation),
  Speed Control (310-03C Speed Control - TDV6 2.7L Diesel, Description and Operation).

The HDC relay is a non-serviceable, solid state relay on the circuit board of the CJB. Operation of the HDC relay is controlled by the ABS module switching the coil to ground.

To operate the stoplamps during HDC or adaptive speed control operation, the ABS module monitors brake system hydraulic pressure and energizes the HDC relay during active braking. A pressure threshold and time filter prevent the stoplamps from flickering when HDC is braking. During dynamic application of the parking brake, the ABS module energizes the HDC relay when it receives a stoplamp request message from the parking brake module on the high speed controller area network (CAN) bus.

STOPLAMP SWITCH

The stoplamp switch is mounted in the brake pedal bracket and operated by the brake pedal. The stoplamp switch is a two pole switch: The BS (brake switch) pole supplies a brake pedal status signal to the ABS module; the BLS (brake lamp switch) pole operates the stoplamps and also supplies a brake pedal status signal to the ABS module and to the engine control module (ECM).

While the brake pedal is released:

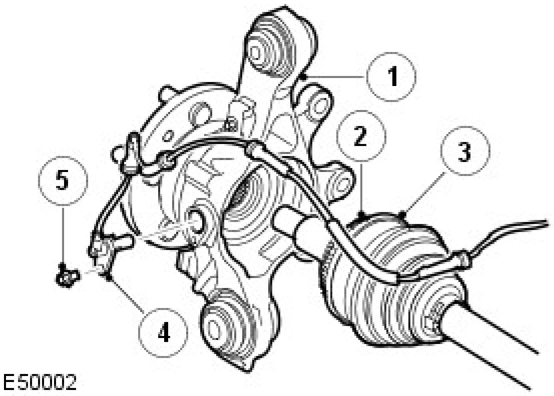
- The BS contacts are closed, and connect an ignition power feed from the CJB to the ABS module.
- The BLS contacts are open.

When the brake pedal is pressed:

- The BS contacts open.
- The BLS contacts close, and connect an ignition power feed from the CJB to the three stoplamps, the ABS module and the ECM.

The ABS module monitors the status inputs from the stoplamp switch and broadcasts the brake pedal status and an associated quality factor on the high speed CAN bus.

WHEEL SPEED SENSORS



Item	Part Number	Description
1	-	Knuckle assembly
2	-	Sensor ring
3	-	Halfshaft
4	-	Wheel speed sensor
5	-	Screw

An active wheel speed sensor is installed in each wheel hub to provide the ABS module with a rotational speed signal from each road wheel. The head of each wheel speed sensor is positioned close to a 48 tooth sensor ring on the outer diameter of the constant velocity joint of the halfshaft. A flying lead connects each sensor to the vehicle wiring.

The wheel speed sensors each have a power supply connection and a signal connection with the ABS module. When the ignition switch is in position II, the ABS module supplies power to the wheel speed sensors and monitors the return signals. Any rotation of the halfshafts induces current fluctuations in the return signals which are converted into individual wheel speeds and the overall vehicle speed by the ABS module.

The ABS module outputs the individual wheel speeds and the vehicle speed on the high speed CAN bus for use by other systems. The quality of the vehicle speed signal is also broadcast on the high speed CAN bus. If all wheel speed signals are available to calculate vehicle speed from, the quality of the vehicle speed signal is set to 'data calculated within specified accuracy'. If one or more wheel speed sensors is faulty, the quality of the vehicle speed signal is set to 'accuracy outside specification'.

The ABS module monitors the wheel speed sensor circuits for faults. If a fault is detected the ABS module stores a related fault code and illuminates the appropriate warning indicators, depending on the system functions affected (DSC/ETC, ABS, EBA/EBD, HDC). Also a warning chime sounds and a related message is shown in the message center.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

Since the wheel speed sensors are active devices, a return signal is available when the road wheels are not turning, which enables the ABS module to check the sensors while the vehicle is stationary. In addition, the direction of travel of each wheel can be sensed. This information is broadcast on the high sped CAN bus for use by other systems.

YAW RATE AND LATERAL ACCELERATION SENSOR

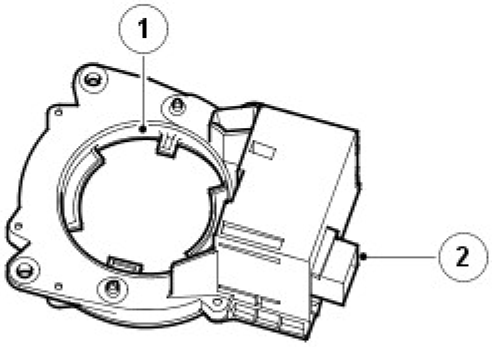
The yaw rate and lateral acceleration sensor provides the ABS module with inputs of yaw rate and lateral acceleration.

The yaw rate and lateral acceleration sensor is installed under the center console and secured to the transmission tunnel with two bolts.

When the ignition switch is in position II, the yaw rate and lateral acceleration sensor receives an ignition power feed from the CJB. The sensor is self diagnosed by the ABS module and can be interrogated using T4. The ABS module broadcasts the yaw rate and lateral acceleration values, on the high speed CAN bus, for use by other systems.

The ABS module monitors the yaw rate and lateral acceleration sensor for faults. If a fault is detected the ABS module stores a related fault code and illuminates the DSC warning indicator. Also, a warning chime sounds and a message advising of an HDC fault is shown in the message center.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

STEERING ANGLE SENSOR



E50003

Item	Part Number	Description
1	-	Gear wheel
2	-	Electrical connector

The steering angle sensor measures the steering wheel angle and the rate of change of the steering wheel angle (known as the steering wheel angle speed). These measurements are output on the high speed CAN bus, together with a quality factor signal, for use by other systems. The ABS module uses the steering angle sensor signals for CBC and DSC operation.

The steering angle sensor is fixed to the pivot bracket of the steering column by three screws. A gear wheel in the steering angle sensor engages with a plastic drive collar fixed onto the lower shaft of the column. Inside the steering angle sensor, the gear wheel meshes with a gear train containing magnets. An eight pin electrical connector provides the interface between the vehicle wiring and integrated circuits in the steering angle sensor.

The steering angle sensor uses the MR (magneto resistive) effect, which evaluates the direction of magnetic fields, to measure the angular position of the lower shaft, and thus the steering wheel angle. When the steering wheel turns, the steering column lower shaft rotates the gear wheel in the steering angle sensor, which drives the gear train and rotates the magnets on the gears. The direction of the magnetic fields is constantly monitored by the steering angle sensor and converted into a steering wheel angle and steering wheel angle speed.

The steering angle sensor performs a plausibility check of the steering wheel angle each time the following conditions co-exist:

- The vehicle is traveling in a straight line.
- The vehicle speed is between 20 and 25 km/h (12.5 and 15.6 mph).

- The transfer box is in high range.
- The brake pedal is not pressed.
- There is no ABS, DSC or ETC activity.

The steering angle sensor uses inputs of wheel speed, yaw rate and lateral acceleration to determine when the vehicle is traveling in a straight line. When all of the conditions co-exist, the steering angle sensor checks the steering angle, which should be 0 ± 15°. If the steering angle is outside the limits on two successive checks, the steering angle sensor changes the quality factor signal to 'outside specification' for the remainder of the ignition cycle and stores a fault code. At the beginning of each ignition cycle the quality factor signal is reset to 'within specified accuracy'.

The status of the steering angle sensor can be determined using T4.

If the steering angle sensor is replaced, the new sensor must be calibrated using T4. The steering angle sensor must also be re-calibrated any time it is disturbed from the steering column, or if the upper and lower steering columns are separated.

WARNING INDICATORS

The following anti-lock control - traction control indicators are installed in the instrument cluster:

ABS Warning Indicator

The ABS warning indicator is an amber colored indicator located between the coolant temperature gage and the fuel level gage.

The ABS warning indicator is continuously illuminated if there is a fault that affects ABS performance or causes the ABS function to be disabled.

Operation of the ABS warning indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

When the ignition switch is first turned to position II, the ABS warning indicator illuminates for approximately 3 seconds as a bulb check. During the bulb check, if a fault is stored in the memory of the ABS module, the ABS warning indicator goes off for 0.5 second, 0.5 second after the start of the bulb check. If a fault during the previous ignition cycle caused the ABS warning indicator to be illuminated, the ABS warning indicator may remain illuminated after the next bulb check, even if the fault has been rectified and cleared from the ABS module; the ABS warning indicator remains illuminated until vehicle speed reaches 15-20 km/h (9.5-12.5 mph) while additional checks of the related inputs are performed.

Brake Warning Indicator

The brake warning indicator is a dual colored indicator, located in the coolant temperature gage, that illuminates amber for EBA faults and red for EBD faults. The brake warning indicator is also used to give warnings of:

- Low brake fluid level (illuminates red).
  For additional information, refer to: Hydraulic Brake Actuation (206-06 Hydraulic Brake Actuation, Description and Operation).
- Brake pad wear (illuminates amber).

For additional information, refer to: Rear Disc Brake (206-04 Rear Disc Brake, Description and Operation).

Operation of the brake warning indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

When the ignition switch is first turned to position II, the brake warning indicator illuminates amber for approximately 1.5 seconds then red for approximately 1.5 seconds, as a bulb check.

DSC Warning Indicator

The DSC warning indicator is an amber colored warning indicator located in the tachometer.

Each time the DSC or the ETC function is active, the DSC warning indicator flashes at 2 Hz. If DSC has been selected off, or there is a fault that disables the DSC or the ETC function, the DSC warning indicator is continuously illuminated. If DSC has been selected off the instrument cluster also displays a message advising that DSC is switched off.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

Operation of the DSC warning indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

When the ignition switch is first turned to position II, the DSC warning indicator illuminates for approximately 3 seconds as a bulb check. If a fault during the previous ignition cycle caused the DSC warning indicator to be illuminated, the DSC warning indicator may remain illuminated after the next bulb check, even if the fault has been rectified and cleared from the ABS module; the DSC warning indicator may remain illuminated during vehicle operation while additional checks of the related inputs are performed.

HDC Information Indicator

The HDC information indicator is a green colored indicator located in the tachometer.

The HDC information indicator is continuously illuminated while the HDC function is selected on and the vehicle is within the parameters for HDC operation; when the vehicle is outside the parameters for HDC operation, the HDC information indicator is flashed at 2 Hz.

Operation of the HDC information indicator is controlled by a high speed CAN bus message from the ABS module to the instrument cluster.

HCU

The HCU is a 4 channel unit that modulates the supply of hydraulic pressure to the brakes under the control of the ABS module.

The HCU is attached by three mounting bushes to a bracket in the plenum box on the driver side of the engine compartment. Hydraulic pipes connect the HCU to the master cylinder and the brakes.
For additional information, refer to: Hydraulic Brake Actuation (206-06 Hydraulic Brake Actuation, Description and Operation).

The primary and secondary outlets of the master cylinder are connected to primary and secondary circuits within the HCU. The primary circuit in the HCU has separate outlet ports to the front brakes. The secondary circuit in the HCU has separate outlet ports to the rear brakes. Each of the circuits in the HCU contain the following components to control the supply of hydraulic pressure to the brakes:

- A normally open, solenoid operated, pilot valve, to enable active braking.
- A normally closed, solenoid operated, priming valve, to connect the brake fluid reservoir to the return pump during active braking.
- A return pump, to generate hydraulic pressure for active braking and return brake fluid to the reservoir.
- Normally open, solenoid operated, inlet valves and normally closed, solenoid operated, outlet valves, to modulate the hydraulic pressure in the individual brakes.
- An accumulator and a relief valve, to allow the fast release of pressure from the brakes.
- Filters, to protect the components from contamination.

The primary circuit also incorporates a pressure sensor to provide the ABS module with a hydraulic pressure signal.

Contact pins on the HCU mate with contacts on the ABS module to provide the electrical connections from the ABS module to the return pump motor and the pressure sensor. The solenoids that operate the valves are installed in the ABS module.

Replacement HCU are supplied pre-filled. After installation on the vehicle, T4 must be used to operate the solenoid valves and the return pump to ensure correct bleeding of the HCU and brake circuits.

16	-	Right front brake

17	-	Right rear brake
18	-	Left rear brake

The HCU has three operating modes: Normal braking/EBD mode, ABS braking and active braking.

Normal Braking/EBD Mode

Initially, all of the solenoid operated valves are de-energized. Operating the brake pedal produces a corresponding increase or decrease of pressure in the brakes, through the open pilot valves and inlet valves. If the ABS module determines that EBD is necessary, it energizes the inlet valves for the brakes of the trailing axle, to isolate the brakes from any further increase in hydraulic pressure.

ABS Braking Mode

If the ABS module determines that ABS braking is necessary, it energizes the inlet and outlet valves of the related brake and starts the return pump. The inlet valve closes to isolate the brake from pressurized fluid; the outlet valve opens to release pressure from the brake into the accumulator and the return pump circuit; the reduced pressure allows the wheel to accelerate. The ABS module then operates the inlet and outlet valves to modulate the pressure in the brake to apply the maximum braking effort without locking the wheel. Control of the valves for each wheel takes place individually.

Active Braking Mode

The active braking mode is used to generate and control hydraulic pressure to the brakes for functions other than ABS braking, e.g. DSC, EBA, ETC, HDC, dynamic application of the parking brake and adaptive speed control.

For active braking, the ABS module energizes the pilot valves and priming valves, starts the return pump and energizes all of the inlet valves. Brake fluid, drawn from the reservoir through the master cylinder and priming valve, is pressurized by the return pump and supplied to the inlet valves. The ABS module then operates the inlet valves and outlet valves, as required, to modulate the pressure in the individual brakes. Some noise may be generated during active braking.

ABS MODULE

The ABS module controls the brake functions using the HCU to modulate hydraulic pressure to the individual wheel brakes.

The ABS module is attached to the HCU, in the plenum box on the driver side of the engine compartment. A 46 pin connector provides the electrical interface between the ABS module and the vehicle wiring.

SYSTEM OPERATION

ARM

The ARM function uses the brakes and the engine to attempt to restore stability if the vehicle is forced into such a harsh manoeuver that it risks tipping over.

The ABS module monitors driver inputs and vehicle behavior using various powertrain signals and the inputs from the wheel speed sensors, the steering angle sensor and the yaw rate and lateral acceleration sensor. These are compared with modeled behavior and, if vehicle behavior reaches a given risk level, the ABS module cuts the engine power, or brakes one or more wheels, just enough to help the vehicle regain its poise and help the driver remain in control.

While the ignition is on, ARM is permanently enabled, even when DSC has been selected off.

ABS

ABS controls the speed of all road wheels to ensure optimum wheel slip when braking at the adhesion limit. This prevents the wheels from locking, which helps to retain effective steering control of the vehicle.

On the front axle, the brake pressure is modulated separately for each wheel. On the rear axle, brake pressure is modulated by select low. Select low applies the same pressure to both rear brakes, with the pressure level being determined by the wheel on the lower friction surface. This maintains rear stability on split friction surfaces.

CBC

CBC influences the brake pressures, below the DSC and ABS thresholds, to counteract the yawing moment produced when braking in a corner. CBC produces a correction torque by limiting the brake pressure on one side of the vehicle.

DSC

DSC uses the brakes and powertrain torque control to help maintain the lateral stability of the vehicle. While the ignition is on the DSC function is permanently enabled unless selected off by the DSC switch. Even if DSC is deselected, driving maneuvers with extreme yaw or lateral acceleration may trigger DSC activity to assist vehicle stability.

DSC enhances driving safety in abrupt maneuvers and in understeer or oversteer situations which may occur in a bend. The ABS module monitors the yaw rate and lateral acceleration of the vehicle, and the steering input, then selectively applies individual brakes and signals for powertrain torque adjustments to reduce understeer or oversteer.

In general: in an understeering situation, the inner wheels are braked to counteract the yaw movement towards the outer edge of the bend; in an oversteering situation, the outer wheels are braked to prevent the rear end of the vehicle from pushing towards the outer edge of the bend.

The ABS module monitors the tracking stability of the vehicle using inputs from the wheel speed sensors, the steering angle sensor and the yaw rate and lateral acceleration sensor. The tracking stability is compared with stored target data and, whenever the tracking stability deviates from the target data, the ABS module intervenes by applying the appropriate brakes. When the DSC function is active, the ABS module also signals the transmission control module (TCM) to prevent gear shifts. If necessary, the ABS module also signals:

- The ECM, to reduce engine torque.
- The transfer box control module, to adjust the locking torque of the center differential.
- The rear differential control module, to adjust the locking torque of the rear differential.

The DSC function overrides the differential locking torque requests from the terrain response system.

EBD

EBD limits the brake pressure applied to the rear wheels. When the brakes are applied, the weight of the vehicle transfers forwards, which reduces the ability of the rear wheels to transfer braking effort to the road surface. This can cause the rear wheels to slip and make the vehicle unstable.

EBD uses the anti-lock braking hardware to automatically optimize the pressure of the rear brakes, below the point where anti-lock braking would be invoked. Only the rear axle is under EBD control.

ETC

ETC attempts to optimize forward traction by reducing engine torque or braking a spinning wheel until it regains grip.

ETC is activated if an individual wheel speed is above that of the vehicle reference speed (positive slip) and the brake pedal is not pressed. The spinning wheel is braked, allowing the excess torque to be transmitted to the non spinning wheels through the drive line. If necessary, the ABS module also sends a high speed CAN bus message to the ECM to request a reduction in engine torque. Torque reduction requests are for either a slow or fast response: a slow response requests a reduction of throttle angle (4.2L and 4.4L only); a fast response requests an ignition cut-off (4.2L and 4.4L) or a fuel cut-off (2.7L Diesel).

When the DSC function is selected off with the DSC switch, the engine torque reduction feature is disabled.

When the ETC function is active the ABS module also signals the TCM to prevent gear shifts.

EBA

EBA assists the driver, in emergency braking situations, by automatically maximizing the braking effort. There are two situations when the ABS module will invoke EBA: when the brake pedal is pressed very suddenly and when the brake pedal is pressed hard enough to bring the front brakes into ABS operation.

When the brake pedal is pressed very suddenly, the ABS module increases the hydraulic pressure to all of the brakes until they reach the threshold for ABS operation, thus applying the maximum braking effort for the available traction. The ABS module monitors for the sudden application of the brakes using the inputs from the stoplamp switch and from the pressure sensor in the HCU. With the brake pedal pressed, if the rate of increase of hydraulic pressure exceeds the predetermined limit, the ABS module invokes emergency braking.

When the brake pedal is pressed hard enough to bring the front brakes into ABS operation, the ABS module increases the hydraulic pressure to the rear brakes up to the ABS threshold.

EBA operation continues until the driver releases the brake pedal enough for the hydraulic pressure in the HCU to drop below a threshold value stored in the ABS module.

EDC

EDC prevents wheel slip caused by any of the following:

- A sudden decrease in engine torque when the accelerator is suddenly released.
- A downshift using the CommandShift™.

When the ABS module detects the onset of wheel slip without the brakes being applied, it signals the ECM, on the high speed CAN bus, to request a momentary increase in engine torque.

HDC

HDC uses brake intervention to control vehicle speed and acceleration during low speed descents in off-road and low grip on-road conditions. Generally, equal pressure is applied to all four brakes, but pressure to individual brakes can be modified by the ABS and DSC functions to retain stability. Selection of the HDC function is controlled by the HDC switch on the center console. HDC operates in both high and low ranges, at vehicle speeds up to 50 km/h (31.3 mph).

HDC may be used in D, R and CommandShift 1 in high range, and in D, R and all CommandShift gears in low range. When in D, the transmission control module will automatically select the most appropriate gear. The vehicle should not be driven with HDC active and the transmission in N.

HDC can be selected at speeds up to 80 km/h (50 mph), but will only be enabled at speeds below 50 km/h (31.3 mph). When HDC is selected:

- At speeds up to 50 km/h (31.3 mph), the HDC information indicator is permanently illuminated if a valid gear is selected.
- At speeds from >50 to 80 km/h (>31.3 to 50 mph) the HDC information indicator flashes and a message advising that the speed is too high is displayed in the message center.
  For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).
  If the HDC switch is pressed while vehicle speed is more than 80 km/h (50 mph), the HDC information indicator will not illuminate and HDC will not be selected.
- If the speed reaches 80 km/h (50 mph) or more, a warning chime sounds, the HDC function is switched off, the information indicator goes off and a message advising that HDC has been switched off is displayed in the message center.

When HDC is enabled, the ABS module calculates a target speed and compares this with the actual vehicle speed. The ABS module then operates the HCU, in the active braking mode, as required to achieve and maintain the target speed. During active braking for HDC, the ABS module also energizes the HDC relay to operate the stoplamps. Applying the foot brakes during active braking may result in a pulse through the brake pedal, which is normal.

The target speed varies, between minimum and maximum values for each gear and transmission range, depending on driver inputs through the foot pedals. If the foot pedals are not operated, the ABS module adopts a default target speed.

Low Range Target Speeds

Limit	Speed, km/h (mph)	
		Gear
	1, R	D, 2 to 6
Default	3.5 (2.19)	6 (3.75)
Minimum	3.5 (2.19)	3.5 (2.19)
Maximum	20 (12.5)	20 (12.5)

High Range Target Speeds

Limit	Speed, km/h (mph)	
		Gear
	1, R	D
Default	6 (3.75)	10 (6.25)
Minimum	6 (3.75)	6 (3.75)
Maximum	20 (12.5)	20 (12.5)

The target speed is varied between the minimum and maximum values using the accelerator pedal.

The target speed can also be varied by pressing the speed control '+' and '-' buttons (where fitted). For additional information, refer to:

Speed Control (310-03A Speed Control - V8 S/C 4.2L Petrol, Description and Operation),
Speed Control (310-03B Speed Control - V8 4.4L Petrol, Description and Operation),
Speed Control (310-03C Speed Control - TDV6 2.7L Diesel, Description and Operation).

During changes of target speed, the ABS module limits deceleration and acceleration to -0.5 m/s^2 (-1.65 ft/s^2) and +0.5 m/s^2 (+1.65 ft/s^2) respectively.

To provide a safe transition from active braking to brakes off, the ABS module invokes a fade out strategy, which gradually discontinues the braking effort, if it detects any of the following during active braking:

- HDC selected off with the HDC switch.
- Failure of a component used by HDC, but not critical to fade out function.
- Accelerator pedal pressed when transmission is in neutral.
- Brake overheat.

If fade out is invoked because of deselection or component failure, the HDC function is cancelled by the ABS module. If fade out is invoked because the accelerator pedal is pressed with the transmission in neutral, or because of brake overheat, the HDC function remains in standby and resumes operation when the accelerator pedal is released or the brakes have cooled.

The fade out strategy increases the target speed, at a constant acceleration rate of 0.5 m/s^2 (1.65 ft/s^2), until the maximum target speed is reached or until no active braking is required for 0.5 s. If the accelerator pedal is positioned within the range that influences target speed, the acceleration rate is increased to 1.0 m/s^2 (3.3 ft/s^2).

When fade out is invoked because of component failure, a warning chime sounds, the HDC information indicator is extinguished and a message advising there is a fault is displayed in the message center.

When fade out is invoked because of brake overheat, a message advising that HDC is temporarily unavailable is displayed. At the end of fade out, the HDC information indicator flashes. The message is displayed, while HDC remains selected, until the brakes have cooled.

To monitor for brake overheat, the ABS module monitors the amount of braking activity and, from this, estimates the temperature of each brake. If the estimated temperature of any brake exceeds a preset limit, the ABS module invokes the fade out strategy. After the fade out cycle, the HDC function is re-enabled when the ABS module estimates that all of the brake temperatures are at less than 64% of the temperature limit.

If there is a fault that affects the HDC function, or if the HDC function is temporarily unavailable because of brake overheat, an appropriate message is displayed in the message center.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

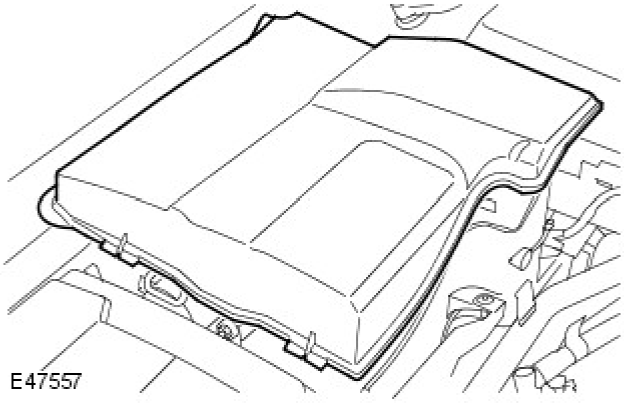
Anti-Lock Control - Traction Control - Anti-Lock Brake System (ABS) Module

Removal and Installation

Removal

⚠ CAUTION: Make sure the ignition switch is in position 0.

1. Remove the cover.



2. Disconnect the electrical connector.

3. CAUTIONS:

⚠ Brake fluid will damage paint finished surfaces. If spilled, immediately remove the fluid and clean the area with water.

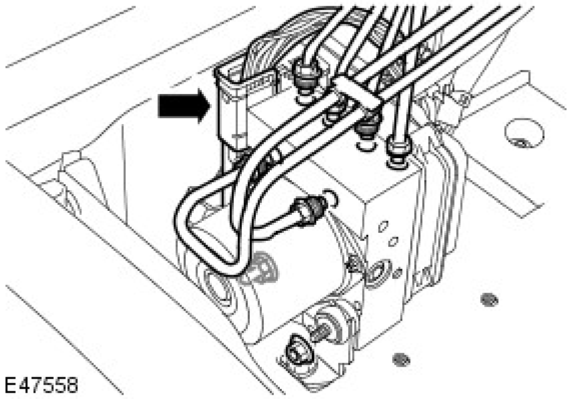
⚠ Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the 6 brake tubes.

- Position an absorbent cloth to collect fluid spillage.

4. Remove the ABS module from the mounting bracket.

- Loosen, but do not remove, the 2 nuts securing the ABS module to the bracket.



Installation

1. NOTE: Make sure the ABS module locating grommet is correctly seated in the bracket before installing the ABS module.

• NOTE: Make sure the ABS module locating pin is correcly located in the grommet, and the 2 front isolators are fully seated in the bracket slots.

Install the ABS module.

- Tighten the 2 ABS module retaining nuts to 8 Nm (6 lb.ft).
- Remove the blanking caps from the ports.
- Tighten the two M10 and three M12 brake tube unions to 15 Nm (11 lb.ft).
- Tighten the M14 brake tube union to 17 Nm (13 lb.ft).
- Connect the electrical connector.
- Remove the ABS module from the mounting bracket.

2. Using T4, bleed the braking system.
For additional information, refer to: Brake System Bleeding - Vehicles With: Standard Brakes (206-00 Brake System - General Information, General Procedures) / Brake System Bleeding - Vehicles With: High Performance Brakes (206-00 Brake System - General Information, General Procedures).

3. Install the cover.

4. If a new ABS module has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Traction Control - Front Wheel Speed Sensor

Removal and Installation

Removal

All vehicles

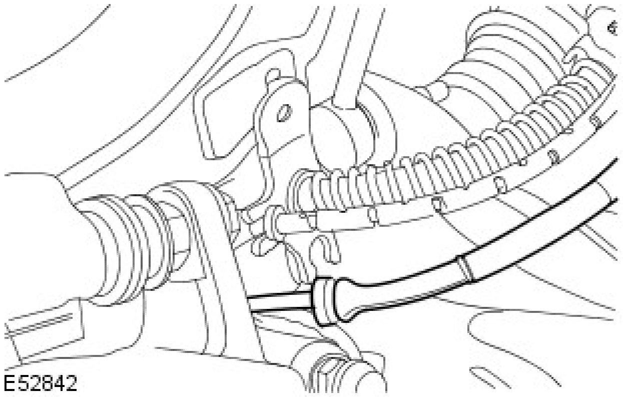
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the front wheel and tire.

3. Remove the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

4. Release the wheel speed sensor lead from the brake hose retaining bracket.

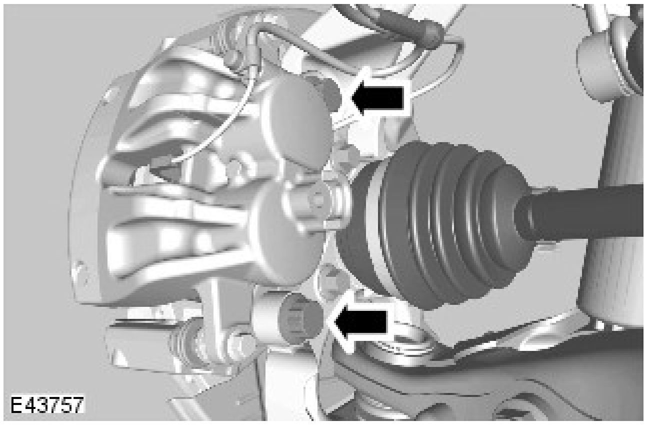


Vehicles with standard brakes

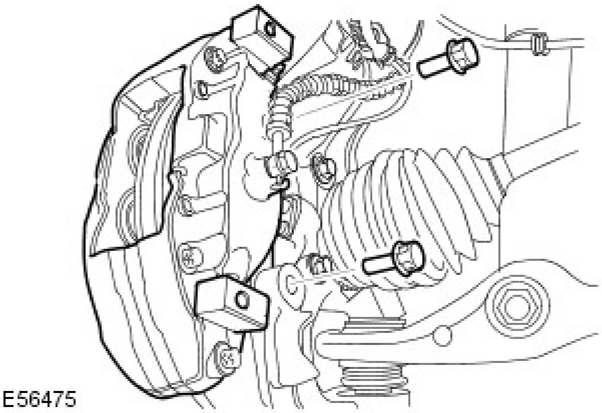
5. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper anchor plate from the wheel knuckle and tie the caliper aside.

- Remove the 2 retaining bolts.



Vehicles with high performance brakes



6. ⚠ CAUTION: Do not allow the brake caliper to hang on the brake hose.

Release the brake caliper from the wheel knuckle.

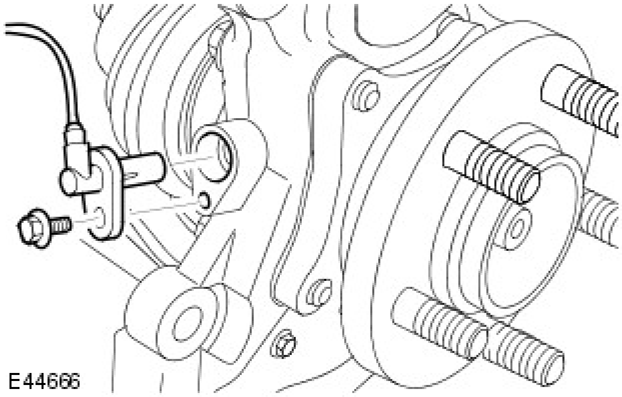
- Remove the 2 retaining bolts.
- Tie the brake caliper aside.

All vehicles

7. NOTE: The brake disc is shown removed for clarity.

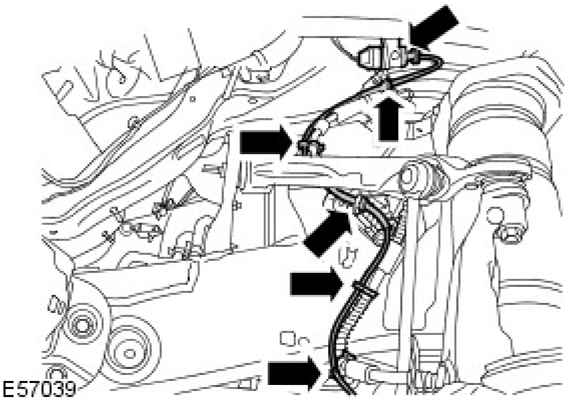
Release the wheel speed sensor from the wheel knuckle.

- Remove the bolt.



8. Remove the wheel speed sensor.

- Disconnect the electrical connector.
- Release the wiring harness from the clips.



Installation

All vehicles

1. Make sure the wheel speed sensor location in the wheel knuckle is free of dirt.

2. NOTE: Make sure the electrical connector retaining clip is attached to the body wiring harness.

Install the wheel speed sensor.

- Tighten the bolt to 9 Nm (7 lb.ft).
- Connect the electrical connector.

- Secure the wiring harness in the clips.

Vehicles with standard brakes

3. Secure the brake caliper and anchor plate to the wheel knuckle.

- Tighten the bolts to 275 Nm (203 lb.ft).

Vehicles with high performance brakes

4. Secure the brake caliper to the wheel knuckle.

- Tighten the bolts to 275 Nm (203 lb.ft).

All vehicles

5. Secure the wheel speed sensor lead to the brake hose retaining bracket.

6. Install the fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

7. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

Anti-Lock Control - Traction Control - Rear Wheel Speed Sensor

Removal and Installation

Removal

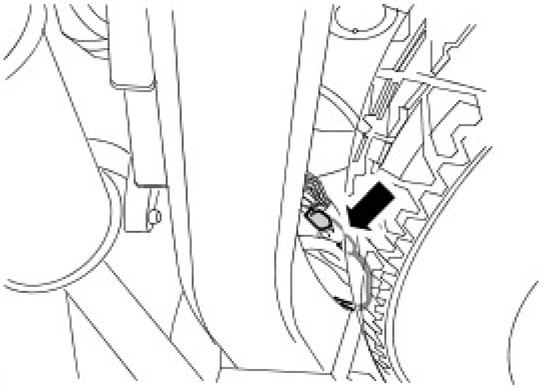
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the wheel and tire.

3. Disconnect the anti-lock brake system (ABS) sensor electrical connector.

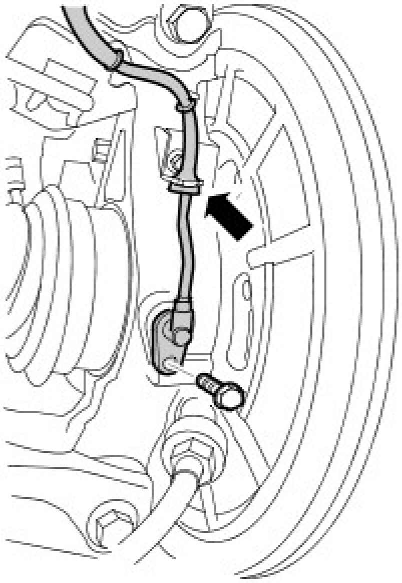
   - Release the wiring harness retaining clip.



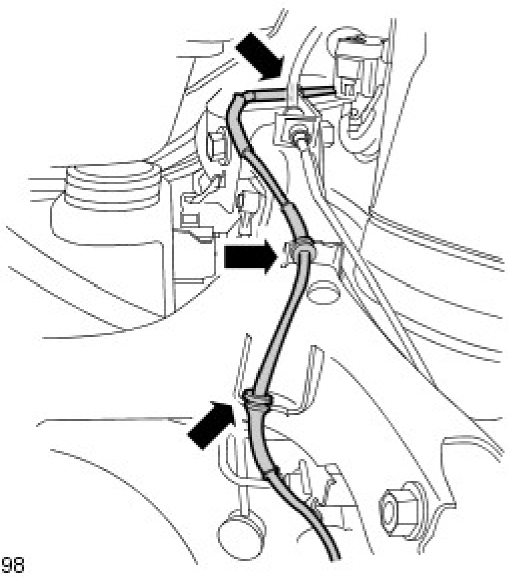
E52454

4. Release the wheel speed sensor from the wheel knuckle.

   - Release the wiring harness.
   - Remove the retaining bolt.



E56445



E56698

5. Remove the wheel speed sensor.

- Release the wiring harness from the 4 clips.

Installation

1. Make sure the wheel speed sensor location in the wheel knuckle is free of dirt.

2. Install the wheel speed sensor.

- Attach the wiring harness to the 4 clips.

3. Secure the wheel speed sensor to the wheel knuckle.

- Tighten the bolt to 9 Nm (7 lb.ft).
- Attach the wiring harness to the clip.

4. NOTE: Make sure the electrical connector retaining clip is attached to the body wiring harness.

Connect the ABS sensor electrical connector.

- Attach the wiring harness.

5. If a new wheel speed sensor has been installed, interrogate the ABS system using T4.

Anti-Lock Control - Traction Control - Anti-Lock Control - Traction Control

Diagnosis and Testing

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• NOTE: If the control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual (section B1.2), or determine if any prior approval programme is in operation, prior to the installation of a new module/component.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
● Tire size, condition and installation ● Wheel speed sensor condition and installation ● Steering Angle Sensor (SAS) condition and installation ● Yaw rate sensor and accelerometer condition and installation ● Hydraulic control unit (with attached ABS module) condition and installation	● Fuses ● Harnesses and connectors ● Warning lamp operation ● Wheel speed sensors ● Central junction box ● HDC switch ● DSC switch ● Combined stop lamp switch / brake switch ● Yaw rate sensor and accelerometer ● Steering Angle Sensor (SAS) ● Anti-lock Braking (ABS) module ● Controller Area Network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible Causes	Action
C1105-67	Brake lamp control signal incorrect after event - signal incorrect after event	• NOTE: The stoplamp-switch contains the brake-lamp -switch (BLS) and the brake-switch (BS) these are located within the same housing ● The BLS circuit and the BS circuit have failed the plausibility test ● Switch internal fault ● Circuit fault	• NOTE: Check for correct operation of the stop-lamps ● Refer to the electrical circuit diagrams and check the ABS module circuit to the hill decent relay for fault
C1109-24	Vehicle dynamics control switch - signal stuck high	● Switch internal fault ● Circuit short to power	• NOTE: This DTC may be logged if the switch state is active for over 1 minute ● Check for correct switch operation. Refer to the electrical circuit diagrams and check the ABS module circuit to the centre facia switch pack / DSC switch for circuit short to power

DTC	Description	Possible Causes	Action
C1A00-16	Control module - circuit voltage below threshold	- Low voltage detected - Circuit short to ground, open circuit or high resistance	• NOTE: DTC may be stored due to a vehicle charging or starting fault - Using the manufacturer approved diagnostic system check other modules for related DTCs. Check for correct vehicle battery / charging system operation. Refer to the electrical circuit diagrams and check the ABS module power **(UZ)** and ground circuit for fault
C1A00-17	Control module - circuit voltage above threshold	- Voltage detected above preset maximum	• NOTE: DTC may be stored due to battery charger use or vehicle charging fault - Using the manufacturer approved diagnostic system check other modules for related DTCs. Check for correct vehicle battery and charging system operation
C1A00-1C	Control module - circuit voltage out of range	- Momentary low voltage detected	• NOTE: DTC may be stored due to a vehicle charging or starting fault - Using the manufacturer approved diagnostic system check other modules for related DTCs. Check for correct vehicle charging system operation. Refer to the electrical circuit diagrams and check the ABS module power **(UZ)** and ground circuit for fault
C1A00-45	Control module - program memory failure	- Module internal fault	- Using the manufacturer approved diagnostic system. Clear the DTC and retest if the DTC returns suspect the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A00-46	Control module - calibration / parameter memory failure	- Incorrect car configuration file (CCF) data received from IPC or CCF incorrectly configured - Module installed to unrecognized vehicle configuration - Module calibration/parameter memory failure (internal error)	Configure the module using the approved diagnostic system. Clear the DTC and check if the DTC resets after ignition reset following >10 seconds ignition on. If the possible causes listed have been checked and the DTC persists, suspect the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A00-49	Control module - internal electronic failure	- Module internal fault	- Using the manufacturer approved diagnostic system, clear the DTC and retest. If the DTC returns, suspect the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A00-4A	Control module - incorrect component installed	- The stored vehicle variant code in the control module (EEPROM) does not match the variant code received via the CAN bus	- Using the manufacturer approved diagnostic system, confirm that the stored vehicle variant code and the transmitted variant code match. Configure as required
C1A00-4B	Control module - over temperature	- The control module has excided a preset maximum temperature - Module internal fault	• NOTE: Investigate the cause of the control module temperature event - Using the manufacturer approved diagnostic system, clear the DTC and retest. If DTC returns suspect an internal fault with the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index

DTC	Description	Possible Causes	Action
C1A00-68	Control module - event information	- Control module event information	Using the manufacturer approved diagnostic system, check for DTCs relating to a defective steering angle sensor, wheel speed sensor or yaw rate sensor. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A00-88	Control module - bus off	- CAN bus circuit fault	- Using the manufacturer approved diagnostic system, carry out the CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN bus circuit to the ABS module for circuit short to power, short to ground, open circuit or high resistance
C1A76-01	Valve relay circuit - general electrical failure	- Module internal fault	- Using the manufacturer approved diagnostic system, clear the DTC and retest. If DTC returns suspect an internal fault with the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A76-04	Valve relay circuit - system internal failures	- Module internal fault	- Using the manufacturer approved diagnostic system, clear the DTC and retest. If DTC returns suspect an internal fault with the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A77-16	Valve relay circuit - circuit voltage below threshold	- Low voltage detected - Circuit fault	• NOTE: DTC may be stored due to a vehicle charging or starting fault - Using the manufacturer approved diagnostic system, check other modules for related DTCs. Check for correct vehicle charging system operation. Refer to the electrical circuit diagrams and check the ABS module **(UBVR)** power and ground circuits for fault
C1A78-04	Front left inlet valve - system internal failures	- Module internal fault	- Using the manufacturer approved diagnostic system, clear the DTC and retest. If the DTC returns suspect the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A79-04	Front left outlet valve - system internal failures	- Module internal fault	- Using the manufacturer approved diagnostic system, clear the DTC and retest. If the DTC returns suspect the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A80-04	Front right inlet valve - system internal failures	- Module internal fault	- Using the manufacturer approved diagnostic system, clear the DTC and retest. If the DTC returns suspect the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index
C1A81-04	Front right outlet valve - system internal failures	- Module internal fault	- Using the manufacturer approved diagnostic system, clear the DTC and retest. If the DTC returns suspect the ABS module. Replace as required. Refer to the new module / component installation note at the top of the DTC index

Pinpoint Tests

PINPOINT TEST A : STOPLAMP-SWITCH PLAUSIBILITY FAULT (DTC C1A96-24)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

A1: CUSTOMER INDUCED DTC

• NOTE: These tests are to be carried out if DTC C1A96-24 has been stored. This DTC indicates plausibility – The stoplamp-switch signal is high (Footbrake pedal pressed condition) while the vehicle is not braking.

• NOTE: Plausibility detail – A DTC will be stored if the stoplamp-switch signal is high for more than 60 seconds while the accelerator pedal is pressed and the vehicle speed is greater than 7 mph/10.8 km/h and the ABS Module is not actively controlling pressure.

1. Confirm that the fault is not being provoked by a customer driving habit (Resting a foot on the brake pedal while accelerating / cruising).

Is the fault being provoked by a customer driving habit?

Yes

Advise the customer that the cause of the DTC being stored maybe due to his/her foot resting on the brake pedal whilst the vehicle is in motion. Clear the stored DTC, operate the footbrake and check for correct stoplamp operation.

No

GO to A2.

A2: STOPLAMP-SWITCH ADJUSTMENT CHECK

• NOTE: Removal and correct installation of the stoplamp-switch will reset the adjustment. Ensure the footbrake pedal is fully raised against its upstop, (pedal rest position) when installing the stoplamp-switch.

1. Check that the stoplamp-switch is securely installed and correctly adjusted. REFER to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

Is the stoplamp-switch securely installed and correctly adjusted?

Yes

GO to A3.

No

Adjust the stoplamp-switch using the approved process. Clear the stored DTC, operate the Footbrake and check for correct stoplamp operation.

A3: STOPLAMP CIRCUIT SHORT TO POWER

• NOTE: If a circuit short to power is present the stoplamps may be illuminated (Footbrake Pedal released).

1. Using the manufacturer approved diagnostic system, monitor the Data Logger Signal, PID-2B00 (brake input switch status - brake pedal switch / brake lamp switch), set the Ignition-state to the on position and with the footbrake released PID-2B00 (brake input switch status) should show **Inactive (BLS = 0)**.

Does PID-2B00 (brake input switch status) show Inactive (BLS =0)?

Yes

GO to A4.

No

Refer to electrical circuit diagrams to locate the fault. Repair the circuit as required using the approved process. Clear the stored DTC, operate the Footbrake and check for correct stoplamp operation.

A4: SHORT CIRCUIT TO ANOTHER POWER CIRCUIT

• NOTE: A short circuit to another circuit will cause the DTC to log in the ABS Module.

1. Using the manufacturer approved diagnostic system, monitor the Data-logger signal, PID-2B00 (brake input switch status - brake pedal switch / brake lamp switch), set the Ignition-state to the on position and with the footbrake released PID-2B00 (brake input switch status) should show **Inactive (BLS = 0)**.
2. Operate any electrical circuits that could supply a voltage to the stoplamp-switch circuit.

Does PID-2B00 (brake input switch status) show **Inactive (BLS =0)**?

Yes

Suspect an intermittent fault. Carry out visual and mechanical check of splice joints, all connectors and cables, check for corrosion, bent or damaged contact faces of pins, terminals and for security of connectors. Where possible flex cables while using the manufacturer approved diagnostic system to monitor the Data-logger signal, PID-2B00 (brake input switch status - brake pedal switch / brake lamp switch). This test should be carried out with the ignition on and the footbrake pedal in the released position. **BLS** should remain **Inactive (BLS=0)**.

No

Refer to electrical circuit diagrams to locate the fault. Repair the circuit as required using the approved process. Clear the stored DTC, operate the footbrake and check for correct stoplamp operation.

Pinpoint Tests

PINPOINT TEST B : SIGNAL COMPARE PLAUSIBILITY (DTC C1A96-62)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

B1: STOPLAMP-SWITCH CIRCUIT

• NOTE: These tests are to be carried out if DTC C1A96-62 signal compare - plausibility, has been stored. This DTC indicates that the brake lamp switch and brake switch have shared the same state (both switches in the open circuit condition at the same time).

• NOTE: The stoplamp switch contains the brake-lamp switch **(BLS)** and the brake-switch **(BS)** these are located within the same housing.

- NOTE: Signal compare - plausibility: Brake lamp switch and brake switch must not be open circuit at the same time.

- NOTE: The datalogger-signals represent the position of the stoplamp switch. Both the brake lamp switch **(BLS)** and the brake switch **(BS)** are shown as **active** with the **footbrake pressed** and **inactive** with the **footbrake released.** This does **not** directly reflect the state of the stoplamp switch internal switch contacts as shown in the circuit diagrams.

1. Using the manufacturer approved diagnostic system, monitor the data-logger signal, PID-2B00 (brake input switch status - brake pedal switch / brake lamp switch) and PID-2B00 (brake input switch status - brake pedal switch /brake switch) inputs while the footbrake pedal is slowly pressed & released.
2. BLS = Brake Pedal Switch (brake lamp switch), BS = Brake Pedal Switch (brake switch). The correct inputs should be, pedal released **BLS = Inactive (BLS = 0)**, **BS = Inactive (BS = 0)**. Brief transition (as the pedal is pressed **BLS = Active (BLS = 1)**, **BS = Inactive (BS = 0)**. Pedal pressed **BLS = Active (BLS = 1)**, **BS = Active (BS = 1)**. If either input remains inactive during the test procedure a fault is evident.

Did the inputs show correctly?

Yes

Suspect an intermittent fault. Carry out visual and mechanical check of splice joints, all connectors and cables, check for corrosion, bent or damaged contact faces of pins, terminals and for security of connectors. Where possible flex cables while using the manufacturer approved diagnostic system, monitor the data-logger signal, PID-2B00 (brake input switch status - brake pedal switch / brake lamp switch) and PID-2B00 (brake input switch status - brake pedal switch /brake switch). This test should be carried out with the stoplamp-switch in both the pressed and released position independently. Refer to electrical circuit diagrams to locate the intermittent open circuit. Repair the circuit as required using the approved process. Clear the stored DTC, operate the footbrake and check for correct stoplamp operation.

No

GO to B2.

B2: STOPLAMP-SWITCH CIRCUIT 2

1. If **BLS = Inactive (0) BS = Active (1)** occurred with the footbrake released the fault is with the **(BS) = Brake Pedal Switch (brake switch) circuit**. If **BLS = Inactive (0) BS = Active (1)** occurred with the footbrake pressed the fault is with the (BLS) = **Brake-pedal switch (brake lamp switch) circuit**.

Did BLS (brake lamp switch) = Inactive (0) BS (brake switch) = Active (1) occur with the footbrake released?

Yes

Suspect a stoplamp-switch (brake switch) circuit fault. Refer to electrical circuit diagrams and replace blown fuse or locate the open circuit. Repair the circuit as required using the approved process. Clear the stored DTC, operate the footbrake and check for correct stoplamp operation.

No

Suspect a stoplamp-switch (brake lamp switch) circuit fault. Refer to electrical circuit diagrams and replace blown fuse or locate the open circuit. Repair the circuit as required using the approved process. Clear the stored DTC, operate the footbrake and check for correct stoplamp operation.

PINPOINT TEST C : PLAUSIBILITY – STOPLAMP-SWITCH (BLS) VERSES BRAKE PRESSURE (PS) (DTC C1A96-64)

TEST CONDITIONS	DETAILS/RESULTS/ACTIONS

C1: IDS MONITOR

- NOTE: These tests are to be carried out if DTC C1A96-64 plausibility – Stoplamp-switch (BLS) verses brake fluid hydraulic pressure (PS) has been stored.

- NOTE: This DTC indicates plausibility – the stoplamp-switch must be seen to operate before brake fluid hydraulic pressure (PS) exceeds a pressure threshold of 10 Bar.

- NOTE: The stoplamp-switch status is monitored by the ABS module (**BLS** terminal 30).

- NOTE: The ABS module contains an internal pressure sensor and monitors the brake fluid hydraulic pressure (PS).

1. Using the manufacturer approved diagnostic system, check for ABS module pressure sensor DTCs C1A99-01 or C1A99-49. If either of these DTCs has been stored carry out the specified action prior to investigating DTC C1A96-64.
2. Using the manufacturer approved diagnostic system, monitor the data-logger signal PID-2B00 (brake input switch status - brake pedal switch / brake lamp switch) and PID-2B0D (brake fluid hydraulic pressure) . When the brake pedal is pressed, the (brake-pedal switch / brake lamp switch) status should change from **Inactive (BLS = 0)** to **Active (BLS = 1)** before the brake fluid hydraulic pressure reaches 1000KPa (10 Bar).

Does the (brake pedal switch / brake lamp switch) change from **Inactive (BLS = 0)** to **Active (BLS = 1)** before the brake fluid hydraulic pressure reaches **1000KPa (10 Bar)**?

Yes

Suspect an intermittent brake-lamp switch circuit fault. Refer to electrical circuit diagrams, carry out visual and mechanical check of the of splice joints, connectors and cables of the stoplamp-switch circuit, check for corrosion, bent or damaged contact faces of pins, terminals and for security of connectors. Where possible flex cables to attempt to induce the intermittent open circuit. Repair the circuit as required using the approved process. Clear the stored DTC, operate the Footbrake and check for correct stoplamp operation.

No

GO to C2.

C2: STOPLAMP-SWITCH ADJUSTMENT CHECK	
• NOTE: Removal and correct installation of the stoplamp-switch will reset the adjustment. Ensure the footbrake pedal is fully raised against its upstop, (pedal rest position) when installing the stoplamp switch.	
	1 Check that the stoplamp-switch is securely installed and correctly adjusted. REFER to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).
	Is the fault still present with the stoplamp-switch securely installed and correctly adjusted? **Yes** Suspect a brake-lamp switch circuit fault. Refer to electrical circuit diagrams, carry out visual and mechanical check of the splice joints, connectors and cables of the stoplamp-switch circuit, check for corrosion, bent or damaged contact faces of pins, terminals and for security of connectors. Repair the circuit as required using the approved process. Clear the stored DTC, operate the Footbrake and check for correct stoplamp operation. **No** Adjust the stoplamp-switch using the approved process. Clear the stored DTC, operate the footbrake and check for correct stoplamp operation.

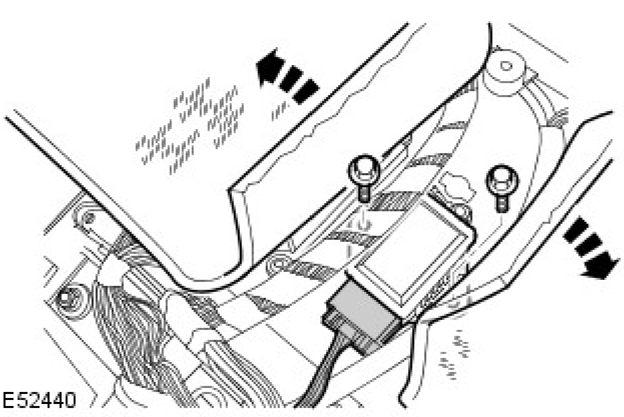
Anti-Lock Control - Stability Assist - Yaw Rate Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the floor console.
   For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).



E52440

3. ⚠ CAUTION: Make sure the wiring harness is protected when cutting the carpet.

   Remove the yaw rate sensor.

   - Cut the carpet for access.
   - Position the wiring harness aside.
   - Disconnect the electrical connector.
   - Remove the 2 bolts.

Installation

1. Install the yaw rate sensor.
   - Tighten the bolts to 10 Nm (7 lb.ft).
   - Connect the electrical connector.
   - Attach the wiring harness.
   - Attach the carpet.
2. Install the floor console.
   For additional information, refer to: Floor Console (501-12 Instrument Panel and Console, Removal and Installation).
3. If a new yaw rate sensor has been installed, interrogate the ABS system using T4.

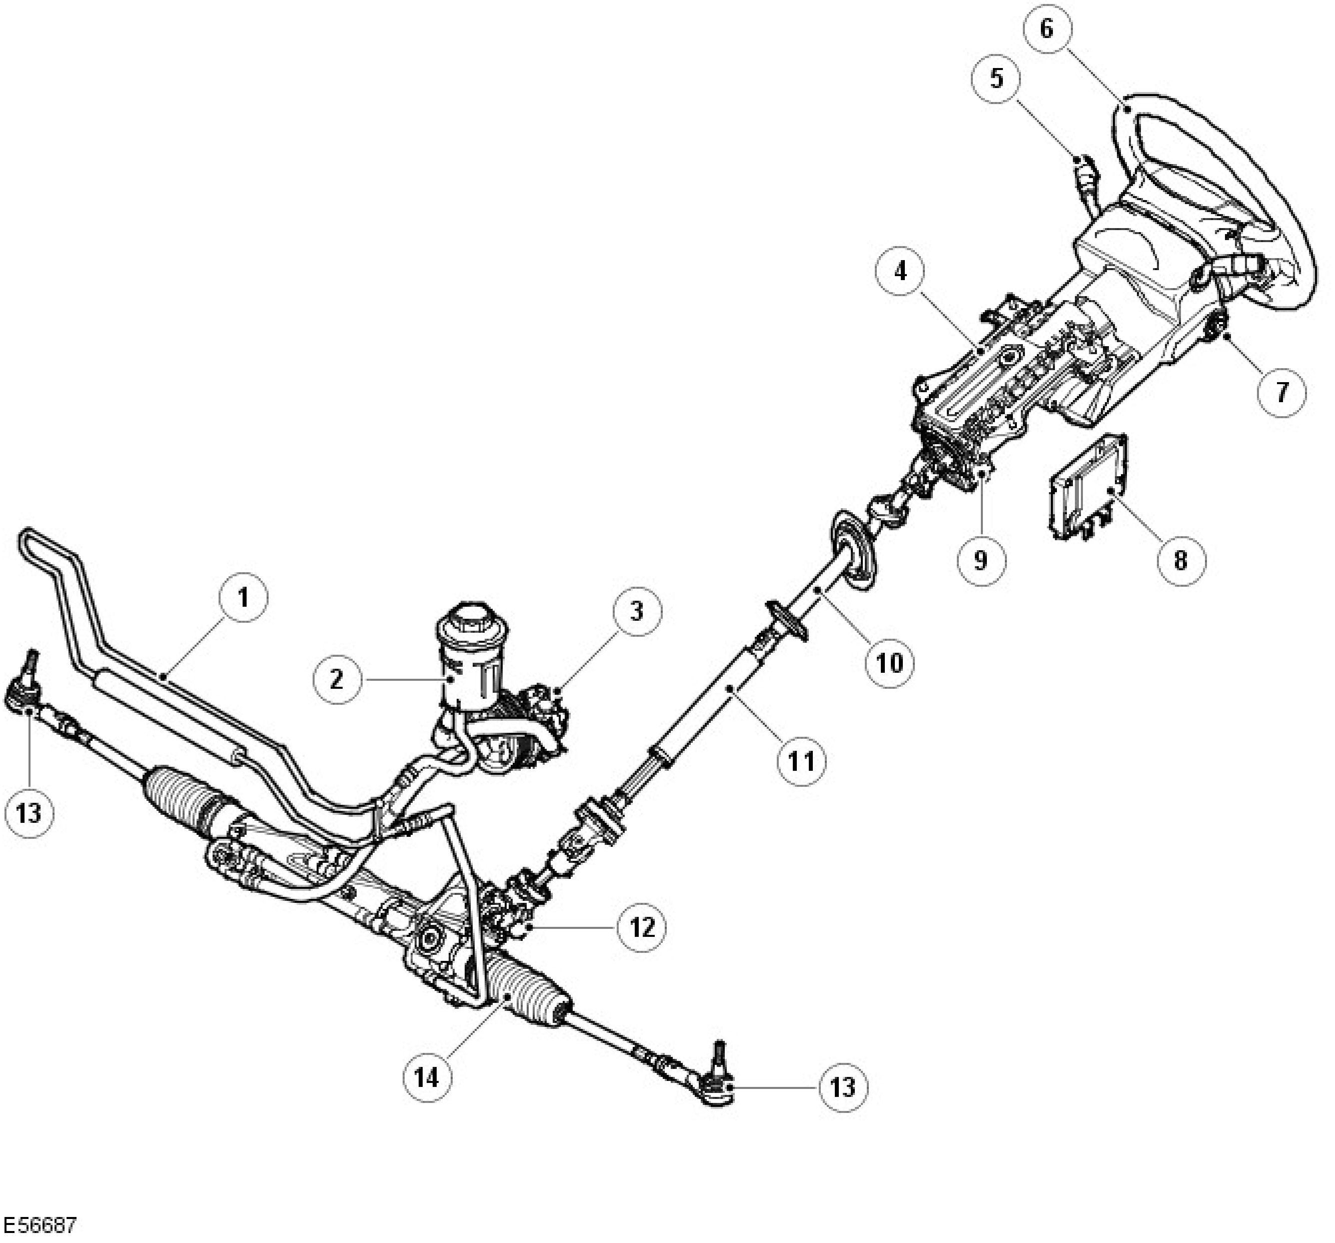
Steering System - General Information - Steering System

Description and Operation

Steering System Component Layout

- NOTE: 2.7L TdV6 Left Hand Drive shown



Item	Part Number	Description
1	-	Fluid cooler
2	-	Reservoir
3	-	Power steering pump
4	-	Upper steering column assembly
5	-	Steering column multifunction switches
6	-	Steering wheel
7	-	Column electric adjustment switch
8	-	Air suspension control module
9	-	Steering angle sensor

10	-	Lower collapsable shaft
11	-	Intermediate shaft
12	-	Servotronic valve
13	-	Track rod end
14	-	Steering gear

GENERAL

The steering system on all models comprises the following components:

- Steering gear with Servotronic valve
- Servotronic software integrated into air suspension control module
- Power steering pump
- Reservoir
- Lower collapsable shaft
- Intermediate shaft
- Upper column assembly with electrical adjustment
- Steering column multifunction switches
- Steering column adjustment switch
- Steering wheel.

The steering system uses a ZF rack and pinion steering gear with a conventional end take-off and a pinion power assisted unit with the addition of ZF Servotronic 2 assistance. The steering gear is handed depending on vehicle drive hand but is common to all three engine variants.

Servotronic 2 adds electronic control and speed sensitive steering to the steering gear. The Servotronic 2 feature provides easy and comfortable steering operation when parking, improved 'road feel' at increased road speeds and adds an integrated, positive center feel feature which optimises steering wheel torque during high speed driving. The Servotronic 2 system is controlled by software which is incorporated into the air suspension control module. The software responds to steering torque inputs and road speed signals and controls the assistance via a transducer valve located on the steering gear valve.

The steering column features fully electrical adjustment for tilt and reach. On vehicles fitted with memory seats, the steering wheel position control is incorporated into the memory module.

Each steering system uses an engine mounted power steering pump which is driven by an auxiliary belt. The location and attachment of the pump differs between engine variants. A power steering fluid reservoir is mounted near to each pump and provides fluid supply to the pump via a suction hose.

The steering system incorporates a fluid cooler in the hydraulic pipe layout. The cooler is routed near to the front of the vehicle to benefit from the increased airflow when the vehicle is moving. The power steering fluid is cooled as it returns from the gear to the reservoir via the cooler by air flowing over the cooler.

The upper column components are common to all models and drive hands. A collapsable lower shaft is located on the gear pinion shaft by two flats. An intermediate shaft is located between the lower collapsable shaft and the upper column assembly.

The column assembly, which is attached to the vehicle cross-car beam, provides the location for the steering column reach and rake adjustment switch, the steering column multifunction switches, the steering wheel, the steering column lock and the ignition switch. The column assembly comprises a number of components which are designed to allow the column to collapse in a controlled manner in the event of a frontal impact (reducing occupant loads). The lower collapsible shaft is designed to telescope, and the intermediate shaft to de-couple, to prevent excessive frontal impact loads/displacements being transmitted to the steering column.

Steering System - General Information - Steering System

Diagnosis and Testing

Overview

The steering is a variable power assist system, the degree of assistance being controlled by the dynamic suspension control module.

For information on the description and operation of the system, refer to section 211-00 - Steering System of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
   - If a road test is necessary make sure the vehicle is safe to do so.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Check the tires for correct pressure, size and tread pattern ● Check for wheel rim and tire damage ● Check road wheel security ● Check the power steering fluid level and the hydraulic circuit for oil leaks ● Check the power steering pump drive belt condition and tension ● Check the power steering pump for security, wear, damage and excessive noise ● Check the steering gear assembly for damage, wear and security ● Check the hydraulic pipes and cooler lines for damage and correct routing ● Check the steering joints for damage, excessive play, wear and security ● Check the steering column and joints for damage, excessive play, wear and security	● Check the electrical connections to the servotronic transducer valve (power steering control valve actuator) ● Steering angle sensor (SAS) and circuits ● Controller area networks (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. • NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

   4. Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the Symptom Chart or DTC Index.
   - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
   - Make sure that all DTCs are cleared following rectification

Symptom Chart

Symptom	Possible Causes	Action
Steering wanders	● Excessive free play in the steering system ● Steering geometry incorrectly aligned	Check for excessive movement or play in the steering system with the engine running. Check for play at several different steering positions. Carry out steering geometry and alignment checks. Refer to the relevant section of the workshop manual
Steering pulls to the left or right	● Steering geometry incorrectly aligned	Carry out steering geometry and alignment checks using a four wheel alignment system. Refer to section 204-00 - Suspension System - General Information of the workshop manual. Ensure that the tire direction of rotation is correct for the position on the vehicle (where directional tires are installed)

Symptom	Possible Causes	Action
Steering feels notchy when turning from lock to lock.	Steering or suspension swivel joints seized Steering tie rod end joints or track rod inner joints seized Steering column or universal joints seized Steering gear internal components misaligned, worn or damaged	Disconnect the steering gear from the suspension. Check for freedom of movement in the suspension. Disconnect the steering column from the steering gear. Check the steering column and universal joints for freedom of movement. Check the steering gear for freedom of movement. Rectify as necessary
Steering feels tight and does not self-center		
Power steering hydraulics noisy operation	Power steering fluid level low or contaminated Incorrect specification of power steering fluid Power steering fluid aerated power steering hoses twisted or restricted.	Check and top-up the power steering fluid level if required, using the correct specification of fluid. Refer to section 204-00 - Suspension System - General Information of the workshop manual. Check for contaminated fluid. Check for air ingress into the system. Check the power steering hoses for twisting or restrictions. Rectify as necessary
Power steering pump noisy	Power steering fluid level low or contaminated Pump internal components worn or damaged	Check and top-up the power steering fluid level if required. Refer to the relevant section of the workshop manual. Check for contaminated fluid. Check for excessive pump noise. Rectify as necessary
Power steering gear noisy	Power steering fluid level low or contaminated Steering gear internal components worn or damaged	Check and top-up the power steering fluid level if required. Refer to the relevant section of the workshop manual. Check for contaminated fluid. Check for excessive steering gear noise. Rectify as necessary
Steering column noisy	Steering column fouling or universal joints dry	Check the steering column and universal joints. Rectify as necessary
Power steering feels heavier than normal through its operating range	Lack of power assistance Servotronic transducer valve or circuit fault	Check the power steering pump pressure. Check the steering column has no damage and rotates freely. Refer to the Network Communications section of the workshop manual. Check for DTCs indicating a steering transducer fault
Power steering feels too light at speed		
Power steering feels too heavy at standstill and low speed		

DTC Index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: Intermittent faults may cause DTCs to be logged, however some DTCs may be cleared during an ignition off, ignition on cycle. Carry out a road test (if safe to do so), check the functionality of the system and retrieve any DTCs **before** turning the ignition off.

DTC	Description	Possible Causes	Action
B1C3173	Steering Column Motor Relay	Software error (electric column not installed) Steering column motor relay fault (stuck on)	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column motor circuit for short or open circuit and check/renew the memory control module as necessary

DTC	Description	Possible Causes	Action
B1C3193	Steering Column Motor Relay	- Software error (electric column not installed) - Memory control module internal relay fault (inoperative)	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, check/renew the control module as necessary
B1C3213	Steering Column Tilt Solenoid	- Software error (electric column not installed) - Steering column motor tilt solenoid open load	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt solenoid circuit for short or open circuit and check/renew the tilt solenoid as necessary
B1C3296	Steering Column Tilt Solenoid	- Software error (electric column not installed) - Steering column motor tilt solenoid thermal overload	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt solenoid circuit for short or open circuit. Check for other relevant DTCs and repair as necessary. Allow the solenoid to cool, clear the DTC and check the solenoid/tilt function operation. If the DTC persists renew the tilt solenoid as necessary
B1C333A	Steering Column Tilt Feedback Signal	- Software error (electric column not installed) - Steering column tilt motor moved beyond expected range - Sensor circuit open or short circuit - Motor position sensor fault	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt solenoid feedback circuit for short or open circuit. Check the solenoid/tilt function operation and range of movement. Renew the tilt solenoid as necessary
B1C3413	Steering Column Telescopic Solenoid	- Software error (electric column not installed) - Steering column motor telescopic solenoid open load	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column telescopic solenoid circuit for short or open circuit and check/renew the tilt solenoid as necessary
B1C3496	Steering Column Telescopic Solenoid	- Software error (electric column not installed) - Steering column motor telescopic solenoid thermal overload	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column telescopic solenoid circuit for short or open circuit. Check for other relevant DTCs and repair as necessary. Allow the solenoid to cool, clear the DTC and check the solenoid/telescopic function operation. If the DTC persists renew the telescopic solenoid as necessary
B1C353A	Steering Column Telescopic Feedback Signal	- Software error (electric column not installed) - Steering column telescopic motor moved beyond expected range - Sensor circuit open or short circuit - Motor position sensor fault	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column telescopic solenoid feedback circuit for short or open circuit. Check the solenoid/telescopic function operation and range of movement. Renew the telescopic solenoid as necessary
B1C363A	Steering Column Tilt/Telescope Switch	- Software error (electric column not installed) - Steering column tilt/telescopic switch voltage beyond expected range - Sensor circuit open or short circuit - Switch fault	Where an electric column adjustment is not installed, no action necessary, clear/ignore DTC. Where an electric column adjustment is installed, refer to the electrical guides and check the column tilt/telescopic switch circuit for short or open circuit. Check the tilt/telescopic switch operation and renew the switch as necessary
C005104	Steering Wheel Position Sensor	- System internal failure - Harness/connector issue	Check the steering angle sensor, connector and circuits. Refer to the electrical guides

DTC	Description	Possible Causes	Action
C005162	Steering Wheel Position Sensor	● Signal compare failure ● Harness/connector issue	Check the steering angle sensor, connector and circuits. Refer to the electrical guides
C005164	Steering Wheel Position Sensor	● Signal plausibility failure ● Harness/connector issue	Check the steering angle sensor, connector and circuits. Refer to the electrical guides
C112201	Steering Isolation Valve	● Servotronic steering valve circuit high resistance ● Servotronic steering valve circuit short circuit to ground ● Servotronic steering valve fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system
C11231C	Steering Isolation Valve Supply Circuit	● Servotronic steering valve supply circuit high resistance ● Servotronic steering valve supply circuit short circuit to ground ● Servotronic steering valve supply circuit short circuit to power ● Servotronic steering valve fault	Refer to the guided diagnostic routine for this code on the approved diagnostic system
C1B1862	Supply Voltage X-Ref Check	● Inconsistent battery voltages received by air suspension control module ● Air suspension control module supply circuit short circuit to ground ● Air suspension control module supply circuit high resistance ● Air suspension control module failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if a module is suspect
U007388	Control Module Communication Bus 'A' Off	● CAN bus off	Refer to the Network Communications section of the workshop manual
U012287	Lost Communication With Vehicle Dynamics Control Module	● CAN module status signals not received from the VDM in the specified time	Check for ABS DTCs. Refer to the Network Communications section of the workshop manual
U012687	Lost Communication With Steering Angle Sensor Module	● CAN bus fault ● Steering angle sensor module disconnected ● Steering angle sensor module not configured ● Steering angle sensor module failure ● Harness/connector issue	Check the control module installation/configuration. Refer to the Network Communications section in the workshop manual
U030055	Internal Control Module Software Incompatibility	● Software incompatibility with ATCM ● Not configured	Configure the modules using the approved diagnostic system. Refer to the Network Communications section of the workshop manual

DTC	Description	Possible Causes	Action
U041686	Invalid Data Received From Vehicle Dynamics Control Module	● ABS fault	Check for dynamic suspension/ABS DTCs. Refer to the relevant section of the workshop manual
U1A1449	CAN Initialization Failure	● Internal electronic fault	Configure the steering angle sensor module using the approved diagnostic system. Refer to the Network Communications section of the workshop manual
U300262	Vehicle Identification Number	● Signal compare failure	Program the module using the approved diagnostic system

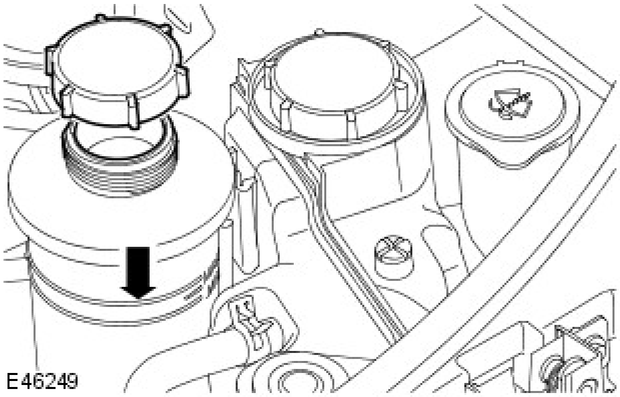
Steering System - General Information - Power Steering System Filling and Bleeding

General Procedures

1. Check the power steering fluid level.



2. ⚠ CAUTION: Fluid must always be present in the reservoir during bleeding.

Remove the filler cap and fill to the MAX level mark.

- Install the reservoir filler cap.

3. Start the engine and allow to run for 10 seconds, stop the engine.

- Check the power steering fluid, if aerated, wait until fluid is free from bubbles then top-up reservoir to UPPER level mark with recommended fluid.

4. ⚠ CAUTION: Do not hold steering on full lock for longer than 10 seconds.

Start the engine and turn steering fully lock to lock, stop the engine.

- Check and top-up power steering fluid level.

5. Start and run the engine for 2 minutes, turn the steering fully lock to lock.

- Check and top-up power steering fluid level.

Published: 11-May-2011

Steering System - General Information - Power Steering System Flushing

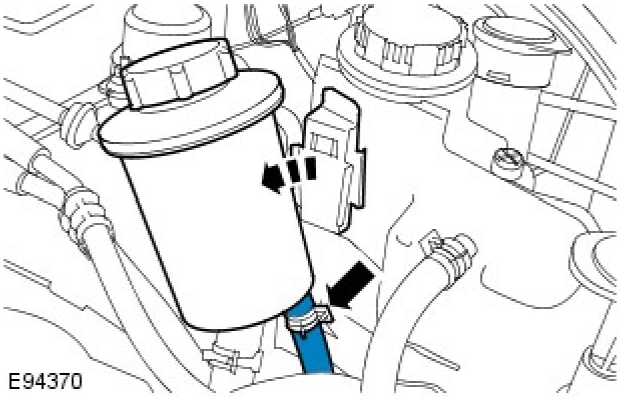
General Procedures

• NOTE: If heavy steering or contamination within the power steering system is found, it is necessary to carry out the system flush procedure as detailed below. If any components have been replaced in the power steering system the procedure below must be carried out in full.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

1. Remove the power steering fluid reservoir cap.

2. Using a suitable syringe, remove the power steering fluid from the power steering fluid reservoir.

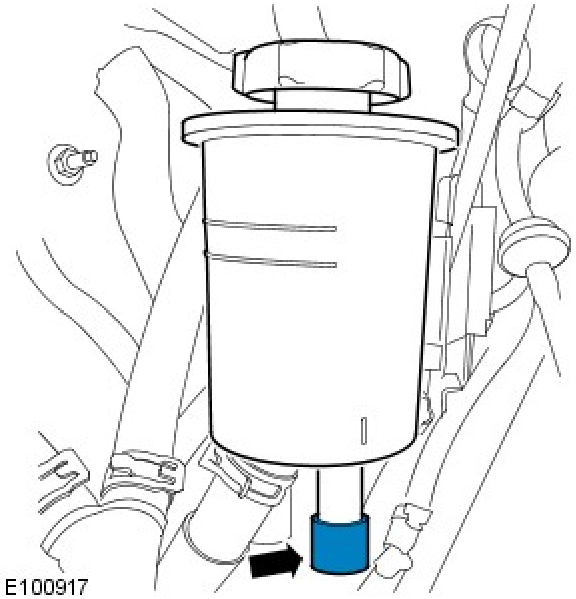


3. ⚠ CAUTION: Be prepared to collect escaping fluids.

• NOTE: Note the orientation of the clip.

Detach the power steering fluid reservoir.

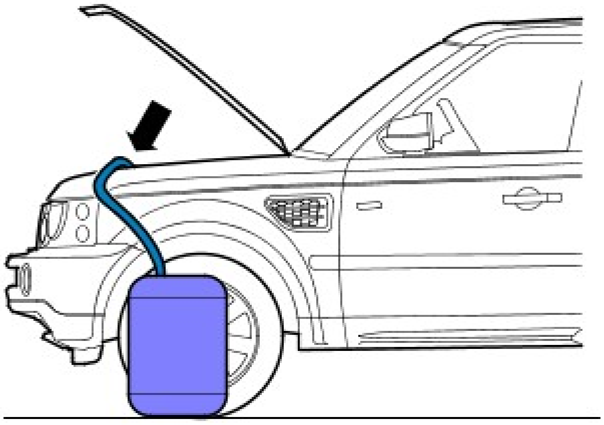
- Detach but do not remove the power steering fluid reservoir.
- Release the power steering fluid return hose from the power steering fluid reservoir.
- If a quick release coupling is fitted to the power steering return hose, release the power steering fluid return hose from the coupling by removing the clip.



4. ⚠ CAUTION: Be prepared to collect escaping fluids.

• NOTE: Make sure that all openings are sealed. Use new blanking caps.

Using a suitable blanking cap, cap the power steering reservoir return pipe.

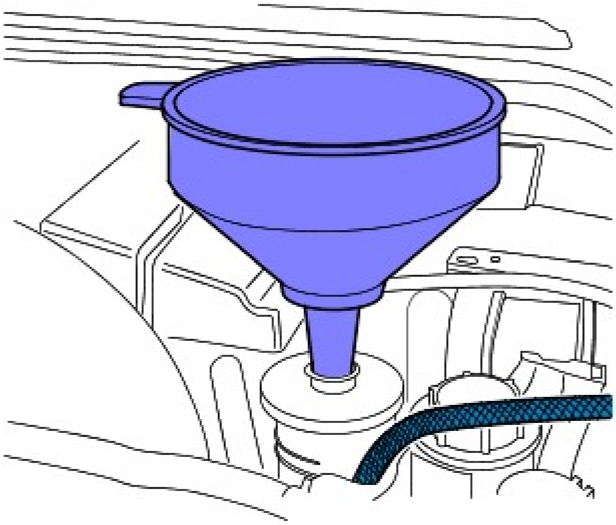


E100918

5. ⚠ CAUTION: Be prepared to collect escaping fluids.

- NOTE: Make sure the extended pipe is not kinked or twisted and is correctly secured with hose clips.

Attach a suitable pipe to the power steering return hose to allow the fluid to drain.



E94372

6. NOTE: The suitable funnel should have the a capacity of 4 litres and O-ring seal

- NOTE: The suitable funnel must be tightly sealed to the power steering fluid reservoir to avoid fluid leakage.

Install a suitable funnel onto the power steering fluid reservoir.

7. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

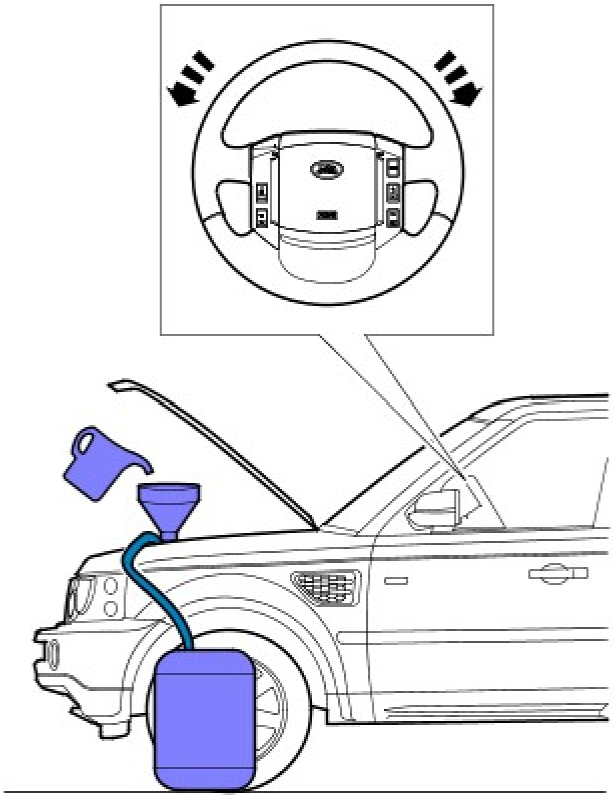
Raise and support the vehicle with the wheels just clear of the ground.

8. CAUTIONS:

⚠ Steps 8 and 9 must be carried out within 2 - 3 seconds of each other. Failure to follow this instruction may result in damage to the power steering system.

⚠ Be prepared to collect escaping fluids.

Using the suitable funnel, top up the power steering system with the specified fluid. Make sure the fluid level is maintained at two thirds full in the funnel.



E94373

9. CAUTIONS:

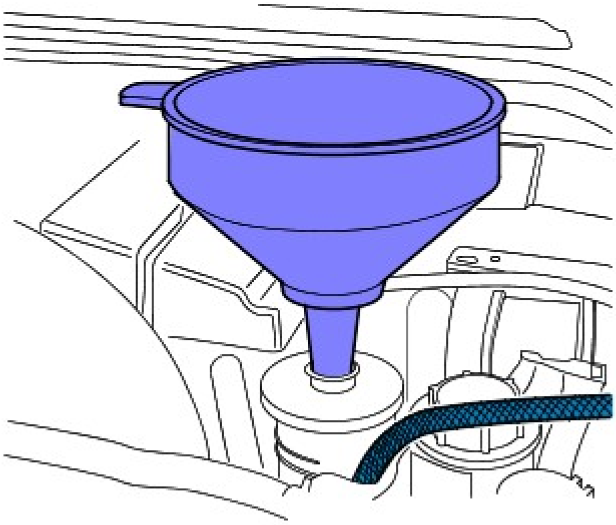
⚠ Be prepared to collect escaping fluids.

⚠ Do not allow the power steering fluid level in the power steering fluid reservoir to fall below the minimum power steering fluid level. Failure to follow this instruction may result in damage to the power steering system.

⚠ Make sure the engine is switched off as soon as the full 4 litres of power steering fluid has entered the power steering fluid reservoir.

Flush the power steering system.

- Start the engine
- With assistance turn the steering slowly lock to lock 3 times at approximately 1 revolution every 5 seconds.
- Continue to flush the power steering system until 4 litres of power steering fluid has been added to the power steering reservoir. This should take approximately 30 seconds.



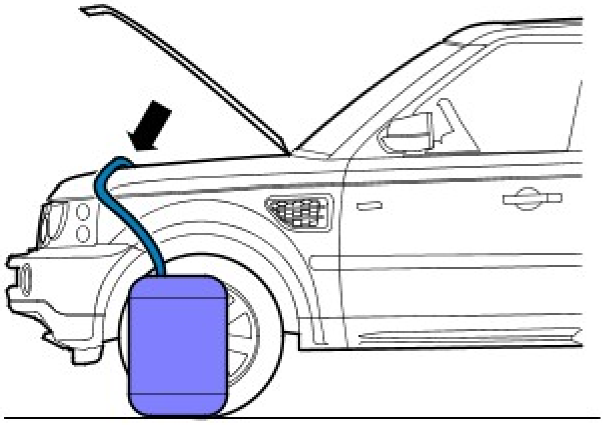
E94372

10. ⚠ CAUTION: Be prepared to collect escaping fluids.

Remove the suitable funnel.

11. ⚠ CAUTION: Be prepared to collect escaping fluids.

Remove the suitable pipe to the power steering return hose.



E100918

12. ⚠ CAUTION: Be prepared to collect escaping fluids.

- NOTE: Note the orientation of the clip.

If a quick release coupling is fitted to the power steering return hose, connect the power steering fluid return hose to the coupling by installing the clip.

13. Install a new power steering fluid reservoir.
For additional information, refer to: Power Steering Fluid Reservoir (211-02, Removal and Installation).

OVERVIEW

The steering system comprises a ZF manufactured rack and pinion Servotronic 2 steering gear, a power steering pump, a reservoir, a fluid cooler and fluid hoses. The steering gear is an end take-off rack and pinion power assisted unit with the addition of road speed proportional ZF Servotronic 2 assistance.

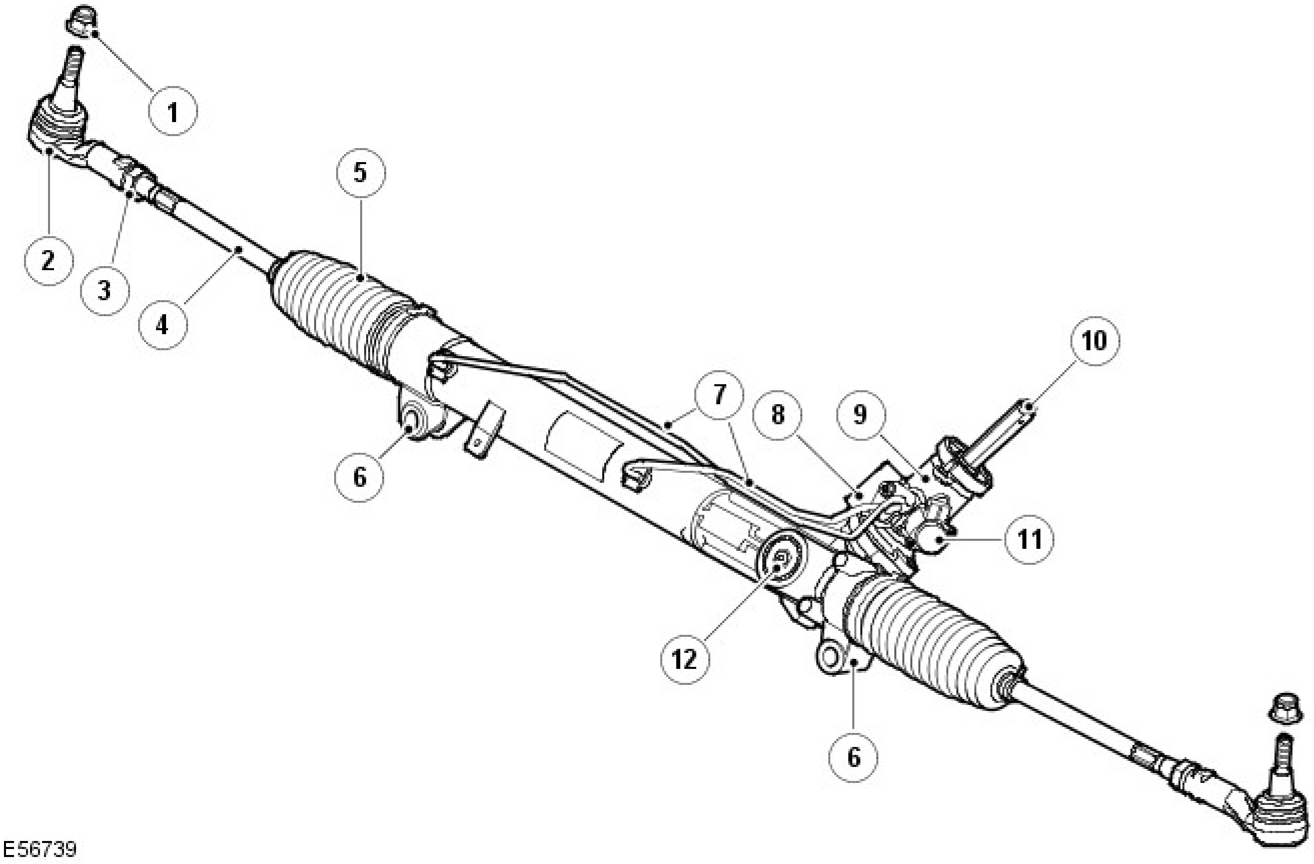
Servotronic 2 adds electronic control and speed sensitive steering to the steering gear. The Servotronic 2 feature provides easy and comfortable steering operation when parking, improved 'road feel' at increased road speeds and adds an integrated, positive centre feel feature which optimises steering wheel torque during high speed driving.

The Servotronic 2 system is controlled by software which is incorporated into the air suspension control module. The software responds to steering torque inputs and road speed signals and controls the assistance via a transducer valve located on the steering gear valve.

The steering gear has a variable ratio rack. This provides conventional response when the steering is in the centre, straight ahead position, but provides more direct and faster steer as the turning angle increases. The variable ratio provides precise and rapid steering response at high speeds and optimizes the steering of the vehicle when manoeuvring into parking spaces, turning in tight areas and when cornering in extreme conditions.

The steering gear rack has a travel of 158 mm (6.22 in). Lock to lock requires 3.167 revolutions of the steering wheel which gives a ratio of 45 mm (1.77 in)/revolution at the centre position and 52.6 mm (2.07 in)/revolution at end of lock.

STEERING GEAR



Item	Part Number	Description
1	-	Locknut

2	-	Tie-rod end
3	-	Locknut
4	-	Tie rod
5	-	steering gear boot
6	-	Steering gear casing attachment lugs
7	-	Pressure/return pipes
8	-	Pressure/return connection from/to pump
9	-	Valve unit housing
10	-	Input shaft
11	-	Servotronic valve
12	-	Pinion housing

The steering gear is located at the front of the engine, below the accessory belt drive. The gear is attached to two brackets on the chassis and is secured to the brackets with flanged bolts and caged nuts. The cage prevents the nuts from turning when the bolts are loosened or tightened. The cage nuts can only be used once and must be replaced when the gear is removed. For service, M12 Nylock nuts are available as a replacement for the cage nuts.

The steering gear comprises an aluminum, cast, valve housing which contains the hydraulic valve unit and Servotronic valve. The mechanical steering rack and the hydraulic power unit are located in a tubular steel cylinder which is attached to the cast valve housing.

The steering gear uses a rack with an integrated piston which is guided on plain bearings within the cylinder and the valve housing. The pinion, which is attached to the valve unit, runs in bearings and meshes with the rack teeth. The rack is pressed against the pinion by a spring loaded yoke which ensures that the teeth mesh with the minimum of play. The pinion is connected to the valve unit via a torsion bar. The rotary motion of the steering wheel is converted into linear movement of the rack by the pinion and is initiated by the valve unit. This movement is transferred into movement of the road wheels by adjustable tie-rods.

The rack teeth angles vary from 20 degrees in the centre position to 40 degrees at the end sections of the rack. It is this variation in teeth angles which provides the variable ratio.

The 50 mm (1.97 in) diameter piston of the hydraulic power unit is located at one end of the cylinder. Each side of the piston is connected to fluid pressure or fluid return via external metal pipes which are connected to the valve unit.

Each end of the gear has a threaded hole which provides for the fitment of the tie-rod. The external ends of the gear are sealed with steering gear boots which prevent the ingress of dirt and moisture. The tie-rod has a long threaded area which allows for the fitment of the tie-rod end. The thread allows for the adjustment of the steering toe. When the correct toe is achieved, a locknut is tightened against the tie-rod end preventing inadvertent movement.

The gear has a central hole machined along part of its length. The hole allows the air in the boots to be balanced when the steering is turned. The boots are serviceable items and are retained on the gear housing and the tie-rod with zip ties.

The valve unit is an integral part of the steering gear. The principle function of the valve unit is to provide maximum power assistance (i.e. when parking) with minimum effort required to turn the steering wheel.

The pinion housing of the valve is an integral part of the main steering gear casting. The pinion housing has four machined ports which provide connections for pressure feed from the power steering pump, return fluid to the reservoir and pressure feeds to each side of the cylinder piston.

The valve unit comprises an outer sleeve, an input shaft, a torsion bar and a pinion shaft. The valve unit is co-axial with the pinion shaft which is connected to the steering column via the input shaft. The valve unit components are located in the steering gear pinion housing which is sealed with a cap.

The outer sleeve is located in the main bore of the pinion housing. Three annular grooves are machined on its outer diameter. PTFE rings are located between the grooves and seal against the bore of the pinion housing. Holes are drilled radially in each annular groove through the wall of the sleeve. The bore of the outer sleeve is machined to accept the input shaft. Six equally spaced slots are machined in the bore of the sleeve. The ends of the slots are closed and do not continue to the end of the outer sleeve. The radial holes in the outer sleeve are drilled into each slot.

The input shaft has two machined flats at its outer end which allow for the attachment of the steering column intermediate shaft yoke. The flats ensure that the intermediate shaft is fitted in the correct position to maintain the optimum phase angle. The inner end of the input shaft forms a dog-tooth which mates with a slot in the pinion shaft. The fit of the dog-tooth in the slot allows a small amount of relative rotation between the input shaft and the pinion shaft before the dog-tooth contacts the wall of the slot. This ensures that, if the power assistance fails, the steering can be operated manually without over stressing the torsion bar. The central portion of the input shaft has equally spaced longitudinal slots machined in its circumference. The slots are arranged alternately around the input shaft.

The torsion bar is fitted inside the input shaft and is an interference fit in the pinion shaft. The torsion bar is connected to the input shaft by a drive pin. The central diameter of the torsion bar is machined to a smaller diameter in its central section. The smaller diameter allows the torsion bar to twist in response to torque applied from the steering wheel in relation to the grip of the tyres on the road surface.

The pinion shaft has machined upper teeth on its central diameter which mate with teeth on the steering gear rack. A slot, machined in the upper end of the pinion shaft mates with the dog-tooth on the input shaft. The pinion shaft locates in the pinion housing and rotates on ball and roller bearings.

Power Steering Hydraulic Operation

The following hydraulic circuits show power steering operation and fluid flow for the steering in a straight ahead, neutral position and when turning right. The circuit diagram for turning left is similar to that shown for turning right.

Power Steering in Neutral Position

- NOTE: Circuit shows steering rotary valve in neutral position with the vehicle not moving.

32	-	Piston
33	-	Power assist cylinder - left

When the engine is started, the power steering pump draws fluid from the reservoir down the low pressure suction line. The fluid passes through the pump and is delivered, via a hose, to the steering rack valve unit.

The pressurized fluid flows through a connecting bore in the valve and, via the feed fluid radial groove and the transverse bores in the valve sleeve, passes to the feed fluid control groove of the valve rotor.

In the neutral (straight ahead) position, the fluid passes over the open feed fluid control edges to all valve sleeve axial grooves. The fluid then passes through the open return fluid control edges and the return fluid control grooves of the valve rotor. The fluid then passes via connecting bores to the return fluid chamber and to the reservoir via an external hose.

Simultaneously, the radial grooves of the valve body and their associated pipes provide a connection between the left and right power assist cylinders.

Power Steering in Right Turn Position

- NOTE: Circuit shows steering rotary valve in right turn position, at high vehicle speed and with rapid steering corrections. The Servotronic transducer valve is fully open and the maximum hydraulic reaction is limited by the cut-off valve.

32	-	Piston
33	-	Power assist cylinder - left

When the steering wheel is turned to the right, the steering rack and piston moves to the right in the piston bore. The valve rotor is rotated to the right (clockwise) which directs pressurized fluid over the further opened feed fluid control edges and associated axial grooves, the radial groove and via an external pipe to the left power assist cylinder chamber. The pressure applied to the piston from the left power assist cylinder chamber provides the hydraulic assistance.

An adaptable pressure build-up is achieved by the partially or fully closed feed fluid control edges restricting or preventing a connection between the fluid pressure inlet and the other axial grooves connected to the radial groove.

Simultaneously, the fluid pressure outlet to the pressurized axial grooves are restricted or partially restricted by the closing return fluid control edges. The fluid displaced by the piston from the right power assist cylinder chamber, flows through an external pipe to the radial grooves. From there the fluid passes to the associated axial grooves and on to the return fluid control grooves, via the further opened return fluid control edges.

The return flow of fluid to the reservoir passes via interconnecting bores which lead to the return fluid chamber. When the steering wheel is turned to the left the operating sequence is as above but the pressure is applied to the opposite side of the piston.

SERVOTRONIC VALVE

The Servotronic transducer valve is located in a port on the side of the steering gear valve housing. The valve is sealed in the housing with an O-ring seal and is secured with two long screws into threaded holes in the housing. The Servotronic valve is a transducer controlled valve which responds to control signals supplied from the body control module.

The Servotronic valve determines the hydraulic reaction at the steering gear rotary valve and controls the input torque required to turn the steering wheel. The Servotronic system allows the steering to be turned with minimum effort when the vehicle is stationary or manoeuvred at slow speed. The hydraulic reaction changes proportional to the vehicle speed, with the required steering effort increasing as the vehicle moves faster. At high speeds, the Servotronic system provides the driver with a good feedback through the steering providing precise steering and improved stability.

The body control module contains a microprocessor which receives road speed signals from the ABS module and calculates the correct controlling signal for the Servotronic valve. The Servotronic software within the control module has a diagnostic capability which allows T4 to check the tune of the steering and retrieve fault codes relating to the Servotronic valve. Two fault codes are stored relating to the valve for positive connection short to ground or battery and negative connection short to ground or battery.

The Servotronic software within the body control module contains a number of steering maps which are selected via the car configuration file depending on the vehicle model, tire fitment and fitment of Dynamic Response.

If a failure of the Servotronic valve or software occurs, the system will suspend Servotronic assistance and only a default level of power assistance will be available. Fault codes relating to the fault are stored in the body control module. No warning lamps are illuminated and the driver may be aware of the steering being 'heavier' than usual.

Servotronic Operation

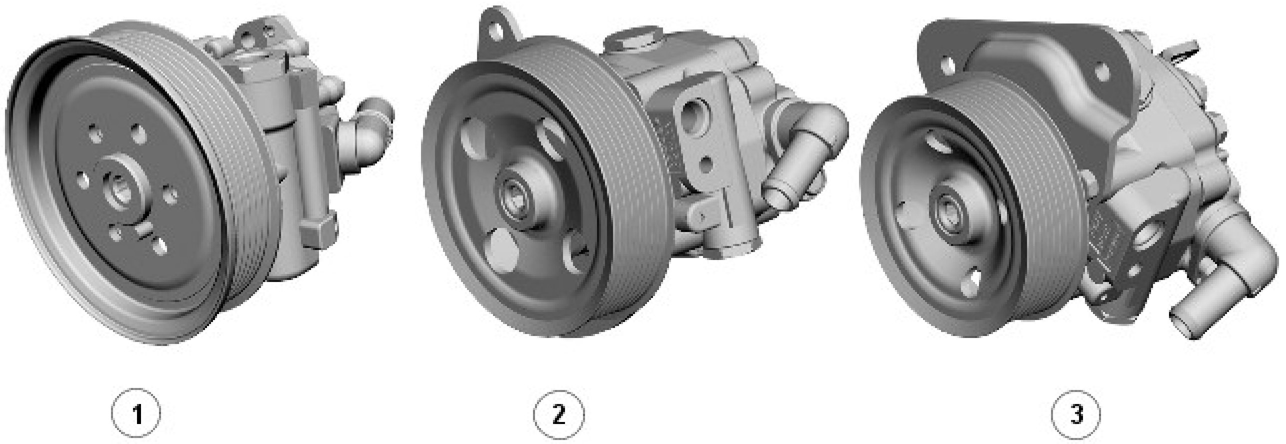
When the vehicle is manoeuvred into and out of a parking space (or other similar manoeuvre), the Servotronic function of the body control module uses road speed data from the ABS module to determine the vehicle speed, which in this case will be slow or stationary. The control module microprocessor analyses the signals and outputs an appropriate control current to the Servotronic transducer valve. The Servotronic valve closes and prevents fluid flowing from the feed fluid radial groove to the reaction chamber. An orifice also ensures that there is return pressure in the reaction chamber. This condition eliminates any 'reaction' ensuring that the steering is very light to operate, reducing the effort required to turn the steering wheel.

As the vehicle is driven and the road speed increases, the body control module microprocessor analyses the road speed signals from the ABS module and reduces the amount of control current supplied to the Servotronic valve. The Servotronic valve reacts to the control current and opens the valve by an amount appropriate to the road speed. This allows a controlled fluid supply from the feed fluid radial groove to the reaction chamber. The orifice prevents the loss of large amounts of fluid to the return fluid chamber. The higher fluid pressure acting on the reaction piston causes compression of the balls which are located between the reaction piston and the centering piece which in turn is securely connected to the valve sleeve. When driving in a straight line, this has a positive effect on the exact centralising of the steering valve. When the steering valve is actuated, the balls, with a higher load on them, provide additional torsional resistance to rotation of the valve rotor. This mode of Servotronic assistance requires an established higher steering wheel torque until the hydraulic assistance required in the left or right power assist cylinder is determined.

At high driving speeds, i.e. on a motorway, the Servotronic valve is fully open due to a very low or non-existent control current supplied from the body control module. This enables maximum pressure supply from the feed fluid radial groove to the reaction piston.

When the steering wheel is turned, the reaction pressure increases appropriate to the existing operating pressure and pressurizes the piston in the reaction chamber. As soon as the reaction pressure reaches its upper limit, the fluid is discharged to the return fluid chamber via the cut-off valve and prevents further increases in reaction pressure. This maintains the input torque applied through the steering wheel and provides the driver with an improved 'road feel' allowing precise steering and directional stability.

POWER STEERING PUMP



E131322

Item	Part Number	Description
1	-	5.0L V8
2	-	3.0L TdV6
3	-	3.6L TdV8 (from 2007MY)

The power steering pumps used are basically the same pump with different connection fitments, therefore they are not interchangeable.

Power Steering Pump - Petrol Engines

The pump is a fixed displacement, vane type pump which supplies hydraulic pressure to the steering gear valve unit. The pump is driven by a Poly Vee belt from the crankshaft pulley. A self-adjusting tensioner is fitted to maintain the correct tension on the belt.

The pump has an internal flow control valve which also incorporates a pressure relief valve. The pressure relief valve limits the maximum pressure supplied to the steering gear to 115 bar (1667 lbf in^2) ± 4 bar (58 lbf in^2). The flow control valve limits the maximum flow to 8.8 l/min (1.93 gal/min) ± 0.5 l/min (0.1 gal/min) regardless of engine speed. The pump has a displacement of 11 cc/rev (0.67 in^3/rev).

A shaft runs longitudinally through the pump. One end of the shaft is bolted on the drive pulley, the opposite end of the shaft is closed by a cover. The shaft runs in bearings located in the body and oil seals at each end of the shaft prevent leakage of hydraulic fluid.

The pump contains ten vanes which rotate within a cam ring and are driven by the shaft. As the vanes rotate, the cam ring causes the space between the vanes to increase. This causes a depression between the vanes and fluid is drawn from the reservoir via the suction hose into the space between the vanes.

As the shaft rotates, the inlet port is closed to the vanes which have drawn in fluid, trapping the fluid between the vanes. The cam ring causes the space between the vanes to reduce and consequentially compresses and pressurizes the hydraulic fluid trapped between them.

Further rotation of the shaft moves the vanes to the outlet port. As the vanes pass the port plate the pressurized fluid passes from the pump outlet port into the pressure hose to the steering gear.

The pressurized fluid is subject to control by the flow control and pressure relief valve. The flow control valve maintains a constant flow of fluid supplied to the steering gear irrespective of engine speed variations. The pressure relief valve activates only to limit the maximum system pressure on the output side of the pump. A metering orifice is included in the discharge port of the pump. If the pressure in the orifice reaches a predetermined level, a spring loaded ball in the centre of the flow control valve is lifted from its seat and allows pressurized fluid to recirculate within the pump.

The pressure relief valve will operate if the discharge from the pump is restricted, i.e.; steering held on full lock. If the output from the pump is blocked, all output is recirculated through the pump. In this condition, as no fresh fluid is drawn into the pump from the reservoir, the fluid temperature inside the pump will increase rapidly. Consequentially, periods of operation of the steering gear on full lock should be kept to a minimum to prevent overheating of the pump and the fluid within it.

Power Steering Pump - Diesel Engines

The pump is a variable displacement, vane type pump which supplies the required hydraulic pressure to the steering gear valve unit. The pump is located at the front of the engine and is driven by a Poly Vee belt which is directly driven from the crankshaft. A self-adjusting tensioner is fitted to maintain the correct tension on the belt.

The pump has an internal pressure relief valve and a flow control valve. The pressure relief valve limits the maximum pressure supplied to the steering gear to 115 bar (1667 lbf in^2) ± 4 bar (58 lbf in^2). The flow control valve limits the maximum flow as follows:

- TdV6 - 8.8 l/min (1.93 gal/min) ± 0.5 l/min (0.1 gal/min) at 10 bar (145 lbf in^2)
- TdV8 - 9.5 l/min (2.09 gal/min) ± 0.5 l/min (0.1 gal/min) at 10 bar (145 lbf in^2).

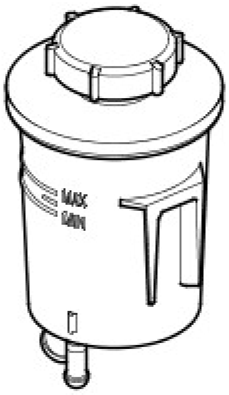
Both pumps have a displacement of 9.6 cc/rev (0.58 in^3/rev).

The output from the pump increases proportionally with the load applied to the steering valve unit. Inside the pump, a cartridge set consisting of 11 vanes and a rotor is mounted on the input shaft and is surrounded by the variable displacement cam.

The variable displacement pump maintains a constant fluid output by varying the internal displacement of the pump, unlike a conventional fixed displacement pump which has to use a flow control valve to recirculate the excess flow within the pump. At low engine speeds, the internal displacement of the variable displacement pump is at its maximum to generate the controlled fluid output.

As the pump speed increases with engine speed, the increased flow inside the pump generates a back pressure within the pump. This back pressure causes the cam ring to move and reduce the internal displacement of the pump to maintain the constant fluid flow from the pump. As the internal displacement of the pump decreases, the power and torque required to drive the pump reduces, which leads to improved fuel economy.

RESERVOIR



E46941

The fluid reservoir is located on a bracket in the left hand side of the engine compartment, behind the radiator. The reservoir comprises a body, cap and filter. The purpose of the reservoir is to contain a surplus of the hydraulic fluid in the system to allow for expansion and contraction of the fluid due to temperature variations. The fluid level ensures that the supply connection on the bottom of the reservoir is covered with fluid at all operating vehicle attitudes. Any air which is present in the system is exhausted from the system in the reservoir.

The body is a plastic moulding with two ports at the bottom which provide for the connection of the suction supply and return hoses. Moulded markings on the side of the reservoir denote the upper and lower fluid levels. A non-serviceable, 100 micron nylon mesh filter is fitted in the body. The filter removes particulate matter from the fluid before it is drawn into the pump supply connection.

The cap is rotated counterclockwise for one quarter turn to release from the body. The cap is fitted with an O-ring to prevent fluid leakage. The cap incorporates a breather hole to allow for changes in fluid level during operation and prevent vacuum or pressurization of the reservoir.

HIGH PRESSURE HOSE

The high pressure hose connecting the pump to the steering gear valve unit contains two attenuators. Each attenuator has a restrictor which is secured inside the hose. The restrictors damp pressure pulses from the pump, consequently reducing noise and strain on downstream components. The attenuators are an integral part of the hose and cannot be serviced separately.

FLUID COOLER

- NOTE: Diesel engine vehicles are not fitted with a fluid cooler.

The fluid cooler is located in the return line from the steering gear to the reservoir. The cooler comprises a flexible hose and a solid pipe which connect between the reservoir and the return pipe from the steering gear. The cooler is an integral part of the pipe and cannot be replaced as a separate component.

The cooler is a fabricated aluminum tube, through which the power steering fluid passes. The outer diameter of the cooler tube has aluminum loops attached to it which dissipate heat. Cool air entering the front of the vehicle passes over the cooler and flows through the loops. The loops act as heat exchangers, conducting heat from the fluid as it passes through the tube.

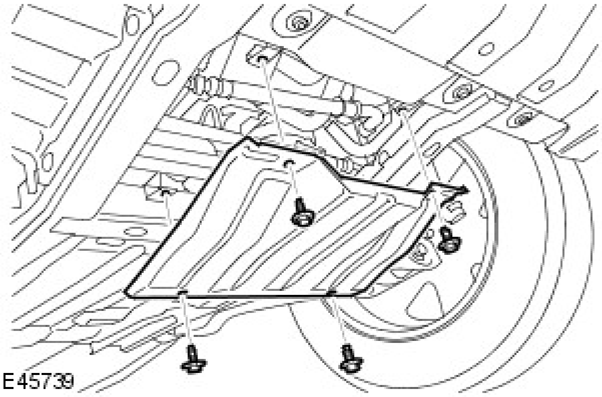
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

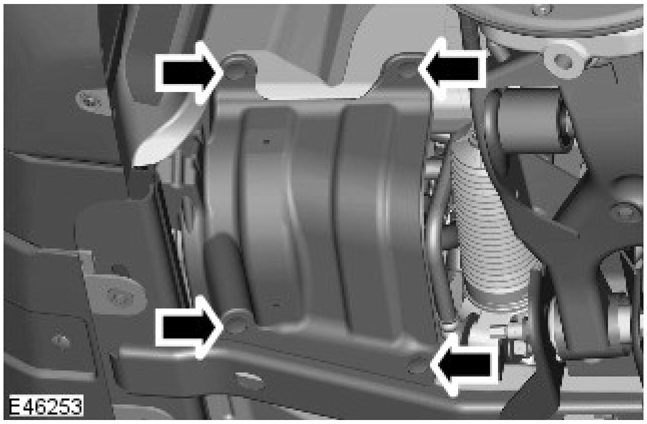
Raise and support the vehicle.

2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



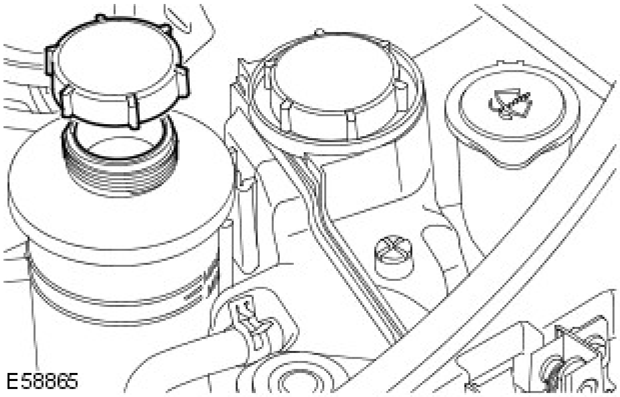
3. Remove the radiator access panel.

- Remove the 4 bolts.



4. Remove the front LH splash shield.

- Remove the 4 clips.



5. Siphon the fluid from the power steering reservoir.

- Remove the filler cap.
- Install the filler cap.

6. Position an absorbent cloth to collect fluid spillage.

7. ⚠CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

• NOTE: Care must be taken to avoid contamination of the drive belt.

Disconnect the power steering high-pressure pipe union.

- Remove the bolt.

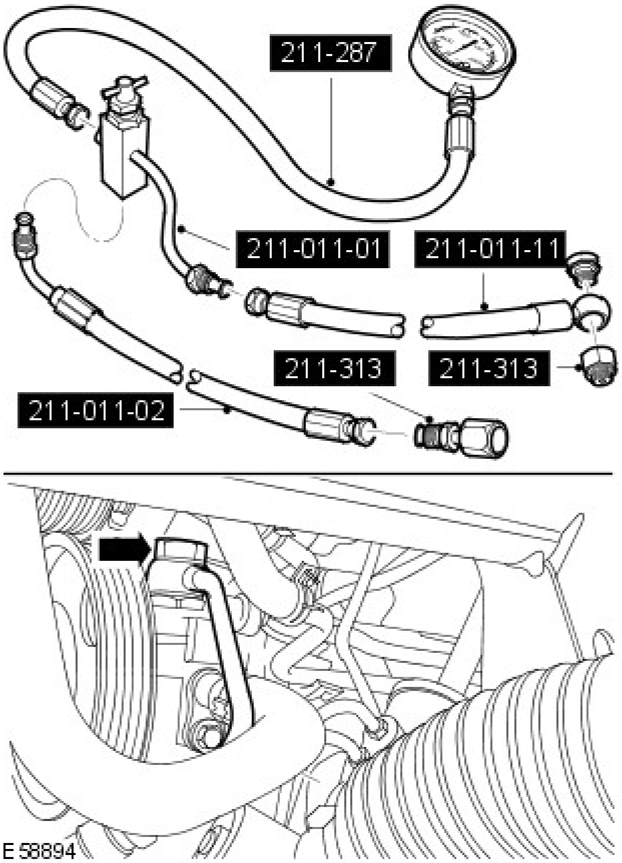
- Remove and discard the 2 sealing washers.
- Position a container to collect the fluid.

8. Install the special tools to the power steering high-pressure port.

- Install the O-ring seal.
- Tie the pressure gauge aside under the hood.

9. Install the special tool to the high-pressure union.

- Install the O-ring seals.
- Connect the special tool line, to the special tool valve block assembly.



10. Refill the power steering reservoir.

- Remove the filler cap.

11. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

12. NOTE: Ensure the steering components and test equipment are free from leaks.

• NOTE: Maintain the maximum fluid level during the test.

• NOTE: Make sure the steering is in the straight ahead position.

• NOTE: Under no circumstances must the low pressure spigot be removed from the steering pump.

With the test valve open start the engine.

- Start the engine and turn steering fully lock to lock, stop the engine.
- Top up the power steering fluid reservoir.
- Install the reservoir filler cap.

13. For correct power steering pressures, refer to the steering specification section.
For additional information, refer to: Specifications (211-02 Power Steering, Specifications).

14. With the engine at idle, slowly turn the steering wheel and hold on full lock.

- Record the pressure reading.

15. Repeat the above procedure for the other side.

- Record the pressure reading.

16. With the engine at idle, release the steering wheel. The pressure should be, at or below, the pressure specified.

17. Pressure outside this tolerance, indicates a fault.

18. To determine if the fault is in the steering pump or the steering rack, close the test valve for a maximum of 5 seconds.

19. If the pressures recorded fall outside the given values, replace the power steering pump.

20. If the maximum pump pressure is correct, then suspect the power steering rack.

21. On completion of the test stop the engine, disconnect the battery ground cable and siphon the steering fluid from the reservoir.

- Remove the filler cap.
- Install the filler cap.

22. Disassemble the test equipment.

23. Connect the high-pressure line to the power steering pump.

- Clean the component mating faces.
- Install the new O-ring seals.
- Tighten the bolt to 25 Nm (18 lb.ft).

24. Install the front LH splash shield.

- Secure with the clips.

25. Install the radiator access panel.

- Tighten the M6 bolts to 10 Nm (7 lb.ft).
- Tighten the M10 bolts to 45 Nm (33 lb.ft).

26. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

27. Refill and bleed the power steering.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

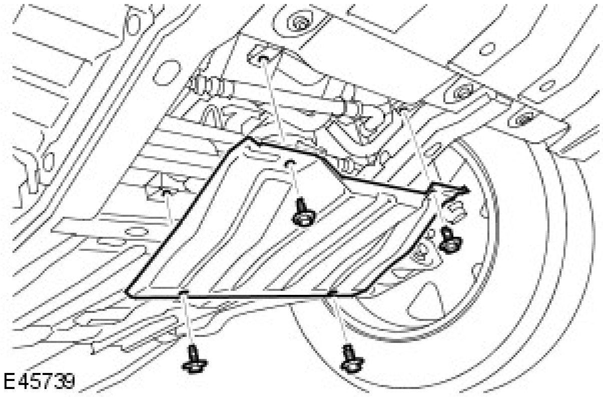
Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

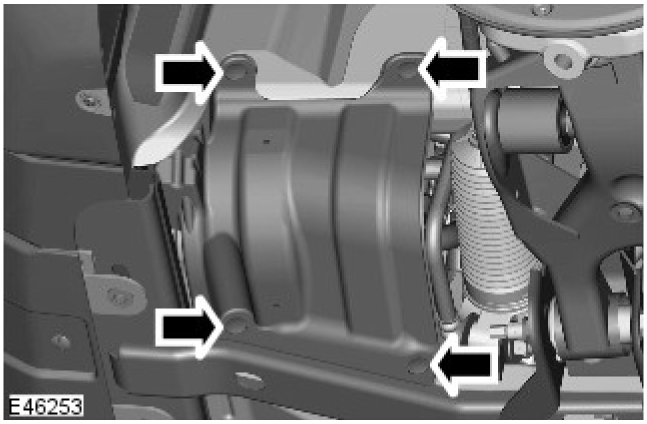
Raise and support the vehicle.

2. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



3. Remove the radiator access panel.

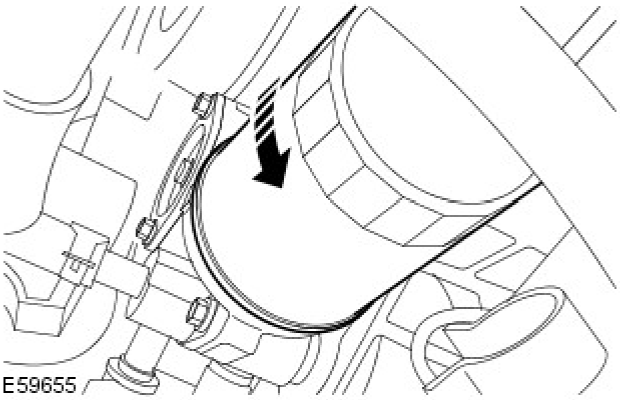
- Remove the 4 bolts.



4. NOTE: Left-hand shown, right-hand similar.

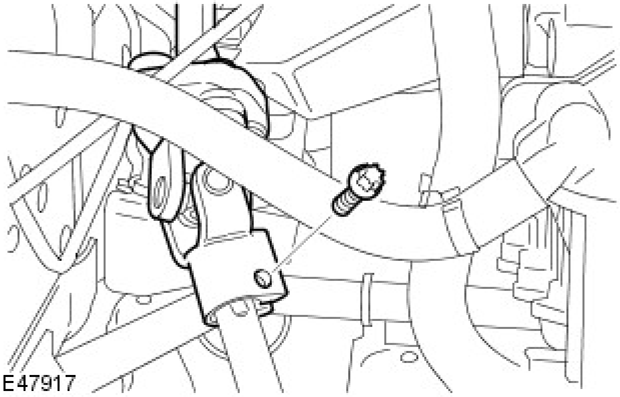
Remove the front RH and LH splash shields.

- Remove the 8 clips.



5. Remove the oil filter.

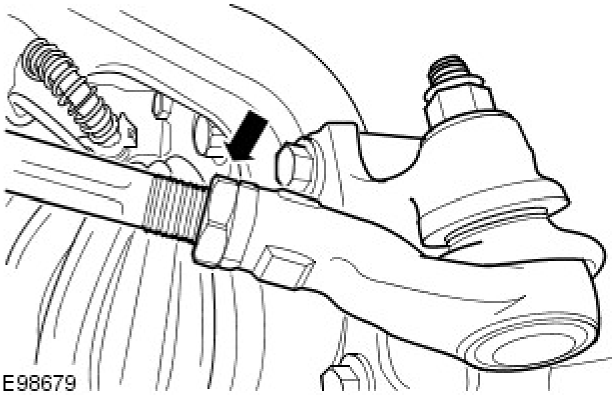
- Position a container to collect the fluid.



6. NOTE: Make sure the steering is in the straight ahead position.

Release the universal joint from the steering gear.

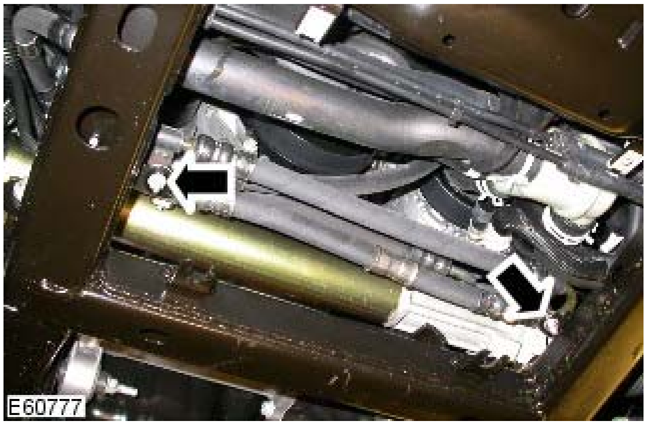
- Remove and discard the bolt.



7. NOTE: LH illustration shown, RH is similar.

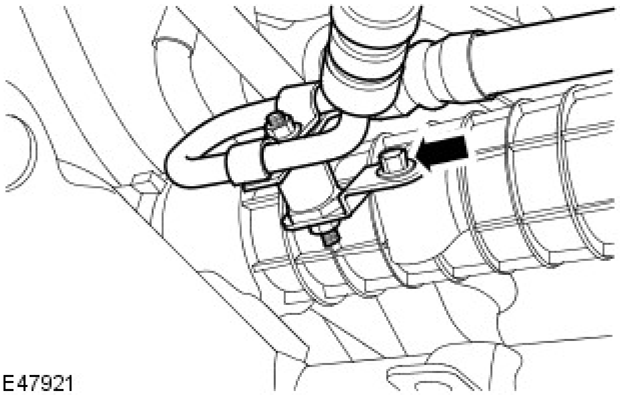
Release both tie-rod end ball joints.

- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.



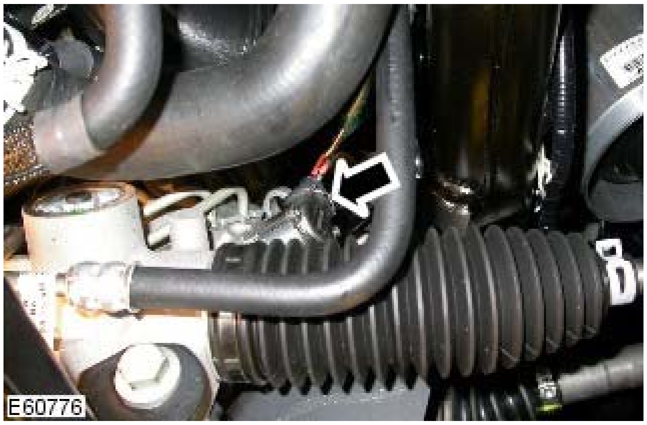
8. Release the dynamic response line supports.

- Remove the 2 nuts.
- Remove the 2 supports.



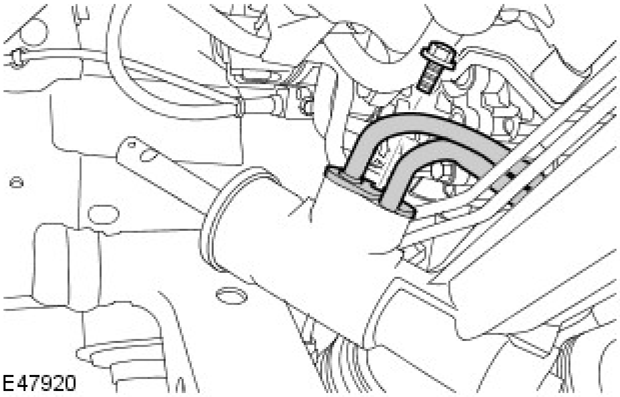
9. Release the power steering line support bracket.

- Remove the nut.



E60776

10. Disconnect the steering gear electrical connector.

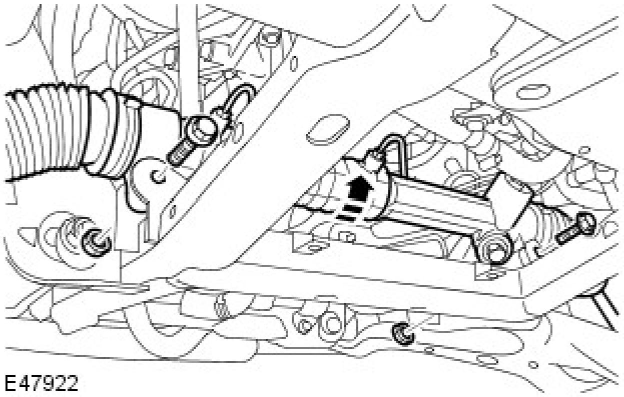


E47920

11. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the pressure lines from the power steering gear.

- Remove and discard the bolt.
- Allow the fluid to drain into a container.
- Remove and discard the O-ring seal.



E47922

12. Remove the steering gear.

- Remove the 2 bolts and discard the cage nuts.
- Support the engine.
- With assistance, carefully rotate and release the steering gear.

Installation

1. Clean the component mating faces.

2. Install the steering gear.

- Tighten the bolts to 175 Nm (129 lb.ft).

3. Connect the electrical connector.

4. Connect the steering gear pressure lines.

- Clean the component mating faces.
- Install new O-ring seals.
- Tighten the bolt to 22 Nm (16 lb.ft).

5. Install the power steering line support bracket.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

6. Install the dynamic response line supports.

- Tighten the supports to 10 Nm (7 lb.ft).
- Tighten the nuts to 10 Nm (7 lb.ft).

7. Connect the tie-rod end ball joints.

- Attach both tie rods to previously noted positions.
- Tighten the tie-rod locking nut.

8. Connect the universal joint to the steering gear.

- Install new patchlock bolt and tighten to 30 Nm (22 lb.ft).

9. Install the engine oil filter.

- Lubricate the oil filter seal with clean engine oil and tighten to 18 Nm (13 lb.ft).
- Tighten the bolts to 10 Nm (7 lb.ft).

10. Fill and bleed the power steering system.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

11. Check and top-up the engine oil.

12. Adjust the front wheel alignment.

13. Install the radiator access panel.

- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).

14. Install the splash shields.

- Install the clips.

15. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

Removal and Installation

Removal

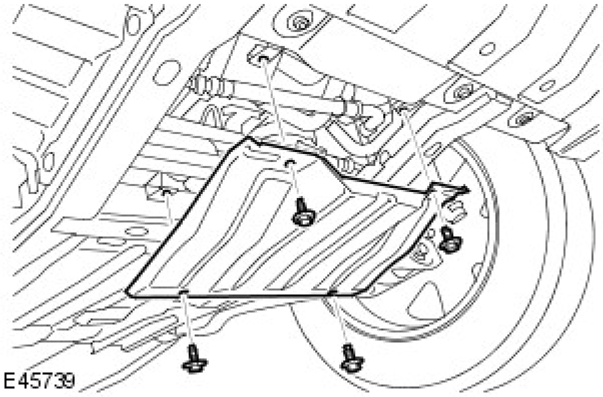
All vehicles

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

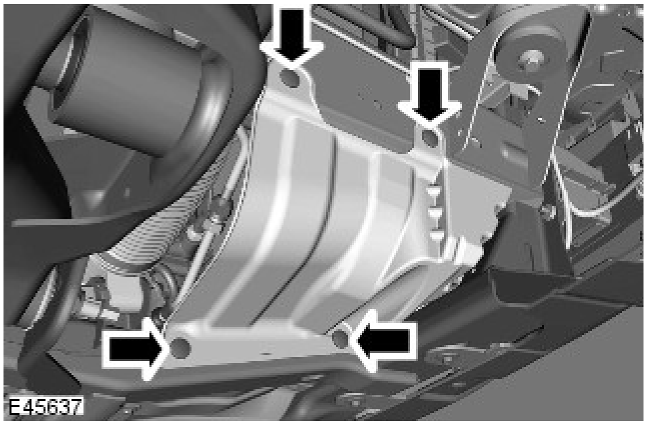
2. Remove the radiator access panel.

- Remove the 4 bolts.



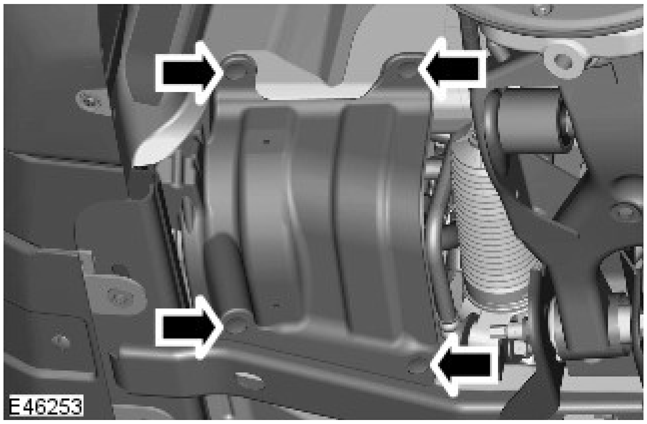
3. Remove the front RH splash shield.

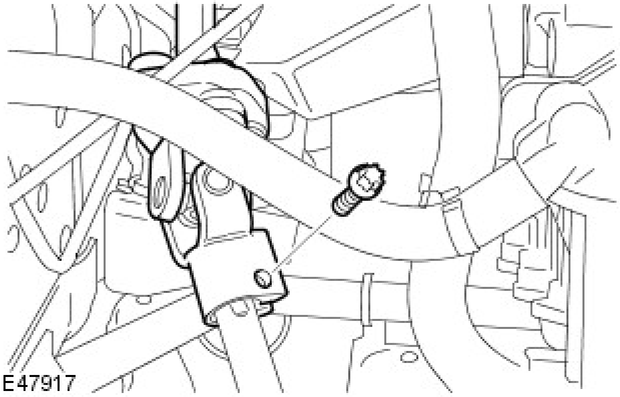
- Remove the 4 clips.



4. Remove the front LH splash shield.

- Remove the 4 clips.





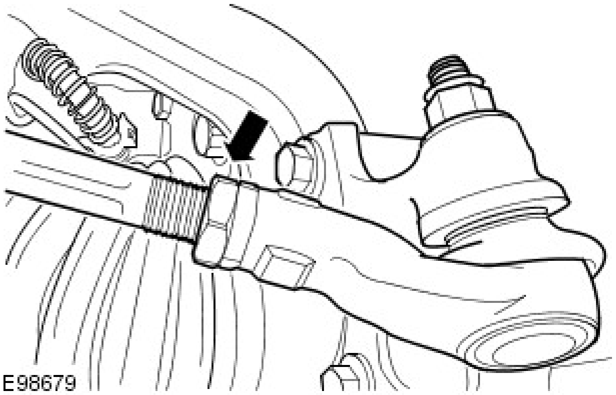
E47917

5. ⚠ CAUTION: Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

• NOTE: Make sure the steering is in the straight ahead position.

Release the universal joint from the steering gear.

- Remove and discard the bolt.

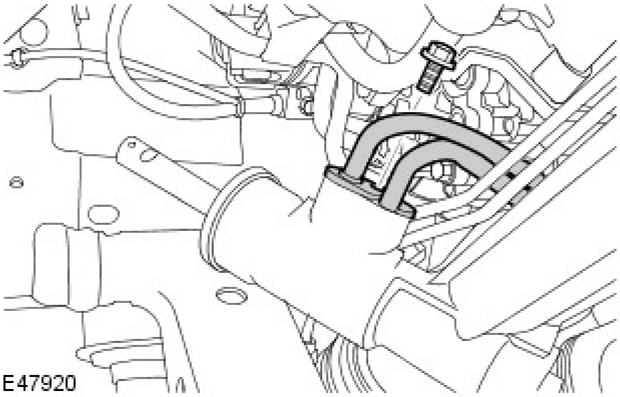


E98679

6. NOTE: LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.

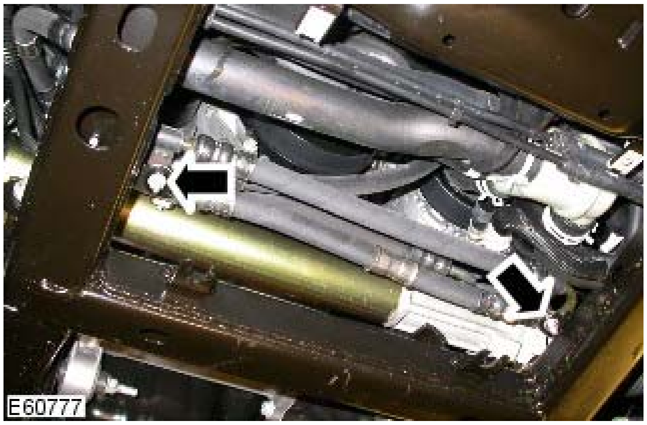


E47920

7. Disconnect the pressure lines from the power steering gear.

- Remove the bolt.
- Position an absorbent cloth to collect fluid spillage.
- Remove and discard the O-ring seals.

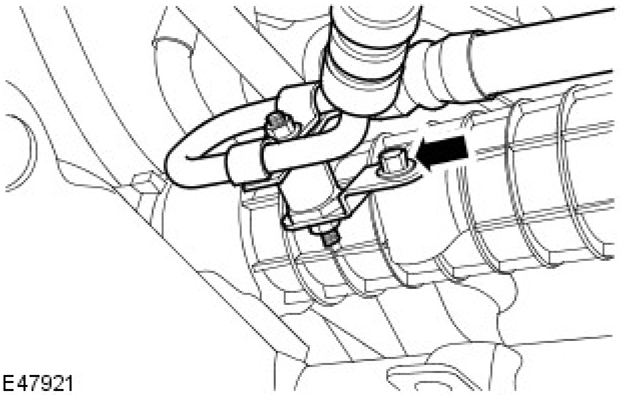
Vehicles with dynamic suspension



8. Release the dynamic response line supports.

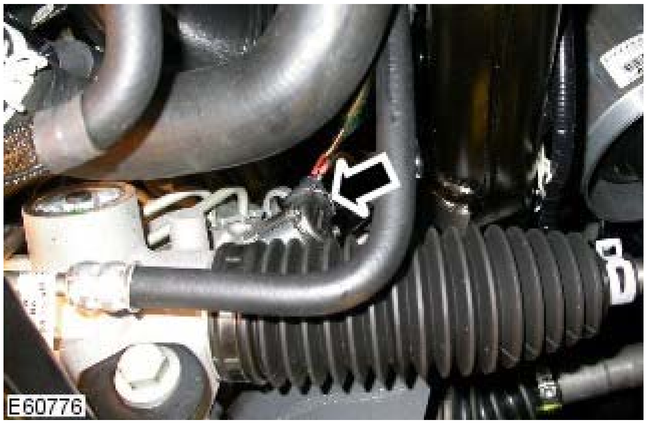
- Remove the 2 nuts.
- Remove the 2 supports.

All vehicles

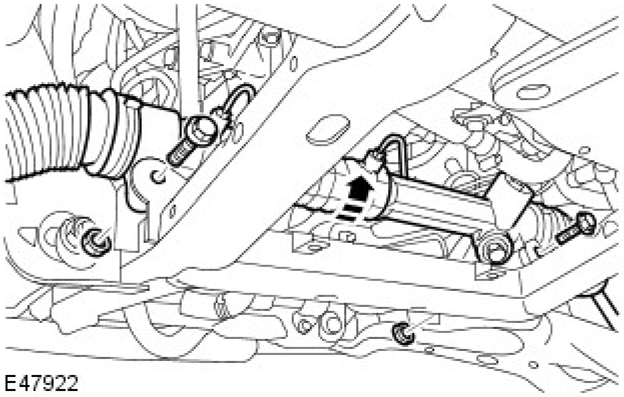


9. Remove the steering gear high-pressure line.

- Remove the bolt.



10. Disconnect the steering gear electrical connector.



E47922

11. Remove the steering gear.

- Remove the 2 bolts and discard the cage nuts.
- Release the steering gear.

Installation

All vehicles

1. Clean the component mating faces.

2. Install the steering gear.

- Tighten the bolts to 175 Nm (129 lb.ft).

3. Connect the electrical connector.

4. NOTE: Do not install the support bracket bolt until the steering gear connections are tightened.

Install the steering gear high pressure line.

5. NOTE: Lubricate the seals with clean power steering fluid.

Connect the steering gear pressure lines.

- Clean the component mating faces.
- Install new O-ring seals.
- Tighten the bolt to 22 Nm (16 lb.ft).

6. Install the power steering line support bracket.

- Tighten the bolt to 10 Nm (7 lb.ft).

Vehicles with dynamic suspension

7. Install the dynamic response line supports.

- Tighten the supports to 10 Nm (7 lb.ft).
- Tighten the nuts to 10 Nm (7 lb.ft).

All vehicles

8. Connect the tie-rod end ball joints.

- Attach both tie rods to previously noted positions.
- Tighten the tie-rod locking nut.

9. Connect the universal joint to the steering gear.

- Install a new patchlock bolt and tighten to 25 Nm (18 lb.ft).

10. Install the radiator access panel.

- Install the 4 bolts and tighten to 10 Nm (7 lb.ft).

11. Install the front LH splash shield.

12. Install the front RH splash shield.

13. Fill and bleed the power steering system.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

14. Adjust the front wheel alignment.

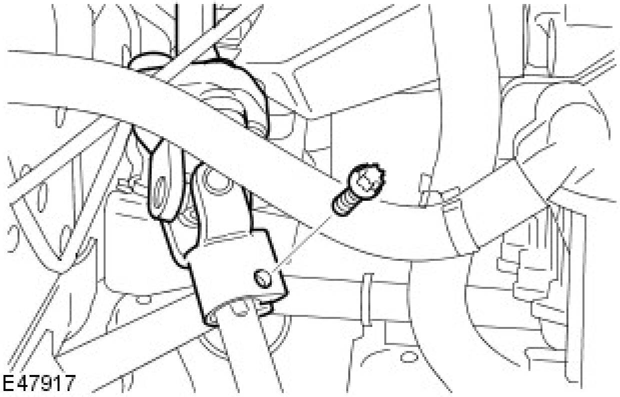
Removal and Installation

Removal

All vehicles

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

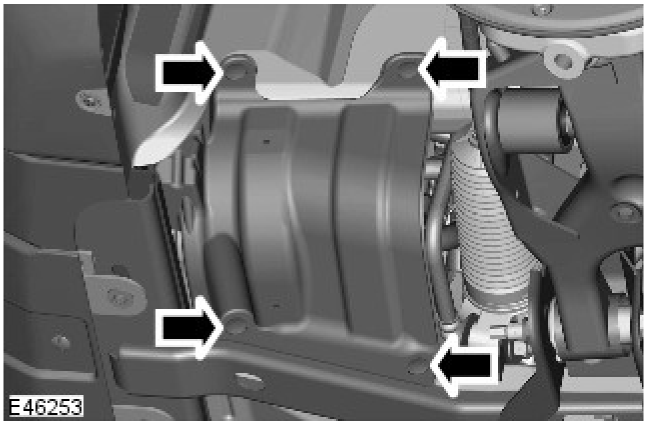
Raise and support the vehicle.



2. NOTE: Make sure the steering is in the straight ahead position.

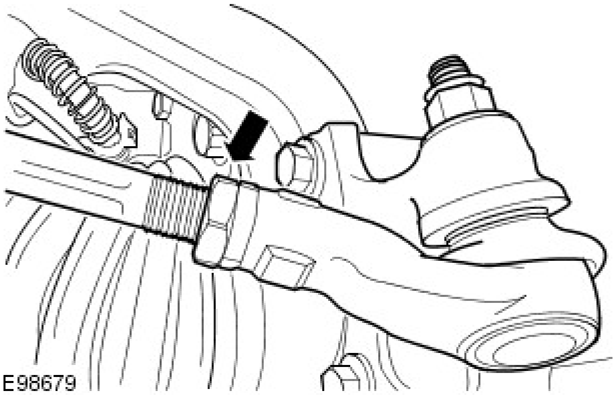
Release the universal joint from the steering gear.

- Remove and discard the bolt.



3. Remove the front RH and LH splash shields.

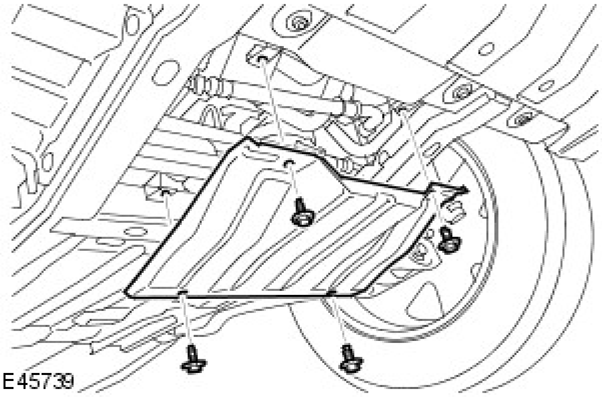
- Remove the 8 clips.



4. NOTE: LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

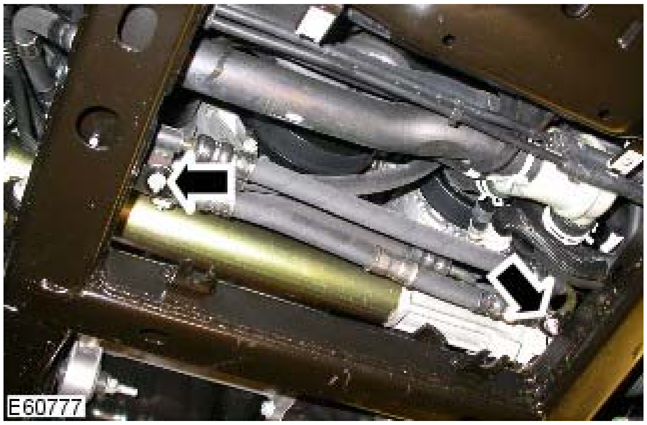
- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.



5. Remove the radiator access panel.

- Remove the 4 bolts.

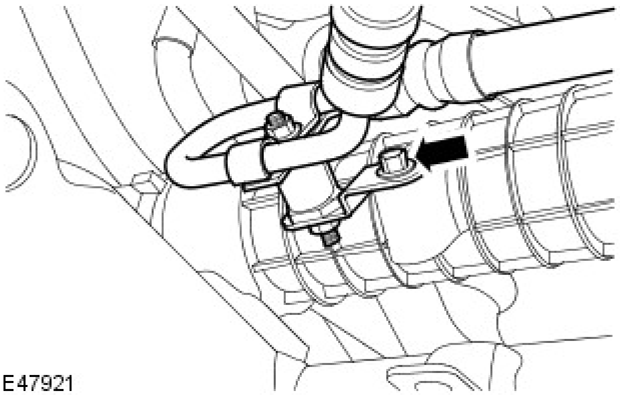
Vehicles with dynamic suspension



6. Release the dynamic response line supports.

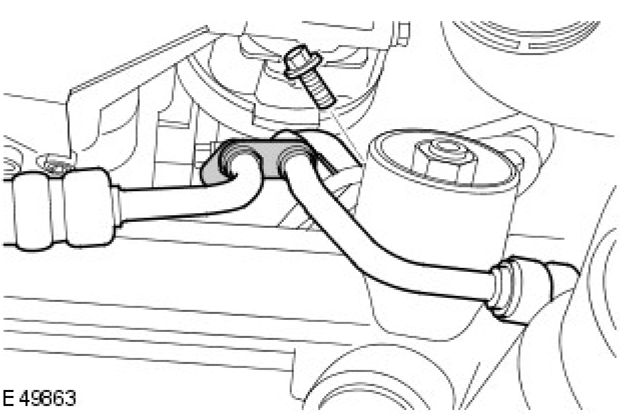
- Remove the 2 nuts.
- Remove the 2 supports.

All vehicles



7. Release the power steering line support mount.

- Remove the bolt.

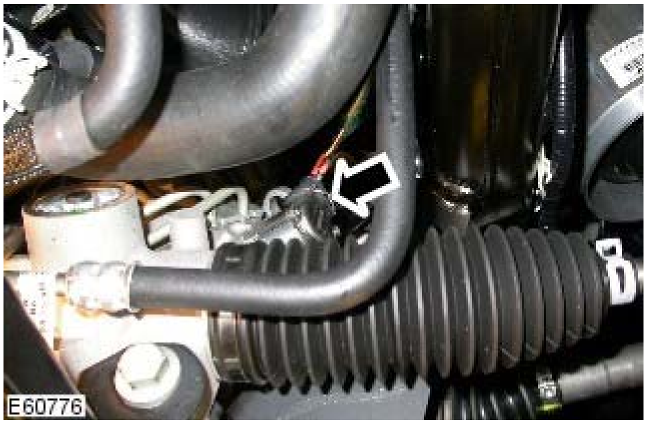


8. ⚠CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

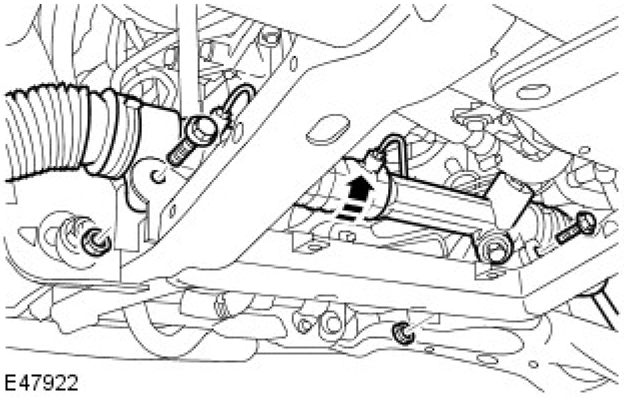
• NOTE: Some fluid spillage is inevitable during this operation.

Disconnect the power steering fluid lines.

- Position a container to collect spillage.
- Remove the clip.
- Remove and discard the bolt.
- Discard the O-ring seals.



9. Disconnect the steering gear electrical connector.



10. Remove the steering gear.

- Remove the 2 bolts and discard the nuts.

Installation

All vehicles

1. Clean the component mating faces.

2. Install the steering gear.

- Tighten the bolts to 175 Nm (129 lb.ft).

3. Connect the electrical connector.

4. Install the power steering fluid lines.

- Clean the component mating faces.
- Install new O-ring seals.
- Install the clip.

- Tighten the bolt to 22 Nm (16 lb.ft).

5. Secure the power steering line support mount.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

6. Connect the universal joint to the steering gear.

- Install new patchlock bolt and tighten to 30 Nm (22 lb.ft).

Vehicles with dynamic suspension

7. Install the dynamic response line supports.

- Tighten the supports to 10 Nm (7 lb.ft).
- Tighten the nuts to 10 Nm (7 lb.ft).

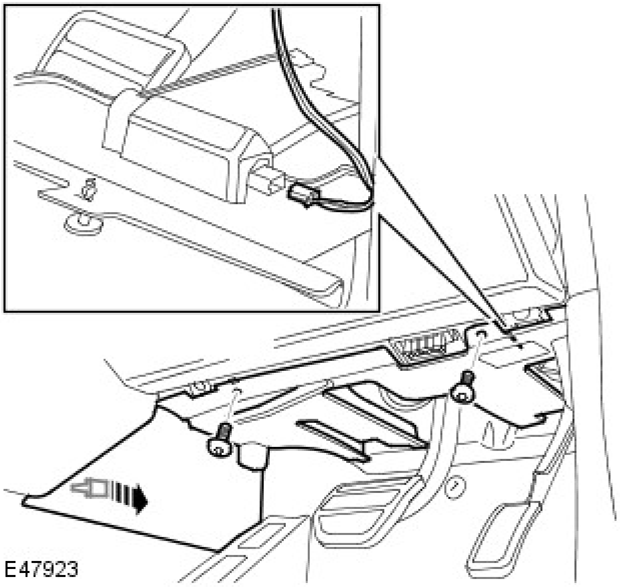
Power Steering - Steering Angle Sensor

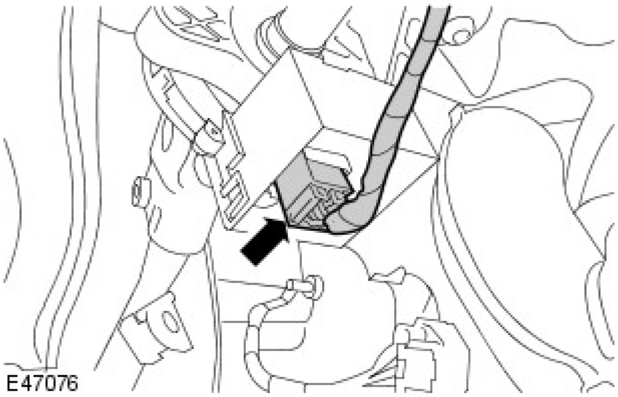
Removal and Installation

Removal

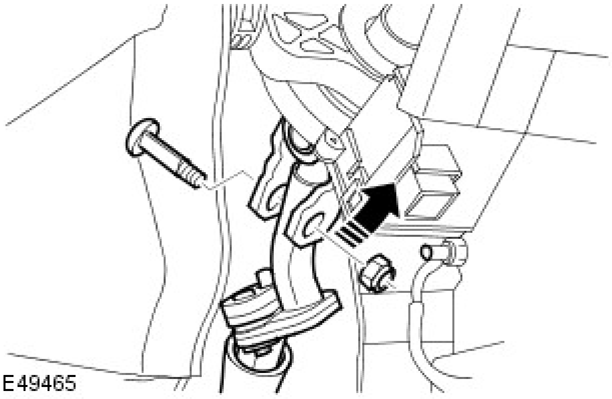
1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the driver side closing trim panel.
   - Release the clip.
   - Remove the 2 screws.
   - Disconnect the electrical connector.

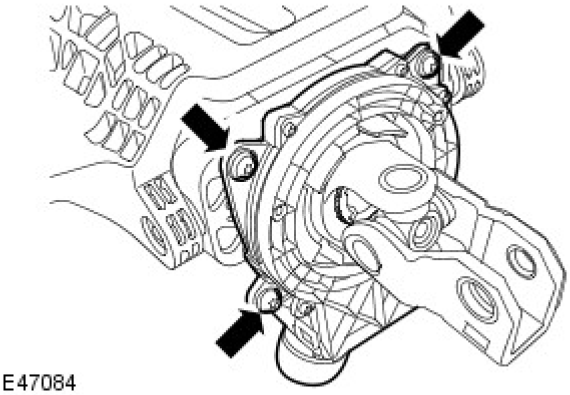


3. Disconnect the steering angle sensor electrical connector.



4. Disconnect the steering column intermediate shaft from the steering column.
   - Note the fitted position.
   - Remove the special bolt and discard the nut.





5. Remove the steering angle sensor.
   - Remove the 3 Torx screws.

Installation

1. Install the steering angle sensor.
   - Tighten the Torx screws to 3 Nm (2 lb.ft).
2. Connect the steering column intermediate shaft.
   - Install the special bolt and tighten the new nut to 22 Nm (16 lb.ft).
3. Connect the steering angle sensor electrical connector.
4. Install the closing trim panel.
   - Connect the electrical connector.
   - Secure the clip.
   - Tighten the screws.
5. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
6. Initiate a new steering angle sensor using T4.

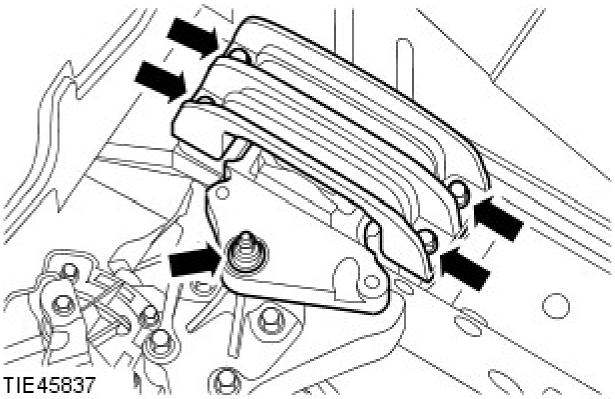
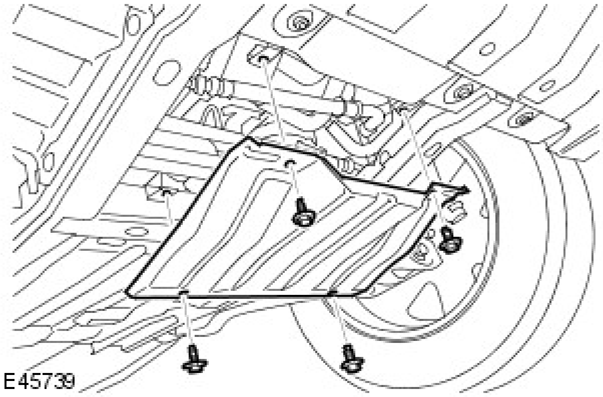
Removal and Installation

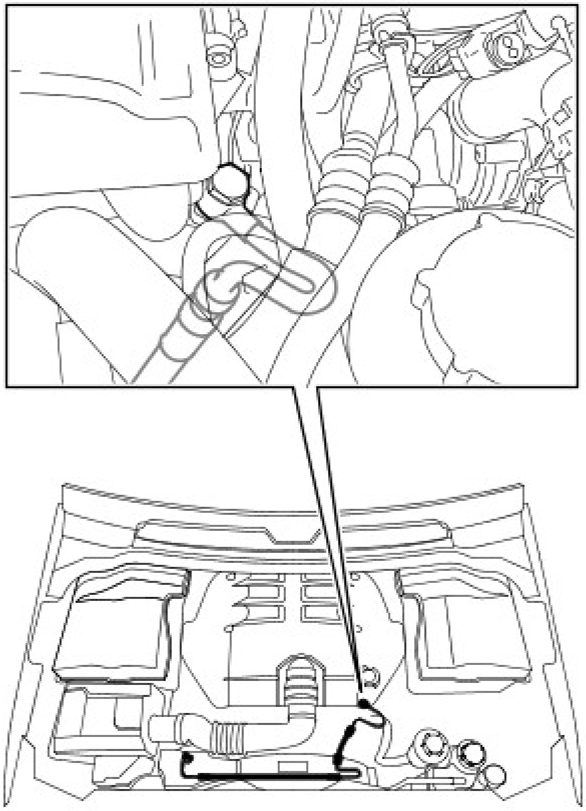
Removal

1. Raise and support the vehicle.
2. Remove the front RH splash shield.
   - Remove the 4 clips.



3. Remove the front LH fender splash shield.
   For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).
4. Remove the radiator access panel.
   - Remove the 4 bolts.



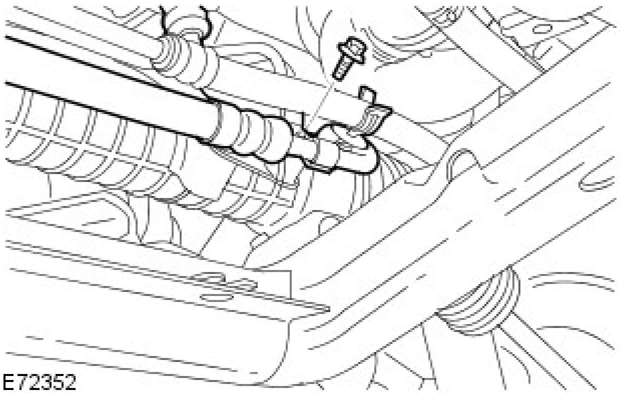


E72350

5. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Disconnect the high pressure line from the power steering pump.

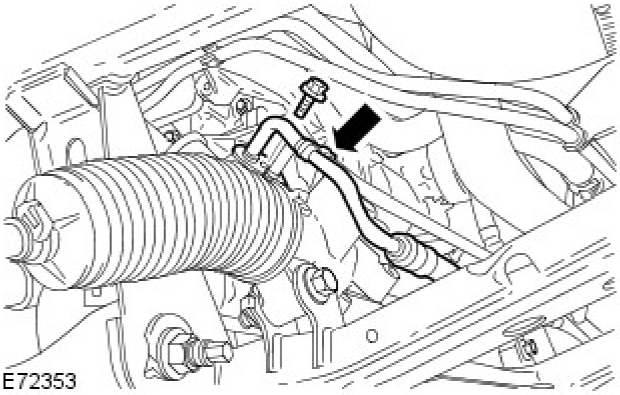
- Loosen and release the power steering pump line.
- Allow the fluid to drain into a container.
- Remove and discard the 2 sealing washers.



E72352

6. Release the power steering line support bracket.

- Remove the nut.
- Release the hose.



E72353

7. Disconnect the high pressure line from the power steering gear.

- Remove the bolt.
- Release the power steering gear line.
- Remove and discard the O-ring seal.

8. Remove the steering gear high-pressure line.

Installation

1. Install the steering gear high-pressure line.
2. Connect the high-pressure line to the power steering gear.
    - Install the O-ring seal.
    - Attach the power steering gear high-pressure line.
    - Tighten the bolt to 25 Nm (18 lb.ft).
3. Install the power steering line support bracket.
    - Tighten the nut to 10 Nm (7 lb.ft).
    - Secure the hose with the clip.
4. ⚠ CAUTION: Always plug any open connections to prevent contamination.

    Connect the high-pressure line to the power steering pump.
    - Install new sealing washers.
    - Connect the power steering pump high-pressure line.
5. Install the radiator access panel.
    - Tighten the bolts to 10 Nm (7 lb.ft).
6. Install the front LH fender splash shield.
    For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).
7. Install the front RH splash shield.
    - Secure with the clips.
8. Fill and bleed the power steering system.
    For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

Power Steering - Power Steering PumpTDV8 3.6L Diesel

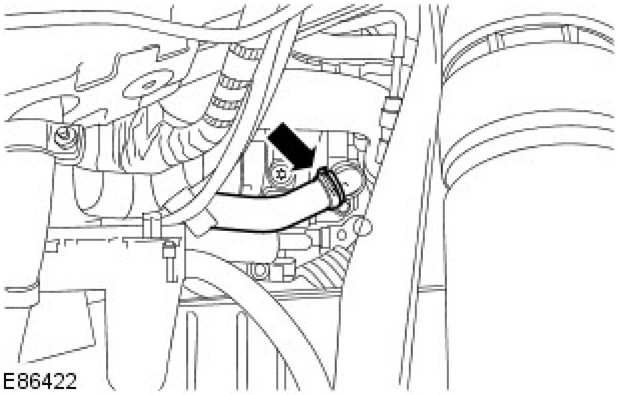
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Raise and support the vehicle.

3. Remove the LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).



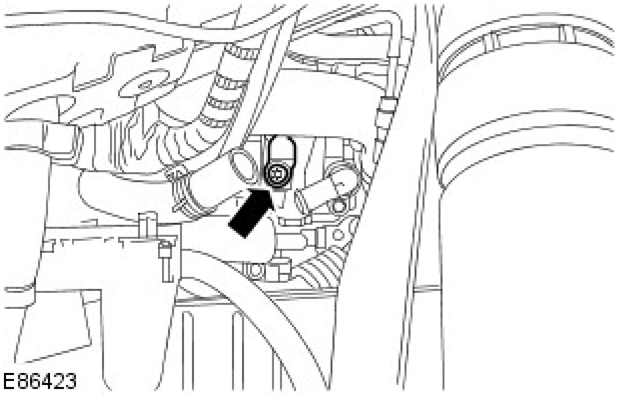
4. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.
- Position a container to collect the fluid.



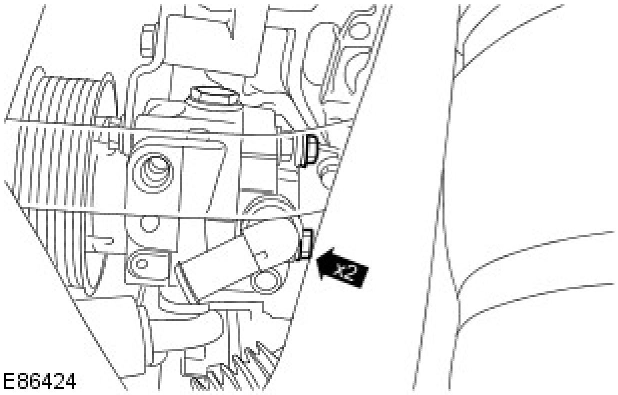
5. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

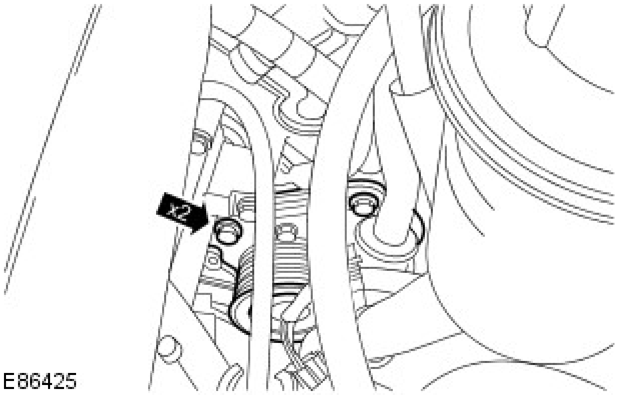
Disconnect the power steering pump high-pressure line.

- Remove the bolt.
- Remove and discard the O-ring seal.



6. Remove the 2 power steering pump rear bolts.

7. Remove the cooling fan belt lower idler pulley.
For additional information, refer to: Cooling Fan Belt Idler Pulley (303-05D Accessory Drive - TDV8 3.6L Diesel, Removal and Installation).



8. Remove the power steering pump and mounting bracket.

- Remove the remaining 2 bolts.

Installation

1. Install the power steering pump and mounting bracket.

- Tighten the bolts to 23 Nm (17 lb.ft).

2. Install the cooling fan belt lower idler pulley.
For additional information, refer to: Cooling Fan Belt Idler Pulley (303-05D Accessory Drive - TDV8 3.6L Diesel, Removal and Installation).

3. Tighten the power steering pump rear bolts to 23 Nm (17 lb.ft).

4. NOTE: Remove and discard the blanking caps.

Connect the power steering pump high-pressure line.

- Install a new O-ring seal.
- Tighten the bolt to 25 Nm (18 lb.ft).

5. NOTE: Remove and discard the blanking caps.

Connect the power steering pump supply hose.

- Secure with the clip.

6. Install the LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

7. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

8. Fill and bleed the power steering system.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

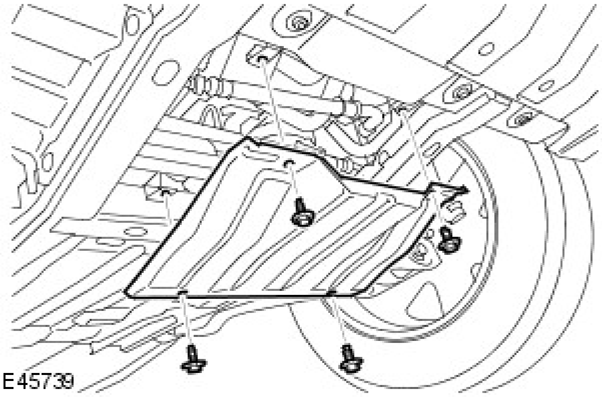
2. ⚠ CAUTION: Do not turn the steering wheel with the steering column lower shaft disconnected as damage to the clockspring and steering wheel switches may occur.

Center the steering wheel.

- Remove the ignition key.

3. Remove the radiator splash shield.

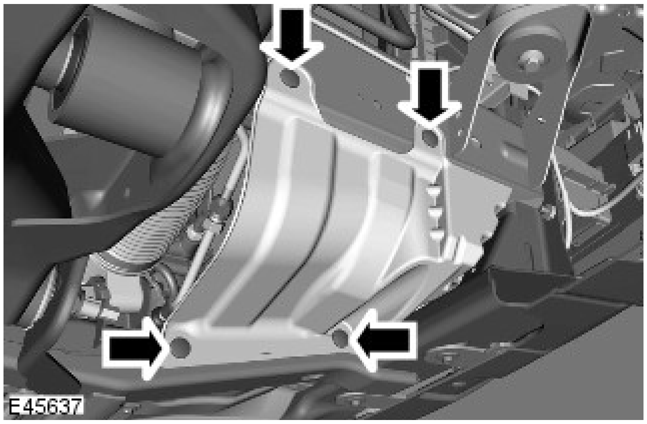
- Remove the 4 bolts.

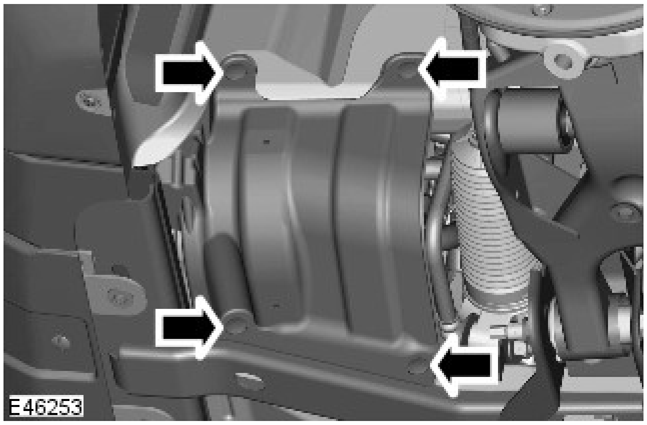


4. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

5. Remove the front RH splash shield.

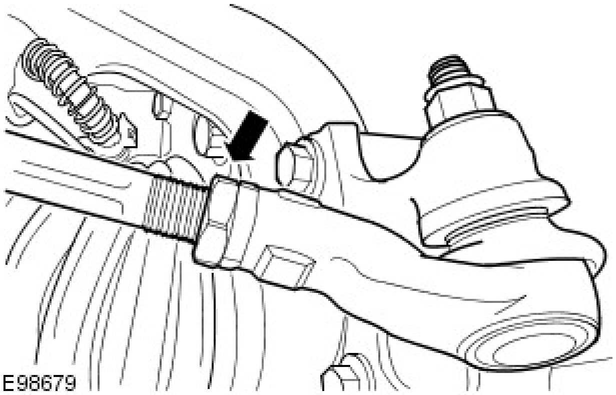
- Remove the 4 clips.





6. Remove the front LH splash shield.

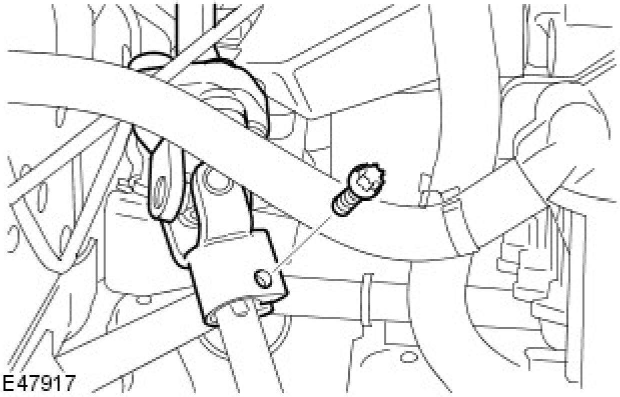
- Remove the 4 clips.



7. NOTE: LH illustration shown, RH is similar.

Release both tie-rod end ball joints.

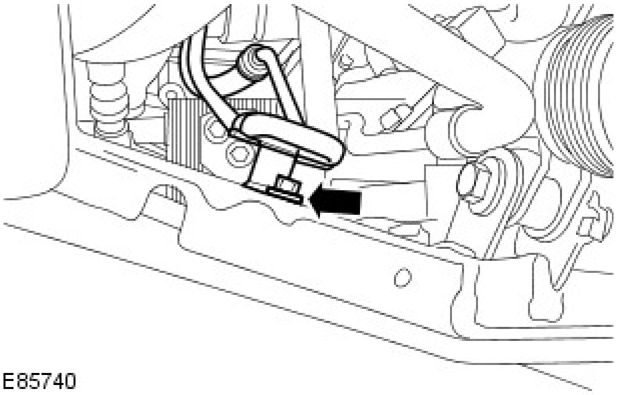
- Loosen the locknut.
- Release both track rods from tie rod ends, note the number of turns for installation.



8. NOTE: Note the fitted position.

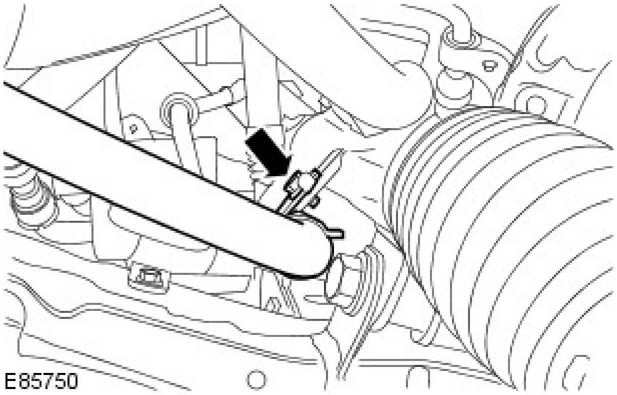
Disconnect the lower steering column from the steering gear.

- Remove and discard the bolt.



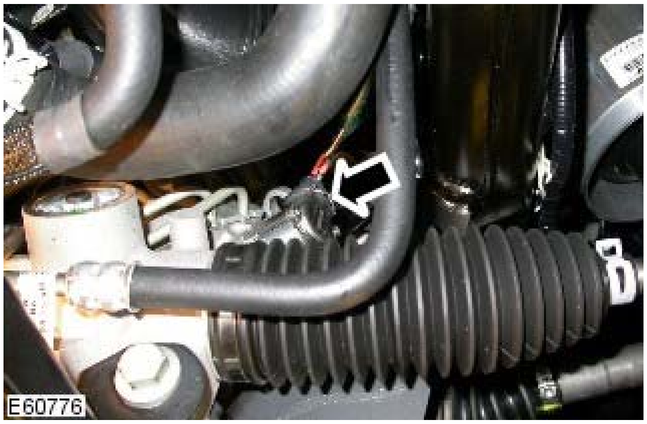
9. Release the power steering return line support bracket.

- Remove the bolt.

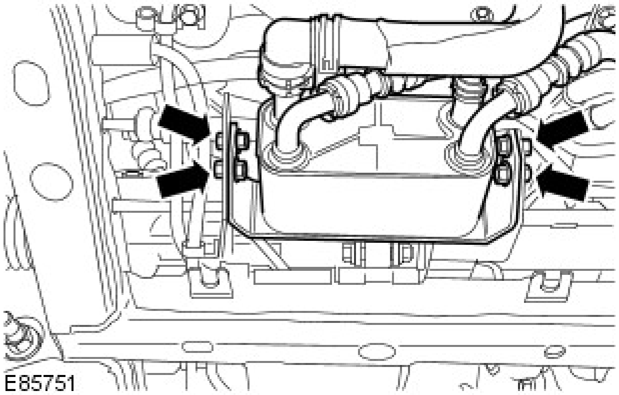


10. Release the steering gear high-pressure line.

- Remove the bolt.

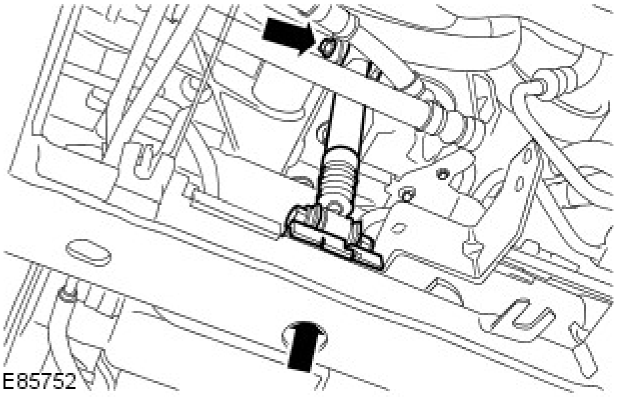


11. Disconnect the steering gear control valve actuator electrical connector.



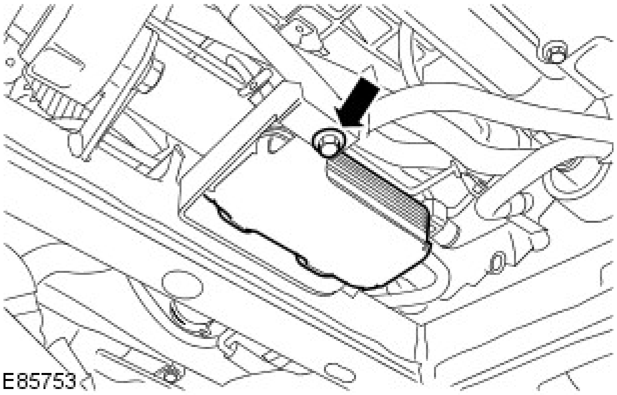
12. Release the transmission fluid cooler.

- Remove the 4 bolts.



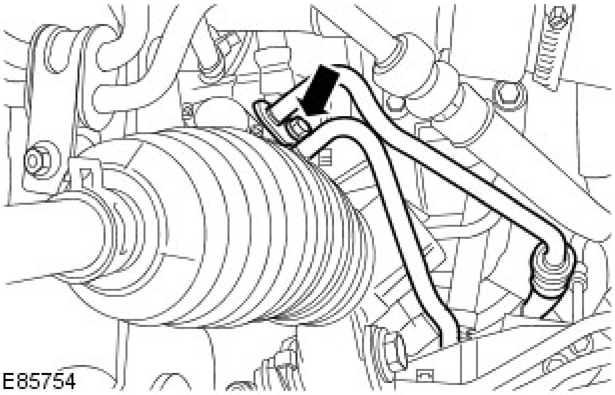
13. Remove the engine stabilizer and engine stabilizer bracket.

- Remove the bolt.
- Remove and discard the nut.



14. Release the fuel cooler.

- Remove the bolt.



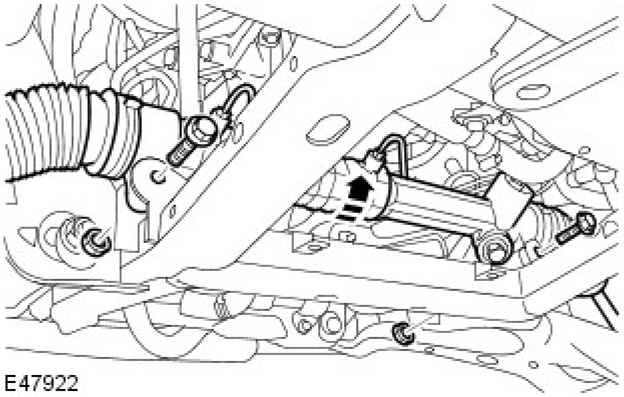
15. CAUTIONS:

⚠ Make sure that the area around the component is clean and free of foreign material.

⚠ Make sure that all openings are sealed. Use new blanking caps.

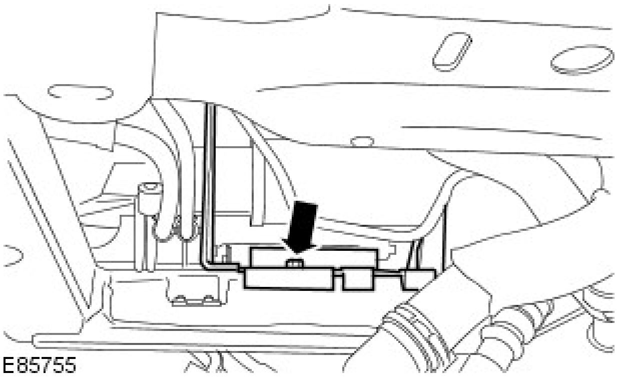
Disconnect the power steering high pressure line and return line from the steering gear.

- Remove and discard the bolt.
- Remove and discard the 2 O-ring seals.



16. Release the steering gear.

- Remove the 2 bolts.



17. Remove the transmission fluid cooler and fuel cooler support bracket.

- Remove the bolt.
- Release the coolant line.

18. Remove the steering gear.

Installation

1. Install the steering gear.

2. Install the transmission fluid cooler and fuel cooler support bracket.

- Secure the coolant line.
- Tighten the bolt to 23 Nm (17 lb.ft).

3. Secure the steering gear.

- Tighten the bolts to 175 Nm (129 lb.ft).

4. NOTE: Remove and discard the blanking caps.

- NOTE: Lubricate the seals with clean power steering fluid.

Connect the power steering high pressure line and return line to the steering gear.

- Install new O-ring seals.
- Tighten the new bolt to 22 Nm (16 lb.ft).

5. Secure the fuel cooler.

- Tighten the bolt to 23 Nm (17 lb.ft).

6. Install the engine stabilizer and engine stabilizer bracket.

- Tighten the nut.
- Tighten the bolt.

7. Secure the transmission fluid cooler.

- Tighten the nuts and bolts to 25 Nm (18 lb.ft).

8. Connect the steering gear control valve actuator electrical connector.

9. Secure the steering gear high pressure line.

- Tighten the bolt to 10 Nm (7 lb.ft).

10. Secure the power steering return line support bracket.

- Tighten the bolt to 10 Nm (7 lb.ft).

11. Connect the lower steering column shaft to the steering gear.

- Tighten the new bolt to 24 Nm (18 lb.ft).

12. Connect the tie-rod end ball joints.

- Attach both tie rods to previously noted positions.
- Tighten the tie-rod locking nut.

13. Install the front LH splash shield.

- Install the clips.

14. Install the front RH splash shield.

- Install the clips.

15. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

16. Install the radiator splash shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

17. Fill and bleed the power steering system.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

18. Adjust the front wheel alignment.

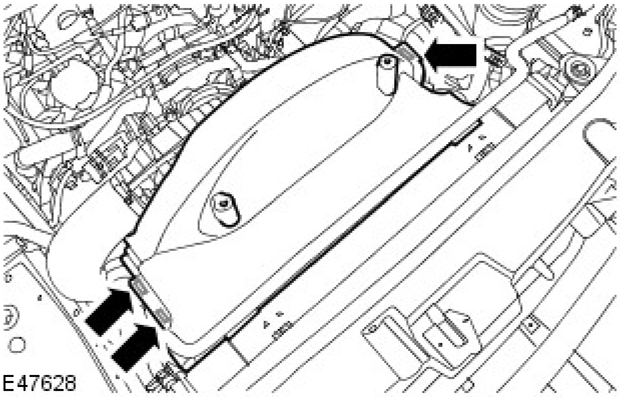
Power Steering - Power Steering Fluid ReservoirTDV6 2.7L Diesel

Removal and Installation

Removal

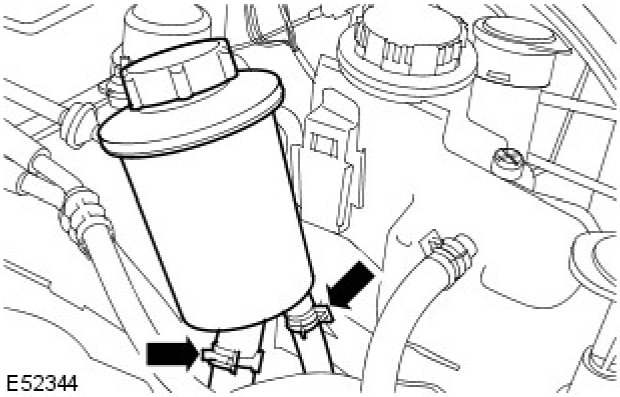
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).



3. Remove the cooling fan shroud.

- Release the coolant hose.
- Release the 3 clips.



4. ⚠CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Some fluid spillage is inevitable during this operation.

Remove the power steering reservoir.

- Position a container to collect spillage.
- Release the 2 clips.
- Disconnect the 2 hoses.

Installation

1. Install the power steering fluid reservoir.

- Clean the component mating faces.
- Connect the hoses.
- Secure with the 2 clips.

2. Install the cooling fan shroud.

- Secure the coolant hose.

3. Install the air cleaner assembly.
For additional information, refer to: Air Cleaner (303-12C Intake Air Distribution and Filtering - TDV6 2.7L Diesel, Removal and Installation).

4. Fill and bleed the power steering system.

For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

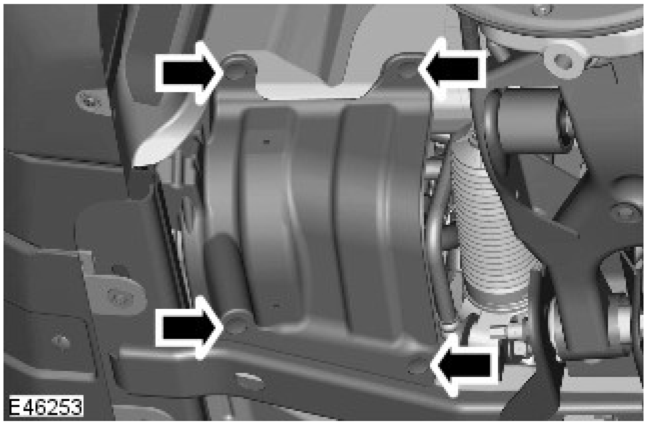
Power Steering - Power Steering Pump to Steering Gear Pressure LineTDV8 3.6L Diesel

Removal and Installation

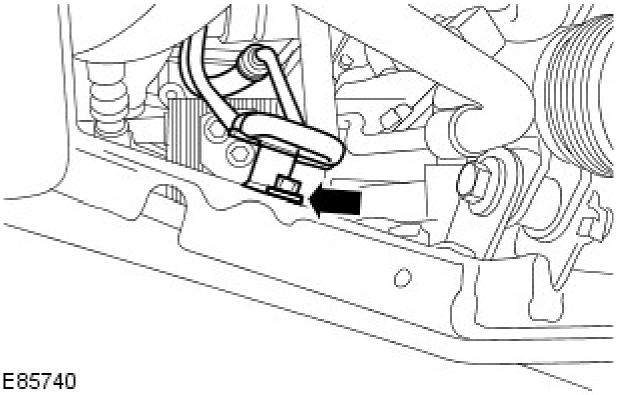
Removal

1. Raise and support the vehicle.



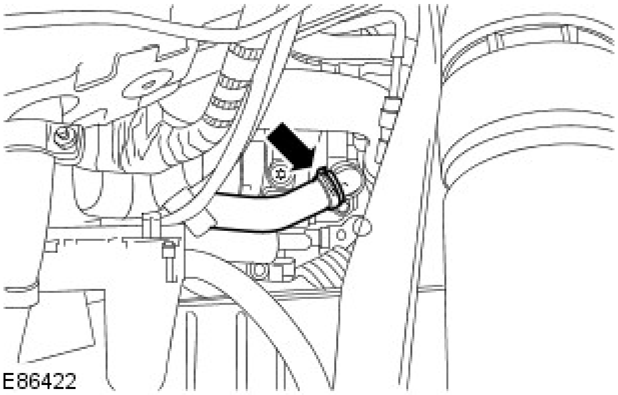
2. Remove the front LH splash shield.

- Remove the 4 clips.



3. Release the steering gear high-pressure line.

- Remove the bolt.



4. Remove the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

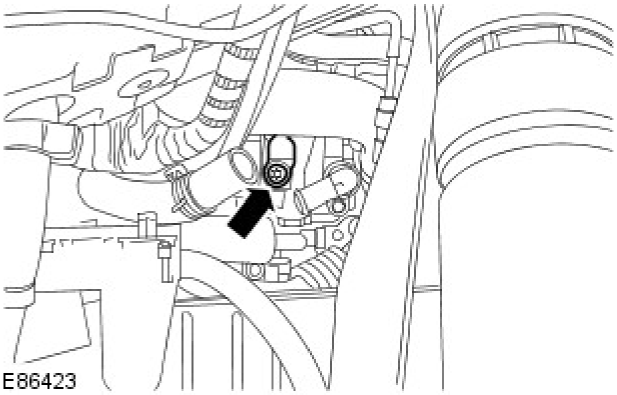
5. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.
- Position a container to collect the fluid.



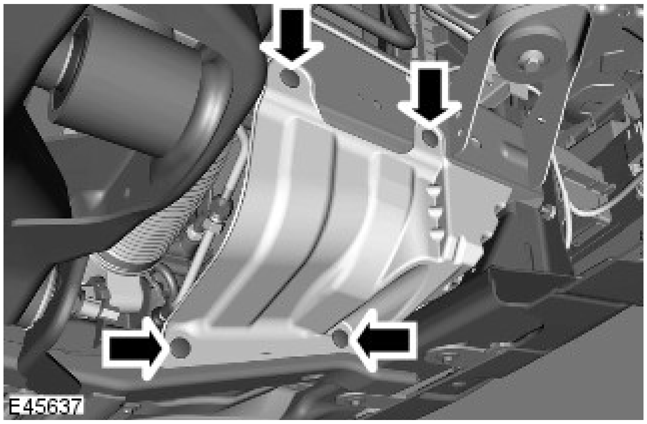
6. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

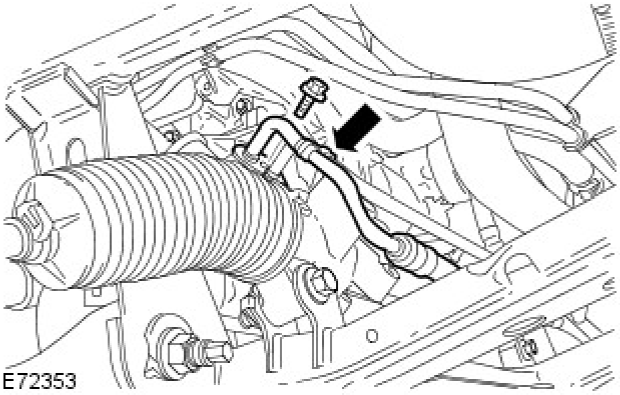
Disconnect the power steering pump high-pressure line.

- Remove the bolt.
- Remove and discard the O-ring seal.



7. Remove the front RH splash shield.

- Remove the 4 clips.



8. CAUTIONS:

⚠ Make sure that the area around the component is clean and free of foreign material.

⚠ Make sure that all openings are sealed. Use new blanking caps.

Disconnect the high-pressure line from the power steering gear.

- Remove and discard the bolt.
- Remove and discard the O-ring seal.

9. Remove the steering gear high-pressure line.

Installation

1. Install the steering gear high-pressure line.

2. NOTE: Remove and discard the blanking caps.

Connect the high-pressure line to the power steering gear.

- Install a new O-ring seal.
- Tighten the new bolt to 22 Nm (16 lb.ft).

3. Install the front RH splash shield.

- Secure with the clips.

4. NOTE: Remove and discard the blanking caps.

Connect the high-pressure line to the power steering pump.

- Install a new O-ring seal.
- Tighten the bolt to 25 Nm (18 lb.ft).

5. NOTE: Remove and discard the blanking caps.

Connect the power steering pump supply hose.

- Secure with the clip.

6. Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

7. Secure the steering gear high-pressure line.

- Tighten the bolt to 10 Nm (7 lb.ft).

8. Install the front LH splash shield.

- Secure with the clips.

9. Fill and bleed the power steering system.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

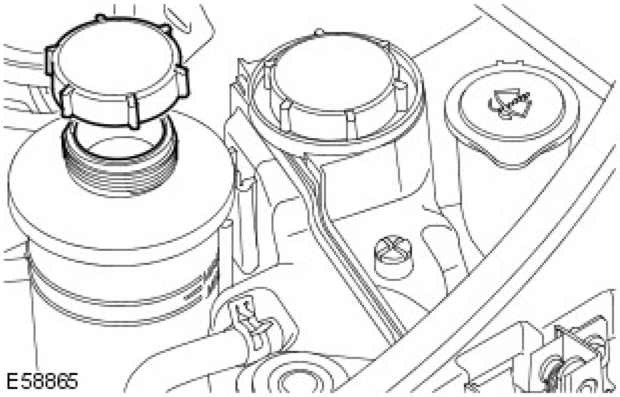
 E58732	Valve block power steering test 211-011-01(LRT-57-001)
 E58733	Hose and gauge - power steering pressure test 211-287(LRT-57-005)

⚠ CAUTION: If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

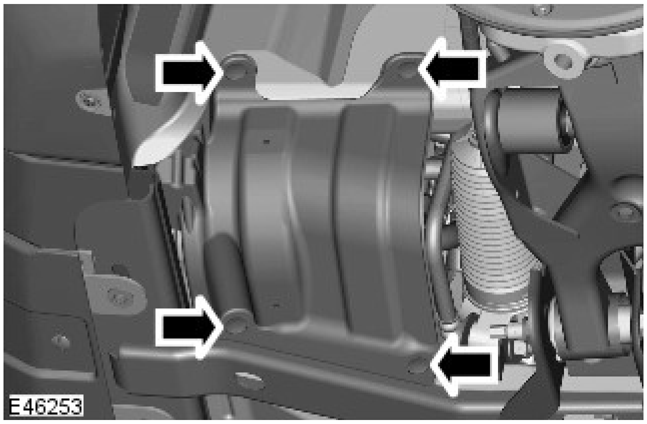
   Raise and support the vehicle.

2. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



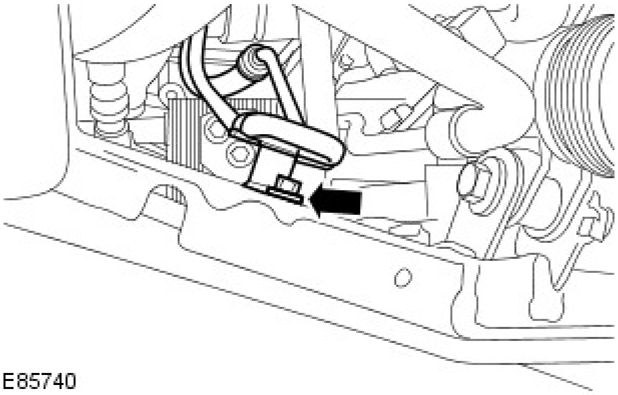
3. Siphon the fluid from the power steering reservoir.

- Remove the filler cap.



4. Remove the front LH splash shield.

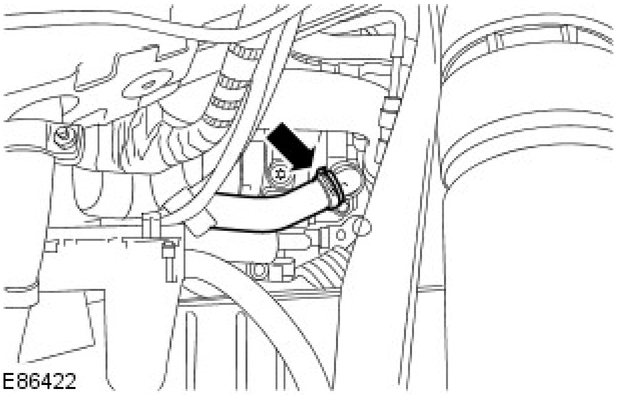
- Remove the 4 clips.



5. Release the steering gear high-pressure line.

- Remove the bolt.

6. Remove the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).



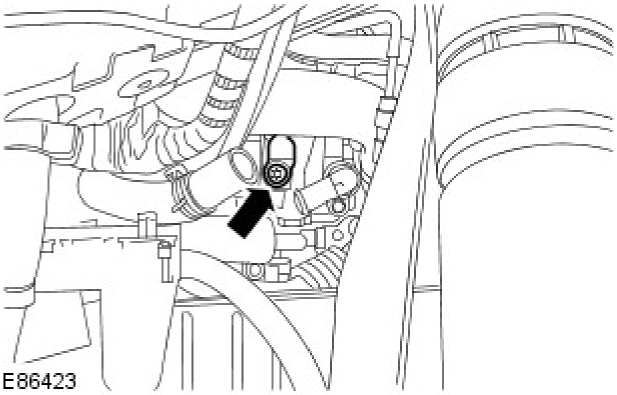
7. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.
- Position a container to collect the fluid.



8. ⚠ CAUTION: Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump high-pressure line.

- Remove the bolt.

9. Install the special tools.

- Tie the pressure gauge aside.

10. NOTE: Remove and discard the blanking caps.

Connect the power steering pump supply hose.

- Secure with the clip.

11. Fill the power steering reservoir.

12. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

13. NOTE: Make sure the steering components and test equipment are free from leaks.

• NOTE: Maintain the maximum fluid level during the test.

• NOTE: Make sure the steering is in the straight ahead position.

• NOTE: Under no circumstances must the low pressure spigot be removed from the steering pump.

With the test valve open start the engine.

- Start the engine and turn steering fully lock to lock, stop the engine.
- Top-up the power steering fluid reservoir.
- Install the reservoir filler cap.

14. For correct power steering pressures, refer to the steering specification section.
For additional information, refer to: Specifications (211-02 Power Steering, Specifications).

15. ⚠ CAUTION: Do not hold steering at full lock for longer than 10 seconds.

With the engine at idle, slowly turn the steering wheel and hold on full lock.

- Record the pressure reading.

16. Repeat the above procedure for the other side.

- Record the pressure reading.

17. With the engine at idle, release the steering wheel. The pressure should be, at or below, the pressure specified.

18. Pressure outside this tolerance, indicates a fault.

19. ⚠ CAUTION: Pump damage will occur if test valve is closed for longer periods.

To determine if the fault is in the steering pump or the steering rack, close the test valve for a maximum of 5 seconds.

20. If the pressures recorded fall outside the given values, replace the power steering pump.

21. If the maximum pump pressure is correct, check the hoses for correct routing and condition, if correct suspect the steering gear.

22. On completion of the test stop the engine, disconnect the battery ground cable and siphon the steering fluid from the reservoir.

23. CAUTIONS:

⚠ Make sure that all openings are sealed. Use new blanking caps.

⚠ Make sure that the area around the component is clean and free of foreign material.

Disconnect the power steering pump supply hose.

- Release the clip.

24. Disassemble the test equipment.

25. Connect the power steering pump high-pressure line.

- Tighten the bolt to 25 Nm (18 lb.ft).
- Install a new O-ring seal.

26. NOTE: Remove and discard the blanking caps.

Connect the power steering pump supply hose.

- Secure with the clip.
- Remove the container.

27. Secure the steering gear high-pressure line.

- Tighten the bolt to 10 Nm (7 lb.ft).

28. Install the front LH splash shield.

- Install the clips.

29. Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02 Front End Body Panels, Removal and Installation).

30. Connect the battery ground cable.

31. Fill and bleed the power steering system.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

Power Steering - Power Steering PumpTDV6 2.7L Diesel

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Remove the cooling fan shroud.
For additional information, refer to: Cooling Fan Shroud (303-03C Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

4. Recover the air conditioning (A/C) refrigerant.
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

5. Remove the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

6. Remove the accessory drive belt.
For additional information, refer to: Accessory Drive Belt (303-05C Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

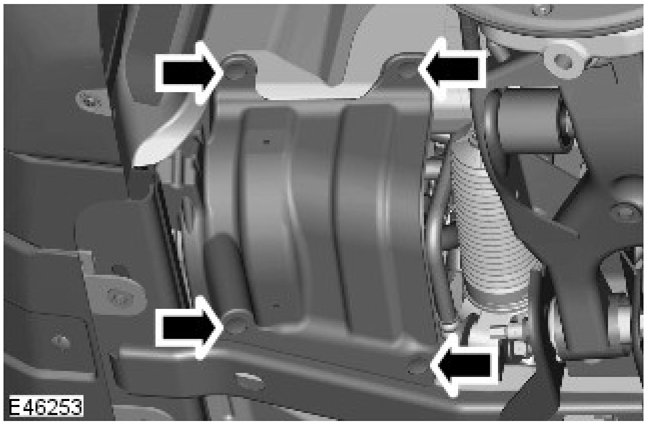
7. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

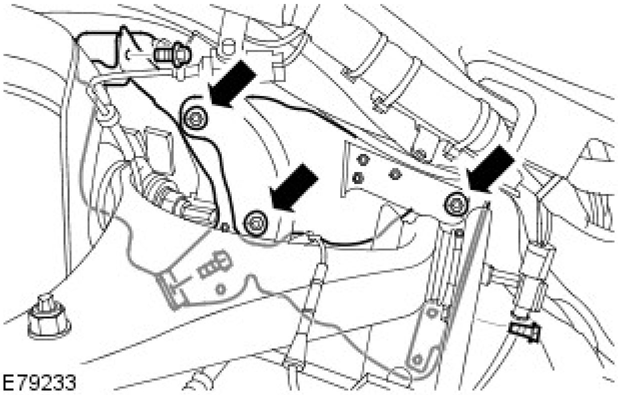
8. Remove the LH front wheel and tire.

9. Remove the fender splash shield lower trim panel.

- Remove the 4 clips.

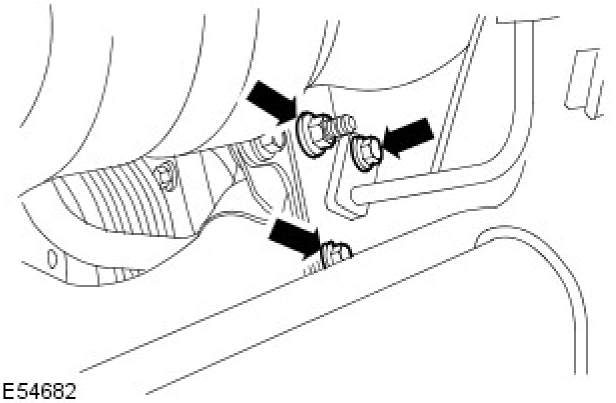


10. Remove the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).



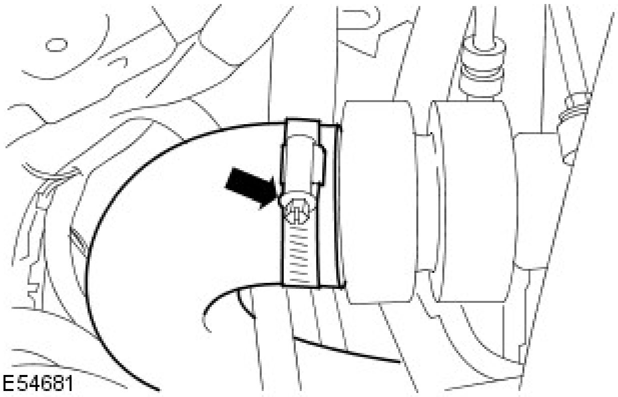
11. Remove the upper arm and brake line heat shields for access.

- Remove the 3 nuts.
- Remove the 3 bolts.



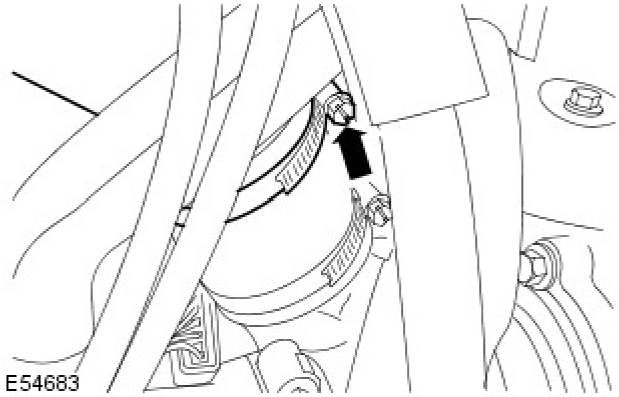
12. Release the charge air cooler inlet pipe.

- Remove the two retaining bolts.
- Remove the retaining nut.



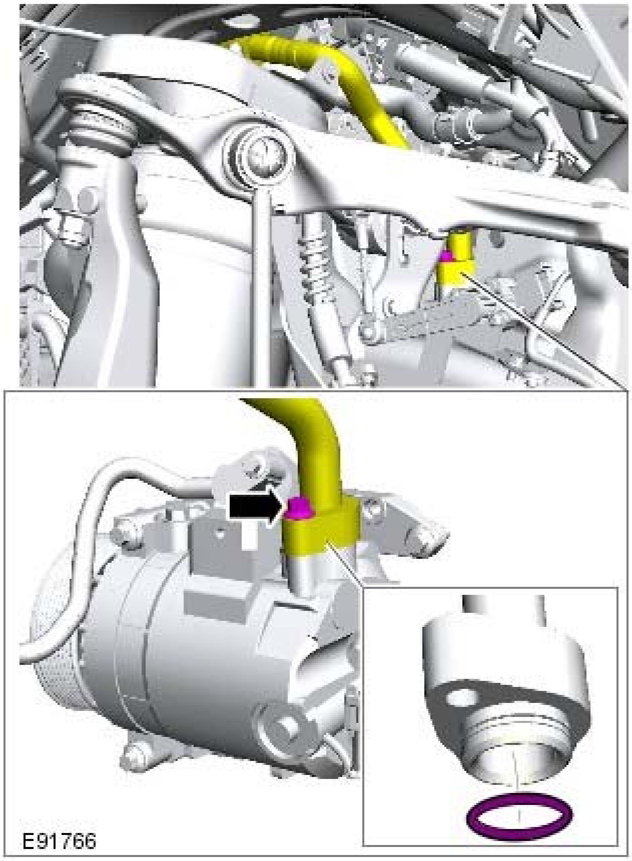
13. Disconnect the charge air cooler inlet hose.

- Loosen the clip.



14. Disconnect the charge air cooler inlet hose.

- Loosen the clip.



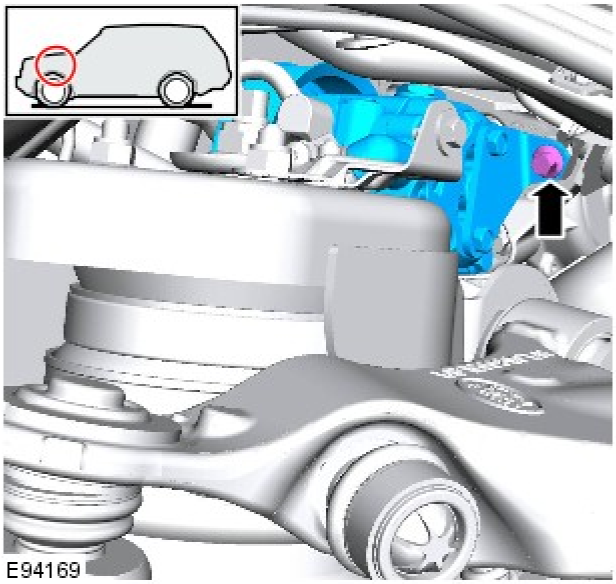
15. CAUTIONS:

⚠ Immediately cap all refrigerant lines to prevent ingress of dirt and moisture.

⚠ Care must be taken to avoid damage to the mating surfaces.

Release the A/C low pressure pipe from the compressor.

- Remove and discard the O-ring seal.
- Using a suitable tie strap, secure the A/C low-pressure pipe aside.

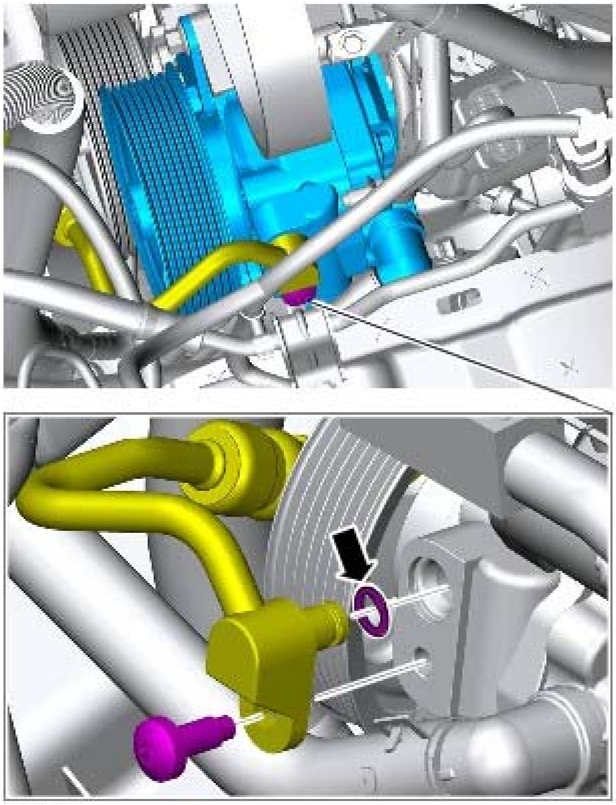


16. Remove the power steering pump rear fixing bracket retaining bolt.

- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolt.

17. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Lower the vehicle.

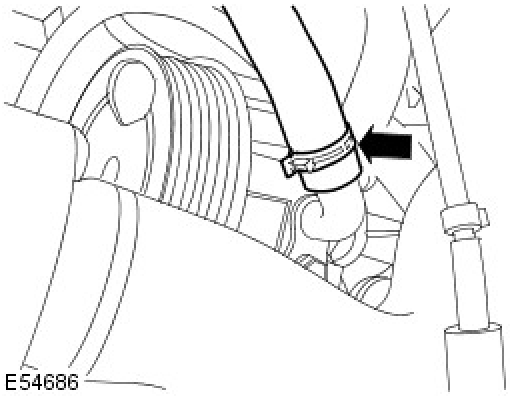


E94170

18. ⚠CAUTION: If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Disconnect the high pressure line from the power steering gear.

- Remove and discard the O-ring seal.
- Install blanking caps to the exposed ports.
- Allow the fluid to drain into a container.

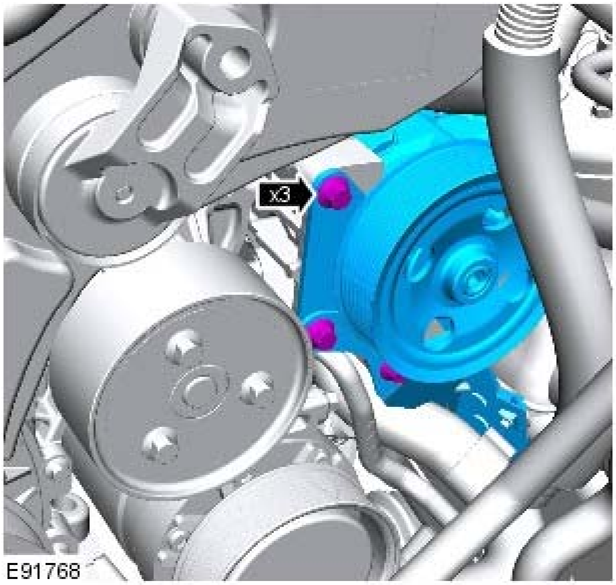


E54686

19. ⚠CAUTION: If power steering fluid comes into contact with the paintwork, the affected area must be immediately washed down with cold water.

Disconnect the power steering pump supply hose.

- Clamp the power steering pump supply hose to minimise fluid loss.
- Install blanking caps to the exposed ports.



20. Remove the power steering pump.

- Remove the 3 power steering pump front retaining bolts.

Installation

1. Install the power steering pump and bracket.

- Install the 3 power steering pump front bolts and lightly tighten, then back off each bolt a 1/4 turn.

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

3. Install the power steering pump rear fixing bracket retaining bolt.

- Reposition the charge air cooler inlet pipe to gain access to the power steering pump retaining bolt.
- Tighten the bolt to 25 Nm (18 lb.ft).

4. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Lower the vehicle.

5. Tighten power steering pump front retaining bolts to 24 Nm (18 lb.ft).

6. Connect the power steering supply hose.

- Remove the blanking caps from the ports.
- Remove the hose clamp.

7. NOTE: Lubricate the seals with clean power steering fluid.

Connect the power steering high-pressure pipe union.

- Remove the blanking caps from the ports.
- Install a new O-ring seal.
- Tighten the Torx bolt to 25 Nm (18 lb.ft).
- Remove the container.

8. CAUTION: Lubricate the new seals with clean refrigerant oil.

Install the A/C low pressure pipe to the compressor.

- Remove the blanking caps from the ports.
- Install a new O-ring seal.
- Tighten the bolt to 9 Nm (7 lb.ft).

9. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise the vehicle.

10. Connect the charge air cooler inlet hose.

- Tighten the clips.

11. Secure the charge air cooler inlet pipe.

- Install the two retaining bolts.
- Install the retaining nut.
- Tighten to 10 Nm (7 lb.ft).

12. Install the upper arm and brake line heat shields.

- Install the 3 bolts.
- Install the 3 nuts.

13. Install the fender splash shield lower trim panel.

- Install the 4 clips.

14. Install the front LH fender splash shield.
For additional information, refer to: Fender Splash Shield (501-02, Removal and Installation).

15. Install the wheel and tire.

16. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Lower the vehicle.

17. Install the accessory drive belt.
For additional information, refer to: Accessory Drive Belt (303-05C Accessory Drive - TDV6 2.7L Diesel, Removal and Installation).

18. Install the auxiliary battery tray.
For additional information, refer to: Auxiliary Battery Tray (414-01 Battery, Mounting and Cables, Removal and Installation).

19. Recharge the A/C system
For additional information, refer to: Air Conditioning (A/C) System Recovery, Evacuation and Charging (412-00 Climate Control System - General Information, General Procedures).

20. Install the cooling fan shroud.
For additional information, refer to: Cooling Fan Shroud (303-03C Engine Cooling - TDV6 2.7L Diesel, Removal and Installation).

21. Check and top-up power steering fluid level.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00 Steering System - General Information, General Procedures).

22. Install the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L

Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

23. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

Power Steering - Power Steering Control Valve Actuator

Removal and Installation

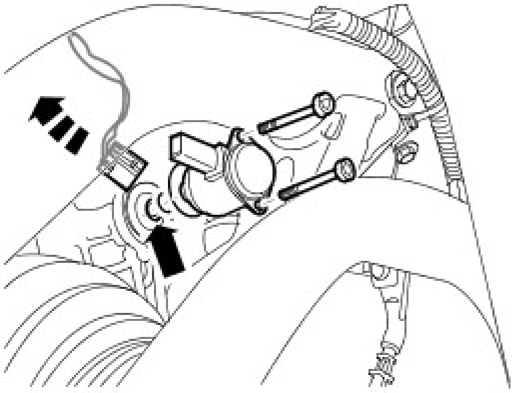
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

2. ⚠ WARNING: Make sure to support the vehicle with axle stands.

Raise the vehicle on the lift.

3. Remove the front wheel and tire.



E71406

4. ⚠ CAUTION: Before disconnecting or removing the components, make sure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Note the fitted position.

• NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the power steering control valve actuator.

- Disconnect the electrical connector.
- Position a container to collect the fluid spillage.
- Remove and discard the 2 Torx screws.
- Remove and discard the 2 O-ring seals.
- Remove and discard the filter.

Installation

1. ⚠ CAUTION: Make sure the working surfaces are thoroughly clean to avoid contamination of the sensitive hydraulic components.

Clean the component mating faces.

2. Install a new filter to the steering gear.

3. Install new seals to the actuator.

4. NOTE: Align to the position noted on removal.

Install the actuator.

- Tighten the new Torx screws, evenly and progressively, to 3 Nm (2.2 lb.ft).
- Connect the electrical connector.

5. Install the wheel and tire.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

6. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

7. Refill and bleed the power steering.
For additional information, refer to: Power Steering System Filling and Bleeding (211-00, General Procedures).

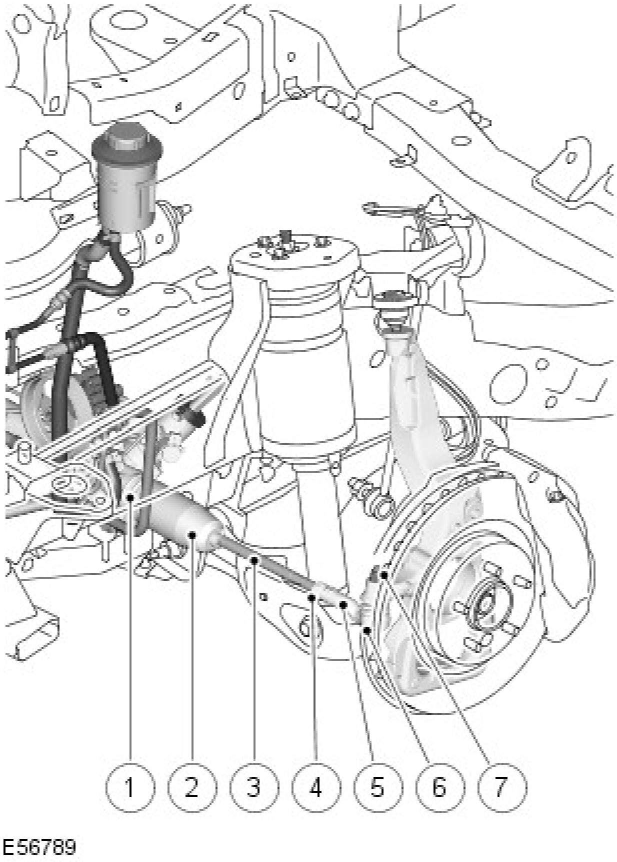
Steering Linkage - Steering Linkage

Description and Operation

Steering Linkage Component Location



Item	Part Number	Description
1	-	Steering gear
2	-	Steering gear gaitor
3	-	Tie rod
4	-	Locknut
5	-	Tie rod end
6	-	Ball joint
7	-	Self-locking nut

GENERAL

The steering linkage comprises the tie rod which provides the connection between the steering gear and the front wheel knuckle.

Each end of the steering gear has a threaded hole which provides for the fitment of the tie rods. The external ends of the tie rods are sealed with steering gear gaitors to prevent the ingress of dirt and moisture into the steering gear.

The outer ends of the tie rods are threaded to allow the fitment of the tie rod ends. The tie rod ends are screwed onto the tie rods and locked with locknuts to prevent inadvertent movement. The thread on the tie rod allows the position of the tie rod end to be adjusted in order to set the correct toe angle for each front wheel.

The tie rod end comprises a forged housing with a threaded bore for attachment to the tie rod. The tie rod end incorporates a non-serviceable tapered ball joint which locates in a tapered hole in the front wheel knuckle and is secured with a self-locking nut. The ball joint has an internal hexagonal drive which enables the joint to be held stationary when the self-locking nut is tightened.

Removal and Installation

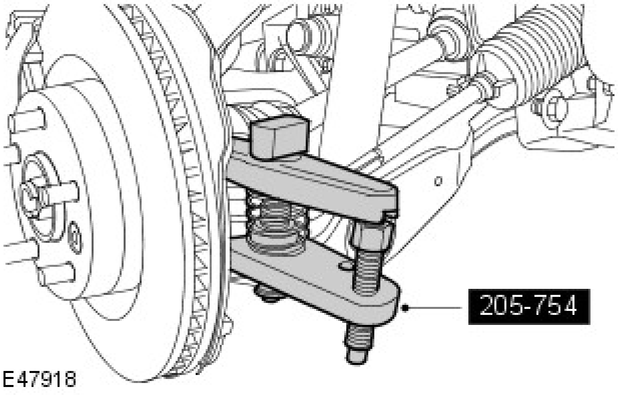
Special Tool(s)	
	Ball joint separator 205-754 (LRT-54-027)

Removal

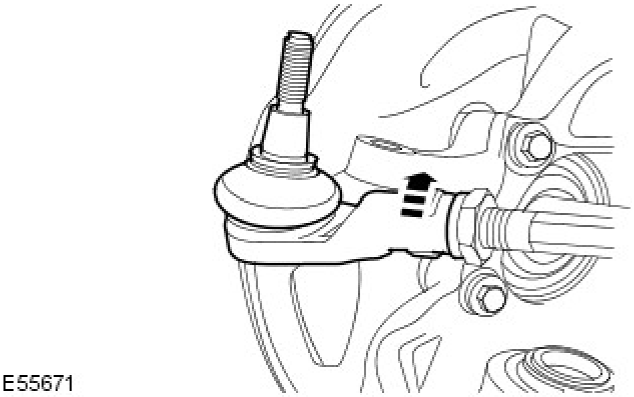
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the front wheel.
3. Loosen the tie rod end ball joint retaining nut.
4. Loosen the tie rod end lock nut.
5. Using the special tool, release the tie-rod end ball joint from the wheel knuckle.
   - Remove and discard the tie rod end retaining nut.



6. Remove the tie-rod end, note the number of turns for installation.



Installation

1. Install the tie rod end, note the number of turns until adjacent to the locknut.
2. CAUTION: To prevent damage to the tie rods, use an

additional wrench when loosening or tightening the components.

Connect the tie rod end ball joint.

- Clean the component mating faces.
- For vehicles fitted with an M12 nut, install a new nut and tighten to 76 Nm (56 lb.ft).
- For vehicles fitted with an M14 nut, install a new nut and tighten to 150 Nm (111 lb.ft).

3. Tighten the tie rod locking nut.

- Clean the component mating faces.
- Tighten the nut to 55 Nm (40 lb.ft).

4. Install the front wheel.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

5. Lower the vehicle.

6. Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

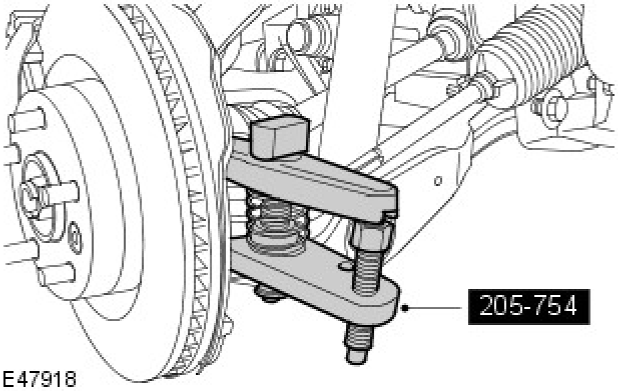
2. Remove the front wheel.

3. Loosen the outer tie-rod end ball joint retaining nut.

4. Loosen the outer tie-rod end lock nut.

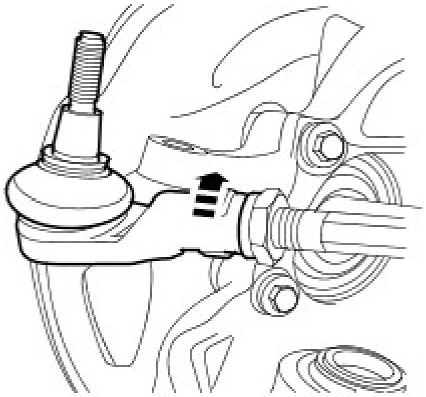
5. Using the special tool, release the tie-rod end ball joint from the wheel knuckle.

- Remove and discard the tie rod end retaining nut.



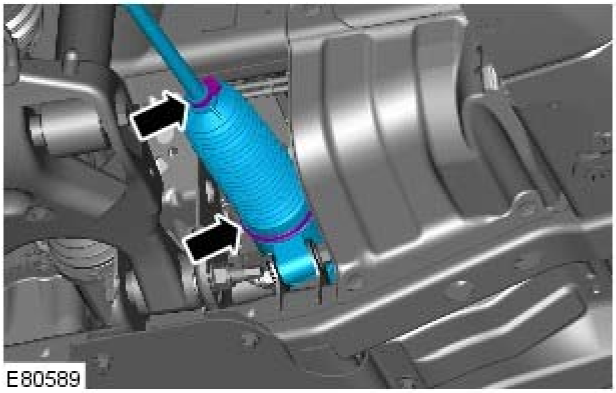
E47918

6. Remove the outer tie-rod end, note the number of turns for installation.



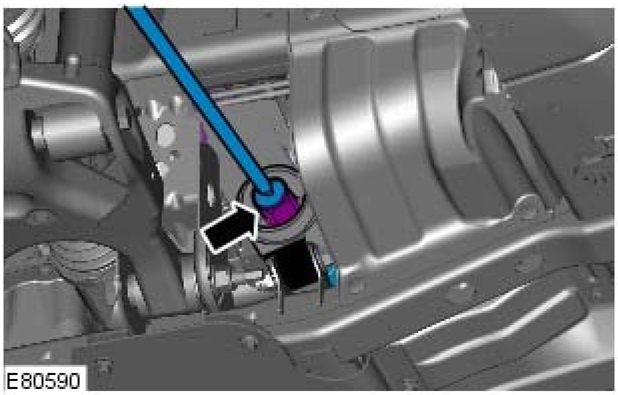
E55671

7. Remove the outer tie-rod end lock nut.



8. Remove the steering gear boot.

- Release the 2 clips.



9. Remove the inner tie-rod end.

- Loosen the nut.

Installation

1. Install the inner tie-rod end.

- Tighten the nut to 100 Nm (74 lb.ft).

2. Install the steering gear boot.

- Secure with the clips.

3. Install the outer tie-rod end lock nut.

4. Install the tie rod end, note the number of turns until adjacent to the locknut.

5. ⚠ CAUTION: To prevent damage to the tie rods, use an additional wrench when loosening or tightening the components.

Connect the tie-rod end ball joint.

- Clean the component mating faces.
- For vehicles fitted with an M12 nut, install a new nut and tighten to 76 Nm (56 lb.ft).
- For vehicles fitted with an M14 nut, install a new nut and tighten to 150 Nm (111 lb.ft).

6. Tighten the tie-rod locking nut.

- Clean the component mating faces.
- Tighten the nut to 55 Nm (40 lb.ft).

7. Install the front wheel.

- Tighten the wheel nuts to 140 Nm (103 lb.ft).

8. Lower the vehicle.

9. Using only four wheel alignment equipment approved by Land Rover, check and adjust the wheel alignment.

OVERVIEW

The steering column comprises the upper column assembly, the intermediate shaft and the lower collapsible shaft. The three components are positively connected together to pass driver rotary input from the steering wheel to a linear output of the steering rack.

The upper steering column assembly is adjustable for steering wheel reach and rake and provides the location for the ignition switch, the ignition lock barrel, the steering lock mechanism and the steering angle sensor. Column adjustment is obtained either manually or electrically, dependant on column variant fitted.

Item	Part Number	Description
A	-	Crash Stroke 120.00 mm (4.72 in)
1	-	Attachment holes

2	-	Roof bracket
3	-	Screw
4	-	Locating hook
5	-	'U' bracket
6	-	Steering wheel splines
7	-	Lock assembly
8	-	Cam plate
9	-	Clamp plate assembly
10	-	Adjustment lever
11	-	Brake pad
12	-	Lever nut
13	-	Lever bolt
14	-	Shearing capsule (2 off)
15	-	Clamp plate assembly
16	-	Adjustment balance spring (2 off)
17	-	Main body
18	-	Strap (2 off)
19	-	Steering angle sensor
20	-	Pivot pin
21	-	Pivot housing
22	-	Spider
23	-	Bush
24	-	Pressure washer (2 off)
25	-	Upper shaft
26	-	Upper bearing
27	-	Tolerance ring
28	-	Lock collar
29	-	Middle bearing
30	-	Spring
31	-	Spring washer
32	-	Lower shaft
33	-	Retaining ring
34	-	Universal joint seal
35	-	Swing yoke
36	-	Driving collar

The steering column is attached to the in-vehicle crossbeam and secured with four, 8 mm thread forming, pan head Torx drive screws. The two forward attachment screws are fixed through the column mounting bracket, the two rearward mounting screws also pass through the shearing capsules. In the event of a high energy frontal impact, the shearing capsules remain fixed to the crossbeam, but the 'U' bracket (with the main body) disengages from the capsules, allowing the column to shorten axially (collapse), with the coiled straps absorbing energy to reduce occupant loading.

⚠ WARNING: Take care when handling the column not to trap fingers if releasing the adjustment lever at any point during the removal procedure when the column is not in the vehicle. The balance springs will cause the column to rapidly move to its upmost position.

The column comprises a cast magnesium roof bracket which is attached to the in-vehicle crossbeam. Attached to the roof bracket are a pivot housing, a 'U' bracket, upper and lower shafts and a main body. The roof bracket has two hooks which locate in slots in the in-vehicle crossbeam. The hooks assist in supporting the weight of the column during removal or installation.

The pivot housing is attached to the forward end of the roof bracket with two pivot pins. The pivot housing allows for adjustment of the column rake and contains a bearing which supports the column lower shaft.

The 'U' bracket is attached to the roof bracket by a screw, bush and plastic washer assembly (third fixing) located in a slot in the top of the roof bracket. When the column is assembled into the vehicle, the shearing capsules, which are attached to the 'U' bracket, are clamped up against the roof bracket by the fixing screws, preventing movement of the 'U' bracket. The bolts also pass through rectangular section steel straps, which at one end, have coils that locate around a plastic bush (positioned on the shearing capsule). The straps are used to control the rate of column collapse, in the event of a high energy frontal impact.

The main body is positioned in the 'U' bracket via the lever bolt. The bolt is captive within the vertical slots in the 'U' bracket and the horizontal slots in the main body. The bolt also passes through the clamp plate assemblies (one on either side of the 'U' bracket). The body houses the middle and upper bearings through which the upper shaft is located. Two offset holes in the main body provide for the attachment of the column lock assembly.

The upper and lower shafts are located through the length of the column assembly. The upper shaft is supported in two bearings in the main body and the lower shaft is located in the upper shaft and supported in a bearing in the pivot housing. The lower shaft has a tubular section with external splines. These mate with the internal splines in the upper shaft. The purpose of the splines is to transmit rotational movement of the upper shaft to the lower shaft, but allowing the two components to telescope into each other in the event of a collision. The length of the splined sections allow for 120 mm (4.72 in) of linear movement. The lower shaft is fitted with a universal joint spider to which a swivel yoke is attached. The swivel yoke attaches to the intermediate shaft of the steering column on the interior side of the bulkhead using a special cam bolt and self-locking nut.

A steering angle sensor is attached to the pivot housing of the column and its centre gear is rotated by a drive collar which is attached to the lower shaft and rotates with movement of the steering wheel. The sensor transmits steering angle data on the high speed CAN bus which is used by various systems on the vehicle. The steering angle sensor is designed to become detached from the column in the event of a frontal impact. Care must be taken when handling the column assembly to prevent accidental damage to the sensor.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

The upper shaft is fitted with a locking collar which engages with the lock bolt of the column lock assembly. The locking collar is retained by a tolerance ring on the shaft. The tolerance ring allows a specified amount of force to be applied to the shaft before it slips, preventing damage to the column lock if excessive torque is applied to the steering wheel. The tolerance ring is designed to slip on the upper shaft when an applied torque exceeds its fitted slip load of 200Nm minimum. Following rotation, the torque to rotate the lock collar should exceed 100Nm.

The steering column is adjustable for reach and rake. The column can be adjusted for 40 mm (1.57 in) of reach adjustment and 6º of rake adjustment. The adjustment mechanism comprises an adjustment lever, a cam plate, a lever bolt and nut, two brake pads and two clamp plate assemblies.

A plastic adjustment lever is located on the underside of the column assembly and is attached to a cam plate. When the lever is pulled downwards, the cam plate rotates and releases tension in the lever bolt. The lever bolt also passes through two sets of clamp plate assemblies. When the lever is moved upwards, the cam plate rotates applying tension to the lever bolt, which applies pressure to the brake pads which in turn apply pressure to the clamp plate assemblies (which lock the column in the desired position). The lever bolt is retained by a self-locking lever nut, which abuts a thrust bearing.

⚠WARNING: Under no circumstances should the lever nut torque be reduced, as this will reduce the clamping efficiency of the adjustment mechanism possibly affecting the stability of the column during a frontal impact.

The pivot housing is attached to the roof bracket with two pivot pins. When the rake adjustment is operated, the pivot housing rotates around the pivot pins to allow for the up and down adjustment, but maintains a positive location to the roof bracket. An adjustment spring is fitted between the 'U' bracket and the main body, to counteract the weight of the main body, upper shaft, steering wheel and airbag, preventing the steering wheel from dropping rapidly when the adjustment lever is released.

In the event of a high energy frontal impact, the upper column assembly is designed to axially collapse reducing impact injury to the driver. A number of components interact together to ensure that the collapse of the column is in a controlled manner. The following components control the column collapse:

- Pressure washer and bush (third fixing)
- Shearing capsules
- Straps
- Upper and lower shaft (splined) connection.

The shearing capsules have a central hole through which the rearward attachment bolts pass through into the roof bracket. The capsules are located in the 'U' bracket by tapered slots, which have small cut-outs in the inside faces. The shearing capsules have a number of small holes which align with the cut-outs in the 'U' bracket. When the capsules are installed, plastic is injected into the holes and cut-outs. This plastic retention of the capsules provides the initial controlled break-out force for the column in the event of a collision. After 10 mm of displacement, the 'U' bracket is no longer located by the shearing capsules. When handling the column, care should be taken that the shearing capsules are not impacted or dislodged.

The tension in the 'Third Fixing' screw, applies a clamp load to the roof bracket (via the bush and compression washers). In the event of a collision, this clamp load (supplementary to the shearing capsules) must be overcome before the column can collapse. When this load has been exceeded (and the fixing has been displaced 20 mm (0.79 in)) it slides easily within the roof bracket slot, providing directional control to the column, as it collapses. Under no circumstances should the screw torque be adjusted.

The straps are rectangular section steel, which at one end, have coils that locate around a plastic bush (positioned on the shearing capsule). The other end is formed into a hook which locates within a slot in the 'U' bracket. When a collision has occurred, and the 'U' bracket has been displaced from the shearing capsules by 8 mm (0.3 in), the straps begin to un-roll due to the displacement of the 'U' bracket. The straps provide the main element for energy absorption as the column collapses. The cross section of the straps change after approximately 40 mm (1.6 in) of extension, changing the amount of energy that they absorb.

E86421

Item	Part Number	Description
A	-	Crash Stroke 90.00 mm (3.54 in)
1	-	Attachment hole
2	-	Roof bracket
3	-	Locating hook
4	-	Steering wheel splines
5	-	Outer profile

6	-	Lock assembly
7	-	Rake solenoid
8	-	Rake clutch
9	-	Reach solenoid
10	-	Reach clutch
11	-	Potentiometer
12	-	Electric motor
13	-	Pivot pin
14	-	Pivot housing
15	-	Steering angle sensor
16	-	Needle bearing
17	-	Driving collar
18	-	Inner profile
19	-	Crash rail
20	-	Rake lever
21	-	Electrical connector
22	-	Upper shaft
23	-	Upper bearing
24	-	Lock collar
25	-	Tolerance ring
26	-	Clip - cowl attachment
27	-	Flat strap
28	-	shear pin
29	-	Lower shaft
30	-	Lower bearing
31	-	Washer
32	-	Retaining ring
33	-	Yoke
34	-	Universal joint seal
35	-	Spider
36	-	Swing yoke

The electric steering column is a standard fit on certain models and an optional fit on other models.

The steering column is attached to the in-vehicle crossbeam and secured with four, 8mm, thread forming, pan head Torx drive screws. In the event of a high energy frontal impact, a strap and shear pin on the underside of the column provides a controlled collapse of the outer housing on the inner housing, allowing the column to shorten axially (collapse), absorbing energy to reduce occupant loading.

The column comprises a cast magnesium roof bracket which is attached to the in-vehicle crossbeam. Attached to the roof bracket is a pivot housing, a outer housing and upper and lower shafts. The roof bracket has two hooks which locate in slots in the in-vehicle crossbeam. The hooks assist in supporting the weight of the column during removal or installation.

The rake lever locates the aluminum outer profile, into which is fixed the steel column lock adaptor (with upper bearing). The inner profile is located within the outer profile, by 2 linear bearing assemblies, which allow a telescopic action for the reach adjustment.

The assembly of the upper and lower shafts is located within the column by the bearings in the column lock adaptor and the pivot housing. Both shafts are tubular. The lower shaft has external splines (which are over molded with nylon), and these mate with the internal splines in the upper shaft. The purpose of the splines is to transmit rotational movement of the upper shaft to the lower shaft, yet allow telescopic movement during column axial collapse. The lower shaft is fitted with a universal joint spider to which a swivel yoke is attached. The swivel yoke attaches to the intermediate shaft of the steering column on the interior side of the bulkhead using a special cam bolt and self-locking nut.

A steering angle sensor is attached to the pivot housing of the column and its centre gear is rotated by a drive collar which is attached to the lower shaft and rotates with movement of the steering wheel. The sensor transmits steering angle data on the high speed CAN bus which is used by various systems on the vehicle. The steering angle sensor is designed to become detached from the column in the event of a frontal impact. Care must be taken when handling the column assembly to prevent accidental damage to the sensor.
For additional information, refer to: Anti-Lock Control - Traction Control (206-09A Anti-Lock Control - Traction Control, Description and Operation).

The upper shaft is fitted with a locking collar which engages with the lock bolt of the column lock assembly. The locking collar is retained by a tolerance ring on the shaft. The tolerance ring allows a specified amount of force to be applied to the shaft before it slips, preventing damage to the column lock due to excessive torque being applied to the steering wheel when the lock is engaged. The tolerance ring is designed to slip on the upper shaft when an applied torque exceeds its fitted slip load of 200Nm minimum. Following rotation, the torque to rotate the lock collar should exceed 100Nm.
